PROPAGATION OF REGULARITY IN L^p-SPACES FOR KOLMOGOROV TYPE HYPOELLIPTIC OPERATORS

Zhen-Qing Chen and Xicheng Zhang

Abstract. Consider the following Kolmogorov type hypoelliptic operator

$$\mathscr{L} := \sum_{j=2}^n x_j \cdot \nabla_{x_{j-1}} + \Delta_{x_n},$$

where $n \geqslant 2$ and $x = (x_1, \cdots, x_n) \in (\mathbb{R}^d)^n = \mathbb{R}^{nd}$. Let $\{\mathcal{T}_t; t \geqslant 0\}$ be the semigroup associated with $\mathscr{L}$. For any $p \in (1, \infty)$, we show that there is a constant $C = C(p, n, d) > 0$ such that for any $f(t, x) \in L^p(\mathbb{R} \times \mathbb{R}^{nd}) = L^p(\mathbb{R}^{1+nd})$,

$$\left\| \Delta_{x_j}^{\frac{1}{1+2(n-j)}} \int_0^\infty \mathcal{T}_t f(t+s, x) \mathrm{d}t \right\|_p \leqslant C \|f\|_p, \ j = 1, \cdots, n,$$

where $\|\cdot\|_p$ is the usual L^p-norm in $L^p(\mathbb{R}^{1+nd}; \mathrm{d}s \times \mathrm{d}x)$. To show this type of estimates, we first study the propagation of regularity in L^2-space from variable x_n to x_1 for the solution of the transport equation $\partial_t u + \sum_{j=2}^n x_j \cdot \nabla_{x_{j-1}} u = f$.

1. Introduction

Let $n \geqslant 2$ and $d \in \mathbb{N}$. In this paper we consider the following Kolmogorov type hypoelliptic operator:

$$\mathscr{L}_t := \sum_{i,j=1}^d a_t^{ij} \partial_{x_{ni}} \partial_{x_{nj}} + \sum_{j=2}^n x_j \cdot \nabla_{x_{j-1}}, \tag{1.1}$$

where $x = (x_1, x_2, \cdots, x_n) \in \mathbb{R}^{nd}$ with $x_j = (x_{j1}, \cdots, x_{jd}) \in \mathbb{R}^d$ for each $j = 1, \cdots, n$, $\nabla_{x_j} = (\partial_{x_{j1}}, \cdots, \partial_{x_{jd}})$, and $a_t = (a_t^{ij}) : \mathbb{R} \to \mathbb{M}^d_{sym}$ is a measurable map. Here $\mathbb{M}^d_{sym}$ stands for the set of all symmetric $d \times d$-matrices. Suppose that

$$\kappa^{-1} \mathbb{I}_{d\times d} \leqslant a_t \leqslant \kappa \mathbb{I}_{d\times d} \tag{1.2}$$

for some $\kappa \geqslant 1$. Let $\nabla := (\nabla_{x_1}, \cdots, \nabla_{x_n})$, $\nabla^2_{x_n} := (\partial_{x_{ni}} \partial_{x_{nj}})_{i,j=1,\cdots,d}$ and

$$A = A_n = \begin{pmatrix} 0_{d\times d} & \mathbb{I}_{d\times d} & 0_{d\times d} & \cdots & \cdots \\ 0_{d\times d} & 0_{d\times d} & \mathbb{I}_{d\times d} & 0_{d\times d} & \cdots \\ \vdots & \ddots & \ddots & \ddots & \vdots \\ \vdots & \cdots & \ddots & 0_{d\times d} & \mathbb{I}_{d\times d} \\ 0_{d\times d} & \cdots & \cdots & 0_{d\times d} & 0_{d\times d} \end{pmatrix}_{nd\times nd}. \tag{1.3}$$

We can rewrite $\mathscr{L}_t$ as the following compact form:

$$\mathscr{L}_t = \mathrm{tr}(a_t \cdot \nabla^2_{x_n}) + Ax \cdot \nabla,$$

where "tr" denotes the trace of matrix.

Consider the following linear stochastic differential equations (SDEs):

$$\mathrm{d}X_{s,t} = AX_{s,t}\mathrm{d}t + \sigma_t^a \mathrm{d}W_t,\ X_{s,s} = x,\ t > s, \tag{1.4}$$

where $(W_t)_{t\in\mathbb{R}}$ is a standard nd-dimensional Brownian motion and

$$\sigma_t^a := \begin{pmatrix} 0_{(n-1)d\times(n-1)d}, & 0_{(n-1)d\times d} \\ 0_{d\times(n-1)d}, & (\sqrt{2a_t})_{d\times d} \end{pmatrix}_{nd\times nd}. \tag{1.5}$$

It is easy to see that the solution $X_{s,t}$ is explicitly given by

$$X_{s,t} := X_{s,t}(x) := \mathrm{e}^{(t-s)A}x + \int_s^t \mathrm{e}^{(t-r)A}\sigma_r^a \mathrm{d}W_r,$$

where e^{tA} is the exponential matrix with the expression

$$\mathrm{e}^{tA} = \begin{pmatrix} \mathbb{I}_{d\times d} & t\mathbb{I}_{d\times d} & \frac{t^2\mathbb{I}_{d\times d}}{2} & \cdots & \frac{t^{n-1}\mathbb{I}_{d\times d}}{(n-1)!} \\ 0_{d\times d} & \mathbb{I}_{d\times d} & t\mathbb{I}_{d\times d} & \cdots & \frac{t^{n-2}\mathbb{I}_{d\times d}}{(n-2)!} \\ \vdots & \ddots & \ddots & \ddots & \vdots \\ \vdots & \cdots & 0_{d\times d} & \mathbb{I}_{d\times d} & t\mathbb{I}_{d\times d} \\ 0_{d\times d} & \cdots & \cdots & 0_{d\times d} & \mathbb{I}_{d\times d} \end{pmatrix}_{nd\times nd}. \tag{1.6}$$

Notice that if $a_t = a$ does not depend on t (i.e., time homogeneous), then

$$X_{s,t}(x) \overset{(d)}{=} Z_{t-s}(x) \text{ with } Z_t(x) := \mathrm{e}^{tA}x + \int_0^t \mathrm{e}^{rA}\sigma^a \mathrm{d}W_r.$$

In this case, $Z_t(x)$ is an (nd)-dimensional Gaussian random variable with density

$$p_t(x,y) = \frac{\mathrm{e}^{-(\Theta_{t^{-1/2}}(y-\mathrm{e}^{tA}x))^*\Sigma^{-1}\Theta_{t^{-1/2}}(y-\mathrm{e}^{tA}x)}}{((2\pi)^{nd}t^{n^2d}\det(\Sigma))^{1/2}},$$

where $\Theta_r : \mathbb{R}^{nd} \to \mathbb{R}^{nd}$ is the dilation operator defined by

$$\Theta_r(x) = (r^{2n-1}x_1, r^{2n-3}x_2, \cdots, rx_n), \tag{1.7}$$

and $\Sigma := \int_0^1 \mathrm{e}^{rA}\sigma^a(\sigma^a)^*\mathrm{e}^{rA^*}\mathrm{d}r$ is the covariance matrix (see [7] or (2.2) below). For $f \in C_b^2(\mathbb{R}^{nd})$, define

$$\mathcal{T}_{s,t}f(x) := \mathbb{E}f(X_{s,t}(x)). \tag{1.8}$$

It is well-known that $\mathscr{L}_t$ is the infinitesimal generator of $\mathcal{T}_{s,t}$, i.e.,

$$\partial_s\mathcal{T}_{s,t}f + \mathscr{L}_s\mathcal{T}_{s,t}f = 0. \tag{1.9}$$

The goal of this paper is to show the following L^p-maximal regularity estimate.

Theorem 1.1. *Let $p \in (1,\infty)$ and $j = 1,\cdots,n$. Under* (1.2)*, there is a constant $C = C(n,\kappa,p,d) > 0$ such that for any $f \in L^p(\mathbb{R}^{1+nd})$ and $\lambda \geqslant 0$,*

$$\left\|\Delta_{x_j}^{\frac{1}{1+2(n-j)}}\int_0^\infty \mathrm{e}^{-\lambda t}\mathcal{T}_{s,t+s}f(t+s,x)\mathrm{d}t\right\|_p \leqslant C\|f\|_p, \tag{1.10}$$

where $\Delta_{x_j}^{\frac{1}{1+2(n-j)}} := -(-\Delta_{x_j})^{\frac{1}{1+2(n-j)}}$ is the fractional Laplacian acting on the variable x_j.

One of the motivation of studying the estimate (1.10) comes from the study of the following $n+1$-order stochastic differential equation:

$$\mathrm{d}X_t^{(n)} = b_t(X_t, X_t^{(1)}, \cdots, X_t^{(n)})\mathrm{d}t + \sigma_t(X_t, X_t^{(1)}, \cdots, X_t^{(n)})\mathrm{d}W_t, \tag{1.11}$$

where $X_t^{(n)}$ denotes the n-order derivative of X_t with respect to the time variable and $b : \mathbb{R}_+ \times \mathbb{R}^{(n+1)d} \to \mathbb{R}^d$ and $\sigma : \mathbb{R}_+ \times \mathbb{R}^{(n+1)d} \to \mathbb{R}^d \otimes \mathbb{R}^d$ are two measurable functions. Notice that if we let

$$\mathbf{X}_t := (X_t, X_t^{(1)}, \cdots, X_t^{(n)}),$$

then $\mathbf{X}_t$ solves the following one order stochastic differential equation

$$\mathrm{d}\mathbf{X}_t = (X_t^{(1)}, \cdots, X_t^{(n)}, b_t(\mathbf{X}_t))\mathrm{d}t + (0, \cdots, 0, \sigma_t(\mathbf{X}_t)\mathrm{d}W_t), \quad \mathbf{X}_0 = \mathbf{x},$$

where $\mathbf{x} = (\mathbf{x}_i)_{i=0,\cdots,n} = ((x_{ij})_{j=1,\cdots,d})_{i=0,\cdots,n}$. In particular, the infinitesimal generator of Markov process $\mathbf{X}_t(\mathbf{x})$ is given by

$$\mathscr{L}_t f(\mathbf{x}) = \sum_{i,j,k=1}^{d} (\sigma_t^{ik}\sigma_t^{jk})(\mathbf{x})\partial_{x_{ni}}\partial_{x_{nj}} f(\mathbf{x}) + \sum_{j=1}^{n} \mathbf{x}_j \cdot \nabla_{\mathbf{x}_{j-1}} f(\mathbf{x}) + b_t(\mathbf{x}) \cdot \nabla_{\mathbf{x}_n} f(\mathbf{x}),$$

which takes the same form as (1.1). Thus, the estimate (1.10) could be used to study the well-posedness of SDE (1.11) with rough coefficients b and σ. Indeed, when $n = 1$ and σ is bounded and uniformly nondegenerate, the second named author [10] studied the strong well-posedness of SDE (1.11) with $(\mathbb{I} - \Delta_{\mathbf{x}_1})^{1/3} b, \nabla\sigma \in L^p_{loc}(\mathbb{R}_+ \times \mathbb{R}^{2d})$ for some $p > 4d + 2$. See also [5] for similar results when $\sigma = \mathbb{I}$.

Let us now recall some related results in literature about the estimate (1.10). In [3], the authors adopted Coifman-Weiss' theorem to show the estimate (1.10) for $j = n$. When $n = 2$, in [4], we used Fefferman-Stein's theorem to show the estimate (1.10) for $j = 1, 2$ even for nonlocal operators. It should be noticed that the methods used in [3] and [4] are quite different. In [3], the key point is to show some weak 1-1 type estimate. While in [4], the main point is to show that the operator in (1.10) is bounded from L^∞ to some BMO spaces. In particular, to show the propagation of the regularity from the nondegenerate component to the degenerate component, in [4], we have used Bouchet's result [2]. More precisely, Bouchet studied the following transport equation:

$$\partial_t u + x_2 \cdot \nabla_{x_1} u = f,$$

and showed that for any $\alpha \geqslant 0$,

$$\|\Delta_{x_1}^{\frac{\alpha}{2(1+\alpha)}} u\|_2 \leqslant C\|\Delta_{x_2}^{\frac{\alpha}{2}} u\|_2^{\frac{1}{1+\alpha}} \|f\|_2^{\frac{\alpha}{1+\alpha}},$$

where $C = C(\alpha, d) > 0$. A simplified proof of this type estimate was provided in [1]. Thus, the first goal of this paper is to extend the above estimate to the following more general transport equation:

$$\partial_t u + \sum_{j=2}^{n} x_j \cdot \nabla_{x_{j-1}} u = f.$$

That is, we want to show that for any $j = 1, \cdots, n-1$ and $\alpha \geqslant 0$, there is a constant $C = C(\alpha, d, j, n) > 0$ such that

$$\|\Delta_{x_j}^{\frac{\alpha}{2(1+\alpha)}} u\|_2 \leqslant C \|\Delta_{x_{j+1}}^{\frac{\alpha}{2}} u\|_2^{\frac{1}{1+\alpha}} \|f\|_2^{\frac{\alpha}{1+\alpha}}.$$

It seems that this type estimate is not trivial compared with [1], see Section 3.

Although the above result is proven for Laplacian operator, we can extend it to more general nonlocal operator as in [4] without any difficulty. Indeed, let us consider the following nonlocal operator:

$$\widetilde{\mathscr{L}}_\sigma^\nu f(x) := \int_{\mathbb{R}^d} [f(x + \sigma y) + f(x - y) - 2f(x)] \nu(\mathrm{d}y),$$

where $\sigma \in \mathbb{M}^d$ is a $d \times d$ matrix and ν is a symmetric Lévy measure. Let $n \geqslant 2$ and

$$\mathscr{L}_t f(x) := \widetilde{\mathscr{L}}_{\sigma_t, x_n}^{\nu_t} f(x) + \sum_{j=2}^n x_j \cdot \nabla_{x_{j-1}} f(x),$$

where $\widetilde{\mathscr{L}}_{\sigma_t, x_n}^{\nu_t}$ means that the operator acts on the variable x_n. Suppose that

$$\|\sigma\|_\infty + \|\sigma^{-1}\|_\infty < \infty$$

and for some $\alpha \in (0, 2)$,

$$\nu_1^{(\alpha)} \leqslant \nu_s \leqslant \nu_2^{(\alpha)},$$

where $\nu_1^{(\alpha)}$ and $\nu_2^{(\alpha)}$ are two symmetric and nondegenerate α-stable Lévy measures (see [4]). Under the above assumptions, as in [4], we can show that for any $j = 1, \cdots, n$,

$$\left\| \Delta_{x_j}^{\frac{\alpha}{2(1+\alpha(n-j))}} \int_0^\infty \mathrm{e}^{-\lambda t} \mathcal{T}_{s,t+s}^{\nu,\sigma} f(t+s, x) \mathrm{d}t \right\|_p \leqslant C \|f\|_p, \tag{1.12}$$

where $\mathcal{T}_{s,t}^{\nu,\sigma}$ is defined as in (1.8) by using the non-stationary Lévy process L_t with Lévy measure ν_t to replace the Brownian motion. We note that at the almost same time, Huang, Menozzi and Priola [6] have obtained (1.12) for time-independent σ and ν by using Coifman-Weiss' theorem. As mentioned above, our proof is based on Fefferman-Stein's theorem.

This paper is organized as follows: In Section 2, we prepare some estimates about the distribution density of $X_{s,t}(x)$, and give the necessary Fefferman-Stein's theorem. In Section 3, we show the propagation of the regularity for transport equation. In Section 4, we prove our main result.

Throughout this paper, we use the following convention: The letters C and c with or without subscripts will denote a positive constant, whose value may change in different places. Moreover, we use $A \lesssim B$ to denote $A \leqslant CB$ for some constant $C > 0$.

2. Preliminaries

2.1. **Estimate of density of $X_{s,t}(x)$.** In this subsection we show some necessary estimate about the density of $X_{s,t}(x)$.

Lemma 2.1. *Under* (1.2)*, $X_{s,t}(0)$ admits a smooth density $p^{(0)}_{s,t}(y)$ so that for each $\beta = (\beta_1, \cdots, \beta_n) \in \mathbb{N}_0^n$, where $\mathbb{N}_0 = \{0\} \cup \mathbb{N}$, there are constants $C, c > 0$ only depending on n, β, d and κ such that for all $s < t$ and $x, y \in \mathbb{R}^{nd}$,*

$$|\nabla^{\beta_1}_{y_1} \cdots \nabla^{\beta_n}_{y_n} p^{(0)}_{s,t}(y)| \leqslant C(t-s)^{-(n^2 d + \sum_{i=1}^n (2(n-i)+1)\beta_i)/2} \mathrm{e}^{-c|\Theta_{(t-s)^{-1/2}} y|^2}, \tag{2.1}$$

where Θ_r is the dilation operator defined by (1.7)*.*

Proof. Since $(cW_{\cdot/c^2}) \overset{(d)}{=} W$ for $c \neq 0$, by the change of variables, we have

$$X_{s,t}(0) = \int_s^t \mathrm{e}^{(t-r)A} \sigma^a_r \mathrm{d}W_r \overset{(d)}{=} (t-s)^{1/2} \int_0^1 \mathrm{e}^{(t-s)(1-r)A} \sigma^a_{s+(t-s)r} \mathrm{d}W_r.$$

Hence, by definitions (1.5), (1.6) and (1.7),

$$\Theta_{(t-s)^{-1/2}} X_{s,t}(0) \overset{(d)}{=} \int_0^1 \mathrm{e}^{(1-r)A} \sigma^a_{s+(t-s)r} \mathrm{d}W_r \overset{(d)}{=} \int_0^1 \mathrm{e}^{rA} \tilde{\sigma}^a_r \mathrm{d}W_r =: Z,$$

where $\tilde{\sigma}^a_r := \sigma^a_{s+(t-s)(1-r)}$. Since Z is a nd-dimensional Gaussian random variable with mean value zero and covariance matrix

$$\Sigma = \int_0^1 \mathrm{e}^{rA} \tilde{\sigma}^a_r (\tilde{\sigma}^a_r)^* \mathrm{e}^{rA^*} \mathrm{d}r,$$

we have

$$p^{(0)}_{s,t}(y) = \frac{\mathrm{e}^{-(\Theta_{(t-s)^{-1/2}} y)^* \Sigma^{-1} (\Theta_{(t-s)^{-1/2}} y)}}{((2\pi)^{nd} (t-s)^{n^2 d} \det(\Sigma))^{1/2}}. \tag{2.2}$$

On the other hand, by (1.5), (1.6) and (1.3), we have for all $y \in \mathbb{R}^{nd}$,

$$\begin{aligned} y^* \Sigma y &= \int_0^1 |y^* \mathrm{e}^{rA} \tilde{\sigma}^a_r|^2 \mathrm{d}r \geqslant 2\kappa^{-1} \int_0^1 \left| \sum_{j=1}^n \frac{r^{n-j}}{(n-j)!} y_j \right|^2 \mathrm{d}r \\ &\geqslant 2\kappa^{-1} |y|^2 \inf_{|\omega|=1} \int_0^1 \left| \sum_{j=1}^n \frac{r^{n-j}}{(n-j)!} \omega_j \right|^2 \mathrm{d}r. \end{aligned}$$

Since the unit sphere in $\mathbb{R}^{nd}$ is compact, and for each $\mathbb{R}^{nd} \ni \omega \neq 0$,

$$\delta(\omega) := \int_0^1 \left| \sum_{j=1}^n \frac{r^{n-j}}{(n-j)!} \omega_j \right|^2 \mathrm{d}r > 0,$$

we obtain that for some $c_0 = c_0(n, \kappa, d) > 0$ and all $y \in \mathbb{R}^{nd}$,

$$y^* \Sigma y \geqslant 2\kappa^{-1} |y|^2 \inf_{|\omega|=1} \delta(\omega) \Rightarrow y^* \Sigma^{-1} y \geqslant c_0 |y|^2. \tag{2.3}$$

The desired estimate now follows by the chain rule, (2.2) and (2.3). □

For $\alpha \in (0, 2]$, the fractional Laplacian $\Delta^{\alpha/2}$ in $\mathbb{R}^d$ is defined by Fourier's transformation as

$$\widehat{\Delta^{\alpha/2} f}(\xi) = |\xi|^\alpha \hat{f}(\xi), \quad f \in \mathcal{S}(\mathbb{R}^d),$$

where $\mathcal{S}(\mathbb{R}^d)$ is the space of Schwartz rapidly decreasing functions. For $\alpha \in (0,2)$, up to a multiplying constant, an alternative definition of $\Delta^{\alpha/2}$ is given by the following integral form (cf. [8]):

$$\Delta^{\alpha/2} f(x) = \int_{\mathbb{R}^d} \frac{\delta_z^{(2)} f(x)}{|z|^{d+\alpha}} \mathrm{d}z, \tag{2.4}$$

where $\delta_z^{(2)} f(x) := f(x+z) + f(x-z) - 2f(x)$. Observe that for $\alpha \in (0,1)$,

$$\Delta^{\alpha/2} f(x) = 2 \int_{\mathbb{R}^d} \frac{\delta_z^{(1)} f(x)}{|z|^{d+\alpha}} \mathrm{d}z \text{ with } \delta_z^{(1)} f(x) := f(x+z) - f(x). \tag{2.5}$$

Corollary 2.2. *For any $j = 1, \cdots, n$, $\alpha \in (0,2]$ and $\beta = (\beta_1, \cdots, \beta_n) \in \mathbb{N}_0^n$, there is a constant $C > 0$ such that for all $f \in C_b^\infty(\mathbb{R}^{nd})$ and $s < t$,*

$$\|\Delta_{x_j}^{\alpha/2} \nabla_{x_1}^{\beta_1} \cdots \nabla_{x_n}^{\beta_n} \mathcal{T}_{s,t} f\|_\infty \leqslant C|t-s|^{-(\sum_{i=1}^n (2(n-i)+1)\beta_i + (2(n-j)+1)\alpha)/2} \|f\|_\infty, \tag{2.6}$$

$$\|\nabla_{x_1}^{\beta_1} \cdots \nabla_{x_n}^{\beta_n} \mathcal{T}_{s,t} \Delta_{x_j}^{\alpha/2} f\|_\infty \leqslant C|t-s|^{-(\sum_{i=1}^n (2(n-i)+1)\beta_i + (2(n-j)+1)\alpha)/2} \|f\|_\infty, \tag{2.7}$$

where $\Delta_{x_j}^{\alpha/2}$ means that the fractional Laplacian acts on the variable x_j.

Proof. Below we only show (2.6) and (2.7) for $\alpha \in (0,2)$. Let $p_{s,t}(x,y)$ be the distribution density of $X_{s,t}(x) = \mathrm{e}^{(t-s)A} x + X_{s,t}(0)$. We have

$$p_{s,t}(x,y) = p_{s,t}^{(0)}(y - \mathrm{e}^{(t-s)A} x). \tag{2.8}$$

For simplicity of notation, we write

$$h_y(x) := \nabla_{x_1}^{\beta_1} \cdots \nabla_{x_n}^{\beta_n} p_{s,t}(x,y), \ \gamma := \textstyle\sum_{i=1}^n (2(n-i)+1)\beta_i/2$$

and

$$\delta_{z_j}^{(2)} h_y(x) = h_y(x + \tilde{z}_j) + h_y(x - \tilde{z}_j) - 2h_y(x), \ \ \tilde{z}_j = (0, \cdots, z_j, \cdots, 0).$$

By (2.1), (2.8) and the chain rule, we have

$$\begin{aligned} |\delta_{z_j}^{(2)} h_y(x)| \leqslant C(t-s)^{-n^2 d/2 - \gamma} \Big(& \mathrm{e}^{-c|\Theta_{(t-s)^{-1/2}}(y - \mathrm{e}^{(t-s)A}(x+\tilde{z}_j))|^2} \\ & + \mathrm{e}^{-c|\Theta_{(t-s)^{-1/2}}(y - \mathrm{e}^{(t-s)A}(x-\tilde{z}_j))|^2} + \mathrm{e}^{-c|\Theta_{(t-s)^{-1/2}}(y - \mathrm{e}^{(t-s)A} x)|^2} \Big), \end{aligned} \tag{2.9}$$

and also by the mean value formula,

$$|\delta_{z_j}^{(2)} h_y(x)| \leqslant C(t-s)^{-n^2 d/2 - \gamma - (2(n-j)+1)} \mathrm{e}^{-c|\Theta_{(t-s)^{-1/2}}(y - \mathrm{e}^{(t-s)A}\tilde{x})|^2} |z_j|^2 \tag{2.10}$$

for some $\tilde{x} \in \mathbb{R}^{nd}$ depending on z_j. By formula (2.4), we have

$$\begin{aligned} \Delta_{x_j}^{\alpha/2} h_y(x) &= \left(\int_{|z_j| > (t-s)^{(2(n-j)+1)/2}} + \int_{|z_j| \leqslant (t-s)^{(2(n-j)+1)/2}} \right) \frac{\delta_{z_j}^{(2)} h_y(x)}{|z_j|^{d+\alpha}} \mathrm{d}z_j \\ &=: I_1(x,y) + I_2(x,y). \end{aligned}$$

For $I_1(x,y)$, by (2.9) we have

$$\int_{\mathbb{R}^{nd}} |I_1(x,y)| \mathrm{d}y \lesssim (t-s)^{-\gamma} \int_{|z_j| > (t-s)^{(2(n-j)+1)/2}} \frac{\mathrm{d}z_j}{|z_j|^{d+\alpha}} \lesssim (t-s)^{-\gamma - (2(n-j)+1)\alpha/2},$$

where we have used that

$$(t-s)^{-n^2d/2}\int_{\mathbb{R}^{nd}} \mathrm{e}^{-c|\Theta_{(t-s)^{-1/2}}(y)|^2}\mathrm{d}y = \int_{\mathbb{R}^{nd}} \mathrm{e}^{-c|y|^2}\mathrm{d}y.$$

For $I_2(x,y)$, by (2.10) we have

$$\begin{aligned}\int_{\mathbb{R}^{nd}} |I_2(x,y)|\mathrm{d}y &\lesssim (t-s)^{-\gamma-(2(n-j)+1)}\int_{|z_j|\leqslant (t-s)^{(2(n-j)+1)/2}} \frac{|z_j|^2}{|z_j|^{d+\alpha}}\mathrm{d}z_j\\ &\lesssim (t-s)^{-\gamma-(2(n-j)+1)\alpha/2}.\end{aligned}$$

Combining the above calculations, we obtain

$$|\Delta_{x_j}^{\alpha/2}\nabla_{x_1}^{\beta_1}\cdots\nabla_{x_n}^{\beta_n}\mathcal{T}_{s,t}f(x)| = \left|\int_{\mathbb{R}^d}\Delta_{x_j}^{\alpha/2}h_y(x)f(y)\mathrm{d}y\right| \leqslant C(t-s)^{-\gamma-(2(n-j)+1)\alpha/2}\|f\|_\infty.$$

Thus we proved (2.6). Similarly, we can show (2.6). □

2.2. **Fefferman-Stein's theorem.** First of all, we introduce a family of "balls" in $\mathbb{R}^{1+nd}$. For any $r>0$ and point $(t_0,x_0)\in\mathbb{R}^{1+nd}$, we define

$$Q_r(t_0,x_0) := \Big\{(t,x) : \ell(t-t_0, x-\mathrm{e}^{(t-t_0)A}x_0)\leqslant r\Big\},$$

where

$$\ell(t,x) := \max\Big(|t|^{\frac{1}{2}}, |x_1|^{\frac{1}{2n-1}}, |x_2|^{\frac{1}{2n-3}}, \cdots, |x_{n-1}|^{\frac{1}{3}}, |x_n|\Big).$$

The set of all such balls is denoted by $\mathbb{Q}$. We have

Lemma 2.3. *(i)* $\ell(r^2t,\Theta_r x) = r\ell(t,x)$ *for any* $r>0$, *where* Θ_r *is the dilation operator defined by* (1.7).

(ii) $|Q_r(t_0,x_0)| = \omega_d^n r^{n^2d+2}$, *where* $|\cdot|$ *denotes the Euclidean volume and* ω_d *is the volume of the unit ball in* $\mathbb{R}^d$.

(iii) For all $(t,x),(s,y),(r,z)\in\mathbb{R}^{1+nd}$, *we have*

$$\begin{aligned}&\ell(s-t, y-\mathrm{e}^{(s-t)A}x)\leqslant 3\ell(t-s, x-\mathrm{e}^{(t-s)A}y)\leqslant\\ &\quad\leqslant 12\Big(\ell(t-r, x-\mathrm{e}^{(t-r)A}z)+\ell(r-s, z-\mathrm{e}^{(r-s)A}y)\Big).\end{aligned}\tag{2.11}$$

(iv) Suppose that $Q_r(t_0,x_0)\cap Q_r(t_0',x_0')\neq\emptyset$, *then*

$$Q_r(t_0,x_0)\subset Q_{20\cdot r}(t_0',x_0').\tag{2.12}$$

(v) For $(t,x),(s,y)\in\mathbb{R}^{1+nd}$, *define*

$$\rho((t,x),(s,y)) := \ell(t-s, x-\mathrm{e}^{(t-s)A}y)+\ell(s-t, y-\mathrm{e}^{(s-t)A}x),$$

and for $(t_0,x_0)\in\mathbb{R}^{1+nd}$ *and* $r>0$,

$$\tilde{Q}_r(t_0,x_0) := \{(t,x) : \rho((t,x),(t_0,x_0))\leqslant r\}.$$

Then $Q_r(t_0,x_0)\subset\tilde{Q}_r(t_0,x_0)\subset Q_{4r}(t_0,x_0)$.

Proof. (i) and (ii) are direct by definition.

(iii) We only prove the second inequality in (2.11). The first one is similar. Observing that for all $(t,x),(s,y)\in\mathbb{R}^{1+nd}$,

$$\ell(t+s,x+y)\leqslant \ell(t,x)+\ell(s,y), \tag{2.13}$$

we have

$$\ell(t-s,x-\mathrm{e}^{(t-s)A}y)\leqslant \ell(t-r,x-\mathrm{e}^{(t-r)A}z)+\ell(r-s,\mathrm{e}^{(t-r)A}z-\mathrm{e}^{(t-s)A}y).$$

For simplicity, we write

$$a:=\ell(t-r,x-\mathrm{e}^{(t-r)A}z),\ b:=\ell(r-s,z-\mathrm{e}^{(r-s)A}y).$$

By the definition of ℓ, we have

$$|t-r|\leqslant a^2,\ \ |(z-\mathrm{e}^{(r-s)A}y)_j|\leqslant b^{1+2(n-j)},\ \ j=1,\cdots,n.$$

Hence, for each $i=1,\cdots,n$,

$$\begin{aligned}|(\mathrm{e}^{(t-r)A}z-\mathrm{e}^{(t-s)A}y)_i| &= \left|\sum_{j=1}^n(\mathrm{e}^{(t-r)A})_{ij}(z-\mathrm{e}^{(r-s)A}y)_j\right|\\ &\overset{(1.6)}{\leqslant}\sum_{j=i}^n\frac{|t-r|^{j-i}}{(j-i)!}b^{1+2(n-j)}\leqslant\sum_{j=i}^n\frac{a^{2(j-i)}}{(j-i)!}b^{1+2(n-j)}\\ &\leqslant(a\vee b)^{1+2(n-i)}\sum_{j=i}^n\frac{1}{(j-i)!}\leqslant 3(a\vee b)^{1+2(n-i)},\end{aligned} \tag{2.14}$$

and

$$\ell(t-s,x-\mathrm{e}^{(t-s)A}y)\leqslant a+3(a\vee b)\leqslant 4(a+b).$$

(iv) and (v) are easy consequences of (iii). □

Now, for any $f\in L^1_{loc}(\mathbb{R}^{1+nd})$, we define the Hardy-Littlewood maximal function by

$$\mathcal{M}f(t,x):=\sup_{r>0}\fint_{Q_r(t,x)}|f(t',x')|\mathrm{d}x'\mathrm{d}t',$$

and the sharp function by

$$\mathcal{M}^\sharp f(t,x):=\sup_{r>0}\fint_{Q_r(t,x)}|f(t',x')-f_{Q_r(t,x)}|\mathrm{d}x'\mathrm{d}t',$$

where for a $Q\in\mathbb{Q}$,

$$f_Q:=\fint_Q f(t',x')\mathrm{d}x'\mathrm{d}t'=\frac{1}{|Q|}\int_Q f(t',x')\mathrm{d}x'\mathrm{d}t'.$$

One says that a function $f\in BMO(\mathbb{R}^{1+nd})$ if $\mathcal{M}^\sharp f\in L^\infty(\mathbb{R}^{1+nd})$. Clearly, $f\in BMO(\mathbb{R}^{1+nd})$ if and only if there exists a constant $C>0$ such that for any $Q\in\mathbb{Q}$, and for some $c_Q\in\mathbb{R}$,

$$\fint_Q|f(t',x')-c_Q|\mathrm{d}x'\mathrm{d}t'\leqslant C.$$

The following version of Fefferman-Stein's theorem can be proven as in [4, Theorem 2.12] by Lemma 2.3. We omit the details.

Theorem 2.4. *For $q \in (1,\infty)$, let $\mathscr{P}$ be a bounded linear operator from $L^q(\mathbb{R}^{1+nd})$ to $L^q(\mathbb{R}^{1+nd})$ and also from $L^\infty(\mathbb{R}^{1+nd})$ to $BMO(\mathbb{R}^{1+nd})$. Then for any $p \in [q,\infty)$ and $f \in L^p(\mathbb{R}^{1+nd})$,*

$$\|\mathscr{P} f\|_p \leqslant C\|f\|_p,$$

where the constant C depends only on p, q and the norms of $\|\mathscr{P}\|_{L^q\to L^q}$ and $\|\mathscr{P}\|_{L^\infty\to BMO}$.

3. Propagation of regularity in L^2-space for transport equations

Fix $n \geqslant 2$ and $\lambda \geqslant 0$. Let A be as in (1.3). In this section we consider the following linear transport equation in $\mathbb{R}^{nd}$:

$$\partial_s u + Ax\cdot\nabla u - \lambda u + f = 0. \tag{3.1}$$

Taking Fourier's transformation in the spatial variable x, we obtain

$$\partial_s \hat{u} - A^*\xi\cdot\nabla\hat{u} - \lambda\hat{u} + \hat{f} = 0, \tag{3.2}$$

where A^* is the transpose of A, and ξ is the dual variable. Multiplying both sides by the complex conjugate of $\hat{u}$, we get

$$\partial_s|\hat{u}|^2 - A^*\xi\cdot\nabla|\hat{u}|^2 - \lambda|\hat{u}|^2 + 2\mathrm{Re}(\hat{f},\bar{\hat{u}}) = 0.$$

Let $\phi(\xi)$ be a smooth function and define

$$g_\phi := 2\phi\mathrm{Re}(\hat{f},\bar{\hat{u}}) + A^*\xi\cdot\nabla\phi|\hat{u}|^2. \tag{3.3}$$

We have

$$\partial_s(|\hat{u}|^2\phi) - A^*\xi\cdot\nabla(|\hat{u}|^2\phi) - \lambda(|\hat{u}|^2\phi) + g_\phi = 0, \tag{3.4}$$

and if $\hat{u}$ has compact support, then

$$\begin{aligned}(|\hat{u}|^2\phi)(s,\xi) &= -\int_0^\infty \partial_t\Big(\mathrm{e}^{-\lambda t}(|\hat{u}|^2\phi)(t+s,\mathrm{e}^{-tA^*}\xi)\Big)\mathrm{d}t\\ &= \int_0^\infty \mathrm{e}^{-\lambda t} g_\phi(t+s,\mathrm{e}^{-tA^*}\xi)\mathrm{d}t,\end{aligned} \tag{3.5}$$

where $\mathrm{e}^{-tA^*} = (\mathrm{e}^{-tA})^*$ is the transpose of exponential matrix in (1.6).

The following propagation of regularity in L^2-space is the key step in the proof of Theorem 1.1.

Theorem 3.1. *Let $f, u \in L^2(\mathbb{R}^{1+nd})$ so that* (3.1) *holds in the weak sense. For any $\alpha \geqslant 0$ and $j = 1,2,\cdots,n-1$, there is a constant $C = C(\alpha, j, d) > 0$ such that*

$$\|\Delta_{x_j}^{\frac{\alpha}{2(1+\alpha)}} u\|_2 \leqslant C\|\Delta_{x_{j+1}}^{\frac{\alpha}{2}} u\|_2^{\frac{1}{1+\alpha}}\|f\|_2^{\frac{\alpha}{1+\alpha}}. \tag{3.6}$$

In particular,

$$\|\Delta_{x_j}^{\frac{\alpha}{2(1+(n-j)\alpha)}} u\|_2 \leqslant C\|\Delta_{x_n}^{\frac{\alpha}{2}} u\|_2^{\frac{1+(n-j-1)\alpha}{1+(n-j)\alpha}}\|f\|_2^{\frac{\alpha}{1+(n-j)\alpha}}. \tag{3.7}$$

Proof. Let $\rho : [0,\infty) \to [0,1]$ be a smooth function with $\rho(s) = 1$ for $s < 1$ and $\rho(s) = 0$ for $s > 2$. For $R > 0$, let $\chi_R(s,\xi) := \rho(s/R)\rho(|\xi|/R)$ and

$$\hat{u}_R := \chi_R \hat{u}, \quad \hat{f}_R := (A^*\xi \cdot \nabla \chi_R - \partial_s \chi_R)\hat{u} + \chi_R \hat{f}.$$

Since $\hat{u}_R$ satisfies

$$\partial_s \hat{u}_R - A^*\xi \cdot \nabla \hat{u}_R - \lambda \hat{u}_R + \hat{f}_R = 0,$$

if we can show that for some $C = C(\alpha, j, d) > 0$,

$$\|\Delta_{x_j}^{\frac{\alpha}{2(1+\alpha)}} u_R\|_2 \leqslant C \|\Delta_{x_{j+1}}^{\frac{\alpha}{2}} u_R\|_2^{\frac{1}{1+\alpha}} \|f_R\|_2^{\frac{\alpha}{1+\alpha}},$$

then letting $R \to \infty$, we get (3.6). Hence, without loss of generality, in the following, we may and shall assume that $\hat{u}$ has compact support. We use the induction method.

Let us first look at the case of $j = 1$. We follow the simple argument of Alexander [1]. For any $\varepsilon > 0$, by Planchel's identity, we have

$$\begin{aligned}
\|\Delta_{x_1}^{\frac{\alpha}{2(1+\alpha)}} u\|_2^2 &= \int_{-\infty}^{\infty} \int_{\mathbb{R}^{nd}} |\xi_1|^{\frac{2\alpha}{1+\alpha}} |\hat{u}(s,\xi)|^2 \mathrm{d}\xi \mathrm{d}s \\
&= \int_{-\infty}^{\infty} \int_{\mathbb{R}^{nd}} |\xi_1|^{\frac{2\alpha}{1+\alpha}} 1_{\{\varepsilon|\xi_2| > |\xi_1|^{1/(1+\alpha)}\}} |\hat{u}(s,\xi)|^2 \mathrm{d}\xi \mathrm{d}s \\
&+ \int_{-\infty}^{\infty} \int_{\mathbb{R}^{nd}} |\xi_1|^{\frac{2\alpha}{1+\alpha}} 1_{\{\varepsilon|\xi_2| \leqslant |\xi_1|^{1/(1+\alpha)}\}} |\hat{u}(s,\xi)|^2 \mathrm{d}\xi \mathrm{d}s \\
&=: I_1(\varepsilon) + I_2(\varepsilon).
\end{aligned}$$

For $I_1(\varepsilon)$, we have

$$I_1(\varepsilon) \leqslant \varepsilon^{2\alpha} \int_{-\infty}^{\infty} \int_{\mathbb{R}^{nd}} |\xi_2|^{2\alpha} |\hat{u}(s,\xi)|^2 \mathrm{d}\xi \mathrm{d}s = \varepsilon^{2\alpha} \|\Delta_{x_2}^{\frac{\alpha}{2}} u\|_2^2.$$

For $I_2(\varepsilon)$, letting $\Omega := \{\varepsilon|\xi_2| \leqslant |\xi_1|^{1/(1+\alpha)}\}$ and by (3.5) with $\phi = 1$, we have

$$\begin{aligned}
I_2(\varepsilon) &= 2 \int_{-\infty}^{\infty} \int_{\mathbb{R}^{nd}} |\xi_1|^{\frac{2\alpha}{1+\alpha}} 1_\Omega(\xi) \int_0^{\infty} \mathrm{e}^{-\lambda t} \mathrm{Re}(\hat{f}, \bar{\hat{u}})(t+s, \mathrm{e}^{-tA^*}\xi) \mathrm{d}t \mathrm{d}\xi \mathrm{d}s \\
&= 2 \int_{-\infty}^{\infty} \int_{\mathbb{R}^{nd}} \int_0^{\infty} |(\mathrm{e}^{tA^*}\xi)_1|^{\frac{2\alpha}{1+\alpha}} 1_\Omega(\mathrm{e}^{tA^*}\xi) \mathrm{e}^{-\lambda t} \mathrm{Re}(\hat{f}, \bar{\hat{u}})(t+s,\xi) \mathrm{d}t \mathrm{d}\xi \mathrm{d}s \\
&= 2 \int_{-\infty}^{\infty} \int_{\mathbb{R}^{nd}} \left(\int_0^{\infty} |(\mathrm{e}^{tA^*}\xi)_1|^{\frac{2\alpha}{1+\alpha}} 1_\Omega(\mathrm{e}^{tA^*}\xi) \mathrm{e}^{-\lambda t} \mathrm{d}t \right) \mathrm{Re}(\hat{f}, \bar{\hat{u}})(s,\xi) \mathrm{d}s \mathrm{d}\xi.
\end{aligned}$$

Observing that

$$\mathrm{e}^{tA^*}\xi = \left(\xi_1, t\xi_1 + \xi_2, \tfrac{t^2}{2}\xi_1 + t\xi_2 + \xi_3, \cdots, \tfrac{t^{n-1}}{(n-1)!}\xi_1 + \cdots + t\xi_{n-1} + \xi_n \right),$$

since $\lambda \geqslant 0$, we have

$$\begin{aligned}
\int_0^{\infty} |(\mathrm{e}^{tA^*}\xi)_1|^{\frac{2\alpha}{1+\alpha}} 1_\Omega(\mathrm{e}^{tA^*}\xi) \mathrm{e}^{-\lambda t} \mathrm{d}t &= |\xi_1|^{\frac{2\alpha}{1+\alpha}} \int_0^{\infty} 1_{\{\varepsilon|\xi_2 + t\xi_1| \leqslant |\xi_1|^{1/(1+\alpha)}\}} \mathrm{e}^{-\lambda t} \mathrm{d}t \\
&\leqslant |\xi_1|^{\frac{2\alpha}{1+\alpha}} \int_{-\infty}^{\infty} 1_{\{|\xi_2|/|\xi_1| - |\xi_1|^{-\alpha/(1+\alpha)}/\varepsilon \leqslant t \leqslant |\xi_2|/|\xi_1| + |\xi_1|^{-\alpha/(1+\alpha)}/\varepsilon\}} \mathrm{d}t = 2|\xi_1|^{\frac{\alpha}{1+\alpha}}/\varepsilon.
\end{aligned} \tag{3.8}$$

Hence, by Young's inequality we have

$$\begin{aligned} I_2(\varepsilon) &\leqslant \frac{4}{\varepsilon}\int_{-\infty}^{\infty}\int_{\mathbb{R}^{nd}} |\xi_1|^{\frac{\alpha}{1+\alpha}}(|\hat{f}|\,|\hat{u}|)(s,\xi)\mathrm{d}s\mathrm{d}\xi \\ &\leqslant \frac{1}{2}\int_{-\infty}^{\infty}\int_{\mathbb{R}^{nd}} |\xi_1|^{\frac{2\alpha}{1+\alpha}}|\hat{u}|^2(s,\xi)\mathrm{d}s\mathrm{d}\xi + \frac{8}{\varepsilon^2}\int_{-\infty}^{\infty}\int_{\mathbb{R}^{nd}} |\hat{f}|^2(s,\xi)\mathrm{d}s\mathrm{d}\xi \\ &= \frac{1}{2}\|\Delta_{x_1}^{\frac{\alpha}{2(1+\alpha)}}u\|_2^2 + \frac{8}{\varepsilon^2}\|f\|_2^2. \end{aligned}$$

Combining the above calculations, we obtain

$$\|\Delta_{x_1}^{\frac{\alpha}{2(1+\alpha)}}u\|_2^2 \leqslant \varepsilon^{2\alpha}\|\Delta_{x_2}^{\frac{\alpha}{2}}u\|_2^2 + \frac{1}{2}\|\Delta_{x_1}^{\frac{\alpha}{2(1+\alpha)}}u\|_2^2 + \frac{8}{\varepsilon^2}\|f\|_2^2,$$

which in turn gives (3.6) for $j = 1$ by letting $\varepsilon = (\|f\|_2/\|\Delta_{x_2}^{\frac{\alpha}{2}}u\|_2)^{\frac{1}{1+\alpha}}$.

Suppose now that (3.6) has been proven for $j = 1, \cdots, k$ with $k \leqslant n-2$. We want to show that (3.6) holds for $j = k+1$. For $\delta > 0$, we define

$$\phi_\delta(\xi) := \Pi_{j=1}^k \chi\Big(|\xi_j|/(\delta^{k-j+1}|\xi_{k+1}|^{(1+(k-j+2)\alpha)/(1+\alpha)})\Big),$$

and write

$$\begin{aligned} \|\Delta_{x_{k+1}}^{\frac{\alpha}{2(1+\alpha)}}u\|_2 &= \int_{-\infty}^{\infty}\int_{\mathbb{R}^{nd}} |\xi_{k+1}|^{\frac{2\alpha}{1+\alpha}}|\hat{u}(s,\xi)|^2\mathrm{d}\xi\mathrm{d}s \\ &= \int_{-\infty}^{\infty}\int_{\mathbb{R}^{nd}} |\xi_{k+1}|^{\frac{2\alpha}{1+\alpha}}(1-\phi_\delta(\xi))|\hat{u}(s,\xi)|^2\mathrm{d}\xi\mathrm{d}s \\ &\quad + \int_{-\infty}^{\infty}\int_{\mathbb{R}^{nd}} |\xi_{k+1}|^{\frac{2\alpha}{1+\alpha}}\phi_\delta(\xi)|\hat{u}(s,\xi)|^2\mathrm{d}\xi\mathrm{d}s \\ &=: K_1(\delta) + K_2(\delta). \end{aligned}$$

We first treat $K_1(\delta)$. By the induction hypothesis, one sees that for $j = 1, 2, \cdots, k$,

$$\|\Delta_{x_j}^{\frac{\alpha}{2(1+(k-j+2)\alpha)}}u\|_2 \leqslant C\|\Delta_{x_{k+1}}^{\frac{\alpha}{2(1+\alpha)}}u\|_2^{\frac{1+\alpha}{1+(k-j+2)\alpha}}\|f\|_2^{\frac{(k-j+1)\alpha}{1+(k-j+2)\alpha}}. \tag{3.9}$$

Observing that

$$1-\phi_\delta(\xi) \leqslant \sum_{j=1}^k 1_{\{|\xi_j|\geqslant\delta^{k-j+1}|\xi_k|^{(1+(k-j+2)\alpha)/(1+\alpha)}\}},$$

by (3.9) and Young's inequality, we have

$$\begin{aligned} K_1(\delta) &\leqslant \sum_{j=1}^k \int_{-\infty}^{\infty}\int_{\mathbb{R}^{nd}} |\xi_{k+1}|^{\frac{2\alpha}{1+\alpha}}1_{\{|\xi_j|\geqslant\delta^{k-j+1}|\xi_k|^{(1+(k-j+2)\alpha)/(1+\alpha)}\}}|\hat{u}(s,\xi)|^2\mathrm{d}\xi\mathrm{d}s \\ &\leqslant \sum_{j=1}^k \delta^{-\frac{2(k-j+1)\alpha}{1+(k-j+2)\alpha}}\int_{-\infty}^{\infty}\int_{\mathbb{R}^{nd}} |\xi_j|^{\frac{2\alpha}{1+(k-j+2)\alpha}}|\hat{u}(s,\xi)|^2\mathrm{d}\xi\mathrm{d}s \\ &= \sum_{j=1}^k \delta^{-\frac{2(k-j+1)\alpha}{1+(k-j+2)\alpha}}\|\Delta_{x_j}^{\frac{\alpha}{2(1+(k-j+2)\alpha)}}u\|_2^2 \end{aligned}$$

$$\leqslant C\sum_{j=1}^{k}\delta^{-\frac{2(k-j+1)\alpha}{1+(k-j+2)\alpha}}\|\Delta_{x_k}^{\frac{\alpha}{2(1+\alpha)}}u\|_2^{\frac{2(1+\alpha)}{1+(k-j+2)\alpha}}\|f\|_2^{\frac{2(k-j+1)\alpha}{1+(k-j+2)\alpha}}$$
$$\leqslant \frac{1}{4}\|\Delta_{x_{k+1}}^{\frac{\alpha}{2(1+\alpha)}}u\|_2^2 + C\delta^{-2}\|f\|_2^2.$$

Next we treat the trouble term $K_2(\delta)$. Let

$$\xi_{(k)} := (\xi_1, \xi_2, \cdots, \xi_k),\ \xi^{(k)} := (\xi_{k+1}, \xi_{k+2}, \cdots, \xi_n)$$

and define

$$h_\delta(s, \xi^{(k)}) := \int_{\mathbb{R}^{kd}} (|\hat{u}|^2\phi_\delta)(s, \xi_{(k)}, \xi^{(k)})\mathrm{d}\xi_{(k)}.$$

Integrating both sides of (3.4) with respect to variable $\xi_{(k)}$, we get

$$\begin{aligned}&\partial_s h_\delta - A_{n-k}\xi^{(k)}\cdot\nabla_{\xi^{(k)}}h_\delta - \lambda h_\delta\\ &\quad= \int_{\mathbb{R}^{kd}}\left(\sum_{j=1}^{k}\xi_j\nabla_{\xi_{j+1}}(|\hat{u}|^2\phi_\delta) - g_{\phi_\delta}\right)\mathrm{d}\xi_{(k)} =: g_{\phi_\delta}^{(k)},\end{aligned}$$

and

$$h_\delta(s, \xi^{(k)}) = \int_0^\infty \mathrm{e}^{-\lambda t}g_{\phi_\delta}^{(k)}(t+s, \mathrm{e}^{-tA_{n-k}^*}\xi^{(k)})\mathrm{d}t.$$

Let

$$\psi_\varepsilon(\xi^{(k)}) := \chi\Big(\varepsilon|\xi_2^{(k)}|/|\xi_1^{(k)}|^{1/(1+\alpha)}\Big) = \chi\Big(\varepsilon|\xi_{k+2}|/|\xi_{k+1}|^{1/(1+\alpha)}\Big).$$

We make the following decomposition:

$$\begin{aligned}K_2(\delta) &= \int_{-\infty}^{\infty}\int_{\mathbb{R}^{(n-k)d}}|\xi_{k+1}|^{\frac{2\alpha}{1+\alpha}}\left(1-\psi_\varepsilon(\xi^{(k)})\right)h_\delta(s,\xi^{(k)})\mathrm{d}\xi^{(k)}\mathrm{d}s\\ &\quad+\int_{-\infty}^{\infty}\int_{\mathbb{R}^{(n-k)d}}|\xi_{k+1}|^{\frac{2\alpha}{1+\alpha}}\psi_\varepsilon(\xi^{(k)})h_\delta(s,\xi^{(k)})\mathrm{d}\xi^{(k)}\mathrm{d}s\\ &= K_{21}(\delta,\varepsilon)+K_{22}(\delta,\varepsilon).\end{aligned}$$

For $K_{21}(\delta,\varepsilon)$, we have

$$\begin{aligned}K_{21}(\delta,\varepsilon) &\leqslant \int_{-\infty}^{\infty}\int_{\mathbb{R}^{(n-k)d}}|\xi_{k+1}|^{\frac{2\alpha}{1+\alpha}}1_{\{\varepsilon|\xi_{k+2}|>|\xi_{k+1}|^{1/(1+\alpha)}\}}h_\delta(s,\xi^{(k)})\mathrm{d}\xi^{(k)}\mathrm{d}s\\ &\leqslant \varepsilon^{2\alpha}\int_{-\infty}^{\infty}\int_{\mathbb{R}^{nd}}|\xi_{k+2}|^{2\alpha}|\hat{u}|^2(s,\xi)\mathrm{d}\xi\mathrm{d}s = \varepsilon^{2\alpha}\|\Delta_{x_{k+2}}^{\frac{\alpha}{2}}u\|_2^2.\end{aligned}$$

For $K_{22}(\delta,\varepsilon)$, in view of $\xi_1^{(k)} = \xi_{k+1}$, we have

$$\begin{aligned}K_{22}(\delta,\varepsilon) &= \int_{-\infty}^{\infty}\int_{\mathbb{R}^{(n-k)d}}|\xi_1^{(k)}|^{\frac{2\alpha}{1+\alpha}}\psi_\varepsilon(\xi^{(k)})\int_0^\infty \mathrm{e}^{-\lambda t}g_\phi^{(k)}(t+s,\mathrm{e}^{-tA_{n-k}^*}\xi^{(k)})\mathrm{d}t\mathrm{d}\xi^{(k)}\mathrm{d}s\\ &= \int_{-\infty}^{\infty}\int_{\mathbb{R}^{(n-k)d}}\left(\int_0^\infty|(\mathrm{e}^{tA_{n-k}^*}\xi^{(k)})_1|^{\frac{2\alpha}{1+\alpha}}\psi_\varepsilon(\mathrm{e}^{tA_{n-k}^*}\xi^{(k)})\mathrm{e}^{-\lambda t}\mathrm{d}t\right)g_\phi^{(k)}(s,\xi^{(k)})\mathrm{d}\xi^{(k)}\mathrm{d}s.\end{aligned}$$

Letting

$$\begin{aligned}\gamma_\varepsilon(\xi^{(k)}) &:= \int_0^\infty |(\mathrm{e}^{tA^*_{n-k}}\xi^{(k)})_1|^{\frac{2\alpha}{1+\alpha}}\psi_\varepsilon(\mathrm{e}^{tA^*_{n-k}}\xi^{(k)})\mathrm{e}^{-\lambda t}\mathrm{d}t \\ &= |\xi_{k+1}|^{\frac{2\alpha}{1+\alpha}}\int_0^\infty \chi(\varepsilon|\xi_{k+2}+t\xi_{k+1}|/|\xi_{k+1}|^{1/(1+\alpha)})\mathrm{e}^{-\lambda t}\mathrm{d}t,\end{aligned}$$

and recalling

$$g^{(k)}_{\phi_\delta} = \int_{\mathbb{R}^{kd}} g_{\phi_\delta}(\xi_{(k)},\cdot)\mathrm{d}\xi_{(k)} + \sum_{j=1}^k \int_{\mathbb{R}^{kd}} \xi_j\cdot\nabla_{\xi_{j+1}}(|\hat{u}|^2\phi_\delta)\mathrm{d}\xi_{(k)},$$

we may write

$$\begin{aligned}K_{22}(\delta,\varepsilon) &= \int_{-\infty}^\infty\int_{\mathbb{R}^{(n-k)d}}\gamma_\varepsilon(\xi^{(k)})\int_{\mathbb{R}^d} g_{\phi_\delta}(s,\xi_{(k)},\xi^{(k)})\mathrm{d}\xi_{(k)}\mathrm{d}\xi^{(k)}\mathrm{d}s \\ &\quad + \sum_{j=1}^k\int_{-\infty}^\infty\int_{\mathbb{R}^{(n-k)d}}\gamma_\varepsilon(\xi^{(k)})\int_{\mathbb{R}^d}\xi_j\cdot\nabla_{\xi_{j+1}}(|\hat{u}|^2\phi_\delta)\mathrm{d}\xi_{(k)}\mathrm{d}\xi^{(k)}\mathrm{d}s \\ &=: K_{221}(\delta,\varepsilon)+K_{222}(\delta,\varepsilon).\end{aligned}$$

As in estimating (3.8), we have

$$\gamma_\varepsilon(\xi^{(k)}) \leqslant 4|\xi_{k+1}|^{\frac{\alpha}{1+\alpha}}/\varepsilon,$$

and also by the definition of g_{ϕ_δ}

$$|g_{\phi_\delta}| \leqslant 2|\hat{f}|\,|\hat{u}| + C\delta|\xi_{k+1}|^{\frac{\alpha}{1+\alpha}}|\hat{u}|^2.$$

Hence,

$$\begin{aligned}K_{221}(\delta,\varepsilon) &\leqslant \frac{8}{\varepsilon}\int_{-\infty}^\infty\int_{\mathbb{R}^{nd}}|\xi_{k+1}|^{\frac{\alpha}{1+\alpha}}|\hat{f}|\,|\hat{u}| + \frac{C\delta}{\varepsilon}\int_{-\infty}^\infty\int_{\mathbb{R}^{nd}}|\xi_{k+1}|^{\frac{2\alpha}{1+\alpha}}|\hat{u}|^2 \\ &\leqslant \left(\tfrac{1}{4}+\tfrac{C\delta}{\varepsilon}\right)\|\Delta_{x_{k+1}}^{\frac{\alpha}{2(1+\alpha)}}u\|_2^2 + C\varepsilon^{-2}\|f\|_2^2.\end{aligned}$$

Moreover, by elementary calculations, we also have

$$|\nabla_{\xi_{k+1}}\gamma_\varepsilon(\xi^{(k)})| \leqslant C|\xi_{k+1}|^{-\frac{1}{1+\alpha}}/\varepsilon.$$

Thus, since $\hat{u}$ has compact support, by the integration by parts formula, we have

$$\begin{aligned}|K_{222}(\delta,\varepsilon)| &= \left|\int_{-\infty}^\infty\int_{\mathbb{R}^{(n-k)d}}\int_{\mathbb{R}^{kd}}\xi_k\nabla_{\xi_{k+1}}\gamma_\varepsilon(\xi^{(k)})(|\hat{u}|^2\phi_\delta)\mathrm{d}\xi_{(k)}\mathrm{d}\xi^{(k)}\mathrm{d}s\right| \\ &\leqslant \frac{C}{\varepsilon}\int_{-\infty}^\infty\int_{\mathbb{R}^{nd}}|\xi_k|\,|\xi_{k+1}|^{-\frac{1}{1+\alpha}}(|\hat{u}|^2\phi_\delta)\mathrm{d}\xi\mathrm{d}s \\ &\leqslant \frac{C}{\varepsilon}\int_{-\infty}^\infty\int_{\mathbb{R}^{nd}}|\xi_k|\,|\xi_{k+1}|^{-\frac{1}{1+\alpha}}|\hat{u}|^2 1_{\{|\xi_k|\leqslant\delta|\xi_{k+1}|^{(1+2\alpha)/(1+\alpha)}\}}\mathrm{d}\xi\mathrm{d}s \\ &\leqslant \frac{C\delta}{\varepsilon}\int_{-\infty}^\infty\int_{\mathbb{R}^{nd}}|\xi_{k+1}|^{\frac{2\alpha}{1+\alpha}}|\hat{u}|^2\mathrm{d}s = \frac{C\delta}{\varepsilon}\|\Delta_{x_{k+1}}^{\frac{\alpha}{2(1+\alpha)}}u\|_2^2.\end{aligned}$$

Combining the above calculations, we obtain

$$\|\Delta_{x_{k+1}}^{\frac{\alpha}{2(1+\alpha)}}u\|_2^2 \leqslant \left(\tfrac{1}{4}+\tfrac{C_1'\delta}{\varepsilon}\right)\|\Delta_{x_{k+1}}^{\frac{\alpha}{2(1+\alpha)}}u\|_2^2+\varepsilon^{2\alpha}\|\Delta_{x_{k+2}}^{\frac{\alpha}{2}}u\|_2^2+C_2'(\varepsilon^{-2}+\delta^{-2})\|f\|_2^2.$$

Choosing $\delta=\varepsilon/(4C_1')$, we get

$$\|\Delta_{x_{k+1}}^{\frac{\alpha}{2(1+\alpha)}}u\|_2^2 \leqslant 2\varepsilon^{2\alpha}\|\Delta_{x_{k+2}}^{\frac{\alpha}{2}}u\|_2^2+2C_2'(1+16(C_1')^2)\varepsilon^{-2}\|f\|_2^2,$$

which then yields (3.6) for $j=k+1$ by letting $\varepsilon=(\|f\|_2/\|\Delta_{x_{k+2}}^{\frac{\alpha}{2}}u\|_2)^{\frac{1}{1+\alpha}}$. □

4. Proof of Theorem 1.1

4.1. **Case:** $p=2$**.** Without loss of generality, we may assume $f\in C_c^\infty(\mathbb{R}^{1+nd})$. It follows from Fourier's transformation and Hölder's inequality that

$$\begin{aligned}
&\int_{-\infty}^\infty\left\|\Delta_{x_n}\int_0^\infty \mathrm{e}^{-\lambda t}\mathcal{T}_{s,t+s}f(t+s,\cdot)\mathrm{d}t\right\|_2^2\mathrm{d}s\\
&=\int_{-\infty}^\infty\int_{\mathbb{R}^{nd}}|\xi_n|^2\left|\int_0^\infty \mathrm{e}^{-\lambda t}\widehat{\mathcal{T}_{s,t+s}f}(t+s,\xi)\mathrm{d}t\right|^2\mathrm{d}\xi\mathrm{d}s\\
&=\int_{-\infty}^\infty\int_{\mathbb{R}^{nd}}|\xi_n|^2\left|\int_0^\infty \mathrm{e}^{-\lambda t}\mathrm{e}^{-\frac{1}{2}\int_0^t|(\sigma_{s+r}^a)^*\mathrm{e}^{-rA^*}\xi|^2\mathrm{d}r}\hat{f}(t+s,\mathrm{e}^{-tA^*}\xi)\mathrm{d}t\right|^2\mathrm{d}\xi\mathrm{d}s\\
&\leqslant\int_{-\infty}^\infty\int_{\mathbb{R}^{nd}}\left(\int_0^\infty|\xi_n|^2\mathrm{e}^{-\frac{1}{2}\int_0^t|(\sigma_{s+r}^a)^*\mathrm{e}^{-rA^*}\xi|^2\mathrm{d}r}|\hat{f}(t+s,\mathrm{e}^{-tA^*}\xi)|^2\mathrm{d}t\right)\\
&\qquad\times\left(\int_0^\infty|\xi_n|^2\mathrm{e}^{-\frac{1}{2}\int_0^t|(\sigma_{s+r}^a)^*\mathrm{e}^{-rA^*}\xi|^2\mathrm{d}r}\mathrm{d}t\right)\mathrm{d}\xi\mathrm{d}s.
\end{aligned}$$

Let Θ_t be the dilation operator defined by (1.7). By definitions (1.5), (1.6) and (1.7), it is easy to see that

$$t^{1/2}(\sigma_u^a)^*\mathrm{e}^{-rtA^*}\xi=(\sigma_u^a)^*\mathrm{e}^{-rA^*}\Theta_{t^{1/2}}(\xi).$$

Thus, by the change of variables and as in showing (2.3), we have for some $c>0$,

$$\int_0^t|(\sigma_{s+r}^a)^*\mathrm{e}^{-rA^*}\xi|^2\mathrm{d}r=\int_0^1|(\sigma_{s+tr}^a)^*\mathrm{e}^{-rA^*}\Theta_{t^{1/2}}(\xi)|^2\mathrm{d}r\geqslant c|\Theta_{t^{1/2}}\xi|^2,$$

and similarly,

$$\int_0^t|(\sigma_{s+r}^a)^*\mathrm{e}^{(t-r)A^*}\xi|^2\mathrm{d}r\geqslant c|\Theta_{t^{1/2}}\xi|^2.$$

Hence,

$$\int_0^\infty|\xi_n|^2\mathrm{e}^{-\frac{1}{2}\int_0^t|(\sigma_{s+r}^a)^*\mathrm{e}^{-rA^*}\xi|^2\mathrm{d}r}\mathrm{d}t\leqslant\int_0^\infty|\xi_n|^2\mathrm{e}^{-c|\Theta_{t^{1/2}}\xi|^2}\mathrm{d}t\leqslant\int_0^\infty|\xi_n|^2\mathrm{e}^{-ct|\xi_n|^2}\mathrm{d}t=c^{-1},$$

and

$$\begin{aligned}
\int_0^\infty|(\mathrm{e}^{tA^*}\xi)_n|^2\mathrm{e}^{-\frac{1}{2}\int_0^t|(\sigma_{s-t+r}^a)^*\mathrm{e}^{(t-r)A^*}\xi|^2\mathrm{d}r}\mathrm{d}t&\leqslant\int_0^\infty|(\mathrm{e}^{tA^*}\xi)_n|^2\mathrm{e}^{-c|\Theta_{t^{1/2}}\xi|^2}\mathrm{d}t\\
&\leqslant\sum_{j=1}^n\frac{1}{(n-j)!}\int_0^\infty|t^{n-j}\xi_j|^2\mathrm{e}^{-ct^{2(n-j)+1}|\xi_j|^2}\mathrm{d}t\leqslant 2c^{-1}.
\end{aligned}$$

Thus, by the change of variables and Fubini's theorem, we further have

$$\begin{aligned}
&\int_{-\infty}^{\infty}\left\|\Delta_{x_n}\int_0^{\infty}\mathrm{e}^{-\lambda t}\mathcal{T}_{s,t+s}f(t+s,\cdot)\mathrm{d}t\right\|_2^2\mathrm{d}s\\
&\leqslant c^{-1}\int_{-\infty}^{\infty}\int_{\mathbb{R}^{nd}}\left(\int_0^{\infty}|\xi_n|^2\mathrm{e}^{-\frac{1}{2}\int_0^t|(\sigma^a_{s+r})^*\mathrm{e}^{-rA^*}\xi|^2\mathrm{d}r}|\hat{f}(t+s,\mathrm{e}^{-tA^*}\xi)|^2\mathrm{d}t\right)\mathrm{d}\xi\mathrm{d}s\\
&= c^{-1}\int_{-\infty}^{\infty}\int_{\mathbb{R}^{nd}}\left(\int_0^{\infty}|(\mathrm{e}^{tA^*}\xi)_n|^2\mathrm{e}^{-\frac{1}{2}\int_0^t|(\sigma^a_{s+r})^*\mathrm{e}^{(t-r)A^*}\xi|^2\mathrm{d}r}|\hat{f}(t+s,\xi)|^2\mathrm{d}t\right)\mathrm{d}\xi\mathrm{d}s\\
&= c^{-1}\int_{-\infty}^{\infty}\int_{\mathbb{R}^{nd}}\left(\int_0^{\infty}|(\mathrm{e}^{tA^*}\xi)_n|^2\mathrm{e}^{-\frac{1}{2}\int_0^t|(\sigma^a_{s-t+r})^*\mathrm{e}^{(t-r)A^*}\xi|^2\mathrm{d}r}\mathrm{d}t\right)|\hat{f}(s,\xi)|^2\mathrm{d}\xi\mathrm{d}s\\
&\leqslant 2c^{-2}\int_{-\infty}^{\infty}\int_{\mathbb{R}^{nd}}|\hat{f}(s,\xi)|^2\mathrm{d}\xi\mathrm{d}s = 2c^{-2}\|f\|_2^2.
\end{aligned}$$

The proof of (1.10) for $p = 2$ is thus complete by (3.7).

4.2. **Case:** $p \in (2,\infty)$**.** For $j = 1,\cdots,n$ and $\varepsilon \in (0,1)$, let us define

$$\mathscr{P}^{\varepsilon}_j f := \mathscr{P}^a_j f_\varepsilon(s,x) := \Delta_{x_j}^{\frac{1}{1+2(n-j)}}\int_0^{\infty}\mathrm{e}^{-\lambda t}\mathcal{T}^a_{s,t+s}f_\varepsilon(t+s,x)\mathrm{d}t,$$

where $f_\varepsilon(t,x) = f(t) * \varrho_\varepsilon(x)$, $\varrho_\varepsilon(x) = \varepsilon^{-nd}\varrho(x/\varepsilon)$ is a family of mollifiers with $\varrho \in C_c^\infty(\mathbb{R}^{nd})$ and $\int\varrho = 1$, and the superscript a denotes the dependence on the diffusion coefficient a. To use Theorem 2.4, our main task is to show that $\mathscr{P}^{\varepsilon}_j$ is a bounded linear operator from $L^\infty(\mathbb{R}^{1+nd})$ to BMO. More precisely, we want to prove that for any $f \in L^\infty(\mathbb{R}^{1+nd})$ with $\|f\|_\infty \leqslant 1$, and any $Q = Q_r(t_0,x_0) \in \mathbb{Q}$,

$$⨍_Q|\mathscr{P}^a_j f_\varepsilon(s,x) - c_j^Q|^2 \leqslant C, \tag{4.1}$$

where c_j^Q is a constant depending on Q and f_ε, and C only depends on n,κ,p,d, and not on ε.

Lemma 4.1. *(Scaling Property) For any $Q = Q_r(t_0,x_0) \in \mathbb{Q}$, we have*

$$⨍_{Q_r(t_0,x_0)}\left|\mathscr{P}^a_j f_\varepsilon(s,x) - c\right|^2 = ⨍_{Q_1(0)}\left|\mathscr{P}^{\tilde{a}}_j \tilde{f}_\varepsilon(s,x) - c\right|^2, \tag{4.2}$$

where $c \in \mathbb{R}$, $\tilde{a}_s := a_{r^2s+t_0}$ and $\tilde{f}_\varepsilon(t,x) := f_\varepsilon(r^2t+t_0,\Theta_r x + \mathrm{e}^{tA}x_0)$. Here Θ_r is the dilation operator defined in (1.7)*.*

Proof. Let us write

$$u_\varepsilon(s,x) := \int_0^{\infty}\mathrm{e}^{-\lambda t}\mathcal{T}^a_{s,t+s}f_\varepsilon(t+s,x)\mathrm{d}t.$$

By the change of variables, we have

$$\tilde{u}_\varepsilon(s,x) := r^{-2}u_\varepsilon(r^2s+t_0,\Theta_r x + \mathrm{e}^{sA}x_0) = \int_0^{\infty}\mathrm{e}^{-\lambda t}\mathcal{T}^{\tilde{a}}_{s,t+s}\tilde{f}_\varepsilon(t+s,x)\mathrm{d}t.$$

Noticing that

$$(\Delta_{x_j}^{\frac{1}{1+2(n-j)}}\tilde{u}_\varepsilon)(s,x) = (\Delta_{x_j}^{\frac{1}{1+2(n-j)}}u_\varepsilon)(r^2 s + t_0, \Theta_r x + \mathrm{e}^{sA}x_0),$$

by the change of variables again, we have

$$\fint_{Q_r(t_0,x_0)} \left|\Delta_{x_j}^{\frac{1}{1+2(n-j)}}u_\varepsilon(s,x) - c\right|^2 = \fint_{Q_1(0)} \left|\Delta_{x_j}^{\frac{1}{1+2(n-j)}}\tilde{u}_\varepsilon(s,x) - c\right|^2.$$

The proof is finished. □

Noticing that

$$\int_0^\infty \mathrm{e}^{-\lambda t}\mathcal{T}^a_{s,t+s}f_\varepsilon(t+s,x)\mathrm{d}t = \int_s^\infty \mathrm{e}^{\lambda(s-t)}\mathcal{T}^a_{s,t}f_\varepsilon(t,x)\mathrm{d}t,$$

for $s \in [-1,1]$, we split $\mathscr{P}^\varepsilon_j f(s,x) = \mathscr{P}^\varepsilon_{j1}f(s,x) + \mathscr{P}^\varepsilon_{j2}f(s,x)$ with

$$\mathscr{P}^\varepsilon_{j1}f(s,x) := \Delta_{x_j}^{\frac{1}{1+2(n-j)}}\int_s^2 \mathrm{e}^{\lambda(s-t)}\mathcal{T}_{s,t}f_\varepsilon(t,x)\mathrm{d}t,$$
$$\mathscr{P}^\varepsilon_{j2}f(s,x) := \Delta_{x_j}^{\frac{1}{1+2(n-j)}}\int_2^\infty \mathrm{e}^{\lambda(s-t)}\mathcal{T}_{s,t}f_\varepsilon(t,x)\mathrm{d}t.$$

Convention: Without extra declaration, all the constants contained in "$\lesssim$" will depend only on n, κ, p, d.

Lemma 4.2. *Under* (1.2)*, there is a constant $C = C(n,\kappa,p,d) > 0$ such that for all $f \in L^\infty(\mathbb{R}^{1+nd})$ with $\|f\|_\infty \leqslant 1$,*

$$\sup_{\varepsilon\in(0,1)}\int_{Q_1(0)} |\mathscr{P}^\varepsilon_{j1}f(s,x)|^2 \leqslant C. \tag{4.3}$$

Proof. For $s \in [-1,1]$, let

$$u_\varepsilon(s,x) := \int_s^2 \mathrm{e}^{\lambda(s-t)}\mathcal{T}_{s,t}f_\varepsilon(t,x)\mathrm{d}t = \int_s^\infty \mathrm{e}^{\lambda(s-t)}\mathcal{T}_{s,t}((1_{[-1,2]}f_\varepsilon)(t))(x)\mathrm{d}t.$$

Since $\|f\|_\infty \leqslant 1$, we have

$$\|u_\varepsilon(s)\|_\infty \leqslant 3, \quad s \in [-1,1]. \tag{4.4}$$

By (2.6), we have for any $s \in [-1,1]$,

$$\|\nabla_{x_n}u_\varepsilon(s)\|_\infty \leqslant \int_s^2 \|\nabla_{x_n}\mathcal{T}_{s,t}f_\varepsilon(t)\|_\infty \mathrm{d}t \lesssim \int_s^2 (t-s)^{-1/2}\mathrm{d}t \lesssim 1. \tag{4.5}$$

Let φ be a nonnegative smooth cutoff function in $\mathbb{R}^{nd}$ with $\varphi(x) = 1$ for $|x| \leqslant n$ and $\varphi(x) = 0$ for $|x| > 2n$. Notice that

$$\partial_s u_\varepsilon + \mathscr{L}_s u_\varepsilon + f_\varepsilon 1_{[-1,2]}(s) = 0.$$

It is easy to see that $u_\varepsilon\varphi$ satisfies

$$\partial_s(u_\varepsilon\varphi) + \mathscr{L}_s(u_\varepsilon\varphi) = \mathscr{L}_s(u_\varepsilon\varphi) - (\mathscr{L}_s u_\varepsilon)\varphi - f_\varepsilon\varphi 1_{[-1,2]}(s) =: g^\varphi_\varepsilon,$$

which implies by (1.9) that

$$(u_\varepsilon\varphi)(s,x)=\int_s^\infty \mathrm{e}^{\lambda(s-t)}\mathcal{T}_{s,t}g^\varphi_\varepsilon(t,x)\mathrm{d}t.$$

By the definition of $\mathscr{P}^\varepsilon_{j1}$, we have

$$\begin{aligned}\int_{Q_1(0)}|\mathscr{P}^\varepsilon_{j1}f|^2&=\int_{Q_1(0)}|\Delta_{x_j}^{\frac{1}{1+2(n-j)}}u_\varepsilon|^2\leqslant\int_{\mathbb{R}^{1+nd}}|(\Delta_{x_j}^{\frac{1}{1+2(n-j)}}u_\varepsilon)\varphi|^2\\&\leqslant 2\big\|\Delta_{x_j}^{\frac{1}{1+2(n-j)}}(u_\varepsilon\varphi)\big\|_2^2+2\big\|\Delta_{x_j}^{\frac{1}{1+2(n-j)}}(u_\varepsilon\varphi)-(\Delta_{x_j}^{\frac{1}{1+2(n-j)}}u_\varepsilon)\varphi\big\|_2^2=:I_1+I_2.\end{aligned}$$

For I_1, by (1.10) for $p=2$ and (4.4), (4.5), we have

$$I_1=\Big\|\Delta_{x_j}^{\frac{1}{1+2(n-j)}}\int_s^\infty \mathrm{e}^{\lambda(s-t)}\mathcal{T}_{s,t}g^\varphi_\varepsilon(t,x)\mathrm{d}t\Big\|_2\lesssim\|g^\varphi_\varepsilon\|_2\lesssim 1.$$

For I_2, if $j=n$, then by (4.4) and (4.5),

$$I_2=2\big\|u_\varepsilon\Delta_{x_n}\varphi+2\nabla_{x_n}u_\varepsilon\cdot\nabla_{x_n}\varphi\big\|_2^2\lesssim 1;$$

if $j=1,\cdots,n-1$, then by definition (2.4) and (4.4),

$$\begin{aligned}I_2&=\Big\|\int_{\mathbb{R}^d}\frac{\delta^{(1)}_{z_j}u_\varepsilon\,\delta^{(1)}_{z_j}\varphi}{|z_j|^{d+2/(1+2(n-j))}}\mathrm{d}z_j\Big\|_2\leqslant\int_{\mathbb{R}^d}\frac{\|\delta^{(1)}_{z_j}u_\varepsilon\,\delta^{(1)}_{z_j}\varphi\|_2}{|z_j|^{d+2/(1+2(n-j))}}\mathrm{d}z_j\\&\leqslant 6\int_{\mathbb{R}^d}\frac{\|\delta^{(1)}_{z_j}\varphi\|_2}{|z_j|^{d+2/(1+2(n-j))}}\mathrm{d}z_j\lesssim\int_{\mathbb{R}^d}\frac{1\wedge|z_j|}{|z_j|^{d+2/(1+2(n-j))}}\mathrm{d}z_j\lesssim 1.\end{aligned}$$

The proof is complete. □

The next lemma is crucial for treating $\mathscr{P}^\varepsilon_{j2}f$.

Lemma 4.3. *Under* (1.3)*, there is a constant $C=C(n,\kappa,p,d)>0$ such that for all $f\in L^\infty(\mathbb{R}^{1+nd})$ with $\|f\|_\infty\leqslant 1$ and all $s\in[-1,1]$,*

$$\sup_{\varepsilon\in(0,1)}\int_2^\infty\Big|\Delta_{x_j}^{\frac{1}{1+2(n-j)}}\mathcal{T}_{s,t}f_\varepsilon(t,0)-\Delta_{x_j}^{\frac{1}{1+2(n-j)}}\mathcal{T}_{0,t}f_\varepsilon(t,0)\Big|\mathrm{d}t\leqslant C.\tag{4.6}$$

Proof. Noticing that by (1.9), for each $s\in(0,t)$ and $x\in\mathbb{R}^{nd}$,

$$\mathcal{T}_{0,t}f_\varepsilon(t,x)-\mathcal{T}_{s,t}f_\varepsilon(t,x)=\int_0^s\mathscr{L}_r\mathcal{T}_{r,t}f_\varepsilon(t,x)\mathrm{d}r,\tag{4.7}$$

we have

$$\begin{aligned}I^\varepsilon_j(s,t)&:=\Delta_{x_j}^{\frac{1}{1+2(n-j)}}\mathcal{T}_{0,t}f_\varepsilon(t,0)-\Delta_{x_j}^{\frac{1}{1+2(n-j)}}\mathcal{T}_{s,t}f_\varepsilon(t,0)\\&=\int_0^s(\Delta_{x_j}^{\frac{1}{1+2(n-j)}}\mathscr{L}_r\mathcal{T}_{r,t}f_\varepsilon)(t,0)\mathrm{d}r.\end{aligned}$$

For $j=1$, we have for all $s\in[-1,1]$,

$$\int_2^\infty|I^\varepsilon_1(s,t)|\mathrm{d}t=\int_2^\infty\Big|\int_0^s\big(\Delta_{x_1}^{\frac{1}{1+2(n-1)}}\mathrm{tr}(a_r\cdot\nabla^2_{x_n})\mathcal{T}_{r,t}f_\varepsilon\big)(t,0)\mathrm{d}r\Big|\mathrm{d}t$$

$$\leqslant \kappa \int_2^\infty\int_0^s |\Delta_{x_1}^{\frac{1}{1+2(n-1)}}\nabla_{x_n}^2 \mathcal{T}_{r,t}f_\varepsilon|(t,0)\mathrm{d}r\mathrm{d}t$$
$$\overset{(2.6)}{\lesssim} \int_2^\infty\int_0^s (t-r)^{-3/2}\mathrm{d}r\mathrm{d}t \lesssim 1.$$

For $j=n$, we have for all $s\in[-1,1]$,

$$\begin{aligned}\int_2^\infty |I_n^\varepsilon(s,t)|\mathrm{d}t &= \int_2^\infty \left|\int_0^s \Big((\Delta_{x_n}\mathrm{tr}(a_r\cdot\nabla_{x_n}^2)+(\nabla_{x_n}\cdot\nabla_{x_{n-1}}))\mathcal{T}_{r,t}f_\varepsilon\Big)(t,0)\mathrm{d}r\right|\mathrm{d}t\\ &\leqslant \int_2^\infty\int_0^s \Big(\kappa|\Delta_{x_n}\nabla_{x_n}^2\mathcal{T}_{r,t}f_\varepsilon|+|(\nabla_{x_n}\cdot\nabla_{x_{n-1}})\mathcal{T}_{r,t}f_\varepsilon|\Big)(t,0)\mathrm{d}r\mathrm{d}t\\ &\overset{(2.6)}{\lesssim} \int_2^\infty\int_0^s (t-r)^{-2}\mathrm{d}r\mathrm{d}t\lesssim 1.\end{aligned}$$

For $j=2,\cdots,n-1$, since $\Delta_{x_j}^{\frac{1}{1+2(n-j)}}$ is a nonlocal operator, we have to carefully treat the trouble term $\Delta_{x_j}^{\frac{1}{1+2(n-j)}}(x_j\cdot\nabla_{x_{j-1}}\mathcal{T}_{r,t}f_\varepsilon)(t,0)$. Fix

$$\gamma\in\Big(\tfrac{2(n-j)+1}{2},\tfrac{(2(n-j)+1)^2}{4(n-j)}\Big).$$

By (2.4) and (4.7), we may write

$$\begin{aligned}I_j^\varepsilon(s,t) &= \int_{|z_j|>t^\gamma}\Big(\delta_{z_j}\mathcal{T}_{0,t}f_\varepsilon(t,0)-\delta_{z_j}\mathcal{T}_{s,t}f_\varepsilon(t,0)\Big)\frac{\mathrm{d}z_j}{|z_j|^{d+2/(1+2(n-j))}}\\ &\quad+\int_{|z_j|\leqslant t^\gamma}\left(\int_0^s \delta_{z_j}\mathrm{tr}(a_r\cdot\nabla_{x_n}^2)\mathcal{T}_{r,t}f_\varepsilon(t,0)\mathrm{d}r\right)\frac{\mathrm{d}z_j}{|z_j|^{d+2/(1+2(n-j))}}\\ &\quad+\int_{|z_j|\leqslant t^\gamma}\left(\int_0^s \delta_{z_j}(Ax\cdot\nabla\mathcal{T}_{r,t}f_\varepsilon)(t,0)\mathrm{d}r\right)\frac{\mathrm{d}z_j}{|z_j|^{d+2/(1+2(n-j))}}\\ &=: I_{j1}^\varepsilon(s,t)+I_{j2}^\varepsilon(s,t)+I_{j3}^\varepsilon(s,t).\end{aligned}$$

For $I_{j1}^\varepsilon(s,t)$, thanks to $\gamma>\frac{2(n-j)+1}{2}$, we have for all $s\in[-1,1]$,

$$\int_2^\infty |I_{j1}^\varepsilon(s,t)|\mathrm{d}t\lesssim\int_2^\infty\int_{|z_j|>t^\gamma}\frac{\mathrm{d}z_j}{|z_j|^{d+2/(1+2(n-j))}}\mathrm{d}t\lesssim\int_2^\infty |t|^{-2\gamma/(1+2(n-j))}\mathrm{d}t\lesssim 1.$$

For $I_{j2}^\varepsilon(s,t)$, by (2.6) and $\gamma<\frac{(2(n-j)+1)^2}{2(2(n-j)-1)}$, we have for all $s\in[-1,1]$,

$$\begin{aligned}\int_2^\infty |I_{j2}^\varepsilon(s,t)|\mathrm{d}t &\lesssim \int_2^\infty\int_0^s\left(\int_{|z_j|\leqslant t^\gamma}|z_j|\,\|\nabla_{x_j}\nabla_{x_n}^2\mathcal{T}_{r,t}f_\varepsilon\|_\infty\frac{\mathrm{d}z_j}{|z_j|^{d+2/(1+2(n-j))}}\right)\mathrm{d}r\mathrm{d}t\\ &\lesssim \int_2^\infty\int_0^s (t-r)^{-(2(n-j)+3)/2}\left(\int_{|z_j|\leqslant t^\gamma}\frac{|z_j|\mathrm{d}z_j}{|z_j|^{d+2/(1+2(n-j))}}\right)\mathrm{d}r\mathrm{d}t\\ &\lesssim \int_2^\infty (t-1)^{-(2(n-j)+3)/2}t^{\gamma(1-2/(1+2(n-j)))}\mathrm{d}t\lesssim 1.\end{aligned}$$

For $I^{\varepsilon}_{j3}(s,t)$, letting $\tilde{z}_j = (0,\cdots,0,z_j,0,\cdots,0)$ and observing that

$$\int_{|z_j|\leqslant t^\gamma} \frac{z_j \mathrm{d}z_j}{|z_j|^{d+2/(1+2(n-j))}} = 0,$$

by (2.6) and $\gamma < \frac{(2(n-j)+1)^2}{4(n-j)}$, we have for all $s \in [-1,1]$,

$$\begin{aligned}
\int_2^\infty |I^{\varepsilon}_{j3}(s,t)|\mathrm{d}t &= \int_2^\infty \left| \int_0^s \int_{|z_j|\leqslant t^\gamma} z_j \cdot \nabla_{x_{j-1}} \mathcal{T}_{r,t} f_\varepsilon(t,\tilde{z}_j) \frac{\mathrm{d}z_j}{|z_j|^{d+2/(1+2(n-j))}} \mathrm{d}r \right| \mathrm{d}t \\
&= \int_2^\infty \left| \int_0^s \int_{|z_j|\leqslant t^\gamma} z_j \cdot \nabla_{x_{j-1}} (\mathcal{T}_{r,t} f_\varepsilon(t,\tilde{z}_j) - \mathcal{T}_{r,t} f_\varepsilon(t,0)) \frac{\mathrm{d}z_j}{|z_j|^{d+2/(1+2(n-j))}} \mathrm{d}r \right| \mathrm{d}t \\
&\leqslant \int_2^\infty \left| \int_0^s \int_{|z_j|\leqslant t^\gamma} |z_j|^2 \|\nabla_{x_j} \nabla_{x_{j-1}} \mathcal{T}_{r,t} f_\varepsilon\|_\infty \frac{\mathrm{d}z_j}{|z_j|^{d+2/(1+2(n-j))}} \mathrm{d}r \right| \mathrm{d}t \\
&\lesssim \int_2^\infty \left(\int_0^s (t-r)^{-2(n-j)-2} \int_{|z|\leqslant t^\gamma} \frac{|z_j|^2 \mathrm{d}z_j}{|z_j|^{d+2/(1+2(n-j))}} \mathrm{d}r \right) \mathrm{d}t \\
&\lesssim \int_2^\infty (t-1)^{-2(n-j)-2} t^{\gamma(2-2/(1+2(n-j)))} \mathrm{d}t \lesssim 1.
\end{aligned}$$

Combining the above calculations, we obtain the desired estimate. □

Lemma 4.4. *Under* (1.3)*, there is a constant $C > 0$ depending only on n, κ, p, d such that for all $f \in L^\infty(\mathbb{R}^{1+nd})$ with $\|f\|_\infty \leqslant 1$,*

$$\sup_{\varepsilon\in(0,1)} \int_{Q_1(0)} |\mathscr{P}^{\varepsilon}_{j2} f(s,x) - \mathscr{P}^{\varepsilon}_{j2} f(0,0)|^2 \leqslant C. \tag{4.8}$$

Proof. By definition, we have

$$\begin{aligned}
|\mathscr{P}^{\varepsilon}_{j2} f(s,x) - \mathscr{P}^{\varepsilon}_{22} f(0,0)| &\leqslant \int_2^\infty |\mathrm{e}^{\lambda(s-t)} - \mathrm{e}^{-\lambda t}| \, \|\Delta_{x_j}^{\frac{1}{1+2(n-j)}} \mathcal{T}_{s,t} f_\varepsilon(t)\|_\infty \mathrm{d}t \\
&\quad + \int_2^\infty \mathrm{e}^{-\lambda t} |\Delta_{x_j}^{\frac{1}{1+2(n-j)}} \mathcal{T}_{s,t} f_\varepsilon(t,x) - \Delta_{x_j}^{\frac{1}{1+2(n-j)}} \mathcal{T}_{s,t} f_\varepsilon(t,0)| \mathrm{d}t \\
&\quad + \int_2^\infty \mathrm{e}^{-\lambda t} |\Delta_{x_j}^{\frac{1}{1+2(n-j)}} \mathcal{T}_{s,t} f_\varepsilon(t,0) - \Delta_{x_j}^{\frac{1}{1+2(n-j)}} \mathcal{T}_{0,t} f_\varepsilon(t,0)| \mathrm{d}t \\
&=: I_1(s) + I_2(s,x) + I_3(s).
\end{aligned}$$

Noticing that by (2.6),

$$\begin{aligned}
\|\Delta_{x_j}^{\frac{1}{1+2(n-j)}} \mathcal{T}_{s,t} f_\varepsilon(t)\|_\infty &\lesssim (t-s)^{-1}, \\
\|\nabla_{x_k} \Delta_{x_j}^{\frac{1}{1+2(n-j)}} \mathcal{T}_{s,t} f_\varepsilon(t)\|_\infty &\lesssim (t-s)^{-(2(n-k)+3)/2},
\end{aligned}$$

we have for all $s \in [-1,1]$,

$$\begin{aligned}
I_1 &\lesssim \int_2^\infty |\mathrm{e}^{\lambda(s-t)} - \mathrm{e}^{-\lambda t}| (t-s)^{-1} \mathrm{d}t \\
&\lesssim |\mathrm{e}^{\lambda s} - 1| \int_2^\infty \mathrm{e}^{-\lambda t} \mathrm{d}t = |\mathrm{e}^{\lambda s} - 1| \mathrm{e}^{-2\lambda}/\lambda \lesssim 1,
\end{aligned}$$

and for all $(s,x)\in Q_1(0)$,

$$I_2(s,x)\lesssim\int_2^\infty\sum_{k=1}^n(t-s)^{-(2(n-k)+3)/2}\mathrm{d}t\lesssim 1.$$

Moreover, by (4.6), we have for all $s\in[-1,1]$,

$$I_3(s)\lesssim 1.$$

Combining the above calculations, we obtain (4.8). □

Now we can give

Proof of (1.10) *for* $p\in(2,\infty)$. By Lemmas 4.1, 4.2 and 4.4, it is easy to see that $\mathscr{P}_j^\varepsilon: L^\infty(\mathbb{R}^{1+nd})\to BMO$ is a bounded linear operator with bound independent of ε. Estimate (1.10) for $p\in(2,\infty)$ follows by Theorem 2.4 and the well-proved estimate for $p=2$. □

4.3. **Case:** $p\in(1,2)$**.** We shall use duality argument to show (1.10) for $p\in(1,2)$. Let $\mathcal{T}_{s,t}^*$ be the adjoint operator of $\mathcal{T}_{s,t}$, that is,

$$\int g\mathcal{T}_{s,t}f=\int f\mathcal{T}_{s,t}^*g.$$

By the definition of $\mathcal{T}_{s,t}$, we have

$$\mathcal{T}_{s,t}^*f(x):=\mathcal{T}_{s,t}^{*,a}f(x):=\mathbb{E}f\left(\mathrm{e}^{(s-t)A}x-\int_s^t\mathrm{e}^{(s-r)A}\sigma_r^a\mathrm{d}W_r\right).$$

For $j=1,\cdots,n$, we introduce a new operator

$$\mathscr{Q}_j^\varepsilon f:=\mathscr{Q}_j^af_\varepsilon(s,x):=\int_{-\infty}^t\mathrm{e}^{\lambda(s-t)}\mathcal{T}_{s,t}^{*,a}\Delta_{x_j}^{\frac{1}{1+2(n-j)}}f_\varepsilon(s,x)\mathrm{d}s,$$

where $f_\varepsilon(t,x)=f(t,\cdot)*\varrho_\varepsilon(x)$ so that $\mathscr{Q}_j^\varepsilon f$ is well defined for $f\in L^\infty(\mathbb{R}^{1+nd})$. Notice that $\mathscr{Q}_j^a$ can be considered as the adjoint operator of $\mathscr{P}_j^a$ in the sense that

$$\int\mathscr{P}_j^af\,g=\int\mathscr{Q}_j^ag\,f.$$

As in the previous subsection, we want to show that

$$\mathscr{Q}_j^\varepsilon\text{ is a bounded linear operator from }L^\infty(\mathbb{R}^{1+nd})\text{ to }BMO.$$

First of all, as in Lemma 4.1 we have

$$\fint_{Q_r(t_0,x_0)}\left|\mathscr{Q}_j^af_\varepsilon(s,x)-c\right|^2=\fint_{Q_1(0)}\left|\mathscr{Q}_j^{\tilde{a}}\tilde{f}_\varepsilon(s,x)-c\right|^2,$$

where $\tilde{a}$ and $\tilde{f}$ are defined as in Lemma 4.1. We aim to prove that there is a constant $C=C(n,\kappa,p,d)>0$ independent of $\varepsilon\in(0,1)$ such that for all $f\in L^\infty(\mathbb{R}^{1+nd})$ with $\|f\|_\infty\leqslant 1$,

$$\fint_{Q_1(0)}\left|\mathscr{Q}_j^{\tilde{a}}\tilde{f}_\varepsilon(s,x)-c\right|^2\leqslant C.$$

Below we drop $\tilde{a}$ and the tilde, and make the following decomposition as above,

$$\mathscr{Q}_j^\varepsilon f(t,x)=\left(\int_{-2}^t+\int_{-\infty}^{-2}\right)\mathrm{e}^{\lambda(s-t)}\mathcal{T}_{s,t}^*\Delta_{x_j}^{\frac{1}{1+2(n-j)}}f_\varepsilon(s,x)\mathrm{d}s=:\mathscr{Q}_{j1}^\varepsilon f(t,x)+\mathscr{Q}_{j2}^\varepsilon f(t,x).$$

The following lemma is crucial for treating $\mathscr{Q}_{j1}^\varepsilon$.

Lemma 4.5. *Let $\varphi\in C_c^\infty(\mathbb{R}^{nd})$. For any $p\in[1,2]$, there are constants $C_\varphi,\beta>0$ such that for all $h\in L^2(\mathbb{R}^{nd})$ and $0<t-s\leqslant 3$,*

$$\|\Delta_{x_j}^{\frac{1}{1+2(n-j)}}(\mathcal{T}_{s,t}(\varphi^2h)-\varphi_{s,t}\mathcal{T}_{s,t}(\varphi h))\|_p\leqslant C_\varphi(t-s)^{\beta-1}\|h\|_2, \tag{4.9}$$

$$\|\Delta_{x_j}^{\frac{1}{1+2(n-j)}}(\varphi_{s,t}\mathcal{T}_{s,t}(\varphi h))-\varphi_{s,t}\Delta_{x_j}^{\frac{1}{1+2(n-j)}}\mathcal{T}_{s,t}(\varphi h)\|_p\leqslant C_\varphi(t-s)^{\beta-1}\|h\|_2, \tag{4.10}$$

where $\varphi_{s,t}(x):=\varphi(\mathrm{e}^{(t-s)A}x)$.

Proof. (1) Let $p_{s,t}^{(0)}(y)$ be the distribution density of $X_{s,t}(0)$. By the definition and the chain rule, we have

$$\begin{aligned}\nabla_{x_j}\mathcal{T}_{s,t}f(x)&=\int_{\mathbb{R}^{nd}}f(y)\nabla_{x_j}p_{s,t}^{(0)}(y-\mathrm{e}^{(t-s)A}\cdot)(x)\mathrm{d}y\\&=\int_{\mathbb{R}^{nd}}f(y)\sum_{i=1}^j(\nabla_{y_i}p_{s,t}^{(0)})(y-\mathrm{e}^{(t-s)A}x)\frac{(t-s)^{j-i}}{(j-i)!}\mathrm{d}y\\&=\int_{\mathbb{R}^{nd}}f(y+\mathrm{e}^{(t-s)A}x)\sum_{i=1}^j(\nabla_{y_i}p_{s,t}^{(0)})(y)\frac{(t-s)^{j-i}}{(j-i)!}\mathrm{d}y.\end{aligned}$$

By this formula, we have

$$\begin{aligned}&\|\nabla_{x_j}\mathcal{T}_{s,t}(\varphi^2h)-\varphi_{s,t}\nabla_{x_j}\mathcal{T}_{s,t}(\varphi h)\|_p\\&\leqslant\|\nabla\varphi\|_\infty\|\varphi h\|_p\sum_{i=1}^j\int_{\mathbb{R}^{nd}}|y||\nabla_{y_i}p_{s,t}^{(0)}|(y)\frac{(t-s)^{j-i}}{(j-i)!}\mathrm{d}y.\end{aligned} \tag{4.11}$$

By (2.1), we have

$$\begin{aligned}\int_{\mathbb{R}^{nd}}|y||\nabla_{y_i}p_{s,t}^{(0)}|(y)\mathrm{d}y&\lesssim(t-s)^{-(n^2d+2(n-i)+1)/2}\sum_{k=1}^n\int_{\mathbb{R}^{nd}}|y_k|\mathrm{e}^{-c|\Theta_{(t-s)^{-1/2}}y|^2}\mathrm{d}y\\&\lesssim\sum_{k=1}^n(t-s)^{-(n^2d+2(k-i))/2}\int_{\mathbb{R}^{nd}}\mathrm{e}^{-c|\Theta_{(t-s)^{-1/2}}y|^2/2}\mathrm{d}y\lesssim\sum_{k=1}^n(t-s)^{i-k}.\end{aligned}$$

Substituting this into (4.11), we obtain

$$\|\nabla_{x_j}\mathcal{T}_{s,t}(\varphi^2h)-\varphi_{s,t}\nabla_{x_j}\mathcal{T}_{s,t}(\varphi h)\|_p\lesssim\|\varphi h\|_p(t-s)^{j-n}\lesssim\|h\|_2(t-s)^{j-n},$$

and further,

$$\|\nabla_{x_j}(\mathcal{T}_{s,t}(\varphi^2h)-\varphi_{s,t}\mathcal{T}_{s,t}(\varphi h))\|_p\lesssim\|h\|_2(t-s)^{j-n}.$$

Hence, for $j=1,2,\cdots,n-1$,

$$\|\Delta_{x_j}^{\frac{1}{1+2(n-j)}}(\mathcal{T}_{s,t}(\varphi^2h)-\varphi_{s,t}\mathcal{T}_{s,t}(\varphi h))\|_p$$

$$
\begin{aligned}
&\leqslant \int_{\mathbb{R}^d} \|\delta_{z_j}(\mathcal{T}_{s,t}(\varphi^2 h) - \varphi_{s,t}\mathcal{T}_{s,t}(\varphi h))\|_p \frac{\mathrm{d}z_j}{|z_j|^{d+2/(1+2(n-j))}} \\
&\leqslant 2\int_{|z_j|>(t-s)^{n-j}} (\|\mathcal{T}_{s,t}(\varphi^2 h)\|_p + \|\varphi_{s,t}\mathcal{T}_{s,t}(\varphi h)\|_p) \frac{\mathrm{d}z_j}{|z_j|^{d+2/(1+2(n-j))}} \\
&\quad + \int_{|z_j|\leqslant(t-s)^{n-j}} (\|\nabla_{x_j}(\mathcal{T}_{s,t}(\varphi^2 h) - \varphi_{s,t}\mathcal{T}_{s,t}(\varphi h))\|_p) \frac{|z_j|\mathrm{d}z_j}{|z_j|^{d+2/(1+2(n-j))}} \\
&\lesssim (\|\varphi^2 h\|_p + \|\varphi h\|_p) \int_{|z_j|>(t-s)^{n-j}} \frac{\mathrm{d}z_j}{|z_j|^{d+2/(1+2(n-j))}} \\
&\quad + \|h\|_2 (t-s)^{j-n} \int_{|z_j|\leqslant(t-s)^{n-j}} \frac{|z_j|\mathrm{d}z_j}{|z_j|^{d+2/(1+2(n-j))}} \lesssim \|h\|_2 (t-s)^{-\frac{2(n-j)}{1+2(n-j)}}.
\end{aligned}
$$

Thus we get (4.9). For $j = n$, (4.9) is direct by the chain rule.

(2) For $j = 1, \cdots, n-1$, by (2.7) we have

$$
\begin{aligned}
&\|\Delta_{x_j}^{\frac{1}{1+2(n-j)}}(\varphi_{s,t}\mathcal{T}_{s,t}(\varphi h)) - \varphi_{s,t}\Delta_{x_j}^{\frac{1}{1+2(n-j)}}\mathcal{T}_{s,t}(\varphi h)\|_p \\
&\leqslant 2\int_{\mathbb{R}^d} \frac{\|\delta_{z_j}^{(1)}\varphi_{s,t}\|_\infty \|\delta_{z_j}^{(1)}\mathcal{T}_{s,t}(\varphi h)\|_p}{|z_j|^{d+2/(1+2(n-j))}} \mathrm{d}z_j \\
&\lesssim \|\varphi h\|_p \int_{\mathbb{R}^d} \frac{1 \wedge ((t-s)^{n-j}|z_j|)}{|z_j|^{d+2/(1+2(n-j))}} \mathrm{d}z_j \lesssim \|h\|_2 (t-s)^{\frac{2(n-j)}{1+2(n-j)}},
\end{aligned}
$$

which gives (4.10). For $j = n$, (4.10) is direct by the chain rule. □

Lemma 4.6. *Under* (1.3)*, there is a constant $C = C(n, \kappa, p, d) > 0$ such that for all $f \in L^\infty(\mathbb{R}^{1+nd})$ with $\|f\|_\infty \leqslant 1$,*

$$
\sup_{\varepsilon\in(0,1)} \int_{Q_1(0)} |\mathscr{Q}_{j1}^\varepsilon f(s,x)|^2 \leqslant C. \tag{4.12}
$$

Proof. For $t \in [-2, 1]$, define

$$
u_\varepsilon(t,x) := \mathscr{Q}_{j1}^\varepsilon f(t,x) = \int_{-\infty}^t \mathrm{e}^{\lambda(s-t)}\mathcal{T}_{s,t}^* \Delta_{x_j}^{\frac{1}{1+2(n-j)}}((1_{[-2,1]}f_\varepsilon)(s))(x)\mathrm{d}s.
$$

Let φ be a nonnegative smooth cutoff function in $\mathbb{R}^{nd}$ with $\varphi(x) = 1$ for $|x| \leqslant 1$ and $\varphi(x) = 0$ for $|x| > 2$. We have

$$
\begin{aligned}
\|u\|_{L^2(Q_1(0))} &\leqslant \|1_{[-2,1]}u\varphi^2\|_2 = \sup_{\|h\|_2\leqslant 1} \int_{\mathbb{R}^{1+nd}} 1_{[-2,1]}u\varphi^2 h \\
&= \sup_{\|h\|_2\leqslant 1} \int_{\mathbb{R}^{1+nd}} 1_{[-2,1]} f_\varepsilon \Delta_{x_j}^{\frac{1}{1+2(n-j)}} \int_\cdot^1 \mathrm{e}^{\lambda(\cdot-t)}\mathcal{T}_{\cdot,t}(\varphi^2 h(t))\mathrm{d}t \\
&\leqslant \sup_{\|h\|_2\leqslant 1} \left\| 1_{[-2,1]}\Delta_{x_j}^{\frac{1}{1+2(n-j)}} \int_\cdot^1 \mathrm{e}^{\lambda(s-t)}\mathcal{T}_{s,t}(\varphi^2 h(t))\mathrm{d}t \right\|_1.
\end{aligned}
$$

Since the support of $\varphi_{s,t}(x) = \varphi(\mathrm{e}^{(t-s)A}x)$ is contained in $\{x : |x| \leqslant n\}$ for $|t-s| \leqslant 3$, by (4.9) and (4.10), we have for any $h \in L^2(\mathbb{R}^{1+nd})$ with $\|h\|_2 \leqslant 1$.

$$
\begin{aligned}
&\left\| 1_{[-2,1]} \Delta_{x_j}^{\frac{1}{1+2(n-j)}} \int_\cdot^1 \mathrm{e}^{\lambda(s-t)} \mathcal{T}_{s,t}(\varphi^2 h(t)) \mathrm{d}t \right\|_1 \\
&\overset{(4.9)}{\lesssim} \left\| 1_{[-2,1]} \Delta_{x_j}^{\frac{1}{1+2(n-j)}} \int_\cdot^1 \mathrm{e}^{\lambda(s-t)} \varphi_{s,t} \mathcal{T}_{s,t}(\varphi h(t)) \mathrm{d}t \right\|_1 + 1 \\
&\overset{(4.10)}{\lesssim} \left\| 1_{[-2,1]} \int_\cdot^1 \mathrm{e}^{\lambda(s-t)} \varphi_{s,t} \Delta_{x_j}^{\frac{1}{1+2(n-j)}} \mathcal{T}_{s,t}(\varphi h(t)) \mathrm{d}t \right\|_1 + 1 \\
&\lesssim \left\| 1_{[-2,1]} \int_\cdot^1 \mathrm{e}^{\lambda(s-t)} \varphi_{s,t} \Delta_{x_j}^{\frac{1}{1+2(n-j)}} \mathcal{T}_{s,t}(\varphi h(t)) \mathrm{d}t \right\|_2 + 1 \\
&\overset{(4.10)}{\lesssim} \left\| 1_{[-2,1]} \Delta_{x_j}^{\frac{1}{1+2(n-j)}} \int_\cdot^1 \mathrm{e}^{\lambda(s-t)} \varphi_{s,t} \mathcal{T}_{s,t}(\varphi h(t)) \mathrm{d}t \right\|_2 + 1 \\
&\overset{(4.9)}{\lesssim} \left\| \Delta_{x_j}^{\frac{1}{1+2(n-j)}} \int_\cdot^\infty \mathrm{e}^{\lambda(s-t)} \mathcal{T}_{s,t}(1_{[-2,1]} \varphi^2 h(t)) \mathrm{d}t \right\|_2 + 1 \\
&\lesssim \|\varphi^2 h\|_2 + 1 \lesssim 1,
\end{aligned}
$$

where the last step is due to (1.10) for $p = 2$. The proof is complete. □

The following lemma is the same as in Lemma 4.4.

Lemma 4.7. *Under* (1.3)*, there is a constant $C = C(n, \kappa, p, d) > 0$ such that for all $f \in L^\infty(\mathbb{R}^{1+nd})$ with $\|f\|_\infty \leqslant 1$,*

$$
\sup_{\varepsilon \in (0,1)} \int_{Q_1(0)} |\mathscr{Q}_{j2}^\varepsilon f(t,x) - \mathscr{Q}_{j2}^\varepsilon f(0,0)|^2 \leqslant C.
$$

Proof. By (2.7), we have for all $t \in [-1, 1]$,

$$
\begin{aligned}
&\int_{-\infty}^{-2} \left| \mathcal{T}_{s,t}^* \Delta_{x_j}^{\frac{1}{1+2(n-j)}} f_\varepsilon(s,0) - \mathcal{T}_{s,0}^* \Delta_{x_j}^{\frac{1}{1+2(n-j)}} f_\varepsilon(s,0) \right| \mathrm{d}s \\
&\quad \leqslant \int_{-\infty}^{-2} \int_0^t \left| \partial_r \mathcal{T}_{s,r}^* \Delta_{x_j}^{\frac{1}{1+2(n-j)}} f_\varepsilon(s,0) \right| \mathrm{d}r \mathrm{d}s \\
&\quad = \int_{-\infty}^{-2} \int_0^t \left| \mathscr{L}_r^* \mathcal{T}_{s,r}^* \Delta_{x_j}^{\frac{1}{1+2(n-j)}} f_\varepsilon(s,0) \right| \mathrm{d}r \mathrm{d}s \\
&\quad = \int_{-\infty}^{-2} \int_0^t \left| \mathrm{tr}(a_r \cdot \nabla_{x_n}^2) \mathcal{T}_{s,r}^* \Delta_{x_j}^{\frac{1}{1+2(n-j)}} f_\varepsilon(s,0) \right| \mathrm{d}r \mathrm{d}s \\
&\quad \leqslant C \int_{-\infty}^{-2} \int_0^t (r-s)^{-2} \mathrm{d}r \mathrm{d}s \leqslant C.
\end{aligned}
$$

Using this estimate and (2.7), as in the proof of Lemma 4.4, we obtain the desired estimate. □

Proof of (1.10) *for* $p \in (1,2)$. By Lemmas 4.6 and 4.7, we know that

$$\mathscr{Q}_j^\varepsilon : L^\infty(\mathbb{R}^{1+2d}) \to BMO \text{ is bounded with norm independent of } \varepsilon.$$

Moreover, by duality, we also have

$$\mathscr{Q}_j^\varepsilon : L^2(\mathbb{R}^{1+2d}) \to L^2(\mathbb{R}^{1+2d}) \text{ is bounded with norm independent of } \varepsilon.$$

Hence, for $q = p/(p-1) \in (2,\infty)$, by Theorem 2.4, we have for some $C > 0$ independent of ε,

$$\|\mathscr{Q}_j^\varepsilon f\|_q = \left\| \int_{-\infty}^t \mathrm{e}^{\lambda(s-t)} \mathcal{T}_{s,t}^* \Delta_{x_j}^{\frac{1}{1+2(n-j)}} f_\varepsilon \mathrm{d}s \right\|_q \leqslant C\|f\|_q.$$

Now for $p \in (1,2)$, by Fatou's lemma, we get

$$\begin{aligned}\|\mathscr{P}_j f\|_p &\leqslant \|f\|_p \sup_{\|h\|_q \leqslant 1} \left\| \int_{-\infty}^t \mathrm{e}^{\lambda(s-t)} \mathcal{T}_{s,t}^* \Delta_{x_j}^{\frac{1}{1+2(n-j)}} h \mathrm{d}s \right\|_q \\ &\leqslant \|f\|_p \sup_{\|h\|_q \leqslant 1} \varliminf_{\varepsilon \to 0} \left\| \int_{-\infty}^t \mathrm{e}^{\lambda(s-t)} \mathcal{T}_{s,t}^* \Delta_{x_j}^{\frac{1}{1+2(n-j)}} h_\varepsilon \mathrm{d}s \right\|_q \leqslant C\|f\|_p,\end{aligned}$$

which gives (1.10) for $p \in (1,2)$. □
