## Checking Optimality Via Complementary Slackness

We consider LPs in standard form:

$$
\begin{array}{ll}
\mathcal{P}: & \text { maximize } c^{T} x \\
& \text { subject to } \quad A x \leq b, \quad 0 \leq x
\end{array}
$$

1. Does the vector $x=[1,1,1,1,1,1]^{T}$ solve $\mathcal{P}$, where

$$
A=\left[\begin{array}{cccccc}
1 & 1 & 1 & 1 & 1 & 1 \\
1 & 0 & 0 & 0 & 0 & -1 \\
-1 & 0 & 1 & 0 & 0 & 0 \\
0 & 0 & 0 & -1 & 0 & 1 \\
0 & 1 & -1 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 1 & -1
\end{array}\right], \quad c=\left[\begin{array}{c}

$$

8. Change $b_{6}$ from 16 to 15 in problem 7 and check if $x=(0,1,1,1)^{T}$ solves $\mathcal{P}$.

Answers: 1. No, $y$ does not exist. 2. Yes, $y=\frac{1}{5}(7,4,1,0,3,13)^{T}$. 3. Yes, $y=$ $(0,0,0,4)^{T}$. 4. Yes (but tricky! Multiple dual solutions), $y_{2}=y_{3}=y_{5}=0$ and $y_{1}+2 y_{4}=$ 8 and $0 \leq y_{1}=8-2 y_{4}$ so $0 \leq y_{4} \leq 3,5$. Yes, 6 . No, 7 . No, since no potential dual solution exists.
