- 4 The portion of the graph of  $y = \tan^{-1} x$  between  $x = 0$  and  $x = 1$  is rotated around the  $y$ -axis to form a container. The container is filled with water. Use  $n = 6$  subdivisions and Simpson's Rule to approximate the work required to pump all the water out over the side. Distance is measured in meters and the density of water is  $1000 \text{ kg/m}^3$ .
