## ABSTRACI

These notes can serve as a mathematical supplement to the standard graduate level texts on general relativity and are suitable for selfstudy. The exposition is detailed and includes accounts of several topics of current interest, e.g., Lovelock theory and Ashtekar's variables.

# MATHEMATICAL ASPECTS OF GENERAL RELATIVITY

Section 0: Introduction A preliminary version of these notes was distributed to the participants in a seminar on quantum gravity which I gave a couple of years ago. As they seemed to be rather well received, I decided that a revised and expanded account might be useful for a wider audience.

Like the original, the focus is on the formalism underlying general relativity, thus there is no physics and virtually no discussion of exact solutions. More seriously, the Cauchy problem is not considered. My only defense for such an omission is that certain choices have to be made and to do the matter justice would require another book.

The prerequisites are modest: Just some differential geometry, much of which is reviewed in the text anyway. As for what is covered, some of the topics are standard, others less so. Included among the latter is a proof of the Lovelock uniqueness theorem, a systematic discussion of the Palatini formalism, a complete global treatment of the Ashtekar variables, and an introduction to the asymptotic theory.

For the most part, the exposition is detail oriented and directed toward the beginner, not the expert. Frankly, I tire quickly of phrases like: "it follows readily" or "one shows without difficulty" or "a short calculation gives" or "it is easy to see that" EIC. To be sure I have left some things for the reader to work out but I have tried not to make a habit of it.

While I have yet to get around to compiling an index, the text is not too difficult to navigate given the number of section headings.

Naturally, I would like to hear about any typos or outright errors and corments and suggestions for improvement would be much appreciated.

Section 1: Geometric Quantities Let $V$ be an $n$-dimensional real vector space and let $\mathrm{V}^{*}$ be its dual.

Notation: $B(V)$ is the set of ordered bases for $V$.
The general linear group $G(n, \underline{R})$ operates to the right on $B(V)$ :

$$
\left\lvert\, \begin{aligned}
B(V) \times \underline{G L}(n, \underline{R}) & B(V) \\
(E, g) & \\
& E \cdot g .
\end{aligned}\right.
$$

In detail: If $E=\left\{E_{1}, \ldots, E_{n}\right\} \in B(V)$, then $E \cdot g=\left\{E_{i} g^{i}{ }_{1}, \ldots, E_{i} g^{i}{ }_{n}\right\}$.
[Note: Therefore row vector conventions are in force: $\mathrm{E} \cdot \mathrm{g}$ is computed by inspection of

$$
\left[E_{1}, \ldots, E_{n}\right] \cdot\left|\begin{array}{ccc}
g^{1}{ }_{1} & \cdots & g_{n}^{1} \\
\vdots & & \vdots \\
g^{n}{ }_{1} & \cdots & g_{n}^{n} \\
-
\end{array}\right|
$$

If $B\left(V^{*}\right)$ stands for the set of ordered bases in $V^{*}$, then $\underline{G L}(n, \underline{R})$ operates to the right on $B\left(V^{\star}\right)$ via duality, i.e., via multiplication by $\left(g^{-1}\right)^{\top}$.

Given a basis $E=\left\{E_{1}, \ldots, E_{n}\right\} \in B(V)$, its cobasis $\omega=\left\{\omega^{l}, \ldots, \omega^{n^{\prime}}\right\} \in B\left(V^{\star}\right)$ is defined by $\omega^{i}\left(\mathrm{~F}_{\mathrm{j}}\right)=\delta^{\mathrm{i}}{ }_{\mathrm{j}}$.

Observation: Let $g \in \underline{G L}(n, \underline{R})$-- then the cobasis corresponding to $E \cdot g$ is $\omega \cdot g$.
[Since

$$
\left[\begin{array}{l}
(E \cdot g)_{j}=E_{i} g_{j}^{i} \\
(\omega \cdot g)^{\ell}=\omega^{k}\left(g^{-l}\right)_{k^{\prime}}^{\ell}
\end{array}\right.
$$

it follows that

$$
\begin{aligned}
&(\omega \cdot g)^{\ell}\left((E \cdot g)_{j}\right)=<(E \cdot g)_{j}(\omega \cdot g)^{\ell}> \\
&=<E_{i} g_{j}^{i},^{k}\left(g^{-1}\right)_{k}^{\ell}{ }_{k} \\
&=\omega^{k}\left(E_{i}\right) g_{j}^{i}\left(g^{-1}\right)^{\ell}{ }_{k} \\
&=\delta_{i}^{k} g^{i}{ }_{j}\left(g^{-1}\right)^{\ell}{ }_{k} \\
&=g^{i}{ }_{j}\left(g^{-1}\right)^{\ell}{ }_{i} \\
&=\left(g^{-1}\right)_{i}^{\ell} g^{i} \\
&\left.=\delta_{j}^{\ell}{ }_{j}\right]
\end{aligned}
$$

[Note: From the definitions,

$$
\begin{aligned}
\left(\omega^{\cdot} g\right)^{\ell} & =\sum_{k} \omega^{k}\left(\left(g^{-1}\right)^{\mathrm{T}}\right)_{\ell}^{\mathrm{k}} \\
& =\sum_{k} \omega^{\mathrm{k}}\left(g^{-1}\right)_{k}^{\ell} \equiv \omega^{\mathrm{k}}\left(g^{-1}\right)^{\ell}{ }_{k^{\prime}}
\end{aligned}
$$

which explains the flip in the indices.]
Let $v_{q}^{p}$ stand for the vector space of tensors of type $(p, q)$, thus an element $\mathrm{T}_{\mathrm{q}}^{\mathrm{q}}$ is a multilinear map

$$
T: \frac{p}{V^{*} \times \cdots \times V^{*}} \times \frac{q}{V \times \cdots \times V} \rightarrow \underline{R},
$$

hence admits an expansion

$$
T=T^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}}\left(E_{i_{1}} \otimes \cdots \otimes E_{i_{p}}\right) \otimes\left(\omega^{j_{1}} \otimes \cdots \otimes \omega^{j_{q}}\right),
$$

where

$$
\begin{aligned}
& T^{i_{1} \cdots{ }^{i_{p}}{ }_{j_{1}} \cdots j_{q}} \\
& =T\left(\omega^{i_{1}}, \ldots, \omega^{i_{p}}, E_{j_{1}}, \ldots, E_{j_{q}}\right) .
\end{aligned}
$$

If

$$
\left[\begin{array}{l}
E \rightarrow E \cdot g \\
\omega \rightarrow \omega \cdot g,
\end{array}\right.
$$

then the components of T satisfy the tensor transformation rule:

$$
\begin{aligned}
& T^{i_{1}^{\prime} \cdots i_{p}^{\prime}}{ }_{j 1} \cdots j_{q}^{\prime}
\end{aligned}
$$

[Note: Any map

$$
\mathrm{T}: \mathrm{B}(\mathrm{~V}) \rightarrow \underline{\mathrm{R}}^{\mathrm{n}^{\mathrm{p}+\mathrm{q}}}
$$

that assigns to each $E \in B(V)$ an $n^{p+q}$-tuple

$$
T^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}}
$$

which obeys the tensor transformation rule determines a unique tensor of type ( $p, q$ ) . So, for instance, the Kronecker delta $\delta^{i}{ }_{j}$ is a tensor of type ( 1,1 ).]

$$
\left[\begin{array}{rl}
x=X^{i} E_{i} & \left(x^{i}=X\left(\omega^{i}\right)\right) \\
\Lambda=\Lambda_{j} \omega^{j} & \left(\Lambda_{j}=\Lambda\left(E_{j}\right)\right) .
\end{array}\right.
$$

Now change the basis: $E \rightarrow E \cdot g$ - then $X=X^{i^{\prime}}(E \cdot g)_{i}$, , where

$$
\begin{aligned}
x^{i^{\prime}} & =X\left((\omega \cdot g)^{i^{\prime}}\right) \\
& =X\left(\omega^{i}\left(g^{-1}\right)^{i^{\prime}}{ }_{i^{\prime}}\right) \\
& =\left(g^{-1}\right)^{i^{\prime}}{ }_{i} X\left(\omega^{i}\right) \\
& =\left(g^{-1}\right)^{i^{\prime}}{ }_{i} x^{i}
\end{aligned}
$$

and $\Lambda=\Lambda_{j \prime}(\omega \cdot g)^{j^{\prime}}$, where

$$
\begin{aligned}
\Lambda_{j^{\prime}} & =\Lambda\left((E \cdot g)_{j \prime}\right) \\
& =\Lambda\left(E_{j} g_{j \prime}^{j}\right) \\
& =g_{j}^{j} \Lambda_{j\left(E_{j}\right)} \\
& =g_{j}^{j} \Lambda_{j} .
\end{aligned}
$$

IEMMA There is a canonical isomorphism

$$
\iota: v_{p+q^{\prime}}^{q+p^{\prime}} \quad \rightarrow \quad \operatorname{Hom}\left(v_{q^{\prime}}^{p}, v_{q^{\prime}}^{p^{\prime}}\right)
$$

[Given $T \in v_{p+q^{\prime}}^{q+p^{\prime}}$, put

$$
\begin{aligned}
& \left(\ulcorner T)\left(X_{1} \otimes \ldots \otimes X_{p} \otimes \Lambda^{l} \otimes \ldots \otimes \Lambda^{q}\right)\left(\Lambda^{I^{\prime}}, \ldots, \Lambda^{p^{\prime}}, X_{1}, \ldots \ldots, x_{q}\right)\right. \\
= & T\left(\Lambda^{1}, \ldots, \Lambda^{q}, \Lambda^{1}, \ldots, \Lambda^{p^{\prime}}, X_{1}, \ldots, X_{p^{\prime}}, X_{1^{\prime}}, \ldots, x_{q^{\prime}}\right)
\end{aligned}
$$

and extend by linearity.]
[Note: Take $p^{\prime}=0, q^{\prime}=0$ to conclude that $v_{p}^{q}$ is the dual of $v_{q}^{p}$.]

Products There is a map

$$
\left[\begin{array}{lll}
v_{q}^{p} \times v_{q^{\prime}}^{p^{\prime}} & \rightarrow & v_{q}^{p+q^{\prime}} \\
\\
\left(T, T^{\prime}\right) & \longrightarrow T \otimes T^{\prime}
\end{array}\right.
$$

viz.

$$
\begin{aligned}
& \left(T \otimes T^{\prime}\right)\left(\Lambda^{l}, \ldots, \Lambda^{p+p^{\prime}}, x_{1}, \ldots, x_{q+q}\right) \\
= & T\left(\Lambda^{1}, \ldots, \Lambda^{p}, x_{1}, \ldots, x_{q}\right) T^{\prime}\left(\Lambda^{p+1}, \ldots, \Lambda^{p+p^{\prime}}, x_{q+1}, \ldots, x_{q+q^{\prime}}\right) .
\end{aligned}
$$

In terms of components,

$$
\begin{aligned}
& \left(T \otimes \mathrm{~T}^{\prime}\right)^{i_{1} \cdots i_{p+p^{\prime}}}{ }_{j_{l} \cdots j_{q+q}} \\
& =T^{i_{l} \cdots i_{p}}{ }_{j_{1} \ldots j_{q} T^{\prime}}{ }^{i_{p+l} \cdots i_{p+p^{\prime}}}{ }_{j_{q+1} \cdots j_{q+q}} .
\end{aligned}
$$

Contractions $\quad \forall \mathrm{k}: \mathrm{l} \leq \mathrm{k} \leq \mathrm{p} \& \forall \ell: \mathrm{l} \leq \ell \leq \mathrm{q}$, there is a map

$$
c_{l}^{k}: v_{q}^{p} \rightarrow v_{q-1}^{p-1}
$$

viz.

$$
\begin{aligned}
& c_{\ell}^{k}\left(x_{l} \otimes \cdots \otimes x_{p} \otimes \Lambda^{l} \otimes \cdots \otimes \Lambda^{q}\right) \\
= & \Lambda^{\ell}\left(x_{k}\right)\left(x_{l} \otimes \cdots \otimes \hat{x}_{k} \otimes \cdots \otimes x_{p} \otimes \Lambda^{l} \otimes \cdots \otimes \hat{\Lambda}^{\ell} \otimes \cdots \otimes \Lambda^{q}\right) .
\end{aligned}
$$

In terms of components,

$$
\begin{aligned}
& \left(C_{\ell}^{k_{T}} i_{1} \cdots \hat{i}_{k} \cdots{ }_{p}^{i_{j_{1}} \cdots \hat{j}_{\ell} \ldots j_{q}}\right. \\
& =T_{T} i_{1} \cdots i_{k-1} a i_{k+1} \cdots i_{p}{ }_{j_{1}} \ldots j_{\ell-1} a j_{\ell+1} \cdots j_{q}
\end{aligned}
$$

Definition: The Kronecker symbol of order $p$ is the tensor of type ( $p, p$ ) defined by

Put

$$
\left.\left.\right|_{-} ^{I}=\left\{i_{1}, \ldots, i_{p}\right\}, ~=j_{1}, \ldots, j_{p}\right\} .
$$

Then

$$
\delta^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{p}}
$$

vanishes if $I \neq J$ but is
${ }^{-}+1$ if $I$ is an even permutation of $J$
-1 if $I$ is an odd permutation of $J$.
[Note: The Kronecker symbol of order $p$ is antisymmetric under interchange
of any two of the indices $i_{1}, \ldots, i_{p}$ or under interchange of any two of the indices $j_{1}, \ldots, j_{p}$. So, if any two of the indices $i_{1}, \ldots, i_{p}$ or $j_{1}, \ldots, j_{p}$ coincide, then

$$
\delta^{i_{1} \cdots i_{p}}{ }_{j_{1} \ldots j_{p}}=0
$$

which is automatic if p>n.]
Example: Let $T \in V_{p}^{0}$ :

$$
T=T_{j_{1}} \ldots j_{p} \omega^{j_{1}} \otimes \ldots \otimes \omega^{j_{p}}
$$

Put

$$
T_{\left[j_{1} \ldots j_{p}\right]}=\frac{1}{p!} \delta^{i_{1} \ldots i_{p}}{ }_{j_{1} \ldots j_{p}} T_{i_{1} \ldots i_{p}}
$$

Then

$$
\text { Alt } T=T_{\left[j_{1} \ldots j_{p}\right]} \omega^{j_{1}} \otimes \cdots \otimes \omega^{j_{p}}
$$

belongs to $\Lambda^{\mathrm{P}} \mathrm{V}$.
Note: If $T \in \Lambda^{P} V$ to begin with, then Alt $T=T$, hence Alto Alt = Alt. As an element of $\mathrm{v}_{\mathrm{p}}^{0}$, the components of Alt T are given by

$$
\left.{ }^{(\text {Alt } T)_{j_{1}} \ldots j_{p}}=T{ }_{\left[j_{1} \ldots j_{p}\right]} \cdot\right]
$$

FACT Suppose that $q<p$ - then

$$
\delta^{i_{1} \cdots i_{q} k_{q+1} \cdots k_{p}} j_{1} \ldots j_{q} k_{q+1} \cdots k_{p}
$$

$$
8 .
$$

$$
=\frac{(n-q)!}{(n-p)!} \delta^{i_{1} \cdots i_{q}}{ }_{j_{1} \cdots j_{q}}
$$

In particular:

$$
\delta^{i_{1} \ldots i_{p}}{ }_{i_{1} \ldots i_{p}}=\frac{n!}{(n-p)!}
$$

Determinant Formula Let $A=\left[a_{j}{ }_{j}\right]$ be an n-by-n matrix -- then

Consider

$$
\underline{R}^{n^{p+q}}=\underline{R}^{n^{p}} \otimes \underline{R}^{n^{q}}
$$

$\underline{R}^{n^{p}}(p>0)$ : View the elements of $\underline{R}^{n}$ as column vectors -- then $\underline{G L}(n, \underline{R})$
operates to the left on $\underline{R}^{n}$ via multiplication by $g$, hence by tensoring on

$$
\underline{R}^{\mathrm{n}}{ }^{\mathrm{p}}=\frac{\mathrm{p}}{\underline{R}^{\mathrm{n}} \otimes \cdots \otimes \underline{R}^{\mathrm{n}}}
$$

$\underline{R}^{n^{q}}(q>0)$ : View the elements of $\underline{R}^{n}$ as column vectors -- then $\underline{G L}(n, \underline{R})$ operates to the left on $\underline{R}^{n}$ via multiplication by $\left(g^{-1}\right)^{\top}$, hence by tensoring on

$$
\underline{R}^{n^{q}}=\frac{q}{\underline{R}^{n} \otimes \cdots \otimes \underline{R}^{n}}
$$

Combine these to get a left action of $\underline{G L}(n, \underline{R})$ on $\underline{R}^{n^{p+q}}$. We now claim that the tensors of type $(p, q)$ can be identified with the equivariant maps $T: B(V) \rightarrow R^{n^{p+q}}$,
i.e., with the maps $T: B(V) \rightarrow \underline{R}^{n^{p+q}}$ such that $\forall g$,

$$
T(E \cdot g)=g^{-1} \cdot T(E)
$$

[Note: Incorporation of $\mathrm{g}^{-1}$ shifts the left action to a right action (bear in mind that $\underline{G L}(\mathrm{n}, \underline{\mathrm{R}})$ operates to the right on $\mathrm{B}(\mathrm{V})$ ).]

To see this, it suffices to remark that the tensor transformation rule is equivalent to equivariance. Thus take a tensor $T$ of type ( $p, q$ ) and put

$$
T(E)=T^{i_{l} \cdots i_{p}}{ }_{j_{l} \ldots j_{q}} e_{i_{l}} \otimes \cdots \otimes e_{i_{p}} \otimes e^{j_{l}} \otimes \cdots \otimes e^{j_{q}} .
$$

Then

$$
\begin{aligned}
& \mathrm{g}^{-1} \cdot \mathrm{~T}(\mathrm{E}) \\
& =T^{i_{1}} \cdots{ }^{i_{p}}{ }_{j_{1}} \ldots j_{q} g^{-1} e_{i_{l}} \otimes \cdots \otimes g^{-1} e_{i_{p}} \otimes g^{T^{j}} e^{j_{1}} \otimes \cdots \otimes g^{T} e^{j_{q}} \\
& =T_{1}{ }^{i_{1}} \cdots i_{j_{1}} \ldots j_{q} \\
& \times\left(g^{-1}\right)^{i_{1}^{\prime}}{ }_{i_{1}} e_{i_{1}} \otimes \cdots \otimes\left(g^{-1}\right)^{i_{p}^{\prime}}{ }_{i_{p}} e_{i_{p}^{\prime}} \otimes(g){ }^{j_{1}}{ }_{j_{1}^{\prime}} e^{j_{l}^{\prime}} \otimes \cdots \otimes(g)^{j_{q}}{ }_{j_{q}^{\prime}} e^{j_{q}^{\prime}} \\
& =\left(g^{-1}\right)^{i_{1}^{\prime}}{ }_{i_{1}} \ldots\left(g^{-1}\right)^{i_{p}^{\prime}}{ }_{i_{p}(g)}{ }^{j_{l}}{ }_{j_{1}} \ldots(g)^{j_{q}}{ }_{j_{q}^{\prime}, T^{i}}{ }^{i_{1}} \cdots{ }_{p}^{i_{p}}{ }_{j_{1}} \ldots j_{q} \\
& \times e_{i}{ }_{i} \otimes \cdots \otimes e_{i p} \otimes e^{j}{ }^{\prime} \otimes \cdots \otimes e^{j_{q}^{\prime}} \\
& =T^{i_{i}^{\prime} \cdots i_{p}^{\prime}}{ }_{j}^{\prime} \ldots j_{q}^{\prime} e_{i}^{\prime} \otimes \cdots \otimes e_{i}^{\prime} \otimes e^{j_{i}^{\prime}} \otimes \cdots \otimes e^{j_{q}^{\prime}} \\
& =T(E \cdot g),
\end{aligned}
$$

which is equivariance (the converse is also clear).

There remains one point of detail, namely when $p=q=0$. In this situation, $\underline{R}^{n^{p+q}}=\underline{R}$ and we shall agree that $\underline{G L}(n, \underline{R})$ operates trivially on $\underline{R}: g x=x \forall x \in R$. Consequently, the tensors of type $(0,0)$ are the constant maps $T: B(V) \rightarrow \underline{R}$, i.e., $V_{0}^{0}=\underline{R}$ (the usual agreement).

Definition: Let $X: \underline{G}(n, \underline{R}) \rightarrow \underline{R}^{\times}$be a continuous homomorphism -- then a tensor of type ( $p, q$ ) and weight $X$ is a map

$$
\mathrm{T}: \mathrm{B}(\mathrm{~V}) \rightarrow \underline{\mathrm{R}}^{\mathrm{n}^{\mathrm{p}+\mathrm{q}}}
$$

such that $\forall g$,

$$
T(E \cdot g)=X(g) g^{-1} \cdot T(E)
$$

Special Cases:

1. Tensors of type $(\mathrm{p}, \mathrm{q})$ are obtained by taking $\chi(\mathrm{g})=|\operatorname{det} \mathrm{g}|^{0}$;
2. Twisted tensors of type $(p, q)$ are obtained by taking $X(g)=s g n$ det $g$. Rappel: The continuous homomorphisms $X: \underline{G}(n, \underline{R}) \rightarrow \underline{R}^{\times}$fall into two classes:

I: $g \rightarrow|\operatorname{det} g|^{r} \quad(r \in \underline{R})$;
II: $g \rightarrow \operatorname{sgn} \operatorname{det} g \cdot|\operatorname{det} g|^{r} \quad(r \in R)$.

- A density is a map

$$
\lambda: B(V) \rightarrow \underline{R}
$$

for which $\exists r \in \mathbb{R}: \forall g$,

$$
\lambda(E \cdot g)=|\operatorname{det} g|^{r} \lambda(E) .
$$

- A twisted density is a map

$$
\lambda: B(V) \rightarrow \underline{R}
$$

for which $\exists r \in R: \forall g$,

$$
\lambda(E \cdot g)=\operatorname{sgn} \operatorname{det} g \cdot|\operatorname{det} g|^{r} \lambda(E) .
$$

[Note: In either case, $r$ is called the weight of $\lambda$.]
Trivially, tensors of type $(0,0)$ are densities of weight 0 .
Example: Suppose that $T$ is a tensor of type $(0,2)$ and weight $X$, where $x(g)=|\operatorname{det} g|^{r}$. Define

$$
\lambda_{\mathrm{T}}: \mathrm{B}(\mathrm{~V}) \rightarrow \underline{\mathrm{R}}
$$

by

$$
\begin{aligned}
\lambda_{T}(E) & =\operatorname{det} T(E) \\
& \equiv \operatorname{det}\left[T_{j_{1} j_{2}}\right]
\end{aligned}
$$

Then

$$
\begin{aligned}
& \lambda_{T}(E \cdot g)=\operatorname{det}\left[T_{j_{1} j_{2}^{\prime}}\right] \\
& =\operatorname{det}\left[x(g)(g){ }^{j_{1}}{ }_{j_{1}^{\prime}(g)}{ }^{j_{2}}{ }_{j_{2}^{\prime}} T_{j_{1} j_{2}}\right] \\
& =|\operatorname{det} g|^{\mathrm{rn}} \operatorname{det}\left[(\mathrm{~g})^{\mathrm{j}_{1}}{ }_{\left.j_{1}^{\prime}(g)^{j_{2}}{ }_{j}{ }_{2}^{\prime} \mathrm{T}_{j_{1} j_{2}}\right]}\right. \\
& =|\operatorname{det} g|^{\mathrm{m}} \operatorname{det}\left[(g)^{j_{1}}{ }_{j_{1}} T_{j_{1} j_{2}}(g)^{j_{2}}{ }_{j_{2}^{\prime}}\right] \\
& =|\operatorname{det} g|^{\mathrm{mm}} \operatorname{det}\left[(g)^{\mathrm{j}_{1}}{ }_{j_{1}^{\prime}}(T(E) g)^{j_{1}}{ }_{j_{2}^{\prime}}\right] \\
& =|\operatorname{det} g|^{\mathrm{mn}} \operatorname{det}\left[\left(g^{T}\right)^{j_{1}^{\prime}}{ }_{j_{1}}(T(E) g)^{j_{1}}{ }_{j_{2}^{\prime}}\right] \\
& =|\operatorname{det} g|^{\mathrm{rn}} \operatorname{det}\left(g^{\top} T(E) g\right)
\end{aligned}
$$

$$
\begin{aligned}
& =|\operatorname{det} g|^{\mathrm{rn}} \operatorname{det} g^{\top} \cdot \operatorname{det} \mathrm{T}(\mathrm{E}) \cdot \operatorname{det} g \\
& =|\operatorname{det} g|^{\mathrm{rn}}(\operatorname{det} g)^{2} \operatorname{det} T(E) \\
& =|\operatorname{det} g|^{\mathrm{rn}+2} \lambda_{\mathrm{T}}(\mathrm{E}) .
\end{aligned}
$$

Therefore $\lambda_{T}$ is a density of weight $\mathrm{rn}+2$.
[Note: If T were instead a $X$-tensor of type $(2,0)$ or $(1,1)$ ( $X$ as above), then the corresponding $\lambda_{T}$ is a density of weight $\mathrm{rn}-2$ or mn .]

Example (The Orientation Map): In $B(V)$, write $E$ ' $\sim$ E iff $\exists \mathrm{g} \in \underline{G L}(n, \underline{R})$ (det $g>0$ ) : $E^{\prime}=E \cdot g$. This is an equivalence relation in $B(V)$ and it divides $B(V)$ into two equivalence classes, say $B(V)=B^{+}(V) \mu B^{-}(V)$. Define a map

$$
\text { Or: }: B(V) \rightarrow \underline{R}
$$

by

$$
\left[\begin{array}{l}
\operatorname{Or}\left(B^{+}(V)\right)=\{+1\} \\
\operatorname{Or}\left(B^{-}(V)\right)=\{-1\} .
\end{array}\right.
$$

Then $\forall g$,

$$
\operatorname{Or}(E \cdot g)=\operatorname{sgn} \operatorname{det} g \cdot \operatorname{Or}(E)
$$

Therefore Or is a twisted density of weight 0 .
[Note: Recall that two elements $\mathrm{E}_{1}^{+}, \mathrm{E}_{2}^{+} \in \mathrm{B}^{+}(\mathrm{V})$ or $\mathrm{E}_{1}^{-}, \mathrm{E}_{2}^{-} \in \mathrm{B}^{-}(\mathrm{V})$ are said to have the same orientation, whereas two elements $E^{+} \in B^{+}(V), E^{-} \in B^{-}(V)$ are said to have the opposite orientation.]

Definition: A scalar density is a map

$$
\lambda: B(V) \rightarrow \underline{R}
$$

for which $\exists \mathrm{w} \in \underline{Z}$ : $\forall \mathrm{g}$,

$$
\lambda(E \cdot g)=(\operatorname{det} g)^{W} \lambda(E) .
$$

[Note: We have
w being termed the weight of $\lambda$.
n-forms Since $\Lambda^{n} V \subset V_{n^{\prime}}^{0}$ an element $T \in \Lambda^{n} V$ can be regarded as an equivariant map

$$
B(V) \rightarrow \underline{R}^{n^{n}} \quad(p=0, q=n)
$$

We have

$$
\begin{aligned}
T & =T_{j_{1}} \ldots j_{n}{ }^{j_{1}} \otimes \cdots \otimes \omega^{j_{n}} \\
& =T_{\left[j_{1} \ldots j_{n}\right]^{\omega}}{ }^{j_{1}} \otimes \cdots \otimes \omega^{j_{n}} \\
& =\frac{1}{n!} \delta^{i_{1} \ldots i_{n}}{ }_{j_{1}} \ldots j_{n} T_{i_{1}} \ldots i_{n} \omega^{j_{1}} \otimes \cdots \otimes \omega^{j_{n}} \\
& =\frac{1}{n!} T_{j_{1}} \ldots j_{n} \omega^{j_{1}} \wedge \cdots \wedge \omega^{j_{n}} \\
& =T_{1} \ldots n^{\omega^{1} \wedge \cdots \wedge \omega}{ }^{n} .
\end{aligned}
$$

Therefore T also determines a map

$$
\mathrm{B}(\mathrm{~V}) \rightarrow \underline{R}^{\prime}
$$

viz.

$$
T(E)=T_{1 \ldots n^{*}}
$$

14. 

Consider the volume form

$$
\omega^{1} \wedge \cdots \wedge \omega^{n} .
$$

Then $\forall g$,

$$
\begin{aligned}
& (\omega \cdot g)^{1^{\prime}} \wedge \cdots \wedge(\omega \cdot g)^{n^{\prime}} \\
& =\omega^{j_{l}}\left(g^{-1}\right)^{l^{\prime}} j_{l} \wedge \cdots \wedge \omega^{j_{n}}\left(g^{-1}\right)^{n^{\prime}} j_{n} \\
& =\left(g^{-1}\right)^{l^{\prime}} j_{l} \cdots\left(g^{-1}\right)^{n^{\prime}} j_{n} \omega^{j_{1}} \wedge \ldots \wedge \omega^{j_{n}} \\
& =\left(g^{-1}\right)_{j_{1}}^{l} \cdots\left(g^{-1}\right)_{j_{n}}^{n} \delta^{j_{1} \cdots j_{n}} 1 \cdots \omega^{1} \wedge \cdots \wedge \omega^{n} \\
& =\left(\operatorname{det} g^{-1}\right) \omega^{1} \wedge \cdots \wedge \omega^{n} .
\end{aligned}
$$

But

$$
\begin{aligned}
& T=T_{l^{\prime} \ldots n^{\prime}(\omega \cdot g)^{\prime \prime} \wedge \ldots \wedge(\omega \cdot g)^{n^{\prime}}, ~}^{n} \\
& \Rightarrow \\
& T=T_{1} \ldots n^{\prime}\left(\operatorname{det} g^{-1}\right) \omega^{1} \wedge \cdots \wedge \omega^{n} \\
& \Rightarrow \\
& T_{1} \cdot \ldots n^{\prime}\left(\operatorname{det} g^{-1}\right)=T_{1} \ldots n \\
& \Rightarrow \\
& T_{1} \ldots n^{\prime}=(\operatorname{det} g) T_{1} \ldots n \\
& \Rightarrow \\
& T(E \cdot g)=(\operatorname{det} g) T(E) .
\end{aligned}
$$

Thus in this way one can attach to each $T \in \Lambda^{n} V$ a scalar density of weight 1. [Note: Define

$$
|T|: B(V) \rightarrow \underline{R}
$$

by

$$
|T|(E)=|T(E)| .
$$

Then $\forall g$,

$$
\begin{aligned}
|T|(E \cdot g) & =|T(E \cdot g)| \\
& =|(\operatorname{det} g) T(E)| \\
& =|\operatorname{det} g||T(E)| \\
& =|\operatorname{det} g||T|(E) .
\end{aligned}
$$

I.e.: $|T|$ is a density of weight l.]

Definition: The upper Levi-Civita symbol of order $n$ is

$$
\varepsilon_{\varepsilon}^{i_{1} \cdots i_{n}}=\delta^{i_{1} \cdots i_{n}}{ }_{l \cdots n}
$$

and the lower Levi-Civita symbol of order $n$ is

$$
\varepsilon_{j_{1} \cdots j_{n}}=\delta^{l \cdots n} j_{1} \cdots j_{n}
$$

Determinant Formula Let $A=\left[a_{j}{ }_{j}\right]$ be an $n$-by-n matrix -- then

$$
\left[\begin{array}{l}
\varepsilon^{i_{l}^{\prime} \cdots i_{n}^{\prime}} \operatorname{det} A=\varepsilon^{i_{l} \cdots i_{n}} a^{i_{1}^{\prime}}{ }_{i_{l}} \cdots a^{i_{n}^{\prime}}{ }_{i_{n}} \\
\varepsilon_{j}^{\prime} \cdots j_{n}^{\prime} \operatorname{det} A=\varepsilon_{j_{1}} \cdots j_{n} a^{j_{l}}{ }_{j_{1}^{\prime}} \cdots a^{j_{n}}{ }_{j_{n}^{\prime}}^{\prime} .
\end{array}\right.
$$

Under a change of basis,

$$
\begin{aligned}
& i_{\varepsilon}^{1} \cdots i_{n}^{\prime} \\
& =\operatorname{det} g\left(g^{-1}\right)^{i_{1}^{\prime}}{ }_{i_{1}} \cdots\left(g^{-1}\right)_{n}^{i_{n}^{\prime}}{ }_{i_{n}}^{i_{1} \cdots i_{n}}
\end{aligned}
$$

and

$$
\begin{aligned}
& \varepsilon_{j_{1}^{\prime} \cdots j_{n}^{\prime}} \\
& =\operatorname{det} g^{-1}(g)^{j_{1}}{ }_{j}^{\prime} \cdots(g){ }_{j_{n}^{\prime}}^{j_{n}} \varepsilon_{j_{1}} \cdots j_{n}
\end{aligned}
$$

Therefore the upper (lower) Levi-Civita symbol is a tensor of type ( $n, 0$ ) (type ( $0, n$ ) ) and weight $x=\operatorname{det}\left(x=\operatorname{det}^{-1}\right)$.

Remark: The components of the Levi-Civita symbol (upper or lower) have the same numerical values w.r.t. all bases. They are $+1,-1$, or 0 .

Identities We have

$$
\varepsilon^{i_{1} \cdots i_{n}} \varepsilon_{j_{1} \cdots j_{n}}=\delta^{i_{1} \cdots i_{n}}{ }_{j_{1} \cdots j_{n}}
$$

and

$$
\begin{gathered}
i_{\varepsilon} \cdots i_{p} k_{1} \cdots k_{n-p_{\varepsilon_{j}}} \cdots j_{p} k_{1} \cdots k_{n-p} \\
\quad=(n-p)!\delta^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{p}} .
\end{gathered}
$$

Example: Let $A=\left[a_{j}^{i}\right]$ be an $n-b y-n$ matrix - then

$$
\varepsilon_{j_{1}^{\prime} \cdots j_{n}^{\prime}} \operatorname{det} A=\varepsilon_{j_{1}} \cdots j_{n} a^{j_{1}}{ }_{j_{1}^{\prime}} \ldots a^{j_{n}}{ }_{j_{n}^{\prime}}
$$

$$
\begin{aligned}
& { }_{\varepsilon}^{j_{1}^{\prime} \cdots j_{n}^{\prime}} \varepsilon_{j_{1}^{\prime} \cdots j_{n}^{\prime}} \operatorname{det} A \\
& =\varepsilon^{j_{l}^{\prime} \cdots j_{n}^{\prime}}{ }_{j_{1}} \cdots j_{n} a^{j_{l}}{ }_{j_{l}^{\prime}} \cdots a^{j_{n}}{ }_{j n}^{\prime}
\end{aligned}
$$

$\Rightarrow$

$$
\begin{aligned}
& \delta^{j_{1}^{\prime \cdots} j_{n}^{\prime}} \underset{j}{\prime} \cdots j_{n}^{\prime} \operatorname{det} A \\
& =\delta^{j_{1}^{\prime} \cdots j_{n}^{\prime}}{ }_{j_{1} \cdots j_{n}}^{a^{j_{l}}{ }_{j}^{\prime} \cdots a_{n}{ }_{j_{n}^{\prime}}^{\prime}}
\end{aligned}
$$

$\Rightarrow$

$$
\left.\operatorname{det} A=\frac{1}{n!} \delta^{j_{l}^{\prime} \cdots j_{n}^{\prime}} j_{l} \cdots j_{n} a_{j_{l}^{\prime}}^{j_{l}} \cdots a_{j_{n}^{\prime}}^{j_{n}} .\right]
$$

From its very definition,

$$
\omega^{i_{1}} \wedge \cdots \wedge \omega^{i_{n}}=\varepsilon^{i_{l} \cdots i_{n}} \omega^{l} \wedge \cdots \wedge \omega^{n}
$$

The interpretation of $\varepsilon_{j_{1}} \ldots j_{n}$ is, however, less direct.
Rappel: Each $\mathrm{X} \in \mathrm{V}$ defines an antiderivation ${ }^{\iota} \mathrm{X}: \Lambda^{*} \mathrm{~V} \rightarrow \Lambda^{*} \mathrm{~V}$ of degree -1 , the interior product w.r.t. X. Explicitly: $\forall T \in \Lambda{ }^{p} V$,

$$
{ }^{L_{X} T}{ }^{T}\left(X_{1}, \ldots, X_{p-1}\right)=T\left(X, X_{1}, \ldots, X_{p-1}\right) .
$$

One has

$$
\iota_{\mathrm{X}}\left(\mathrm{~T}_{1} \wedge \mathrm{~T}_{2}\right)=\iota_{\mathrm{X}} \mathrm{~T}_{1} \wedge \mathrm{~T}_{2}+(-1)^{\mathrm{p}_{\mathrm{T}_{1}} \wedge \iota_{\mathrm{x}} \mathrm{~T}_{2} .}
$$

Properties:
(1) ${ }^{\iota}{ }_{X}{ }^{\circ} \iota_{X}=0$;
(2) $\iota_{X}{ }^{\circ} \iota_{Y}+\iota_{Y}{ }^{\circ} \iota_{X}=0$;
(3) $\iota_{X+Y}=\iota_{X}+\iota_{Y}$;
(4) $\iota_{r X}=r \iota_{X}$.

Example: By definition,

$$
{ }_{E_{j}}\left(\omega^{i}\right)=\omega^{i}\left(E_{j}\right)=\delta_{j}^{i}
$$

LEMMA Let $T \in A^{P} \mathrm{~V}$, say

$$
T=\frac{l}{p!} T_{j_{l}} \cdots j_{p} \omega^{j_{l}} \wedge \ldots \wedge \omega^{j_{p}}
$$

Then

$$
{ }^{{ }^{E_{i}}}{ }_{i}^{T}=\frac{1}{(p-l)!} T_{i j_{2}} \cdots j_{p} \omega^{j_{2}} \wedge \cdots \wedge \omega^{j_{p}}
$$

Example: $\forall T \in \Lambda{ }^{\mathrm{P}} \mathrm{V}$,

$$
\left[\begin{array}{l}
\omega^{i} \wedge{ }_{L_{i}} T=p T \\
{ }_{-}{ }^{E_{E_{i}}}\left(\omega^{i} \wedge T\right)=(n-p) T .
\end{array}\right.
$$

Put

$$
\operatorname{vol}_{E}=\omega^{1} \wedge \cdots \wedge \omega^{n}
$$

and then set

$$
\operatorname{vol}_{j}=c_{E_{j}} \operatorname{vol}_{E}
$$

Proceed from here by iteration:

$$
\begin{aligned}
& \operatorname{vol}_{\mathrm{j}_{1} \mathrm{j}_{2}}={ }^{\iota_{E_{j_{2}}}} \operatorname{vol}_{\mathrm{j}_{1}} \\
& { }^{\mathrm{vol}}{ }_{j_{1}} \cdots j_{n} \quad=^{c_{E}}{ }_{j_{n}} \quad{ }^{c_{E_{j_{1}}}}{ }^{\operatorname{vol}_{E}} \cdot
\end{aligned}
$$

FACT We have

$$
\operatorname{vol}_{j_{1}} \cdots \cdot j_{n}=\varepsilon_{j_{1}} \cdots j_{n}
$$

In the definition of density, twisted density, or scalar density, one can replace the target $\underline{R}$ by any finite dimensional real vector space $W$.

Example (The $T$-Construction): Let $T$ be a symmetric tensor of type $(0,2)$. Assume: $T$ is nonsingular, hence $\operatorname{det} T(E) \neq 0$ for all $E \in B(V)$. Define

$$
\lambda_{|T|}: B(\mathrm{~V}) \rightarrow \underline{R}
$$

by

$$
\begin{aligned}
\lambda_{|T|}(E) & =\left|\lambda_{T}(E)\right| \\
& =|\operatorname{det} T(E)| .
\end{aligned}
$$

Then $\forall g$,

$$
\begin{aligned}
\lambda_{|T|}(\mathrm{E} \cdot \mathrm{~g}) & =\left|\lambda_{\mathrm{T}}(\mathrm{E} \cdot \mathrm{~g})\right| \\
& =|\operatorname{det} g|^{2} \lambda_{|T|}(\mathrm{E})
\end{aligned}
$$

Given $E \in B(V)$, put

$$
\operatorname{vol}_{T}(E)=\left(\lambda|T|{ }^{(E))^{1 / 2} \mathrm{vol}_{E^{\prime}}}\right.
$$

where, as before,

$$
\operatorname{vol}_{E}=\omega^{I} \wedge \cdots \wedge \omega^{n}
$$

Accordingly,

$$
\mathrm{Vol}_{\mathrm{T}}: \mathrm{B}(\mathrm{~V}) \rightarrow \Lambda^{\mathrm{n}} \mathrm{~V} .
$$

And $\forall g$,

$$
\begin{aligned}
& \operatorname{vol}_{T}(E \cdot g) \\
&=\left(\lambda|T|{ }^{(E \cdot g))^{1 / 2}(\omega \cdot g)^{I^{\prime}} \wedge \ldots \wedge(\omega \cdot g)^{n^{\prime}}}\right.
\end{aligned}
$$

$$
\begin{aligned}
& =\left(\lambda_{|T|}(E \cdot g)\right)^{1 / 2}\left(\operatorname{det} g^{-1}\right) \omega^{1} \wedge \cdots \wedge \omega^{n} \\
& =|\operatorname{det} g|(\operatorname{det} g)^{-1}\left(\lambda_{|T|}(E)\right)^{1 / 2} \mathrm{Vol}_{E} \\
& =\operatorname{sgn} \operatorname{det} g \cdot \operatorname{vol}_{T}(E) .
\end{aligned}
$$

Therefore $\mathrm{vol}_{\mathrm{T}}$ is a $\Lambda^{\mathrm{n}} \mathrm{V}$-valued twisted density of weight 0 .
[Note: It follows that the n-form $\operatorname{vol}_{T}(E)$ is an invariant of $E \in B^{+}(V)$ or $\left.E \in B^{-}(\mathrm{V}).\right]$

Let $\varepsilon^{\bullet}$ stand for the upper Levi-Civita symbol -- then $\varepsilon^{\bullet}: B(V) \rightarrow \underline{R}^{n^{n}}$ is a tensor of type $(n, 0)$ and weight $X=\operatorname{det}$. On the other hand,

$$
\frac{1}{(\lambda|T|)^{1 / 2}}: B(V) \rightarrow R
$$

is a density of weight -1 ( $T$ as above). Therefore the product

$$
e^{\bullet}=\frac{1}{\left(\lambda_{|T|}\right)^{1 / 2}} \cdot \varepsilon
$$

is a twisted tensor of type ( $\mathrm{n}, 0$ ).
[Note: Analogous considerations apply to the lower Levi-Civita symbol
$\varepsilon_{\text {. }}$ : The product

$$
e_{\bullet}=\left(\lambda_{|T|}\right)^{1 / 2} \cdot \varepsilon
$$

is a twisted tensor of type $(0, \mathrm{n})$.]
Example: Consider

$$
\operatorname{vol}_{T}(E)=\left(\lambda_{|T|}(E)\right)^{l / 2} \operatorname{vol}_{E}
$$

Then

$$
\operatorname{vol}_{E}=\frac{1}{n!} \varepsilon_{j_{1}} \ldots j_{n} \omega^{j_{1}} \wedge \ldots \wedge \omega^{j_{n}}
$$

$$
\operatorname{vol}_{T}(E)=\frac{1}{n!} e_{j_{l}} \cdots j_{n} \omega^{j_{l}} \wedge \cdots \wedge \omega^{j_{n}}
$$

Section 2: Scalar Products Fix a pair ( $k, n-k$ ), where $0 \leq k \leq n$. Put

$$
\eta=\left|\begin{array}{cc}
-I_{k} & 0 \\
0 & I_{n-k}
\end{array}\right|
$$

Then the prescription

$$
<x, y>_{k}=\left.\eta_{i j} x^{i} y^{j}\right|^{x=x^{i} e_{i}} \begin{aligned}
& y=y^{j} e_{j}
\end{aligned}
$$

defines a scalar product on $\underline{R}^{\mathrm{n}}$.
Definition: The semiorthogonal group $O(k, n-k)$ consists of those $A \in G L(n, R)$ such that $\forall x, y \in \underline{R}^{n}$,

$$
<A x, A y\rangle_{k}=\langle X, Y\rangle_{k}
$$

[Note: This amounts to requiring that

$$
\left.A^{\top} \eta A=\eta .\right]
$$

In other words, if $\underline{R}^{k, n-k}$ stands for $\underline{R}^{n}$ equipped with the inner product $<, \quad>_{k^{\prime}}$ then $\underline{O}(k, n-k)$ is the linear isometry group of $\underline{R}^{k, n-k}$.

FACT $\quad \forall A \in O(k, n-k), \operatorname{det} A= \pm 1$.
It is not difficult to see that

$$
\underline{O}(k, n-k) \approx \underline{O}(n-k, k) .
$$

If $\mathrm{k}=0$ or $\mathrm{k}=\mathrm{n}$,

$$
\underline{O}(0, n) \approx \underline{O}(n, 0)
$$

is the orthogonal group $\underline{O}(\mathrm{n})$. It has two components

$$
\left\{\begin{array}{l}
\underline{O}^{+}(n)=\{A \in \underline{O}(n): \operatorname{det} A=+1\} \\
\underline{O}^{-}(n)=\{A \in \underline{O}(n): \operatorname{det} A=-1\}
\end{array}\right.
$$

Suppose that $0<k<n-$ then $\underline{O}(k, n-k)$ has four components

$$
\underline{\mathrm{O}}^{++}(k, n-k), \underline{\mathrm{O}}^{+-}(k, n-k), \underline{\mathrm{O}}^{-+}(k, n-k), \underline{\mathrm{O}}^{--}(k, n-k)
$$

indexed by the signs of $\operatorname{det} A_{T}$ and $\operatorname{det} A_{S}$. Here

$$
A=\left|\begin{array}{cc}
A_{T} & \\
& \\
C & A_{S}
\end{array}\right|
$$

with

$$
A_{T} \in \underline{G L}(k, \underline{R}), A_{S} \in G L(n-k, \underline{R})
$$

Definition: The special semiorthogonal group $\mathrm{SO}(\mathrm{k}, \mathrm{n}-\mathrm{k})$ consists of those $A \in \underline{O}(k, n-k)$ such that $\operatorname{det} A=1$.

Therefore

$$
\underline{S O}(k, n-k)=\underline{O}^{++}(k, n-k) \cup \underline{O}^{--}(k, n-k)
$$

is both open and closed in $\underline{O}(\mathrm{k}, \mathrm{n}-\mathrm{k})$. One has

$$
\underline{s o}(k, n-k)=\underline{o}(k, n-k)=\left\{A \in \underline{g l}(n, \underline{R}): A^{\top}=-\eta A \eta\right\}
$$

Remark: By construction, $\mathrm{SO}(\mathrm{k}, \mathrm{n}-\mathrm{k})$ is the group of orientation preserving linear isometries $\underline{R}^{k, n-k} \rightarrow \underline{R}^{k, n-k}$. On the other hand,

$$
\left[\begin{array}{l}
\underline{o}^{++}(k, n-k) \cup \underline{o}^{+-}(k, n-k) \\
\underline{o}^{++}(k, n-k) \cup \underline{o}^{-+}(k, n-k)
\end{array}\right.
$$

consist of those linear isometries $\underline{R}^{k, n-k} \rightarrow \underline{R}^{k, n-k}$ that preserve the
$\left.\right|_{\text {time orientation }} ^{\text {space orientation, }}$
respectively.
[Note: If $0<k<n$, then each of the groups

$$
\left[\begin{array}{l}
\underline{o}^{++}(k, n-k) \cup \underline{o}^{--}(k, n-k) \\
\underline{o}^{++}(k, n-k) \cup \underline{o}^{+-}(k, n-k) \\
\underline{o}^{++}(k, n-k) \cup \underline{o}^{-+}(k, n-k)
\end{array}\right.
$$

is of index 2 in $\underline{O}(k, n-k)$.]
Let V be an n -dimensional real vector space -- then a scalar product on V is a nondegenerate symmetric bilinear form

$$
\mathrm{g}: \mathrm{V} \times \mathrm{V} \rightarrow \underline{\mathrm{R}}
$$

N.B. Nondegeneracy amounts to saying that the map $g^{b}: V \rightarrow V^{*}$ defined by

$$
\mathrm{g}^{\forall} \mathrm{X}(\mathrm{Y})=\mathrm{g}(\mathrm{X}, \mathrm{Y})
$$

is bijective.
[Note: The inverse to $g^{b}$ is denoted by $g^{\#}$.]
Therefore $g$ is a symmetric tensor of type $(0,2): g \in V_{2}^{0}$. In terms of a basis $E=\left\{E_{1}, \ldots, E_{n}\right\} \in B(V)$ and its cobasis $\omega=\left\{\omega^{1}, \ldots, \omega^{n^{n}}\right\} \in B\left(V^{*}\right)$,

$$
g=g_{i j} \omega^{i} \otimes \omega^{j}
$$

where

$$
g_{i j}=g\left(E_{i}, E_{j}\right)=g\left(E_{j}, E_{i}\right)=g_{j i}
$$

Observation: The assigrment

$$
\mathrm{g}^{-1}: \mathrm{V}^{\star} \times \mathrm{V}^{\star} \rightarrow \underline{R}
$$

characterized by the condition

$$
g^{-1}\left(g^{b} X, g^{b}\right)=g(X, Y)
$$

is a scalar product on $\mathrm{V}^{*}$.
Therefore $\mathrm{g}^{-1}$ is a symmetric tensor of type $(2,0): g^{-1} \in \mathrm{~V}_{0}^{2}$. And here

$$
\left(g^{-1}\right)^{i j}=g^{i j}
$$

where $g^{i j}$ is the $i j^{\text {th }}$ entry of the matrix inverse to $\left[g_{i j}\right]$, so

$$
g^{-1}=g^{i j_{E}} E_{i} \otimes E_{j}
$$

LEMMA We have

$$
\left[\begin{array}{l}
\varepsilon_{j_{1} \cdots j_{n}}=\frac{1}{\operatorname{det} g(E)} g_{j_{1} i_{1}} \cdots g_{j_{n} i_{n}} \varepsilon^{i_{l} \cdots i_{n}} \\
\varepsilon_{\varepsilon}^{i_{1} \cdots i_{n}}=\operatorname{det} g(E) g^{i_{1} j_{1}} \cdots g^{i_{n} j_{n}} \varepsilon_{j_{1} \cdots j_{n}}
\end{array}\right.
$$

[Note: In the jargon of the trade, this shows that $\varepsilon$, and $\varepsilon$ are not obtained from one another by the operations of lowering or raising indices.]

Notation: Given $\mathrm{E} \in \mathrm{B}(\mathrm{V})$, put

$$
|g|(E)=|\operatorname{det} g(E)| .
$$

In the T -construction, take $\mathrm{T}=\mathrm{g}-$ - then

$$
\lambda_{|g|}(E)=|\operatorname{det} g(E)|=|g|(E)
$$

and, by definition,

$$
\operatorname{vol}_{g}(E)=(|g|(E))^{1 / 2} \operatorname{vol}_{E^{\prime}}
$$

an n-form that depends only on the orientation class of E. Moreover,

$$
\left[\begin{array}{l}
e^{\bullet}=\frac{1}{|g|^{1 / 2}} \cdot \varepsilon \\
e_{e}=|g|^{1 / 2} \cdot \varepsilon_{\bullet}
\end{array}\right.
$$

these being twisted tensors of type $\prod_{-(0, n)}^{(n, 0)}$.
LEMMA We have

$$
\left[\begin{array}{l}
e_{j_{1} \cdots j_{n}}=\operatorname{sgn} \operatorname{det} g(E) g_{j_{1} i_{1}} \cdots g_{j_{n} i_{n}} e^{i_{1} \cdots i_{n}} \\
e^{i_{1} \cdots i_{n}}=\operatorname{sgn} \operatorname{det} g(E) g^{i_{1} j_{1}} \cdots g^{i_{n} j_{n}} e_{j_{1} \cdots j_{n}}
\end{array}\right.
$$

Definition: An element $E \in B(V)$ is said to be orthonormal if

$$
g(E)=\operatorname{diag}(-1, \ldots,-1,1, \ldots, 1) .
$$

It is well-known that $g$ admits such a basis.
[Note: The pair ( $k, n-k$ ), where $k$ is the number of ( -1 ) -entries and $\mathrm{n}-\mathrm{k}$ is the number of ( +1 )-entries, is called the signature of g and $\iota \in\{0,1\}: \imath \equiv k \bmod 2\left(\Rightarrow(-1)^{\imath}=\operatorname{sgn} \operatorname{det} g(E)\right)$ is called the index of $g$. These entities are well-defined, i.e., independent of E . In fact, the orthonormal elements of $B(V)$ per $g$ are precisely the $E \cdot A(A \in O(k, n-k))$.

Remark: If $\mathrm{E} \in \mathrm{B}(\mathrm{V})$ is arbitrary, then

$$
\text { sgn det } g(E)=(-1)^{2}
$$

Let $M_{k, n-k}$ be the set of scalar products on $V$ of signature $(k, n-k)$-- then

$$
M_{k, n-k} \leftrightarrow B(V) / \underline{O}(k, n-k)
$$

or still,

$$
M_{k, n-k} \leftrightarrow \underline{G L}(n, \underline{R}) / \underline{O}(k, n-k) .
$$

[Note: If $E=\left\{E_{1}, \ldots, E_{n}\right\} \in B(V)$, then the prescription

$$
g_{E}(X, Y)=\eta_{i j} X^{i} Y^{j} \quad \int_{-} X=X^{i} E_{i}
$$

defines a scalar product $g_{E} \stackrel{\in M}{k}, n-k$ having $E$ as an orthonormal basis. And

$$
g_{E}=g_{E \cdot A}
$$

for all $A \in \underline{O}(k, n-k)$.
Suppose that $g \in M_{k, n-k}$ and $E \in B(V)$ is orthonormal. Put

$$
\varepsilon_{i}=g\left(E_{i}, E_{i}\right)
$$

Then

$$
\varepsilon_{i}=\left.\right|_{-1} ^{-1} \quad(1 \leq i \leq k) .
$$

LEMMA We have

$$
g^{b} E_{i}=\varepsilon_{i} \omega^{i} \quad(\text { no sum })
$$

Remark: If $\mathrm{E} \in \mathrm{B}(\mathrm{V})$ is arbitrary, then

$$
\left[\begin{array}{rl}
g^{b} E_{i}=g_{i j} \omega^{j} & \left(\equiv \omega_{i}\right) \\
g^{\#} \omega^{i}=g^{i j} E_{j} & \left(\equiv E^{i}\right)
\end{array}\right.
$$

Initially, we started with a scalar product $g$ on $V$ and then saw how $g$ induces a scalar product on $V^{*}$. More is true: $g$ induces a scalar product $g\left[{ }_{q}^{p}\right]$ on each of the $V_{q}^{p}$.
[Note: Here, $g\left[\begin{array}{l}1 \\ 0\end{array}\right]=g$ and $g\left[\begin{array}{l}0 \\ 1\end{array}\right]=g^{-1}$.]
Notation: Given $T \in V_{q}^{p}$, define

$$
T^{b} \in V_{p+q}
$$

by

$$
\begin{aligned}
& T^{b}\left(x_{1}, \ldots, x_{p+q}\right) \\
= & T\left(g^{b} x_{1}, \ldots, g^{\forall} x_{p}, x_{p+1}, \ldots, x_{p+q}\right)
\end{aligned}
$$

and define

$$
\mathrm{T}^{\#} \in \mathrm{~V}^{\mathrm{p}+\mathrm{q}}
$$

by

$$
\begin{aligned}
& T^{\#}\left(\Lambda_{1}, \ldots, \Lambda_{p+q}\right) \\
= & T\left(\Lambda_{1}, \ldots, \Lambda_{p^{\prime}} g^{\#} \Lambda_{p+1}, \ldots, g^{\#} \Lambda_{p+q}\right)
\end{aligned}
$$

components of $\mathrm{T}^{\boldsymbol{b}}$ :

$$
T_{i_{1}} \cdots i_{p} j_{1} \cdots j_{q}=g_{i_{1} k_{1}} \cdots g_{i_{p} k} T^{k_{1} \cdots k_{p}}{ }_{j_{1}} \cdots j_{q}
$$

Components of $\mathrm{T}^{\#}$ :

$$
T^{i_{1} \cdots i_{p} j_{1} \cdots j_{q}}=g^{j_{1} \ell_{1}} \cdots g^{j_{q}^{\ell}}{ }_{T}^{i_{1} \cdots i_{p}}{ }_{\ell_{1} \cdots \ell_{q}}
$$

Remark: If $\mathrm{p}=0$, then $\mathrm{T}^{\mathrm{b}}=\mathrm{T}$ and if $\mathrm{q}=0$, then $\mathrm{T}^{\#}=\mathrm{T}$.

Example: Take $T=g-$ then

$$
\Rightarrow
$$

$$
\begin{aligned}
& g^{\#}\left(g^{b} X_{, g}{ }^{b} \mathrm{Y}\right) \\
& \quad=g\left(g^{\#} g_{\left.X, g^{\#} g^{\forall}\right)}\right. \\
& =g(X, Y) \\
& g^{\#}=g^{-1}
\end{aligned}
$$

LEMMA The bilinear form

$$
\mathrm{g}\left[{ }_{\mathrm{q}}^{\mathrm{P}}\right]: \mathrm{V}_{\mathrm{q}}^{\mathrm{p}} \times \mathrm{V}_{\mathrm{q}}^{\mathrm{P}} \rightarrow \underline{\mathrm{R}}
$$

that sends ( $\mathrm{T}, \mathrm{S}$ ) to the complete contraction

$$
\mathrm{C}_{1}^{1} \ldots \mathrm{C}_{\mathrm{p}+\mathrm{q}}^{\mathrm{p}+\mathrm{q}}\left(\mathrm{~T}^{\#} \otimes \mathrm{~s}^{\downarrow}\right)
$$

is a scalar product on $\mathrm{V}_{\mathrm{q}}^{\mathrm{p}}$.
[Note: If $g$ is positive definite, then so is $\left.g\left[\begin{array}{l}\mathrm{P} \\ \mathrm{q}\end{array}\right].\right]$

From the definitions,

$$
\mathrm{T}^{\#} \otimes \mathrm{~s}^{b} \in \mathrm{v}_{\mathrm{p}+\mathrm{q}}^{\mathrm{p}+\mathrm{q}}
$$

Therefore

$$
\begin{aligned}
& \left(T^{\#} \otimes S^{b}\right)^{i_{1} \cdots i_{p+q}}{ }_{j_{1}} \cdots j_{p+q} \\
& =g^{i_{p+1}}{ }^{\ell} p+1 \ldots g^{i_{p+q}}{ }^{\ell} p+q T^{i_{1}}{ }^{\cdots i_{p}}{ }_{\ell}{ }_{p+1} \cdots \ell_{p+q} \\
& \times g_{j_{1} k_{l}} \cdots g_{j_{p} k_{p}} s^{k_{1} \cdots k_{p}}{ }_{j_{p+1}} \cdots j_{p+q}
\end{aligned}
$$

$$
=T_{T}^{i_{1} \cdots i_{p}{ }^{i_{p+1}} \cdots{ }^{i_{p+q}}} s_{j_{1} \cdots j_{p}} j_{p+1} \cdots j_{p+q}
$$

To compute the complete contraction of $T^{\#} \otimes S^{b}$, one then sets $i_{1}=j_{1}, \ldots, i_{p+q}=$ $j_{p+q}$ and sums the result.

Example: Suppose that $T \in V_{2}^{0} \& S \in V_{2}^{0}-$ then $T^{\#} \in V_{0}^{2} \& S^{b}=S$, so

$$
\begin{gathered}
g\left[{ }_{2}^{0}\right](T, S)=C_{1}^{1} C_{2}^{2}\left(T^{\#} \otimes S\right) \\
=\left(T^{\#} \otimes S\right)^{i_{1} i_{2}}{ }_{i_{1} i_{2}} \\
=g^{i_{1} \ell_{1}} g^{i_{2} \ell}{ }^{\ell} T_{\ell_{1} \ell_{2}} S_{i_{1} i_{2}} \\
=T^{i_{1} i_{2}} S_{i_{1} i_{2}} .
\end{gathered}
$$

[Note: Take $\mathrm{T}=\mathrm{g}$-- then

$$
\begin{aligned}
g\left[\left[_{2}^{0}\right](g, s)\right. & =g^{i_{1} i_{2}} s_{i_{1} i_{2}} \\
& =g^{i_{2} i_{1}} s_{i_{1} i_{2}} \\
& \left.=s^{i_{2}} i_{2} .\right]
\end{aligned}
$$

Let $E \in B(V)$ be orthonormal -- then $\left(\omega^{i}\right)_{j}=\delta^{i}{ }_{j}$

$$
\quad\left(\omega^{i_{1}} \otimes \ldots \otimes \omega^{i_{n}}\right)_{j_{1}} \cdots j_{n}=\delta^{i_{1}}{ }_{j_{1}} \cdots \delta^{i_{n}}{ }_{j_{n}} .
$$

Therefore

$$
\mathrm{g}\left[{ }_{0}^{\mathrm{n}}\right]\left(\mathrm{vol}_{\mathrm{E}}, \mathrm{vol}_{\mathrm{E}}\right)
$$

$$
\begin{aligned}
& =g\left[{ }_{0}^{n}\right]\left(\varepsilon_{i_{1}} \cdots i_{n} \omega^{i_{1}} \otimes \ldots \otimes \omega^{i_{n}}, \varepsilon_{j_{1}} \ldots j_{n} \omega^{j_{l}} \otimes \cdots \otimes \omega^{j_{n}}\right) \\
& =\varepsilon_{i_{1}} \cdots i_{n}{ }^{\varepsilon} j_{l} \cdots j_{n} g\left[{ }_{0}^{n_{0}}{ }^{i_{(\omega}}{ }^{i_{l}} \otimes \cdots \otimes \omega^{i_{n}}, \omega^{j_{l}} \otimes \cdots \otimes \omega^{j_{n}}\right) \\
& =\varepsilon_{i_{1}} \cdots i_{n}{ }^{\varepsilon} j_{1} \cdots j_{n} \\
& \times\left(\omega^{i_{1}} \otimes \cdots \otimes \omega^{i_{n}}\right){ }^{k_{1} \cdots \cdot k_{n}}{ }_{(\omega}{ }^{j_{1}} \otimes \cdots \otimes \omega^{j_{n}}{ }_{k_{1}} \cdots k_{n} \\
& =\varepsilon_{i_{1}} \cdots i_{n}{ }^{\varepsilon} j_{1} \cdots j_{n} \\
& \times g^{k_{1} \ell_{1}} \ldots g^{k_{n} \ell_{n}} \delta^{i_{1}}{ }_{\ell}{ }_{1} \ldots \delta^{i_{n}}{ }_{\ell_{n}} \delta^{j_{1}}{ }_{k_{1}} \ldots \delta^{j_{n}}{ }_{k_{n}} \\
& =\varepsilon_{i_{1}} \cdots i_{n}\left(\varepsilon_{j_{1}} \cdots j_{n} g^{j_{l} i_{l}} \ldots g^{j_{n} i_{n}}\right) \\
& \left.=\varepsilon_{i_{1} \cdots i_{n}}{ }^{i_{1} \cdots i_{n}} \operatorname{det} g(E)^{-l}\right) \\
& =n!(-1)^{2} \text {. }
\end{aligned}
$$

Section 3: Interior Multiplication Let $V$ be an $n$-dimensional real vector space. Fix $g \in M_{k, n-k}$-- then $g$ can be extended to a scalar product on the $\Lambda^{p} V$ ( $p=0,1, \ldots, n$ ). While a direct approach is possible, it is more instructive to proceed conceptually.

- on $\Lambda^{0} \mathrm{~V}=\underline{R}$, put

$$
g(\alpha, \beta)=\alpha \beta .
$$

- on $\Lambda^{1} \mathrm{~V}\left(=\mathrm{v}_{1}^{0}=\mathrm{V}^{*}\right)$, put

$$
g(\alpha, \beta)=g\left(g^{\#} a, g^{\#} \beta\right)
$$

[Note: Fix $E \in B(V)$-- then

$$
\begin{aligned}
& \left.\right|_{-\alpha=a_{i} \omega^{i}} ^{\beta=\beta_{j} \omega^{j}} \quad \& \quad \left\lvert\, \begin{array}{l}
a^{i} \equiv g^{i k^{\alpha_{k}}} \\
\beta^{j} \equiv g^{j \ell} \beta_{\ell}
\end{array}\right. \\
& g(\alpha, \beta)=g\left(g^{\#} \alpha, g^{\#} \beta\right) \\
& =g\left(\alpha^{i} E_{i}, \beta^{j} E_{j}\right) \\
& =g_{i j} a^{i_{\beta}}{ }^{j} \\
& \left.=\alpha^{i_{\beta}}{ }_{i} .\right]
\end{aligned}
$$

Remark: We have

$$
\begin{gathered}
g\left(\omega^{i}, \omega^{j}\right)=g\left(g^{\#} \omega^{i}, g^{\#} \omega^{j}\right) \\
=g\left(g^{i k} E_{k^{\prime}} g^{j \ell} E_{\ell}\right) \\
=g^{i k} g^{j \ell} g\left(E_{k^{\prime}} E_{\ell}\right)
\end{gathered}
$$

$$
\begin{aligned}
& =g^{i k} g^{j \ell} g_{k \ell} \\
& =g^{i k_{g} j \ell} g_{\ell k} \\
& =g^{i k_{\delta}}{ }_{k} \\
& \left.=g^{i j} .\right]
\end{aligned}
$$

Let $q \leq p-$ then there is a bilinear map
which is characterized by the following properties:

$$
\begin{gathered}
\forall \alpha, \beta \in \Lambda \frac{1}{V}, \iota_{\beta} a=g(a, \beta), \\
\iota_{\beta}\left(a_{1} \wedge a_{2}\right)=\iota_{\beta} \alpha_{1} \wedge a_{2}+(-1)^{p_{1}} a_{1} \wedge \iota_{\beta} \alpha_{2} \quad\left(\alpha_{i} \in \Lambda{ }^{p_{i}} v_{1} \beta \in \Lambda{ }^{1} v\right), \\
\iota_{\beta_{1}} \wedge \beta_{2}=\iota_{\beta_{2}}{ }^{\circ} \iota_{\beta_{1}} .
\end{gathered}
$$

[Note: One calls $\imath$ the interior product on $\Lambda^{P} V$. If $\beta \in \Lambda{ }^{0} V=\underline{R}$, then $\iota_{\beta}$ is simply multiplication by $\beta$.]

Remark: $\forall X \in V$,

$$
\iota_{X}=\iota_{\mathrm{g}} b_{\mathrm{X}} .
$$

[Indeed,

$$
\begin{gathered}
c_{g} b_{X}\left(g^{b} Y\right)=g\left(g^{b} X_{,} g^{b}\right) \\
=g\left(g^{\#} g^{b} X_{,} g^{\#} g^{b} Y\right)
\end{gathered}
$$

3. 

$$
\begin{aligned}
& =g(X, Y) \\
& =g(Y, X) \\
& =g^{b} Y(X) \\
& \left.=c_{X}\left(g^{b} Y\right) .\right]
\end{aligned}
$$

Per $E \in B(V)$, write

$$
\left[\begin{array}{l}
\alpha=\frac{1}{p!} a_{i_{1}} \ldots i_{p} \omega^{i_{l}} \wedge \cdots \wedge \omega^{i_{p}} \\
\beta=\frac{1}{q!} \beta_{j_{1}} \cdots j_{q} \omega^{j_{1}} \wedge \cdots \wedge \omega^{j_{q}} .
\end{array}\right.
$$

Put

$$
\beta^{j_{1} \cdots j_{q}}=g^{j_{1} \ell_{1}} \cdots g^{j_{q}^{\ell} q_{q}} \beta_{\ell_{1}} \cdots \ell_{q}
$$

LEMMA Let $a \in \Lambda{ }^{p} V, \beta \in \Lambda q_{V}$, where $q \leq p-$ then

$$
\tau_{\beta}^{\alpha}=\frac{1}{q!(p-q)!} \beta^{j_{1} \cdots j_{q}}{ }_{j_{j_{1}} \cdots j_{q}} i_{1} \cdots i_{p-q} \omega^{i_{1}} \wedge \cdots \wedge \omega^{i_{p-q}}
$$

Take $q=p-$ then $\tau_{\beta} a$ is a real number and we set, by definition,

$$
g(\alpha, \beta)=\iota_{\beta} \alpha=\iota_{\alpha} \beta
$$

Consequently,

$$
g(\alpha, \beta)=\frac{1}{p!} a^{i_{1} \cdots i^{p_{\beta_{i_{1}}}}{ }_{i_{p}}}
$$

and $g$ is a scalar product on $\Lambda^{\mathrm{p}} \mathrm{V}$.
Remark: Due to the way that the definitions have been arranged,

$$
g(\alpha, \beta) \neq g\left[{ }_{p}^{0}\right](\alpha, \beta) .
$$

To see this, consider the RHS:

$$
\begin{aligned}
& g\left[{ }_{p}^{0}\right](\alpha, \beta) \\
& =g\left[{ }_{p}^{0}\right]\left(\alpha_{i_{1}} \ldots i_{p} \omega^{i_{1}} \otimes \ldots \otimes \omega^{i_{p}}, \beta_{j_{1}} \cdots j_{p} \omega^{j_{1}} \otimes \ldots \otimes \omega^{j_{p}}\right) \\
& \left.=a_{i_{1}} \cdots i_{p} \beta_{j_{1}} \cdots j_{p} g\left[{ }_{p}^{0}\right]_{(\omega}{ }^{i_{1}} \otimes \cdots \otimes \omega^{i_{p}},{ }^{j_{1}} \otimes \cdots \otimes \omega^{j_{p}}\right) \\
& =\alpha_{i_{1}} \cdots i_{p} \beta_{j_{1}} \cdots j_{p} g^{j_{1} i_{1}} \ldots g^{j_{p}{ }^{i} p} \\
& =g^{i_{1} j_{1}} \ldots g^{i_{p} j_{p}} \alpha_{j_{1}} \ldots j_{p} \beta_{i_{1}} \cdots i_{p} \\
& =a^{i_{1} \cdots i_{p}} \beta_{i_{1} \cdots i_{p}} .
\end{aligned}
$$

Example: Let

$$
\left[\begin{array}{ll}
\alpha^{1}, \ldots, a^{p} & \\
\beta^{1}, \ldots, \beta^{1} \mathrm{~V} . &
\end{array}\right.
$$

Then

$$
g\left(\alpha^{1} \wedge \cdots \wedge \alpha^{p}, \beta^{1} \wedge \cdots \wedge \beta^{p}\right)=\operatorname{det}\left[g\left(\alpha^{i}, \beta^{j}\right)\right]
$$

IEMMA Let $\left\{\mathrm{E}_{1}, \ldots, \mathrm{E}_{\mathrm{n}}\right\}$ be an orthonormal basis for g -- then the collection

$$
\left\{\omega^{i_{1}} \wedge \cdots \wedge \omega^{i_{p}}: 1 \leq i_{1}<\cdots<i_{p} \leq n\right\}
$$

is an orthonormal basis for the extension of $g$ to $\Lambda^{p} V(l \leq p \leq n)$.
[Note: We have

$$
\begin{aligned}
& g\left(\omega^{i}, \omega^{j}\right)=g\left(g^{\#} \omega^{i}, g^{\#} \omega^{j}\right) \\
& \quad=g\left(\frac{l}{\varepsilon_{i}} E_{i}, \frac{l}{\varepsilon_{j}} E_{j}\right) \quad \text { (no sum) } \\
& \quad=\frac{1}{\varepsilon_{i} \varepsilon_{j}} g\left(E_{i}, E_{j}\right) \quad \text { (no sum) } \\
& \quad=\begin{array}{l}
{ }^{\varepsilon} \quad i=j \\
0 \\
i \neq j
\end{array}
\end{aligned}
$$

Therefore

$$
g\left(\omega^{i_{l}} \wedge \ldots \wedge \omega^{i_{p}}, \omega^{i_{l}} \wedge \ldots \wedge \omega^{i_{p}}\right)=\varepsilon_{i_{l}} \cdots \varepsilon_{i_{p}}=(-1)^{p}
$$

where $P$ is the number of indices among $\left\{i_{1}, \ldots, i_{p}\right\}$ for which $\varepsilon_{i}=-1$.]

Let $a \in \Lambda \Lambda^{p} V, \beta \in \Lambda q_{V}(q<p)-$ then $\forall \gamma \in \Lambda n-q_{V}$,

$$
\begin{aligned}
g\left(\iota_{\beta} \alpha, \gamma\right) & =\iota_{\gamma} \iota_{\beta}{ }^{\alpha} \\
& =\iota_{\beta \wedge \gamma} \alpha \\
& =g(\alpha, \beta \wedge \gamma) .
\end{aligned}
$$

In other words, the operations

$$
\begin{aligned}
& \iota_{\beta}: \Lambda^{p} V \rightarrow \Lambda^{p-q_{V}} \\
& \beta \Lambda-: \Lambda^{p-q} V \rightarrow \Lambda^{p} V
\end{aligned}
$$

are mutually adjoint.
Consider now

$$
\mathrm{vol}_{\mathrm{g}}=|g|^{1 / 2} \mathrm{vol}_{\mathrm{E}} .
$$

This n-form depends only on the orientation class of E . Thus there are but two possibilities. Pick one, call it an orientation of $V$, and freeze it for the ensuing discussion.
N.B. We have

$$
\operatorname{vol}_{g}=\frac{1}{n!} e_{j_{1}} \cdots j_{n} \omega^{j_{1}} \wedge \cdots \wedge \omega^{j_{n}}
$$

Definition: The star operator is the isomorphism

$$
\star: \Lambda^{\mathrm{p}} \mathrm{~V} \rightarrow \Lambda^{\mathrm{n}-\mathrm{p}_{V}}
$$

given by

$$
\star a=\iota_{\alpha} \operatorname{vol}_{g}
$$

Therefore

$$
* \alpha=\frac{1}{p!(n-p)!} a^{i_{1} \cdots i_{p}} e_{i_{1}} \cdots i_{p} j_{1} \cdots j_{n-p} \omega^{j_{1}} \wedge \cdots \wedge \omega^{j_{n-p}}
$$

LEMMA We have

$$
* * a=(-1)^{c}(-1)^{p(n-p)_{a}}
$$

7. 

Example: $* l=\operatorname{vol}_{g}$

$$
\Rightarrow \quad \operatorname{vol}_{g}=* * 1=(-1)^{\iota}
$$

$=$

$$
\begin{aligned}
g\left(\mathrm{vol}_{\mathrm{g}}, \mathrm{vol}_{\mathrm{g}}\right) & =\iota_{\mathrm{vol}}^{\mathrm{g}} \\
& \mathrm{vol}_{\mathrm{g}} \\
& =* \mathrm{vol}_{\mathrm{g}} \\
& =(-1)^{\iota}
\end{aligned}
$$

Observation: Let $a \in \Lambda^{P} P_{V}, \beta \in \Lambda^{n-P_{V}}$ - then

$$
\begin{aligned}
g\left(\alpha \wedge \beta, \operatorname{vol}_{g}\right) & =\iota_{\alpha \wedge \beta} \operatorname{vol}_{g} \\
& =\iota_{\beta} \iota_{\alpha} \operatorname{vol} g \\
& =\iota_{\beta} * \alpha \\
& =g(* \alpha, \beta)
\end{aligned}
$$

Example: We have

$$
\begin{aligned}
& g\left(*\left(\omega^{i_{l}} \wedge \cdots \wedge \omega^{i_{p}}\right), \omega^{i_{p+l}} \wedge \cdots \wedge \omega^{i_{n}}\right) \\
& \quad=g\left(\omega^{i_{l}} \wedge \cdots \wedge \omega^{i_{n}}, \operatorname{vol}_{g}\right) \\
& \quad=|g|^{1 / 2} g\left(\omega^{i_{l}} \wedge \cdots \wedge \omega^{i_{n}}, \omega^{l} \wedge \cdots \wedge \omega^{n}\right) \\
& \quad=|g|^{l / 2} g\left(\varepsilon^{i_{l} \cdots i_{n}} \omega^{l} \wedge \cdots \wedge \omega^{n}, \omega^{l} \wedge \cdots \wedge \omega^{n}\right) \\
& \quad=|g|^{l / 2} \varepsilon_{\varepsilon}^{i_{l} \cdots i_{n}} g\left(\operatorname{vol}_{E^{\prime}} \operatorname{vol}_{E}\right)
\end{aligned}
$$

$$
\begin{aligned}
& =\frac{1}{|g|^{1 / 2}} \varepsilon^{i_{1} \cdots i_{n}} g\left(\operatorname{vol}_{g}, \mathrm{vol}_{g}\right) \\
& =\frac{1}{|g|^{1 / 2}} \varepsilon^{i_{1} \cdots i_{n}}(-1)^{\iota} .
\end{aligned}
$$

In what follows, $\alpha \in \Lambda^{p} V$ and $\beta \in \Lambda^{q} V$ (subject to the obvious restrictions).

## Rules

- $\iota_{\beta} * \alpha=*(\alpha \wedge \beta)$.
[In fact,

$$
\begin{aligned}
\iota_{\beta} * \alpha & =\iota_{\beta} \iota_{\alpha} \mathrm{vol}_{g} \\
& =\iota_{\alpha \wedge \beta} \mathrm{vol}_{g} \\
& =*(\alpha \wedge \beta) \cdot] \\
* \quad * \iota_{\beta}^{\alpha} & =(-1)^{\mathrm{q}(\mathrm{n}-\mathrm{q})} * \alpha \wedge \beta
\end{aligned}
$$

[In fact,

$$
\iota_{\beta} * * \alpha=*(* \alpha \wedge \beta)
$$

$\Rightarrow$

$$
* c_{\beta} * * \alpha=* *(* \alpha \wedge \beta)
$$

$\Rightarrow$

$$
\begin{aligned}
& (-1)^{\iota}(-1)^{p(n-p)} * \iota_{\beta}^{\alpha} \\
& \quad=(-1)^{\iota} \quad(-1)^{(n-p+q)(n-(n-p+q))} \star \alpha \wedge \beta
\end{aligned}
$$

$\Rightarrow$

$$
\left.* \iota_{\beta} \alpha=(-1)^{q(n-q)} \star \alpha \wedge \beta .\right]
$$

$$
\text { - } \alpha \wedge * \beta=g(\alpha, \beta) \operatorname{vol}_{g}=\beta \wedge * \alpha \text {. }
$$

[In fact,

$$
\begin{aligned}
& \alpha \wedge * \beta=(-1)^{p(n-p)} * \beta \wedge \alpha \\
& \quad=(-1)^{p(n-p)}(-1)^{p(n-p)} * \iota_{\alpha} \beta \\
& \quad=g(\alpha, \beta) * 1 \\
& \left.\quad=g(\alpha, \beta) v o l_{g} \cdot\right] \\
& \bullet g(* a, * \beta)=(-1)^{\imath} g(\alpha, \beta)
\end{aligned}
$$

[In fact,

$$
\begin{aligned}
& g(* \alpha, * \beta) v o l_{g}=\star \alpha \wedge * * \beta \\
& \quad=(-1)^{c}(-1)^{n(n-p)} * \alpha \wedge \beta \\
& \quad=(-1)^{c} \beta \wedge * \alpha \\
& \left.\quad=(-1)^{c} g(\alpha, \beta) \operatorname{vol}_{g} \cdot\right]
\end{aligned}
$$

Example: Specialize the relation

$$
* \iota_{\beta}^{\alpha}=(-1)^{q(n-q)} * \alpha \wedge \beta
$$

and take $\beta=g^{b} \mathrm{x}-$ then

$$
{ }^{*} \mathrm{x}^{\alpha}=(-1)^{\mathrm{n}-1} * \alpha \wedge g^{b} \mathrm{x}
$$

Example: Let $a, \beta \in \Lambda^{2} V-$ then

$$
\iota_{\mathrm{F}_{\mathrm{i}}}^{\alpha \wedge \iota} \mathrm{E}^{\mathrm{i}} \mathrm{*}^{\beta \beta=*\left(\iota_{\mathrm{E}_{\mathrm{i}}}^{\alpha \wedge \iota} \mathrm{E}^{\mathrm{i}}\right.}{ }^{\beta)} .
$$

[Write

$$
a=\frac{1}{2} A_{i j} \omega^{i} \wedge \omega \quad j \quad\left(A_{i j}=-A_{j i}\right)
$$

Then

$$
\begin{aligned}
& =A_{i j} \omega^{j}{ }_{\wedge \iota}{ }_{E^{i}}{ }^{* \beta} \\
& =A_{i j} \omega^{j^{\prime}}{ }_{g} b_{E}{ }^{i^{* \beta}} \\
& =A_{i j} \omega^{j}{ }^{j \iota}{ }_{g} b_{g}{ }^{\#} \omega^{i^{* \beta}} \\
& =A_{i j} \omega^{j}{ }_{\wedge \tau}{ }_{\omega^{i}}{ }^{\star \beta} \\
& =A_{i j} \omega^{j}{ }_{\wedge *\left(\beta \wedge \omega^{i}\right)} \\
& =A_{i j}(-1)^{\iota} \quad(-1)^{(n-2)(n-(n-2))} * *\left(\omega^{j}{ }_{\left.\wedge *\left(\beta \wedge \omega^{i}\right)\right)}\right. \\
& =(-1)^{\ell} A_{i j} *\left(*\left(\omega^{j} \wedge *\left(\beta \wedge \omega^{i}\right)\right)\right) \\
& =(-1)^{\iota}(-1)^{n-3} A_{i j} *\left(*\left(*\left(\beta \wedge \omega^{i}\right) \wedge \omega^{j}\right)\right) \\
& =(-1)^{\iota}(-1)^{n-3} A_{i j} *\left((-1)^{n-1} *\left(* \iota \omega_{j}\left(\beta \wedge \omega^{i}\right)\right)\right) \\
& =(-1)^{\imath} A_{i j} *\left(* * \left(\iota_{\omega} j^{\left.\left.\left(\beta \wedge \omega^{i}\right)\right)\right)}\right.\right.
\end{aligned}
$$

$$
\begin{aligned}
& =(-1)^{\imath} A_{i j} *\left((-1)^{\iota}(-1)^{2(n-2)}{ }_{\omega}{ }_{\omega}\left(\beta \wedge \omega^{i}\right)\right) \\
& =A_{i j} *\left(\iota{ }_{\omega}{ }^{j}\left(\beta \wedge \omega^{i}\right)\right) \\
& =A_{i j} *\left(\left(\iota_{\omega} j^{\beta) \wedge \omega^{i}+\beta \iota}{ }_{\omega} \omega^{\left.\omega^{i}\right)}\right.\right. \\
& =A_{i j} *\left(\iota{ }_{\omega}{ }^{j} \beta \wedge \omega^{i}\right)+\star \beta A_{i j} g^{i j} .
\end{aligned}
$$

But

$$
\begin{gathered}
A_{i j} g^{i j}=-A_{j i} g^{i j}=-A_{j i} g^{j i}=-A_{i j} g^{i j} \\
\Rightarrow \\
A_{i j} g^{i j}=0 .
\end{gathered}
$$

Therefore

$$
\begin{aligned}
& { }^{t_{E_{i}}}{ }^{\alpha \wedge \iota} E^{i}{ }^{* \beta} \\
& =A_{i j} *\left(\iota{ }_{\omega} j^{\left.\beta \wedge \omega^{i}\right)}\right. \\
& =*\left(\iota{ }_{\omega} j^{\left.\beta \wedge A_{i j} \omega^{i}\right)}\right. \\
& =-*\left(A_{i j}{ }^{i}{ }^{i}{ }_{\omega c}{ }_{\omega}{ }^{\beta}\right) \\
& =*\left(A_{j i} \omega^{i} \wedge \tau{ }_{\omega}{ }^{\beta}\right) \\
& =*\left(A_{i j}{ }^{\omega}{ }^{\wedge}{ }_{\omega \iota}{ }_{i^{i}}{ }^{\beta}\right) \\
& =*\left(\tau_{E_{i}}{ }^{\alpha \wedge \iota}{ }_{E^{i}}{ }^{\beta)} .\right]
\end{aligned}
$$

FACT We have

$$
\begin{aligned}
& * \varepsilon_{E_{i}}\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i^{p}}\right) \\
& \left.=(-1)^{p+1}{ }_{g} b_{E_{i} \wedge *\left(\omega^{i}\right.}{ }^{i^{\prime}} \wedge \cdots \wedge \omega^{i^{p}}\right) .
\end{aligned}
$$

[For

$$
\begin{aligned}
& * \iota_{E_{i}}\left(\omega^{i_{1}} \wedge \cdots \wedge \omega^{i^{p}}\right) \\
& =* c_{g} b_{E_{i}}\left(\omega^{i_{1}} \wedge \cdots \wedge \omega^{i_{p}}\right) \\
& =(-1)^{n-1} *\left(\omega^{i_{1}} \wedge \cdots \wedge \omega^{i_{p}}\right) \wedge g^{\forall} E_{i} \\
& =(-1)^{n-1}(-1)^{n-p_{g} b} E_{i^{\wedge}}{ }^{i_{1}}\left(\omega^{1} \wedge \ldots \wedge \omega^{i_{p}}\right) \\
& =(-1)^{p+1} g^{b} E_{i^{\wedge *}}{\left(\omega^{i} 1\right.}_{{ }^{i}}^{\left.\left(\ldots \wedge \omega^{i} p\right) .\right]}
\end{aligned}
$$

LEMMA We have

$$
\begin{aligned}
& { }^{{ }^{i^{\prime}}{ }^{1} \wedge \cdots \wedge \omega^{i_{p}}} \\
& =\frac{|g|^{1 / 2}}{(n-p)!} g^{i_{1} j^{j} 1} \ldots g^{i_{p} j_{p}} \varepsilon_{j_{1} \cdots j_{n}} \omega^{j_{p+1}} \wedge \cdots \wedge \omega^{j_{n}}
\end{aligned}
$$

[To understand the procedure, start with the simplest case:

$$
\begin{aligned}
*_{\omega}^{\mathbf{i}_{1}} & =\iota_{\omega} 1^{\operatorname{vol}} g \\
& =\iota_{g^{\#} \omega^{1}}{ }^{\operatorname{vol}} g
\end{aligned}
$$

$$
\begin{aligned}
& =g^{i_{1} k_{1}} \iota_{E_{k_{1}}} \operatorname{vol}_{g} \\
& =g^{i_{1} k_{1}} \iota_{E_{k_{1}}}\left(\frac{1}{n!}|g|^{1 / 2} \varepsilon_{j_{1}} \cdots j_{n} \omega^{j_{1}} \wedge \cdots \wedge \omega^{j_{n}}\right) \\
& =|g|^{1 / 2} g^{i_{1} k_{1}}{ }_{\iota_{E_{k_{l}}}}\left(\frac{l}{n!} \varepsilon_{j_{1}} \cdots j_{n} \omega^{j_{1}} \wedge \ldots \wedge \omega^{j_{n}}\right) \\
& =|g|^{1 / 2} g^{i_{1} k_{1}}\left(\frac{1}{(n-1)!} \varepsilon_{k_{1} j_{2}} \cdots j_{n} \omega^{j_{2}} \wedge \ldots \wedge \omega^{j_{n}}\right) \\
& =\frac{|g|^{l / 2}}{(n-1)!} g^{i_{1} j_{1}} \varepsilon_{j_{1}} \cdots j_{n} \omega^{j_{2}} \wedge \cdots \wedge \omega^{j_{n}} .
\end{aligned}
$$

Now go from here by iteration:

$$
\begin{aligned}
& =\iota_{\omega} 2^{\iota} \omega^{1^{\mathrm{VOl}}} \mathrm{~g} \\
& =\iota_{\omega}|g|^{1 / 2}{ }_{g}^{i_{1} k_{1}}\left(\frac{1}{(n-1)!} \varepsilon_{k_{1} j_{2}} \cdots j_{n} \omega^{j_{2}} \wedge \cdots \wedge \omega^{j_{n}}\right) \\
& =|g|^{1 / 2}{ }_{g}^{i_{1} k_{1}} \iota_{\omega}\left(\frac{1}{(n-1)!} \cdot \varepsilon_{k_{1} j_{2}} \cdots j_{n} \omega^{j_{2}} \wedge \cdots \wedge \omega^{j_{n}}\right) \\
& =|g|^{1 / 2}{ }_{g}{ }^{i_{1} k_{1}}{ }_{g} i^{i_{2} k_{2}}\left(\frac{1}{(n-2)!} \varepsilon_{k_{1} k_{2} j_{3}} \cdots j_{n} \omega^{j_{3}} \wedge \cdots \wedge \omega^{j_{n}}\right) \\
& \left.=\frac{|g|^{l / 2}}{(n-2)!} g^{i_{1} j_{1}} g^{i_{2} j_{2}} \varepsilon_{j_{1}} \cdots j_{n} \omega^{j_{3}} \wedge \cdots \wedge \omega^{j_{n}} .\right]
\end{aligned}
$$

Remark: Since

$$
e_{j_{1}} \cdots j_{n}=|g|^{1 / 2} \varepsilon_{j_{1}} \cdots j_{n}
$$

it is tempting to write

$$
e^{i_{1} \cdots i_{p}}{ }_{j_{p+1} \cdots j_{n}}=g^{i_{1} j_{1}} \cdots g^{i_{p} j_{p}} e_{j_{1} \cdots j_{n}}
$$

But this is nonsense: Take $\mathrm{p}=\mathrm{n}$ and recall that

$$
e^{i_{1} \cdots i_{n}}=(-1)^{c_{g} i_{1} j_{l}} \ldots g^{i_{n} j_{n}} e_{j_{1}} \cdots j_{n}
$$

IEMMA $\forall \alpha \in \Lambda^{\mathrm{P}} \mathrm{V}$,

$$
\iota_{E_{i}} \alpha \wedge c_{E^{i}}^{* \alpha}=0 .
$$

Application: Let $\alpha, \beta \in \Lambda{ }^{P} \mathrm{~V}$-- then

$$
{ }^{\iota_{E_{i}}}{ }^{\alpha \wedge c} \mathrm{E}^{* \beta}=-\tau_{\mathrm{E}_{\mathrm{i}}}^{\beta \wedge \iota} \mathrm{E}^{* * \alpha .}
$$

[Consider

$$
\iota_{E_{i}}(\alpha+\beta) \wedge \iota_{E^{i}}{ }^{*(\alpha+\beta) \cdot]}
$$

Section 4: Tensor Analysis Let $M$ be a connected $C^{\infty}$ manifold of dimension n,

$$
D(\mathrm{M})=\underset{\mathrm{p}, \mathrm{q}=0}{\oplus} \quad \mathrm{D}_{\mathrm{q}}^{\mathrm{p}}(\mathrm{M})
$$

its tensor algebra.
[Note: Here, $D_{0}^{0}(M)=C^{\infty}(M), \quad D_{0}^{l}(M)=D^{l}(M)$, the derivations of $C^{\infty}(M)$ (a.k.a. the vector fields on $M$ ), and $D_{1}^{0}(M)=D_{1}(M)$, the linear forms on $D^{l}(M)$ viewed as a module over $\left.\left.C^{\infty}(\mathrm{M})\right).\right]$

Remark: By definition, $D_{q}^{p}(M)$ is the $C^{\infty}(M)$-module of all $C^{\infty}(M)$-multilinear maps

$$
\frac{p}{D_{1}(\mathrm{M}) \times \cdots \times D_{1}(\mathrm{M})} \times \frac{q}{D^{I}(\mathrm{M}) \times \cdots \times D^{1}(\mathrm{M}) \rightarrow C^{\infty}(\mathrm{M})}
$$

One can also interpret the elements of $D_{q}^{p}(M)$ geometrically. To this end, consider the frame bundle

$$
\begin{aligned}
\underline{G L}(n, \underline{R}) \rightarrow & L M \\
& \downarrow \pi \\
& M .
\end{aligned}
$$

Thinking of $\underline{R}^{n}$ as merely a vector space (and not as a manifold), let $T_{q}^{p}(n)$ be the tensors of type ( $p, q$ ) - then $\underline{G U}(n, R)$ operates to the left on $T_{q}^{p}(n)$ (cf. Section l). Now form the vector bundle

$$
\mathrm{T}_{\mathrm{q}}^{\mathrm{p}}(\mathrm{M})=\mathrm{LM} \times \underline{\underline{G L}(n, \underline{R})^{T_{\mathrm{q}}^{\mathrm{P}}}(\mathrm{n})}
$$

Then, on general grounds, there is a one-to-one correspondence between the sections $T$ of $T_{q}^{p}(M)$ and the equivariant maps $\Phi: L M \rightarrow T_{q}^{p}(n)$.

Of course, as a set

$$
L M=\operatorname{II}_{\mathrm{x} \in \mathrm{M}} \mathrm{~B}\left(\mathrm{~T}_{\mathrm{x}} \mathrm{M}\right),
$$

hence $\Phi=\left\{\Phi_{x}: x \in M\right\}$, where

$$
\Phi_{x}: B\left(T_{x}^{M}\right) \rightarrow T_{q}^{p}(n)
$$

And we have

$$
\mathcal{D}{ }_{\mathrm{q}}^{\mathrm{P}}(\mathrm{M}) \leftrightarrow \sec \left(\mathrm{T}_{\mathrm{q}}^{\mathrm{p}}(\mathrm{M})\right)
$$

or still,

$$
D{\underset{\mathrm{q}}{\mathrm{p}}}_{\mathrm{p}}^{(\mathrm{M})} \leftrightarrow \operatorname{map}_{\underline{\mathrm{GL}}(\mathrm{n}, \underline{R})}\left(\mathrm{IM}, \mathrm{~T}_{\mathrm{q}}^{\mathrm{p}}(\mathrm{n})\right) .
$$

[Note: One advantage of the geometric point of view is that it can be readily generalized, e.g., to tensors of type ( $p, q$ ) and weight $\chi$.

Details Given $(x, E) \in L M\left(\Rightarrow E \in B\left(T_{X} M\right)\right)$, define $\zeta_{E}: \underline{R}^{n} \rightarrow T_{x} M$ by

$$
\zeta_{E}\left(e_{i}\right)=E_{i} \quad(i=1, \ldots, n)
$$

Then $\forall \mathrm{g} \in \underline{G L}(\mathrm{n}, \underline{\mathrm{R}})$, the composite $\underline{R}^{\mathrm{n}} \xrightarrow{\mathrm{g}} \underline{R}^{\mathrm{n}} \xrightarrow{\zeta_{\mathrm{E}}} \mathrm{T}_{\mathrm{x}} \mathrm{M}$ is $\zeta_{\mathrm{E} \cdot \mathrm{g}}$.

$$
\begin{aligned}
& \underline{T \rightarrow \Phi_{T}:} \text { This is the arrow } \\
& \qquad \sec \left(T_{q}^{p}(M)\right) \rightarrow \operatorname{map}_{\left.\underline{G L}(n, \underline{R})^{(L M,} T_{q}^{p}(n)\right),}
\end{aligned}
$$

where

$$
\begin{aligned}
& \Phi_{T}(x, E)\left(\Lambda^{l}, \ldots, \Lambda^{p}, x_{1}, \ldots, x_{q}\right) \\
&= T_{x}\left(\Lambda^{1} \circ \zeta_{E}^{-1}, \ldots, \Lambda^{p} \circ \zeta_{E}^{-1}, \zeta_{E}\left(x_{1}\right), \ldots, \zeta_{E}\left(x_{q}\right)\right) . \\
& \Phi \rightarrow T_{\Phi}: \text { This is the arrow }
\end{aligned}
$$

$$
\operatorname{map}_{\underline{G}(n, \underline{R})}\left(\operatorname{LM}, T_{\mathrm{q}}^{\mathrm{p}}(\mathrm{n})\right) \rightarrow \sec \left(\mathrm{T}_{\mathrm{q}}^{\mathrm{p}}(\mathrm{M})\right),
$$

where

$$
\begin{gathered}
\left.T_{\Phi}\right|_{x}\left(\Lambda^{l}, \ldots, \Lambda^{p}, X_{1}, \ldots, X_{q}\right) \\
=\Phi(x, E)\left(\Lambda^{l} \circ \zeta_{E}, \ldots, \Lambda^{p} \circ \zeta_{E^{\prime}}, \zeta_{E}^{-1}\left(X_{1}\right), \ldots, \zeta_{E}^{-1}\left(X_{q}\right)\right) .
\end{gathered}
$$

FACT These arrows are mutually inverse:

$$
\left[\begin{array}{l}
T \rightarrow \Phi_{\mathrm{T}} \rightarrow \mathrm{~T}_{\Phi_{\mathrm{T}}}=T \\
\Phi \rightarrow \mathrm{~T}_{\Phi} \rightarrow \Phi_{\mathrm{T}_{\Phi}}=\Phi .
\end{array}\right.
$$

In what follows, all operations will be defined globally. However, for computational purposes, it is important to have at hand their local expression as well, meaning the form they take on a connected open set $U C M$ equipped with coordinates $\mathrm{x}^{\mathrm{l}}, \ldots, \mathrm{x}^{\mathrm{n}}$.

$$
\begin{aligned}
& \text { Let } T \in D_{q}^{p}(M)-\text { then locally } \\
& \qquad T=T^{i_{1}} \cdots^{i_{p}}{ }_{j_{l} \cdots j_{q}}\left(\frac{\partial}{\partial x^{i_{l}}} \otimes \cdots \otimes \frac{\partial}{\partial x_{p}}\right) \otimes\left(d x^{j^{\prime}} \otimes \cdots \otimes d x^{j^{q}}\right),
\end{aligned}
$$

where

$$
\begin{aligned}
& T^{i_{l} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}} \\
& =T\left(d x^{i_{1}}, \ldots, d x^{i^{i}}, \frac{\partial}{\partial x^{j}}, \ldots, \frac{\partial}{\partial x^{j} q}\right) \in C^{\infty}(U)
\end{aligned}
$$

are the components of T .

Under a change of coordinates, the components of $T$ satisfy the tensor transformation rule:

$$
\begin{gathered}
T^{i_{1}^{\prime} \cdots i_{p}^{\prime}}{ }_{j 1} \cdots j_{q}^{\prime} \\
=\frac{\partial x^{i_{1}^{\prime}}}{i_{1}} \cdots \frac{\partial x_{p}^{i_{p}^{\prime}}}{i_{p}^{\prime}} \frac{\partial x_{1}^{j_{1}}}{\partial j_{1}^{\prime}} \cdots \frac{\partial x_{q}^{j_{q}}}{j_{q}^{\prime}} T^{i_{1}} \cdots^{i_{p}}{ }_{j_{1}} \cdots j_{q}
\end{gathered}
$$

[Note: There are maps

$$
g, g^{-1}: U^{\prime} U^{\prime} \rightarrow \underline{G L}(n, \underline{R}),
$$

viz.

$$
\left.g(x)=\left[\left.\frac{\partial x^{i}}{\partial x^{i^{\prime}}}\right|_{x}\right], g^{-1}(x)=\left[\left.\frac{\partial x^{i^{\prime}}}{\partial x^{i}}\right|_{x}\right] .\right]
$$

FACT Equip $\mathrm{T}_{\mathrm{q}}^{\mathrm{p}}(\mathrm{n})$ with its standard basis -- then

$$
\forall \Phi \in \operatorname{map}_{\underline{G L}(\mathrm{n}, \underline{\mathrm{R}})}\left(\mathrm{LM}, \mathrm{~T}_{\mathrm{q}}^{\mathrm{p}}(\mathrm{n})\right),
$$

we have

$$
\begin{aligned}
& \Phi\left(x,\left\{\left.\frac{\partial}{\partial x^{1}}\right|_{x} \ldots \ldots,\left.\frac{\partial}{\partial x^{n}}\right|_{x}\right\}\right) \\
& =\left.T_{\Phi}\right|_{x} i_{1} \cdots i_{p} j_{j_{1}} \cdots j_{q}
\end{aligned}
$$

Renark: Suppose there is assigned to each $U$ in a coordinate atlas for $M$, functions

$$
T^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}} \in C^{\infty}(U)
$$

subject to the tensor transformation rule -- then there is a unique $T \in D_{q}^{p}(M)$
whose components in $U$ are the $T^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}}$.
[It is simply a matter of manufacturing a global section of $\mathrm{T}_{\mathrm{q}}^{\mathrm{p}}(\mathrm{M})$ by gluing together local sections.]

Example: The Kronecker tensor is the tensor $K$ of type ( 1,1 ) defined by $K(\Lambda, X)=\Lambda(X)$, thus

$$
K_{j}^{i}=K\left(d x^{i}, \frac{\partial}{\partial x^{j}}\right)=\delta_{j}^{i}
$$

FACT There is a tensor $K(p)$ of type ( $p, p$ ) with the property that in any coordinate system,

$$
k(p){ }^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{p}}=\delta^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{p}}
$$

Notation: Given $\mathrm{f} \in \mathrm{C}^{\infty}(\mathrm{U})$, write

$$
\frac{\partial f}{\partial x^{i}}=f_{, i}
$$

Example: Let $X, Y \in \mathcal{D}^{1}(M)$-- then locally

$$
\begin{aligned}
& \int^{-} x=x^{i} \frac{\partial}{\partial x^{i}} \quad\left(x^{i}=<x, d x^{i}>\right) \\
& Z_{-}=Y^{j} \frac{\partial}{\partial X^{j}} \quad\left(Y^{j}=<Y, d X^{j}>\right) \\
& \Rightarrow \\
& {[X, Y]=\left(X^{i} Y_{, i}^{j}-Y^{i} X_{, i}^{j}\right) \frac{\partial}{\partial X^{j}} .}
\end{aligned}
$$

[Note: The bracket

$$
[,]: D^{l}(\mathrm{M}) \times D^{1}(\mathrm{M}) \rightarrow D^{1}(\mathrm{M})
$$

is $\underline{R}$-bilinear but not $C^{\infty}(M)$-bilinear. In fact,

$$
[f X, g Y]=f g[X, Y]+f(X g) Y-g(Y f) X .]
$$

Definition: A type preserving R-linear map

$$
\mathrm{D}: \mathcal{D}(\mathrm{M}) \rightarrow \mathcal{D}(\mathrm{M})
$$

which commutes with contractions is said to be a derivation if $\forall T_{1}, T_{2} \in \mathcal{D}(M)$,

$$
\mathrm{D}\left(\mathrm{~T}_{1} \otimes \mathrm{~T}_{2}\right)=\mathrm{DT}_{1} \otimes \mathrm{~T}_{2}+\mathrm{T}_{1} \otimes \mathrm{DT}_{2}
$$

[Note: To say that $D$ is type preserving means that $\left.D D_{q}^{p}(M) \subset D_{q}^{p}(M).\right]$ The set of all derivations of $\mathcal{D}(M)$ forms a Lie algebra over $\underline{R}$, the bracket operation being defined by

$$
\left[\mathrm{D}_{1}, \mathrm{D}_{2}\right]=\mathrm{D}_{1} \circ \mathrm{D}_{2}-\mathrm{D}_{2} \circ \mathrm{D}_{1}
$$

Remark: For any $f \in C^{\infty}(M)$ and any $T \in \mathcal{D}(M), f T=f \otimes T$, so $D(f T)=f(D T)$

+ (Df)T. In particular: $D$ is a derivation of $C^{\infty}(M)$, hence is represented on $C^{\infty}(\mathrm{M})$ by a vector field.

Construction: Let

$$
A \in D_{1}^{l}(M) \approx \operatorname{Hom}_{C^{\infty}(M)}\left(D^{l}(M), D^{l}(M)\right)
$$

Then $\forall x \in M$,

$$
A_{x}: T_{x}^{M} \rightarrow T_{x}^{M}
$$

is R-linear, hence can be uniquely extended to a derivation $D_{A_{X}}$ of the tensor algebra over $\mathrm{T}_{\mathrm{X}}$ M. This said, define

$$
\mathrm{D}_{\mathrm{A}}: D(\mathrm{M}) \rightarrow D(\mathrm{M})
$$

by

$$
\left(\mathrm{D}_{\mathrm{A}} \mathrm{~T}\right)_{\mathrm{x}}=\mathrm{D}_{\mathrm{A}_{x}} \mathrm{~T}_{\mathrm{x}}
$$

Then $D_{A}$ is a derivation of $\mathcal{D}(M)$ which is zero on $C^{\infty}(M)$.
FACI Any derivation of $\mathcal{D}(\mathrm{M})$ which is zero on $C^{\infty}(\mathrm{M})$ is induced by a tensor of type ( 1,1 ).
[Note: If $D$ is a derivation of $D(M)$ and if $A \in D_{1}^{l}(M)$, then $\left[D, D_{A}\right] \mid C^{\infty}(M)=0$, hence $\left[D, D_{A}\right]=D_{B}$ for some $B \in D_{1}^{1}(M)$. Therefore $D_{1}^{l}(M)$ is an ideal in the Lie algebra of derivations of $D(M)$.]

Product Formula Let $D: D(M) \rightarrow D(M)$ be a derivation -- then $\forall T \in D_{q}^{p}(M)$,

$$
\begin{aligned}
& D\left[T\left(\Lambda^{1}, \ldots, \Lambda^{p}, x_{1}, \ldots, x_{q}\right)\right] \\
& =(D T)\left(\Lambda^{1}, \ldots, \Lambda^{p}, x_{1}, \ldots, x_{q}\right) \\
& +\sum_{i=1}^{p} T\left(\Lambda^{l}, \ldots, D \Lambda^{i}, \ldots, \Lambda^{p}, x_{1}, \ldots, x_{q}\right) \\
& +\sum_{j=1}^{q} T\left(\Lambda^{1}, \ldots, \Lambda^{p}, x_{1}, \ldots, D x_{j}, \ldots, x_{q}\right) .
\end{aligned}
$$

[Note: This shows that $D$ is known as soon as it is known on $C^{\infty}(M), D^{l}(\mathrm{M})$, and $D_{1}(\mathrm{M})$. But for $\omega \in D_{1}(\mathrm{M})$,

$$
(D \omega)(X)=D[\omega(X)]-\omega(D X),
$$

thus functions and vector fields suffice.]
FACT Let $D_{1}, D_{2}$ be derivations of $D(M)$. Assume: $D_{1}=D_{2}$ on $C^{\infty}(M)$ and $D^{1}(M)$ - then $D_{1}=D_{2}$.

EXIENSION PRINCIPLE Suppose given a vector field $X$ and an R-linear map
$\delta: D^{l}(\mathrm{M}) \rightarrow D^{1}(\mathrm{M})$ such that

$$
\delta(f Y)=(X f) Y+f \delta(Y)
$$

for all $f \in C^{\infty}(M), Y \in D^{1}(M)$-- then there exists a unique derivation

$$
\mathrm{D}: D(\mathrm{M}) \rightarrow D(\mathrm{M})
$$

such that $D \mid C^{\infty}(M)=X$ and $D \mid D^{l}(M)=\delta$.
[Define $D$ on $D_{1}(M)$ by

$$
(\mathrm{D} \omega)(\mathrm{Y})=\mathrm{X}[\omega(\mathrm{Y})]-\omega(\delta \mathrm{Y})
$$

and extend to all of $D(M)$ via the product formula.]

The notion of a tensor $T$ of type ( $p, q$ ) and weight $X$ is clear, there being two possibilities for the form that the tensor transformation rule takes.

Notation: Put

$$
J=\operatorname{det}\left[\frac{\partial x^{i}}{\partial x^{i^{\prime}}}\right] .
$$

I: For some $r \in \underline{R}$,

$$
\begin{aligned}
& T_{i}{ }^{\prime} \cdots i_{p}^{\prime} \\
& j_{1}^{\prime} \cdots j_{q}^{\prime}
\end{aligned}
$$

II: For some $r \in \underline{R}$,

$$
\mathrm{T}^{i_{1}^{\prime} \cdots i_{p}^{\prime}}{ }_{j_{j}^{\prime} \cdots j_{q}^{\prime}}
$$

$$
=\operatorname{sgn} J \cdot|J|^{r} \frac{\partial x_{i}^{i}}{\partial x_{l}^{\prime}} \cdots \frac{\partial x_{p}^{i_{p}^{\prime}}}{\partial x_{p}^{i_{p}}} \frac{\partial x_{l}^{j_{l}}}{\partial x_{l}^{\prime}} \cdots \frac{\partial x^{j_{q}}}{\partial x_{q}^{\prime}} T^{i_{1} \cdots i_{p}}{ }_{j_{1}} \cdots j_{q} .
$$

Accordingly, there are two kinds of tensors of type ( $p, q$ ) and weight $X$, which we shall refer to as class I and class II. It is also convenient to single out a particular combination of these by an integrality condition.

Definition: A tensor of type ( $p, q$ ) and weight $w$ is a tensor $T$ of type $(p, q)$ and weight $X=(\text { det })^{W}(w \in Z)$, hence

$$
\begin{aligned}
& T^{i}{ }^{\prime} \cdots{ }_{p}^{\prime} \\
& j_{1} \cdots j_{q}^{\prime} \\
& =J^{w} \frac{\partial x^{i_{1}^{\prime}}}{i^{i_{l}}} \cdots \frac{\partial x_{p}^{i_{p}^{\prime}}}{\partial x_{p}^{i_{p}}} \frac{\partial x_{l}^{j_{l}}}{\partial x_{1}^{\prime}} \cdots \frac{\partial x^{j_{q}}}{j_{q}^{\prime}} T^{i_{1}}{ }^{\cdots}{ }^{i_{p}}{ }_{j_{1}} \cdots j_{q} .
\end{aligned}
$$

[Note: Needless to say, the tensors of type ( $p, q$ ) and weight 0 are precisely the elements of $D_{\mathrm{q}}^{\mathrm{p}}(\mathrm{M})$.]

Remark: The product of a tensor $T$ of type ( $p, q$ ) and weight $w$ with a tensor $T^{\prime}$ of type ( $p^{\prime}, q^{\prime}$ ) and weight $w^{\prime}$ is a tensor $T \otimes T^{\prime}$ of type ( $p+p^{\prime}, q+q^{\prime}$ ) and weight $w+w^{\prime}$.

Example: The upper Levi-Civita symbol is a tensor of type ( $n, 0$ ) and weight 1 and the lower Levi-Civita symbol is a tensor of type ( $0, \mathrm{n}$ ) and weight -1 .
[To discuss the upper Levi-Civita symbol, write

$$
\begin{aligned}
& \varepsilon_{\varepsilon}^{i_{1}^{\prime} \cdots i_{n}^{\prime}}=\delta^{i_{1}^{\prime} \cdots i_{n}^{\prime}} \\
& =\frac{\partial x_{i}^{i}}{i_{1}^{\prime}} \cdots \frac{\partial x_{n}^{i_{n}^{\prime}}}{i_{n}} \frac{\partial x^{j_{1}}}{\partial x^{\prime}} \cdots \frac{\partial x^{\prime}}{j_{n}}{ }^{n^{\prime \prime}} \delta^{i_{1} \cdots i_{n}}{ }^{j_{1}} \cdots j_{n}
\end{aligned}
$$

$$
\begin{aligned}
& =\frac{\partial x^{i_{1}^{\prime}}}{\partial x^{i_{1}}} \cdots \frac{\partial x_{n}^{i_{n}^{\prime}}}{\partial x_{n}^{i_{n}}} \frac{\partial x^{j_{1}}}{\partial x^{\prime \prime}} \cdots \frac{\partial x_{n}^{j_{n}}}{\partial x^{n^{\prime}}} \varepsilon^{i_{1} \cdots i_{n}} \varepsilon_{j_{1}} \cdots j_{n} \\
& =\left(\varepsilon_{j_{1}} \cdots j_{n} \frac{\partial x^{j_{l}}}{\partial x^{\prime \prime}} \cdots \frac{\partial x_{n}^{j_{n}}}{\partial x^{\prime}}\right) \frac{\partial x^{i_{1}^{\prime}}}{\partial x^{i_{1}}} \cdots \frac{\partial x_{n}^{i_{n}^{\prime}}}{\partial x_{n}^{i_{n}}} \varepsilon^{i_{1}} \cdots{ }^{i_{n}} \\
& =\varepsilon_{l^{\prime} \cdots n^{\prime}} J \frac{\partial x_{1}^{i_{1}}}{\partial x_{1}} \cdots \frac{\partial x_{n}^{i_{n}^{\prime}}}{\partial x_{n}} \varepsilon^{i_{1} \cdots i_{n}} \\
& \left.=J \frac{\partial x^{i_{1}^{\prime}}}{\partial x^{i_{1}}} \cdots \frac{\partial x_{n}^{i_{n}^{\prime}}}{\partial x_{n}^{i_{n}}} \varepsilon^{i_{1} \cdots i_{n}} .\right]
\end{aligned}
$$

When $(p, q)=(0,0)$, the foregoing considerations specialize to that of density, twisted density, and scalar density.

Density A density of weight $r$ is a section of the line bundle $L_{I}^{r}(M)$ whose transition functions are the

$$
\left|\operatorname{det}\left[\frac{\partial x^{i^{\prime}}}{\partial x^{i}}\right]\right|^{r}
$$

[Note: The sections of

$$
T_{q}^{p}(M) \otimes L_{I}^{r}(M)
$$

are the class I tensors of type ( $p, q$ ).]
Twisted Density A twisted density of weight $r$ is a section of the line bundle $L_{I I}^{r}(M)$ whose transition functions are the

$$
\operatorname{sgn} \operatorname{det}\left[\frac{\partial x^{i}}{\partial x^{i}}\right] \cdot\left|\operatorname{det}\left[\frac{\partial x^{i^{\prime}}}{\partial x^{i}}\right]\right|^{r} .
$$

[Note: The sections of

$$
\mathrm{T}_{\mathrm{q}}^{\mathrm{p}}(\mathrm{M}) \otimes \mathrm{L}_{\mathrm{II}}^{\mathrm{r}}(\mathrm{M})
$$

are the class II tensors of type ( $\mathrm{p}, \mathrm{q}$ ).]

Scalar Density A scalar density of weight $w$ is a section of the line bundle $\mathrm{L}^{\mathrm{W}}(\mathrm{M})$ whose transition functions are the

$$
\left(\operatorname{det}\left[\frac{\partial x^{i^{\prime}}}{\partial x^{i}}\right]\right)^{w}
$$

[Note: The sections of

$$
T_{q}^{p}(M) \otimes L^{W}(M)
$$

are the tensors of type ( $p, q$ ) and weight w.]
Example: The density bundle is the line bundle

$$
\mathrm{L}_{\mathrm{den}}(\mathrm{M}) \rightarrow \mathrm{M}
$$

whose transition functions are the

$$
\left|\operatorname{det}\left[\frac{\partial x^{i^{\prime}}}{\partial x^{i}}\right]\right|
$$

Therefore

$$
L_{\mathrm{den}}(M)=L_{\mathrm{I}}^{1}(M)
$$

Example: The orientation bundle is the line bundle

$$
\operatorname{Or}(\mathrm{M}) \rightarrow \mathrm{M}
$$

whose transition functions are the

$$
\operatorname{sgn} \operatorname{det}\left[\frac{\partial x^{i^{\prime}}}{\partial x^{i}}\right]
$$

Therefore

$$
\operatorname{Or}(\mathrm{M})=L_{I I}^{0}(\mathrm{M}) .
$$

Example: The canonical bundle is the line bundle

$$
L_{\text {can }}(M) \rightarrow M
$$

whose transition functions are the

$$
\operatorname{det}\left[\frac{\partial x^{i^{\prime}}}{\partial x^{i}}\right]
$$

Therefore

$$
L_{\operatorname{can}}(M)=L^{1}(M)
$$

Remark: The canonical bundle can be identified with $\Lambda^{n^{\prime}} \mathrm{T}_{\mathrm{M}}$, where $\mathrm{T}^{*} \mathrm{M}_{\mathrm{M}}$ is the cotangent bundle. Since

$$
\Lambda^{n} M=\sec \left(A^{n} T^{*} M\right),
$$

it follows that the n-forms on $M$ are scalar densities of weight 1 .
[Note: The upper Levi-Civita symbol is a section of

$$
T_{0}^{n}(M) \otimes \Lambda^{n} T^{n} * M
$$

and the lower Levi-Civita symbol is a section of

$$
\left.T_{n}^{0}(M) \otimes\left(\Lambda^{n} T^{*}\right)^{-1} \cdot\right]
$$

Section 5: Lie Derivatives Let $M$ be a connected $C^{\infty}$ manifold of dimension n .

IEMMA One may attach to each $X \in \mathcal{D}^{l}(M)$ a derivation

$$
L_{X}: D(\mathrm{M}) \rightarrow D(\mathrm{M})
$$

called the Lie derivative w.r.t. X. It is characterized by the properties

$$
L_{X} f=X f \quad, L_{X} Y=[X, Y]
$$

[In the notation of the Extension Principle, define $\delta: D^{\perp}(M) \rightarrow D^{\perp}(M)$ by

$$
\delta(\mathrm{Y})=[\mathrm{X}, \mathrm{Y}] .
$$

Then

$$
\begin{aligned}
\delta(\mathrm{fY}) & =[\mathrm{X}, \mathrm{fY}] \\
& =\mathrm{f}[\mathrm{X}, \mathrm{Y}]+(\mathrm{Xf}) \mathrm{Y} \\
& =(\mathrm{Xf}) \mathrm{Y}+\mathrm{f}[\mathrm{X}, \mathrm{Y}] \\
& =(\mathrm{Xf}) \mathrm{Y}+\mathrm{f} \delta(\mathrm{Y}) .]
\end{aligned}
$$

Owing to the product formula, $\forall T \in D_{\mathrm{q}}^{\mathrm{P}}(\mathrm{M})$,

$$
\begin{aligned}
& x\left[T\left(\Lambda^{l}, \ldots, \Lambda^{p}, x_{1}, \ldots, x_{q}\right)\right] \\
& =\left(L_{X} T\right)\left(\Lambda^{1}, \ldots, \Lambda^{p}, x_{1}, \ldots, x_{q}\right) \\
& +\sum_{i=1}^{p} T\left(\Lambda^{1}, \ldots, L_{X^{\Lambda}}^{i}, \ldots, \Lambda^{p}, x_{1}, \ldots, x_{q}\right) \\
& +\sum_{j=1}^{q} T\left(\Lambda^{1}, \ldots, \Lambda^{p}, X_{1}, \ldots, L_{X^{\prime}}, \ldots, x_{q}\right) .
\end{aligned}
$$

[Note: If $\omega \in D_{1}(M)$, then

$$
\left.\left(L_{X} \omega\right)(Y)=X \omega(Y)-\omega([X, Y]) .\right]
$$

Locally,

$$
\begin{aligned}
& \left(L_{X}{ }^{T}\right)^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}} \\
& =x_{T}{ }^{i_{1} \cdots{ }^{i_{p}}}{ }_{j_{1} \cdots j_{q^{\prime}}}{ }^{a} \\
& -X_{, a}^{i_{1}}{ }^{a i_{2}}{ }^{\cdots i_{p}}{ }_{j_{1} \cdots j_{q}}-\cdots \\
& +X_{, j_{l}}^{a}{ }^{i_{1} \cdots i_{p}}{ }_{a j_{2} \cdots j_{q}}+\cdots .
\end{aligned}
$$

[Note: From the definitions,

$$
\left[\begin{array}{l}
L_{X} \frac{\partial}{\partial x^{i}}=-x_{, i}^{a} \frac{\partial}{\partial x^{a}} \\
\left.L_{X} d x^{i}=x_{r, a}^{i} d x^{a} .\right]
\end{array}\right.
$$

At a given $\mathrm{x} \in \mathrm{M}$, the expression

$$
\begin{aligned}
& -x_{, a}^{i_{1}}{ }^{a i_{2} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}}-\cdots \\
& +x_{{ }_{1} j_{1}}^{a} T^{i_{1} \cdots i_{p}}{ }_{a j_{2} \cdots j_{q}}+\cdots
\end{aligned}
$$

can be explained in terms of the canonical representation $\rho$ of $\underline{G L}(n, \underline{R})$ on $T_{q}^{p}(n)$ or, more precisely, its differential dp.

To see this, fix for the moment an element $T \in T_{q}^{p}(n)$-- then $\forall g \in \underline{G I}(n, \underline{R})$,

$$
\begin{aligned}
& (g \cdot T){ }^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}}
\end{aligned}
$$

Now pass to the derived map of Lie algebras

$$
\mathrm{d} \rho: \underline{\mathrm{g} \ell}(\mathrm{n}, \underline{\mathrm{R}}) \rightarrow \underline{\mathrm{g} \ell}\left(\mathrm{~T}_{\mathrm{q}}^{\mathrm{p}}(\mathrm{n})\right)
$$

So, $\forall A \in \underline{g}(n, \underline{R})$,

$$
A \cdot T=\left.\frac{d}{d t}(\exp (t A) \cdot T)\right|_{t=0}
$$

and we have

$$
\begin{aligned}
& (A \cdot T){ }^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}} \\
& =A^{i_{l}}{ }_{a} T^{a i_{2} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}}+\cdots \\
& -A_{j_{l}}{ }^{T}{ }^{i_{1} \cdots i_{p}}{ }_{a j_{2} \cdots j_{q}}-\cdots .
\end{aligned}
$$

Returning to $M$, use the basis $\left\{\left.\frac{\partial}{\partial x^{1}}\right|_{x}, \ldots,\left.\frac{\partial}{\partial x^{n}}\right|_{x}\right\}$
to identify $T_{x} M$ with $\underline{R}^{n}$, thence $T_{q^{p}}^{p} T_{x}$ with $T_{q}^{p}(n)$. Put

$$
A_{j}^{i}(x)=-x_{, j}^{i}(x)
$$

Then at x ,

$$
\begin{aligned}
& { }_{-x_{, a^{T}}^{i_{1}} a i_{2} \cdots i_{p}^{j_{1} \cdots j_{q}}}-\cdots \\
& +x_{{ }_{r} j_{1}}^{a}{ }^{i_{1}}{ }^{\cdots i_{p}}{ }_{a j_{2} \cdots j_{q}}+\cdots
\end{aligned}
$$

equals

$$
\left(A(x) \cdot T_{x}\right)^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}}
$$

Remark: The symbol

$$
\left(L_{X}{ }^{T}\right)^{i_{1} \cdots i_{p}}{ }_{j_{1}} \cdots j_{q}
$$

is usually abbreviated to

$$
L_{X^{T}}{ }^{i_{1} \cdots i_{p}^{j_{1}} \cdots j_{q}}{ }
$$

Rules

$$
\left\{\begin{array}{l}
L_{X+Y}=L_{X}+L_{Y}, L_{r X}=r L_{X},(r \in \underline{R}) \\
L_{[X, Y]}=\left[L_{X}, L_{Y}\right] \quad\left(=L_{X} \circ L_{Y}-L_{Y} \circ L_{X}\right)
\end{array}\right.
$$

Example: Let K be the Kronecker tensor -- then

$$
L_{X} K=0
$$

Indeed,

$$
\begin{aligned}
L_{x}^{K^{i}} & =x^{a} \delta_{j, a}^{i}-x_{, a}^{i} \delta_{j}^{a}+x_{, j}^{a} \delta_{a}^{i} \\
& =0-x_{, j}^{i}+x_{, j}^{i} \\
& =0 .
\end{aligned}
$$

[Note: In general, $\forall \mathrm{p} \geq 1$,

$$
\left.L_{X} K(p)=0 .\right]
$$

FACT Let $D: \mathcal{D}(M) \rightarrow \mathcal{D}(M)$ be a derivation - then there is a unique $X \in D^{1}(M)$ and a unique $A \in \mathcal{D}_{1}^{1}$ (M) such that

$$
D=L_{X}+D_{A}
$$

Consider now the exterior algebra $\Lambda^{\star}$ M -- then $L_{X}$ induces a derivation of $\Lambda^{*}$ M:

$$
L_{X}(\alpha \wedge \beta)=L_{X} \alpha \wedge \beta+\alpha \wedge L_{X} \beta .
$$

Notation: ${ }^{{ }^{2}} \mathrm{X}$ is the interior product w.r.t. $X$, so

$$
\iota_{X}: \Lambda^{\star} M \rightarrow \Lambda^{*} M
$$

is an antiderivation of degree -1 .
Explicitly, $\forall a \in \Lambda^{\mathrm{P}} \mathrm{M}$,

$$
\iota_{x} x^{\alpha}\left(x_{1}, \ldots, x_{p-1}\right)=a\left(x_{1}, x_{1}, \ldots, x_{p-1}\right) .
$$

And one has

$$
\iota_{x}\left(\alpha_{1} \wedge \alpha_{2}\right)=\iota_{x} \alpha_{1} \wedge \alpha_{2}+(-1)^{p} \alpha_{1} \wedge c_{x} \alpha_{2}
$$

Properties: (1) $\iota_{\mathrm{X}}{ }^{\circ} \iota_{\mathrm{X}}=0$; (2) $\iota_{\mathrm{X}}{ }^{\circ} \iota_{\mathrm{Y}}+\iota_{\mathrm{Y}}{ }^{\circ} \iota_{\mathrm{X}}=0$; (3) $\iota_{\mathrm{X}+\mathrm{Y}}={ }^{\iota_{\mathrm{X}}}+\iota_{\mathrm{Y}}$;
(4) $\iota_{f X}=f \iota_{X}$.

- $L_{X}=\iota_{X}{ }^{\circ d+d o c_{X}}$.
- ${ }^{\iota_{[X, Y]}}=L_{X}{ }^{\circ} \iota_{Y}-\iota_{Y}{ }^{\circ} L_{X}$.

Therefore

$$
\left[\begin{array}{l}
L_{X}{ }^{\circ d=d o L_{X}} \\
L_{X^{\circ} L_{X}}=L_{X}{ }^{\circ} L_{X}
\end{array}\right.
$$

FACT $\forall f \in C^{\infty}(\mathrm{M})$,

$$
L_{f x}{ }^{\alpha}=f L_{x^{\alpha}}+d f \wedge \iota_{x}{ }^{\alpha} .
$$

[For

$$
\begin{aligned}
& L_{f X}{ }^{\alpha}=\iota_{f X} d \alpha+d \iota_{f X}{ }^{\alpha} \\
& =f \iota_{X} d a+d\left(f \iota_{X}{ }^{\alpha}\right) \\
& =f \iota_{X} d a+d f \wedge_{X}{ }^{\alpha}+f d \tau_{X}{ }^{\alpha} \\
& =f\left(\iota_{X} d+d \iota_{X}\right) \alpha+d f \wedge_{X} \iota^{\alpha} \\
& =f L_{X}{ }^{\alpha}+d f \wedge c_{X}{ }^{\alpha .]}
\end{aligned}
$$

If $\varphi: N \rightarrow M$ is a diffeomorphism, then

$$
\begin{aligned}
& \Gamma^{-} L_{X}{ }^{\alpha}=L_{\varphi * X}{ }^{\star *} \alpha \\
& -\varphi^{*} \iota_{X}{ }^{\alpha}=\iota_{\varphi^{\star} X}{ }^{\star *} \alpha .
\end{aligned}
$$

If $\Phi: N \rightarrow M$ is a map and if $X$ is $\Phi-r e l a t e d$ to $Y$, then

$$
\left[\begin{array}{l}
\Phi^{\star *} L_{X} \alpha=L_{Y} \Phi^{\star *} \alpha \\
\Phi^{*} \iota_{X} \alpha=\iota_{Y^{\Phi *}} .
\end{array}\right.
$$

[Note: Recall that

$$
X \in \mathcal{D}^{1}(M) \& Y \in \mathcal{D}^{1}(\mathbb{N})
$$

are said to be $\Phi$-related if

$$
\mathrm{d} \mathrm{\Phi}\left(\mathrm{Y}_{\mathrm{y}}\right)=\mathrm{X}_{\Phi(\mathrm{y})} \quad \forall \mathrm{y} \in \mathrm{Y}
$$

or, equivalently, if

$$
Y(f \circ \Phi)=X f \circ \Phi
$$

for all $\left.\mathrm{f} \in \mathrm{C}^{\infty}(\mathrm{M}).\right]$
Denote by $w-D_{q}^{p}(M)$ the tensors of type $(p, q)$ and weight $w$-- then

$$
\mathrm{w}-D_{\mathrm{q}}^{\mathrm{P}}(\mathrm{M}) \leftrightarrow \sec \left(\mathrm{T}_{\mathrm{q}}^{\mathrm{p}}(\mathrm{M}) \otimes \mathrm{L}^{\mathrm{W}}(\mathrm{M})\right)
$$

or still,

$$
\mathrm{w}-D_{\mathrm{q}}^{\mathrm{p}}(\mathrm{M}) \leftrightarrow \sec \left(\mathrm{T}_{\mathrm{q}}^{\mathrm{p}}(M) \otimes\left(\Lambda^{\left.\mathrm{n}^{\star}{ }^{\star} M\right)}{ }^{\otimes \mathrm{W}}\right) .\right.
$$

Put

$$
\mathrm{w}-D(\mathrm{M})={\underset{\mathrm{p}, \mathrm{q}=0}{\infty} \mathrm{w}-D_{\mathrm{q}}^{\mathrm{p}}(\mathrm{M}) . . . . .}_{\infty}^{\infty}
$$

FACT One may attach to each $X \in \mathcal{D}^{l}(M)$ a type preserving $R$-linear map

$$
L_{X}: \mathrm{w}-\mathcal{D}(\mathrm{M}) \rightarrow \mathrm{w}-\mathcal{D}(\mathrm{M})
$$

called the Lie derivative w.r.t. X. Locally, $L_{X} T$ has the same form as a tensor of type ( $p, q$ ) except that there is one additional term, namely

$$
w_{x^{a}}^{a}{ }^{T_{1}}{ }^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}}
$$

[Note: If

$$
\left[\begin{array}{l}
T \in W-D_{q}^{p}(M) \\
T^{\prime} \in W^{\prime}-D_{q^{\prime}}^{p^{\prime}}(M),
\end{array}\right.
$$

then

$$
T \otimes T^{\prime} \in\left(w+w^{\prime}\right)-D_{q+q^{\prime}}^{p+p^{\prime}}(M)
$$

and

$$
\left.L_{X}\left(T \otimes T^{\prime}\right)=L_{X} T \otimes T^{\prime}+T \otimes L_{X} T^{\prime} .\right]
$$

To understand how this comes about, it suffices to consider the case when $\mathrm{w}=1$. So suppose that

$$
T=S \otimes \omega,
$$

where

$$
\left.\right|_{-} \begin{aligned}
& S \in D_{q}^{p}(M) \\
& \omega \in \Lambda^{n} M
\end{aligned}
$$

Then

$$
L_{X} T=L_{X} S \otimes \omega+S \otimes L_{X} \omega
$$

Bearing in mind that $L_{X} \omega$ is a scalar density of weight 1 , write

$$
\omega=\omega_{1} \ldots n^{d x^{1} \wedge \ldots \wedge d x^{n} .}
$$

Then

$$
\begin{aligned}
L_{x}= & \left(L_{x^{\omega}} 1 \ldots n n\right) d x^{l} \wedge \ldots \wedge d x^{n} \\
& +\omega_{1} \ldots L^{L} d x^{1} \wedge \ldots \wedge d x^{n} \\
& +\cdots+\omega_{1} \ldots n^{d x^{1} \wedge \ldots \wedge L_{x} d x^{n}} \\
= & \left(L_{x^{\omega}} 1 \ldots n\right) d x^{1} \wedge \ldots \wedge d x^{n} \\
& +\omega_{1} \ldots n^{\left(x_{, 1}^{1}+\cdots+x_{, n}^{n}\right) d x^{1} \wedge \ldots \wedge d x^{n}}
\end{aligned}
$$

$$
=\left(x^{a} \omega_{1} \ldots n, a+x_{, a}^{a} \omega_{1} \ldots n\right) d x^{1} \wedge \ldots \wedge d x^{n}
$$

Therefore

$$
\begin{aligned}
& L_{X}{ }^{i_{1}}{ }^{\cdots i_{p}}{ }_{j_{1} \cdots j_{q}} \\
& =L_{X} s^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}} \omega_{1} \cdots n \\
& +s^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}}\left(x^{a} \omega_{1} \cdots n, a+x_{,} a_{1} \omega_{1} \cdot n\right) \\
& =x^{a_{s}}{ }^{i_{1}}{ }^{\cdots i_{p}}{ }_{j_{1}} \cdots j_{q}, a^{\omega} 1 \cdots n \\
& -X_{, a}^{i_{1}}{ }^{a i_{2}}{ }^{\cdots i_{p}}{ }_{j_{1} \cdots j_{q}} \omega_{1} \cdots n_{n}-\cdots \\
& +X_{{ }^{\prime} j_{1}} S^{i_{1} \cdots i_{p}}{ }_{a j_{2} \cdots j_{q}}{ }_{1} \cdots n+\cdots \\
& +s^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}}\left(x^{a} \omega_{1} \cdots n, a+x_{, ~}^{a} \omega_{1} \ldots n\right) \\
& =x^{a}\left(s^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}} \omega_{1 \cdots n}\right), a \\
& -X_{{ }^{\prime}}{ }^{i_{1}}{ }^{a i_{2} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}} \omega_{1} \cdots n-\cdots \\
& +x_{{ }_{, j_{1}}}^{a}{ }^{i_{1} \cdots i_{p}}{ }_{a j_{2} \cdots j_{q}}^{\omega_{1} \cdots n}+\cdots
\end{aligned}
$$

$$
\begin{aligned}
& +x_{, a}^{a}{ }^{i_{1}}{ }^{\cdots i_{p}}{ }_{j_{1}} \cdots j_{q} \omega_{l} \cdots n \\
& =x^{a_{T}}{ }^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q^{\prime}}} a \\
& -X_{, a^{T}}^{i_{1}}{a i_{2}}^{\cdots i_{p}}{ }_{j_{1}} \cdots j_{q}-\cdots \\
& +x_{{ }_{1} j_{l}}^{a}{ }^{i_{1} \cdots i_{p}}{ }_{a j_{2} \cdots j_{q}}+\cdots \\
& +x_{, a^{a}}{ }^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}} .
\end{aligned}
$$

Example: Let $T$ be the upper Levi-Civita symbol (a tensor of type ( $n, 0$ ) and weight 1) or the lower Levi-Civita symbol (a tensor of type ( $0, \mathrm{n}$ ) and weight -1) -- then $L_{X} T=0$.
[70 discuss the upper Levi-Civita symbol, note that

$$
\begin{aligned}
& L_{X} \varepsilon^{i_{1} \cdots i_{n}} \\
& =x^{a}{ }_{\varepsilon}^{i_{1} \cdots i_{n}}
\end{aligned}
$$

$$
\begin{aligned}
& +X_{, a}^{a}{ }^{i_{1} \cdots i_{n}} \\
& =-X_{{ }_{1} i_{l}}{ }^{i_{l}}{ }^{i_{l} \cdots i_{n}}-\cdots-x_{{ }_{n} i_{n}}^{i_{n}} i_{n} \cdots i_{n} \\
& +X_{, a^{\varepsilon}}{ }^{i_{1} \cdots i_{n}}
\end{aligned}
$$

$$
\begin{gathered}
=\left(-x_{, i_{l}}^{i_{l}}-\cdots-x_{, i_{n}}^{i_{n}}+x_{, a}^{a}\right) \varepsilon \varepsilon^{i_{l} \cdots i_{n}} \\
=0 .]
\end{gathered}
$$

[Note: The terms involving three identical indices are not summed.]
Given $w \in \underline{Z}$, let $\rho_{w}=(\operatorname{det})^{-w} \rho$ and consider the derived map of Lie algebras

$$
d \rho_{\mathrm{w}}: \underline{g \ell}(\mathrm{n}, \underline{\mathrm{R}}) \rightarrow \underline{\mathrm{g} \ell}\left(\mathrm{~T}_{\mathrm{q}}^{\mathrm{p}}(\mathrm{n})\right) .
$$

Then $\forall A \in \underline{g} \ell(n, \underline{R})$,

$$
\begin{aligned}
& d \rho_{w}(A)=\left.\frac{d}{d t} \rho_{w}\left(e^{t A}\right)\right|_{t=0} \\
& =\frac{d}{d t}\left(\operatorname{det} e^{t A}\right)-\left.w \rho_{\rho}\left(e^{t A}\right)\right|_{t=0} \\
& =\left.\frac{d}{d t}\left(e^{t \operatorname{tr}(A)}\right)^{-w} \rho\left(e^{t A}\right)\right|_{t=0} \\
& =-w \operatorname{tr}(A)+d \rho(A)
\end{aligned}
$$

Put

$$
A_{j}^{i}(x)=-x_{, j}^{i}(x)
$$

and let $T \in W-D_{q}^{p}(M)$-- then at $x$,

$$
\begin{aligned}
& -x_{, a}^{i_{1}}{ }^{a i_{2} \cdots i_{p}}{ }_{j_{l} \cdots j_{q}}-\cdots \\
& +x_{, j_{l}}^{a} T^{i_{1} \cdots i_{p}}{ }_{a j_{2} \cdots j_{q}}+\cdots \\
& +w_{x_{, a}}^{a} T^{i_{1} \cdots i_{p}}{ }_{j_{l} \cdots j_{q}}
\end{aligned}
$$

equals

$$
\left(A(x) \cdot T_{x}\right) \quad i_{1} \cdots i_{j_{1}} \cdots j_{q}
$$

Section 6: Flows Let $M$ be a connected $C^{\infty}$ manifold of dimension $n$. Fix an $X \in D^{1}(M)$-- then the image of a maximal integral curve of $X$ is called a trajectory of X . The trajectories of X are connected, immersed submanifolds of $M$. They form a partition of $M$ and their dimension is either 0 or 1 (the trajectories of dimension 0 are the points of $M$ where the vector field $X$ vanishes).

Definition: A first integral for $X$ is an $f \in C^{\infty}(M): X f=0$.
In order that f be a first integral for X it is necessary and sufficient that $f$ be constant on the trajectories of $X$.

Recall now that there exists an open subset $D(X) \subset \underline{R} \times M$ and a differentiable function $\phi_{X}: D(X) \rightarrow M$ such that for each $x \in M$, the map $t \rightarrow \phi_{X}(t, x)$ is the trajectory of $X$ with $\phi_{X}(0, x)=x$.
(I) $\forall x \in M$,

$$
I_{x}(X)=\{t \in R:(t, x) \in D(X)\}
$$

is an open interval containing the origin and is the domain of the trajectory which passes through x .
(2) $\forall t \in R$,

$$
D_{t}(X)=\{x \in M:(t, x) \in D(X)\}
$$

is open in $M$ and the map

$$
\phi_{t}, x \rightarrow \phi_{X}(t, x)
$$

is a diffeomorphism $D_{t}(X) \rightarrow D_{-t}(X)$ with inverse $\phi_{-t}$.
(3) If $(t, x)$ and $\left(s, \phi_{X}(t, x)\right)$ are elements of $D(X)$, then ( $\left.s+t, x\right)$ is an element of $D(X)$ and

$$
\phi_{X}\left(s, \phi_{X}(t, x)\right)=\phi_{X}(s+t, x)
$$

i.e.,

$$
\phi_{s}{ }^{\circ} \phi_{t}(x)=\phi_{s+t}(x)
$$

One calls $\phi_{\mathrm{X}}$ the flow of X and X its infinitesimal generator.
[Note: $X$ is said to be complete if $D(X)=\underline{R} \times M$.
FACT Suppose that $X_{x} \neq 0$-- then $\exists$ a chart $U$ containing $x$ such that $x \left\lvert\, v=\frac{\partial}{\partial x^{1}}\right.$ and $\phi_{t}\left(x^{1}, \ldots, x^{n}\right)=\left(x^{1}+t, x^{2}, \ldots, x^{n}\right)$.

Let $Y \in \mathcal{D}^{\perp}(M)$-- then $Y$ is invariant under $\phi_{X}$ if $\left(\phi_{t}\right)_{*} Y_{X}=Y_{\phi_{t}}(x)$ for all $(t, x) \in D(X)$.

Example: X is invariant under $\phi_{\mathrm{X}}$ -
[Fix $\left(t_{0}, x_{0}\right) \in D(X)$ and suppose that $f$ is a $C^{\infty}$ function defined in some neighborhood of $\phi_{t_{0}}\left(x_{0}\right)$-- then

$$
\begin{aligned}
& \quad\left(\left(\phi_{t_{0}}\right) * x_{x_{0}}\right) f=x_{x_{0}}\left(f \circ \phi_{t_{0}}\right) \\
& =\left.\frac{d}{d t} f \circ \phi_{t_{0}} \circ \phi_{X}\left(t, x_{0}\right)\right|_{t=0} \\
& =\left.\frac{d}{d t} f\left(\phi_{X}\left(t_{0}, \phi_{X}\left(t, x_{0}\right)\right)\right)\right|_{t=0} \\
& =\left.\frac{d}{d t} f\left(\phi_{X}\left(t_{0}+t, x_{0}\right)\right)\right|_{t=0} \\
& =X_{\phi_{t_{0}}}\left(x_{0}\right)^{f .]}
\end{aligned}
$$

FACT $Y$ is invariant under $\phi_{X}$ iff $[X, Y]=0$.
Push and Pull Let $\varphi: M \rightarrow M$ be a diffeomorphism -- then there is a vector bundle isomorphism $T_{q}^{p}: T_{q}^{p}(M) \rightarrow T_{q}^{p}(M)$ and a commatative diagram

|  | ${ }^{T_{q^{p}}^{p}}$ |  |
| :--- | :--- | :--- |
| $\mathrm{~T}_{\mathrm{q}}^{\mathrm{p}}(\mathrm{M})$ | $\rightarrow$ | $\mathrm{T}_{\mathrm{q}}^{\mathrm{p}}(\mathrm{M})$ |
| $\pi \downarrow$ |  | $\downarrow \pi$ |
| M | $\rightarrow$ | $M$ |

(a) Given $T \in D_{q}^{p}(M)$, put

$$
\varphi_{\star} \mathrm{T}=\mathrm{T}_{\mathrm{q}}^{\mathrm{p}} \mathrm{p}^{\circ \mathrm{T} \circ \varphi}{ }^{-1}
$$

the pushforward of $T$.
[Note: Thus

$$
\begin{aligned}
& \varphi_{\star} T\left(\Lambda^{1}, \ldots, \Lambda^{\mathrm{p}}, \mathrm{X}_{1}, \ldots, \mathrm{X}_{\mathrm{q}}\right) \\
& \left.\quad=T\left(\varphi^{\star} \Lambda^{1}, \ldots, \varphi^{\star} \Lambda^{\mathrm{p}}, \varphi_{\star}^{-1} \mathrm{X}_{1}, \ldots, \varphi_{\star}^{-1} \mathrm{X}_{\mathrm{q}}\right) \cdot\right]
\end{aligned}
$$

(b) Given $T \in D_{q}^{p}(M)$, put

$$
\varphi^{*} \mathrm{~T}=\mathrm{T}_{\mathrm{q}}{ }^{\varphi}{ }^{-1} \circ \mathrm{~T}_{\circ} \varphi,
$$

the pullback of $T$.
[Note: Thus

$$
\begin{aligned}
& \varphi^{*} T\left(\Lambda^{1}, \ldots, \Lambda^{\mathrm{p}}, \mathrm{X}_{1}, \ldots, \mathrm{X}_{\mathrm{q}}\right) \\
& \left.\quad=\mathrm{T}\left(\varphi^{-1 *_{\Lambda}}, \ldots, \varphi^{-1 *} \Lambda^{\mathrm{p}}, \varphi_{*} \mathrm{X}_{1}, \ldots, \varphi_{*} \mathrm{X}_{\mathrm{q}}\right) .\right]
\end{aligned}
$$

Remark: Obviously,

$$
\varphi^{*}=\left(\varphi^{-1}\right)_{\star} .
$$

The standard fact that

$$
[X, Y]_{X}=\left.L_{X} Y\right|_{x}
$$

$$
=\lim _{t \rightarrow 0} \frac{\phi_{t}^{k Y} \phi_{t}(x)-Y_{x}}{t}
$$

can be generalized: $\forall T \in D_{\mathrm{q}}^{\mathrm{p}}(\mathrm{M})$,

$$
\left.L_{x} T\right|_{x}=\lim _{t \rightarrow 0} \frac{\phi_{t^{*} \mathrm{~T}}^{\phi_{t}}(\mathrm{x})-\mathrm{T}}{t}
$$

[Note: For $\mathrm{t} \neq 0$ and small, the difference quotient on the right makes sense (both $\phi_{t}^{* k} \mathrm{~T}_{\phi_{t}}(\mathrm{x})$ and $\mathrm{T}_{\mathrm{x}}$ are elements of the vector space $\mathrm{T}_{\mathrm{q}} \mathrm{P}_{\mathrm{T}} \mathrm{x}^{M}$ ).]

So, in brief,

$$
L_{\mathrm{X}}^{\mathrm{T}}=\left.\frac{\mathrm{d}}{\mathrm{dt}} \phi_{\mathrm{t}}^{* T}\right|_{\mathrm{t}=0},
$$

hence $L_{X} T=0$ iff $T$ is constant on the trajectories of $X$.
Let $\varphi: M \rightarrow M$ be a diffeomorphism -- then $\varphi$ lifts to a diffeomorphism $\bar{\varphi}: L M \rightarrow L M$, where $\bar{\varphi}(x, E)$ is computed from

$$
\begin{array}{rlr}
\mathrm{T}_{\mathrm{X}}^{\mathrm{M}} & \stackrel{\mathrm{~d} \varphi_{\mathrm{x}}}{ } \quad \mathrm{~T}_{\varphi(\mathrm{x})^{\mathrm{M}}} \\
\zeta_{\mathrm{E}} \uparrow & \\
\underline{R}^{\mathrm{n}} & &
\end{array}
$$

N.B. The pair $(\bar{\varphi}, \varphi)$ is an automorphism of ( $L M, M ; \underline{G}(n, R)$ ), i.e., $\bar{\varphi}$ is equivariant and the diagram

$$
\begin{array}{rll} 
& \stackrel{\bar{\varphi}}{ } & \\
\mathrm{LM} & \mathrm{LM} \\
\pi & \downarrow & \\
\mathrm{M} & \nrightarrow \pi \\
& \mathrm{P} & \mathrm{M}
\end{array}
$$

commutes.

Observation: We have

$$
\Phi_{\varphi^{\star} T}=\Phi_{T} \circ \bar{\varphi}
$$

[In fact,

$$
\begin{aligned}
& \Phi_{T} \circ \bar{\varphi}(x, E)\left(\Lambda^{l}, \ldots, \Lambda^{p}, x_{1}, \ldots, x_{q}\right) \\
& =\Phi_{T}\left(\varphi(x), \varphi_{\star} E\right)\left(\Lambda^{l}, \ldots, \Lambda^{p}, X_{1}, \ldots, X_{q}\right) \\
& =T_{\varphi(x)}\left(\Lambda^{1} \circ \zeta_{\varphi_{\star} E}^{-1}, \ldots, \Lambda^{p} \circ \zeta_{\varphi_{\star} E}^{-1}, \zeta_{\varphi_{\star} E}\left(X_{1}\right), \ldots, \zeta_{\varphi_{\star} E}\left(X_{q}\right)\right) \\
& =T_{\varphi(x)}\left(\Lambda^{1} \circ \zeta_{E}^{-1} \circ d \varphi_{x}^{-1}, \ldots, \Lambda^{p} \circ \zeta_{E}^{-1} \circ d \varphi_{x}^{-1}, d \varphi_{x}\left(\zeta_{E}\left(X_{1}\right)\right), \ldots, d \varphi_{x}\left(\zeta_{E}\left(X_{q}\right)\right)\right) \\
& =\left(\varphi^{\star} T\right){ }_{x}\left(\Lambda^{l} \circ \zeta_{E}^{-1}, \ldots, \Lambda^{p} \circ \zeta_{E}^{-1}, \zeta_{E}\left(X_{1}\right), \ldots, \zeta_{E}\left(X_{q}\right)\right) \\
& \left.=\Phi_{\varphi * T}(x, E) .\right]
\end{aligned}
$$

Let $X \in D^{1}(M)$-- then $\phi_{X}$ lifts to a flow $\bar{\phi}_{\bar{X}}$ on LM.

LEMMA We have

$$
\Phi_{L_{X}}=L_{\bar{X}} \Phi_{T}
$$

[At $t=0$,

$$
\begin{aligned}
& \frac{L}{\bar{X}} \Phi_{T}(x, E) \quad\left(\Lambda^{l}, \ldots, \Lambda^{p}, x_{1}, \ldots, x_{q}\right) \\
= & \frac{d}{d t} \Phi_{T}\left(\bar{\phi}_{t}(x, E)\right)\left(\Lambda^{1}, \ldots, \Lambda^{p}, x_{1}, \ldots, x_{q}\right)
\end{aligned}
$$

$$
\begin{gathered}
=\frac{d}{d t} \Phi_{T}\left(\phi_{t}(x), \phi_{t *}(E)\right)\left(\Lambda^{l}, \ldots, \Lambda^{p}, x_{1}, \ldots, x_{q}\right) \\
=\frac{d}{d t} T_{\phi_{t}(x)}\left(\Lambda^{l} \circ \zeta_{E}^{-1} \circ \phi_{t *}^{-1}, \ldots, \Lambda^{p} \circ \zeta_{E} \circ \phi_{t *}^{-1}, \phi_{t *}\left(\zeta_{E}\left(x_{1}\right)\right), \ldots, \phi_{t *}\left(\zeta_{E}\left(x_{q}\right)\right)\right) \\
=\frac{d}{d t}\left(\phi_{t}^{*} T\right) x_{x}\left(\Lambda^{l} \circ \zeta_{E}^{-1}, \ldots, \Lambda^{p} \circ \zeta_{E}^{-1}, \zeta_{E}\left(x_{1}\right), \ldots, \zeta_{E}\left(x_{q}\right)\right) \\
=\left.L_{x}^{T}\right|_{x}\left(\Lambda^{1} \circ \zeta_{E}^{-1}, \ldots, \Lambda^{p} \circ \zeta_{E}^{-1}, \zeta_{E}\left(x_{1}\right), \ldots, \zeta_{E}\left(x_{q}\right)\right) \\
\left.=\Phi_{L_{X} T}(x, E)\left(\Lambda^{l}, \ldots, \Lambda^{p}, x_{1}, \ldots, x_{q}\right) .\right]
\end{gathered}
$$

Section 7: Covariant Differentiation Let M be a connected $C^{\infty}$ manifold of dimension $n$. Suppose that $\mathrm{E} \rightarrow \mathrm{M}$ is a vector bundle -- then a connection $\nabla$ on $E$ is a map

$$
\nabla: D^{l}(M) \rightarrow \operatorname{Hom}_{\underline{R}}(\sec (E), \sec (E))
$$

such that
(1) $\nabla_{X+Y} s=\nabla_{X} s+\nabla_{Y} s$;
(2) $\nabla_{X}(s+t)=\nabla_{X} s+\nabla_{X} t$;
(3) $\nabla_{f X} s=f \nabla_{X} s ;$
(4) $\nabla_{X}(f s)=(X f) s+f \nabla_{X} s$.
[Note: By definition, $\nabla_{X} s$ is the covariant derivative of $s$ w.r.t. X.] Rappel: There is a one-to-one correspondence

$$
\left[\begin{array}{rll}
\Gamma & \rightarrow & \nabla^{\Gamma} \\
\nabla & \rightarrow & \Gamma^{\nabla}
\end{array}\right.
$$

between the connections $\Gamma$ on the frame bundle

$$
\begin{aligned}
\underline{\mathrm{GL}(\mathrm{n}, \underline{\mathrm{R})} \rightarrow} & \mathrm{LM} \\
& \downarrow \pi \\
& M
\end{aligned}
$$

and the connections $\nabla$ on the tangent bundle

$$
\mathrm{TM}=\mathrm{LM} \times \underline{\underline{\mathrm{GL}}(\mathrm{n}, \underline{\mathrm{R}})^{\mathrm{R}^{\mathrm{n}}} .}
$$

Let con TM stand for the set of connections on TM .

- Let $\nabla \in$ con $T M$-- then the assignment

$$
\left[\begin{array}{rl}
D_{1}(\mathrm{M}) \times D^{1}(\mathrm{M}) & \times D^{l}(\mathrm{M}) \rightarrow \mathrm{C}^{\infty}(\mathrm{M}) \\
(\Lambda, \mathrm{X}, \mathrm{Y}) & \rightarrow \Lambda\left(\nabla_{\mathrm{X}} \mathrm{Y}\right)
\end{array}\right.
$$

is not a tensor.

- Let $\nabla^{\prime}, \nabla " \in$ con TM -- then the assignment

$$
\left[\begin{array}{c}
D_{1}(M) \times D^{l}(M) \times D^{l}(M) \rightarrow C^{\infty}(M) \\
(\Lambda, X, Y) \rightarrow \Lambda\left(\nabla_{X}^{\prime} \mathrm{Y}-\nabla_{X}^{\prime \prime} \mathrm{Y}\right)
\end{array}\right.
$$

is $C^{\infty}(M)$-multilinear, hence is a tensor.

- Let $\nabla \in$ con TM -- then $\forall \Psi \in \mathcal{D}_{2}^{1}(M)$, the assigmment

$$
\left[\begin{array}{l}
D^{D^{l}(\mathrm{M}) \times D^{l}(\mathrm{M}) \rightarrow D^{\mathrm{l}}(\mathrm{M})} \\
\quad(\mathrm{X}, \mathrm{Y}) \rightarrow \nabla_{\mathrm{X}} \mathrm{Y}+\mathrm{Y}(\mathrm{X}, \mathrm{Y})
\end{array}\right.
$$

is a connection.
Scholium: con TM is an affine space with translation group $D_{2}^{1}(M)$.
[The action $\nabla \cdot \Psi=\nabla+\Psi$ is free and transitive.]
Remark: Write con IM for the set of connections on LM -- then, on general grounds, con LM is an affine space (in the l-form description, the translation group is $\left.\Lambda_{A d}^{l}(\operatorname{LM} ; \underline{g \ell}(n, \underline{R}))\right)$.

Let $\nabla$ be a connection on TM. Put $\nabla_{X} f=X f$ and in the notation of the Extension Principle, take $\delta=\nabla_{X}$ (permissible, since $\left.\nabla_{X}(f Y)=(X f) Y+f \nabla_{X} Y\right)-$ then there exists a unique derivation

$$
\nabla_{\mathrm{X}}: \mathcal{D}(\mathrm{M}) \rightarrow \mathcal{D}(\mathrm{M})
$$

such that $\nabla_{X} \mid C^{\infty}(M)=X$ and $\nabla_{X} \mid D^{l}(M)=\delta$.
[Note: The difference $\nabla_{X}-L_{X}$ is $C^{\infty}(M)$-linear on $D^{l}(M)$ :

$$
\left(\nabla_{X}-L_{X}\right)(f Y)
$$

$$
\begin{aligned}
& =(X f) Y+f \nabla_{X} Y-(X f) Y-f L_{X} Y \\
& =f\left(\nabla_{X} Y-L_{X} Y\right)
\end{aligned}
$$

hence $\nabla_{\mathrm{X}}$ as a derivation of $D(\mathrm{M})$ admits the decomposition

$$
\left.\nabla_{\mathrm{X}}=L_{\mathrm{X}}+\mathrm{D}_{\nabla_{\mathrm{X}}}-L_{\mathrm{X}} .\right]
$$

Remark: Write $\nabla=\nabla^{\Gamma}$ - then $\Gamma$ induces a connection $\nabla_{\mathrm{q}}^{\mathrm{p}}$ on

$$
\mathrm{T}_{\mathrm{q}}^{\mathrm{p}}(\mathrm{M})=\mathrm{LM} \times \underline{\underline{\mathrm{GL}}(\mathrm{n}, \underline{\mathrm{R}})} \mathrm{T}_{\mathrm{q}}^{\mathrm{p}}(\mathrm{n})
$$

and matters are consistent: $\forall T \in D_{\mathrm{q}}^{\mathrm{p}}(\mathrm{M})$,

$$
\nabla_{\mathrm{X}}^{\Gamma_{T}}=\nabla_{\mathrm{q}}^{\mathrm{p}}(\mathrm{X}) \mathrm{T}
$$

On general grounds, each $X \in \mathcal{D}^{1}(M)$ admits a unique lifting to a horizontal vector field $X^{h}$ on LM such that $\pi_{*} x^{h}=x$.

FACT We have

$$
\Phi_{\nabla_{X^{T}}}=L_{X^{h^{\Phi}}}
$$

Owing to the product formula, $\forall T \in D_{\mathrm{q}}^{\mathrm{p}}(\mathrm{M})$,

$$
\begin{aligned}
X & {\left[T\left(\Lambda^{l}, \ldots, \Lambda^{p}, x_{1}, \ldots, x_{q}\right)\right] } \\
= & \left(\nabla_{X^{T}}^{T}\right)\left(\Lambda^{l}, \ldots, \Lambda^{p}, x_{1}, \ldots, x_{q}\right) \\
& +\sum_{i=1}^{p} T\left(\Lambda^{I}, \ldots, \nabla_{X^{\prime}} \Lambda^{i}, \ldots, \Lambda^{p}, x_{1}, \ldots, x_{q}\right) \\
& +\sum_{j=1}^{q} T\left(\Lambda^{l}, \ldots, \Lambda^{p}, x_{1}, \ldots, \nabla_{X^{\prime}} x_{j}, \ldots, x_{q}\right) .
\end{aligned}
$$

[Note: If $\omega \in D_{1}(M)$, then

$$
\left.\left(\nabla_{X} \omega\right)(Y)=X \omega(Y)-\omega\left(\nabla_{X} Y\right) \cdot\right]
$$

Definition: Let $\nabla$ be a connection on TM. Suppose that ( $U,\left\{x^{1}, \ldots, x^{n}\right\}$ ) is a chart -- then the connection coefficients of $\nabla$ w.r.t. the coordinates $x^{l}, \ldots, x^{n}$ are the $C^{\infty}$ functions $\Gamma^{k}$ ij on $U$ defined by the prescription

$$
\nabla_{\frac{\partial}{\partial x^{i}}} \frac{\partial}{\partial x^{j}}=\Gamma_{i j}^{k} \frac{\partial}{\partial x^{k}}
$$

Observation: $\quad \forall X \in \mathcal{D}^{1}(M)$,

$$
\left[\begin{array}{l}
\nabla_{X} \frac{\partial}{\partial x^{i}}=x^{a} \Gamma^{k}{ }_{a i} \frac{\partial}{\partial x^{k}} \\
\nabla_{X} d x^{i}=-x^{a} \Gamma^{i} a k^{d x}
\end{array}\right.
$$

So locally,

$$
\begin{aligned}
& {\left(\nabla_{X}\right)^{T}{ }^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}}} \\
& =x^{a_{T}}{ }^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q^{\prime}}} \\
& +x^{a}{ }^{i_{1}}{ }_{a b^{T}}{ }^{b i_{2}} \cdots_{j_{1}} \cdots j_{q}+\cdots \\
& -x^{a}{ }_{\Gamma}^{b}{ }_{a j_{l}}{ }^{i_{1} \cdots i_{p}}{ }_{b j_{2} \cdots j_{q}}-\cdots .
\end{aligned}
$$

Remark: The symbol

$$
\left(\nabla x^{T)}{ }^{i_{1} \cdots i_{p}}{ }_{j_{1}} \cdots j_{q}\right.
$$

is usually abbreviated to

$$
\nabla_{X^{T}}{ }^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}}
$$

Example: Let $K$ be the Kronecker tensor -- then

$$
\nabla_{X} K=0
$$

Indeed,

$$
\begin{aligned}
\nabla_{x^{k}}{ }^{i} & =x^{a} \delta_{j, a}^{i}+x^{a} \Gamma_{a b}^{i} \delta_{j}^{b}-x^{a} \Gamma_{a j}^{b} \delta_{b}^{i} \\
& =0+x^{a} \Gamma^{i}{ }_{a j}-x^{a} \Gamma^{i}{ }_{a j} \\
& =0 .
\end{aligned}
$$

[Note: In general, $\forall \mathrm{p} \geq 1$,

$$
\left.\nabla_{X} K(p)=0 .\right]
$$

LEMMA Let $\nabla$ be a connection on $T M$-- then on UnU',

$$
\Gamma_{i^{\prime} j^{\prime}}^{k^{\prime}}=\frac{\partial x^{k \prime}}{\partial x^{k}} \frac{\partial x^{i}}{\partial x^{i^{\prime}}} \frac{\partial x^{j}}{\partial x^{j^{\prime}}} \Gamma_{i j}^{k}+\frac{\partial^{2} x^{a}}{\partial x^{i^{\prime}} \partial x^{j^{\prime}}} \frac{\partial x^{k \prime}}{\partial x^{a}} .
$$

[Note: This relation is called the connection transformation rule.]

Therefore the $\Gamma_{i j}^{k}$ are not the components of a tensor.
FACT Assume that there is assigned to each $U$ in a coordinate atlas for $M$, functions

$$
\Gamma_{i j}^{k} \in C^{\infty}(U)
$$

subject to the connection transformation rule -- then there is a unique
connection $\nabla$ on TM whose connection coefficients w.r.t. the coordinates $x^{1}, \ldots, x^{n}$ are the $r^{k}{ }_{i j}$.

Remark: Consider the contraction $\Gamma_{i j}^{j}$. To determine its transformation law, write

$$
\Gamma^{j^{\prime}}{ }_{i^{\prime} j^{\prime}}=\frac{\partial x^{j^{\prime}}}{\partial x^{k}} \frac{\partial x^{i}}{\partial x^{i^{\prime}}} \frac{\partial x^{j}}{\partial x^{j^{\prime}}} \Gamma_{i j}^{k}+\frac{\partial^{2} x^{a}}{\partial x^{i^{\prime}} \partial x^{j^{\prime}}} \frac{\partial x^{j^{\prime}}}{\partial x^{a}} .
$$

Then

$$
\begin{aligned}
& \frac{\partial x^{j^{\prime}}}{\partial x^{k}} \frac{\partial x^{i}}{\partial x^{i^{\prime}}} \frac{\partial x^{j}}{\partial x^{j^{\prime}}} \Gamma_{i j}^{k} \\
= & \frac{\partial x^{i}}{\partial x^{1^{\prime}}} \frac{\partial x^{j}}{\partial x^{j^{\prime}}} \frac{\partial x^{j^{\prime}}}{\partial x^{k}} \Gamma_{i j}^{k} \\
= & \frac{\partial x^{i}}{\partial x^{i^{\prime}}} \delta^{j}{ }_{k} \Gamma_{i j}^{k}=\frac{\partial x^{i}}{\partial x^{i^{\prime}}} \Gamma_{i j}^{j} .
\end{aligned}
$$

On the other hand, by determinant theory,

$$
\frac{\partial^{2} x^{a}}{\partial x^{i}} \partial x^{j^{\prime}} \frac{\partial x^{j^{\prime}}}{\partial x^{a}}=\frac{\partial}{\partial x^{i^{\prime}}} \log |J|
$$

[Note: Analogously,

$$
\left.\Gamma_{i^{\prime} j^{\prime}}^{\prime}=\frac{\partial x^{j}}{\partial x^{j^{\prime}}} r_{i j}^{i}+\frac{\partial}{\partial x^{j^{\prime}}} \log |J| .\right]
$$

Let $\nabla$ be a connection on $T M-$ then $\nabla$ induces a $\operatorname{map} D_{q}^{p}(M) \rightarrow D_{q+1}^{p}(M)$, viz.

$$
\begin{aligned}
& \nabla T\left(\Lambda^{1}, \ldots, \Lambda^{p}, x_{1}, \ldots, x_{q^{\prime}} \mathrm{X}\right) \\
& =\left(\nabla_{X^{T}}^{T}\right)\left(\Lambda^{1}, \ldots, \Lambda^{p}, x_{1}, \ldots, X_{q}\right)
\end{aligned}
$$

[Note: One calls $\nabla T$ the covariant derivative of T.]
Working locally, put

$$
\begin{aligned}
& T^{i_{l}}{ }^{\cdots i_{p}}{ }_{j_{1} \cdots j_{q} ; a} \\
& \quad=\nabla_{a}{ }^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}}
\end{aligned}
$$

where

$$
\nabla_{a}=\nabla_{\frac{\partial}{\partial x^{a}}}
$$

Then in view of what has been said above,

$$
\begin{aligned}
& T^{i_{l} \cdots i_{p}}{ }_{j_{1} \cdots j_{q^{\prime}}} \\
& =T^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q^{\prime}}} a \\
& +\Gamma^{i_{1}}{ }_{a b}{ }^{T i_{2}}{ }^{\cdots i_{p}}{ }_{j_{l} \cdots j_{q}}+\cdots \\
& -\Gamma_{a j_{1}}^{T^{i}}{ }^{i_{1} \cdots i_{p}}{ }_{b j_{2} \cdots j_{q}}-\cdots \cdot
\end{aligned}
$$

[Note: The components of $\nabla \mathrm{T}$ are the

$$
T^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q} ; a}
$$

Thus

$$
(\nabla T){ }^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}}
$$

$$
\begin{aligned}
& =\nabla T\left(d x^{i_{1}}, \ldots, d x^{i} p, \frac{\partial}{\partial x^{j}}, \ldots, \frac{\partial}{\partial x_{q}}, \frac{\partial}{\partial x^{a}}\right) \\
& =\nabla_{a} T\left(d x^{i_{1}}, \ldots, d x^{i} p, \frac{\partial}{\partial x_{1}}, \ldots, \frac{\partial}{\partial x^{j_{q}}}\right) \\
& =\nabla_{a}{ }^{T_{1}}{ }^{M^{\prime} i_{p}}{ }_{j_{1} \cdots j_{q}} \\
& \left.=T_{1}{ }^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q} ; a} \cdot\right]
\end{aligned}
$$

Example: $\forall X \in D^{1}(M), \quad \nabla X \in D_{1}^{1}(M)$, so locally,

$$
\nabla X=X_{i j}^{i} \frac{\partial}{\partial x^{i}} \otimes d x^{j}
$$

where

$$
\nabla_{j} x^{i}=x_{; j}^{i}=x_{, j}^{i}+x^{a_{\Gamma}^{i}}{ }_{j a}
$$

Remark: Let $T \in D_{q}^{p}(M)$-- then $T$ is said to be parallel if $\nabla T=0$, which is the case iff $\nabla_{X} T=0$ for all $X \in \mathcal{D}^{l}(M)$.

Notation: Define $\nabla^{\mathrm{k}}: \nabla_{\mathrm{q}}^{\mathrm{p}}(\mathrm{M}) \rightarrow D_{\mathrm{q}+\mathrm{k}}^{\mathrm{p}}(\mathrm{M})$ by $\nabla^{1}=\nabla$ and $\nabla^{\mathrm{k}}=\nabla\left(\nabla^{\mathrm{k}-1}\right)(\mathrm{k}>1)$.

LEMMA Let $X, Y \in D^{1}(M)$-- then $\forall T \in D_{q}^{p}(M)$,

$$
\begin{aligned}
& \nabla^{2} T\left(\Lambda^{1}, \ldots, \Lambda^{p}, x_{1}, \ldots, X_{q}, \mathrm{X}, \mathrm{Y}\right) \\
= & \nabla_{Y}\left(\nabla_{X^{T}}^{T}\right)\left(\Lambda^{1}, \ldots, \Lambda^{p}, x_{1}, \ldots, X_{q}\right) \\
& \quad-\nabla_{\nabla_{Y}} X^{T}\left(\Lambda^{1}, \ldots, \Lambda^{p}, x_{1}, \ldots, x_{q}\right) .
\end{aligned}
$$

[Thanks to the product formula, we have

$$
\begin{aligned}
& \nabla^{2} T\left(\Lambda^{l}, \ldots, \Lambda^{p}, X_{1}, \ldots, X_{q}, X, Y\right) \\
& =\left(\nabla_{Y} \nabla T\right)\left(\Lambda^{l}, \ldots, \Lambda^{p}, X_{1}, \ldots, X_{q}, X\right) \\
& =Y\left[\nabla T\left(\Lambda^{1}, \ldots, \Lambda^{p}, X_{1}, \ldots, X_{q}, X\right)\right] \\
& -\sum_{i=1}^{p} \nabla T\left(\Lambda^{1}, \ldots, \nabla_{Y^{\prime}} \Lambda^{i}, \ldots, \Lambda^{p}, X_{1}, \ldots, X_{q^{\prime}}, X\right) \\
& -\sum_{j=1}^{q} \nabla T\left(\Lambda^{1}, \ldots, \Lambda^{p}, x_{1}, \ldots, \nabla_{Y} X_{j}, \ldots, X_{q^{\prime}}, X\right) \\
& -\nabla T\left(\Lambda^{l}, \ldots, \Lambda^{p}, X_{1}, \ldots, X_{q}, \nabla_{Y} X\right) \\
& =Y\left[\nabla_{X^{T}}\left(\Lambda^{1}, \ldots, \Lambda^{P}, X_{1}, \ldots, X_{q}\right)\right] \\
& -\sum_{i=1}^{p} \nabla_{X} T\left(\Lambda^{l}, \ldots, \nabla_{Y} \Lambda^{i}, \ldots, \Lambda^{p}, X_{1}, \ldots, X_{q}\right) \\
& -\sum_{j=1}^{q} \nabla_{X} T\left(\Lambda^{l}, \ldots, \Lambda^{p}, X_{1}, \ldots, \nabla_{Y} X_{j}, \ldots, X_{q}\right) \\
& -\nabla_{\nabla_{Y}} x^{T\left(\Lambda^{1}, \ldots, \Lambda^{p}, x_{1}, \ldots, x_{q}\right)} \\
& =\nabla_{Y}\left(\nabla_{X} T\right)\left(\Lambda^{l}, \ldots, \Lambda^{p}, X_{1}, \ldots, X_{q}\right) \\
& \left.-\nabla_{\nabla_{Y}} X^{T}\left(\Lambda^{1}, \ldots, \Lambda^{p}, x_{1}, \ldots, X_{q}\right) \cdot\right] \\
& \text { [Note: } \quad \nabla^{2} \mathrm{~T} \in D_{\mathrm{q}+2}^{\mathrm{p}}(\mathrm{M}) \text { and }
\end{aligned}
$$

10. 

$$
\left(\nabla^{2} \mathrm{~T}\right)^{i_{1} \cdots i_{p}^{j_{1}} \cdots_{q} a b}
$$

is written as

$$
T^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q} ; a ; b}
$$

or still,

$$
\left.\nabla_{b} \nabla_{a} T^{i_{1} \cdots i_{p}}{ }_{j_{l} \cdots j_{q}} \cdot\right]
$$

Definition: Let $\nabla$ be a connection on TM -- then the torsion of $\nabla$ is the map

$$
T: D^{l}(M) \times D^{l}(M) \rightarrow D^{l}(M)
$$

defined by

$$
T(X, Y)=\nabla_{X} Y-\nabla_{Y} X-[X, Y]
$$

[Note: $\nabla$ is said to be torsion free if $T \equiv 0$.
Example: Let $f \in C^{\infty}(M)$ - then $\nabla^{2} f \in D_{2}^{0}(M)$ and

$$
\begin{aligned}
\nabla^{2} f(X, Y) & =\nabla_{Y}\left(\nabla_{X} f\right)-\nabla_{\nabla_{Y}} X^{f} \\
& =\left(Y X-\nabla_{Y} X\right) £ \\
& =\left(X Y-\nabla_{X} Y+T(X, Y)\right) £ \\
& =\nabla^{2} f(Y, X)+T(X, Y) \mp
\end{aligned}
$$

Thus $\nabla^{2} \mathrm{f}$ is symmetric whenever $\nabla$ is torsion free.
Obviously,

$$
T(X, Y)=-T(Y, X) .
$$

It is also easy to check that

$$
T(f X, g Y)=f g T(X, Y) \quad\left(f, g \in C^{\infty}(M)\right) .
$$

Therefore the assignment

$$
\left[\begin{array}{l}
D_{1}(\mathrm{M}) \times \mathcal{D}^{1}(\mathrm{M}) \times \mathcal{D}^{1}(\mathrm{M}) \rightarrow \mathrm{C}^{\infty}(\mathrm{M}) \\
(\Lambda, \mathrm{X}, \mathrm{Y}) \rightarrow \Lambda(\mathrm{T}(\mathrm{X}, \mathrm{Y}))
\end{array}\right.
$$

is a tensor, the torsion tensor attached to $\nabla$.
Construction: Given $\nabla \in$ con TM, define $\nabla^{\prime} \in$ con TM by

$$
\nabla^{\prime}=\nabla-T .
$$

This makes sense (recall that con TM is an affine space with translation group $\left.D_{2}^{l}(\mathrm{M})\right)$. To compute the torsion of $\nabla^{\prime}$, note that

$$
\begin{gathered}
\nabla_{X}^{\prime} Y-\nabla_{Y}^{\prime} X-[X, Y] \\
=\nabla_{Y} X+[X, Y]-\nabla_{X} Y-[Y, X]-[X, Y] \\
=\nabla_{Y} X-\nabla_{X} Y-[Y, X] \\
=T(Y, X)=-T(X, Y)
\end{gathered}
$$

Therefore the connection

$$
\frac{1}{2} \nabla+\frac{1}{2} \nabla^{\prime}
$$

is torsion free and

$$
\nabla=\left(\frac{1}{2} \nabla+\frac{1}{2} \nabla^{\prime}\right)+\frac{1}{2} T .
$$

Finally, suppose that

$$
\nabla=\tilde{\nabla}+\frac{1}{2} S,
$$

where $\widetilde{\nabla}$ is torsion free and

$$
\mathrm{S}: D^{1}(\mathrm{M}) \times D^{1}(\mathrm{M}) \rightarrow D^{1}(\mathrm{M})
$$

subject to

$$
S(X, Y)=-S(Y, X) .
$$

Then the torsion of $\nabla$ is the torsion of $\widetilde{\nabla}$ plus

$$
\frac{1}{2} S(X, Y)-\frac{1}{2} S(Y, X)=S(X, Y)
$$

I.e.:

$$
T=S
$$

$\Rightarrow$

$$
\tilde{\nabla}=\frac{1}{2} \nabla+\frac{1}{2} \nabla^{\prime} .
$$

Working locally, write

$$
T\left(\frac{\partial}{\partial x^{i}}, \frac{\partial}{\partial x^{j}}\right)=T_{i j}^{k} \frac{\partial}{\partial x^{k}}
$$

Then

$$
T_{i j}^{k}=\Gamma_{i j}^{k}-\Gamma_{j i}^{k}
$$

[Note: Consider the decomposition

$$
\nabla=\left(\frac{1}{2} \nabla+\frac{1}{2} \nabla^{\prime}\right)+\frac{1}{2} T .
$$

Then, in terms of connection coefficients,

$$
\left.\Gamma_{i j}^{k}=\frac{1}{2}\left(\Gamma_{i j}^{k}+r_{j i}^{k}\right)+\frac{1}{2}\left(\Gamma_{i j}^{k}-\Gamma_{j i}^{k}\right) \cdot\right]
$$

Example: Let $f \in C^{\infty}(M)$-- then

$$
\Rightarrow
$$

$$
\begin{aligned}
& \nabla^{2} f\left(\frac{\partial}{\partial x^{i}} ; \frac{\partial}{\partial x^{j}}\right)=\nabla^{2} f\left(\frac{\partial}{\partial x^{j}}, \frac{\partial}{\partial x^{i}}\right)+T\left(\frac{\partial}{\partial x^{i}} ; \frac{\partial}{\partial x^{j}}\right) f \\
& f_{; i ; j}=f_{; j ; i}+T_{i j}^{k}, k
\end{aligned}
$$

or still,

$$
\begin{aligned}
& \nabla_{j} \nabla_{i} f=\nabla_{i} \nabla_{j} f+T_{i j}^{k}{ }_{i j}^{f} \cdot \\
& \text { Let } T \in D_{q}^{0}(M)-- \text { then } \\
& \left(L_{X} T\right)\left(X_{1}, \ldots, X_{q}\right) \\
& =X\left[T\left(X_{1}, \ldots, X_{q}\right)\right] \\
& \quad-\sum_{j=1}^{q} T\left(X_{1}, \ldots, L_{X} X_{j}, \ldots, X_{q}\right)
\end{aligned}
$$

On the other hand,

$$
\begin{aligned}
& \left(\nabla_{X} T\right)\left(X_{1}, \ldots, X_{q}\right) \\
& =X\left[T\left(X_{1}, \ldots, X_{q}\right)\right] \\
& \quad-\sum_{j=1}^{q} T\left(X_{1}, \ldots, \nabla_{X} X_{j}, \ldots, X_{q}\right) .
\end{aligned}
$$

Assume: $\nabla$ is torsion free -- then

$$
L_{x} X_{j}=\left[x, x_{j}\right]=\nabla_{x} x_{j}-\nabla_{x_{j}} x
$$

Therefore

$$
\begin{aligned}
& \left(L_{X} T\right)\left(X_{1}, \ldots, X_{q}\right) \\
& =X\left[T\left(X_{1}, \ldots, X_{q}\right)\right] \\
& -\sum_{j=1}^{q} T\left(X_{1}, \ldots, \nabla_{X} X_{j}, \ldots, X_{q}\right) \\
& +\sum_{j=1}^{q} T\left(x_{1}, \ldots, \nabla_{X_{j}} x, \ldots, x_{q}\right) \\
& =\left(\nabla_{X}{ }^{T}\right)\left(X_{1}, \ldots, X_{q}\right) \\
& +\sum_{j=1}^{q} T\left(X_{1}, \ldots, \nabla_{X_{j}} X, \ldots, X_{q}\right) .
\end{aligned}
$$

[Note: If $T$ is parallel, i.e., if $\nabla T=0$, then

$$
\begin{aligned}
& \left(L_{x} T\right)\left(x_{1}, \ldots, x_{q}\right) \\
& \left.=\sum_{j=1}^{q} T\left(x_{1}, \ldots, \nabla_{X_{j}} X_{1}, \ldots, x_{q}\right) \cdot\right]
\end{aligned}
$$

Turning now to the exterior algebra $\Lambda^{*} M$, suppose that $a \in \Lambda{ }^{M} M-$ then

$$
\left(\nabla_{X}{ }^{\alpha}\right)\left(X_{1}, \ldots, X_{p}\right)
$$

$$
\begin{aligned}
=X[ & {\left[\left(x_{1}, \ldots, x_{p}\right)\right] } \\
& -\sum_{i=1}^{p} a\left(x_{1}, \ldots, \nabla_{X_{i}}, \ldots, x_{p}\right),
\end{aligned}
$$

so $\nabla_{X}{ }^{\alpha \in \Lambda}{ }^{P_{M}}$.
Observation: The following diagram

$$
\begin{array}{lll}
D_{\mathrm{P}}^{0}(\mathrm{M}) & \mathrm{\nabla}_{\mathrm{X}} & D_{\mathrm{P}}^{0}(\mathrm{M}) \\
\text { Alt } \downarrow & & \downarrow \text { Alt } \\
\Lambda^{\mathrm{P}_{\mathrm{M}}} & \vec{\nabla}_{\mathrm{X}} & \Lambda^{\mathrm{P}_{\mathrm{M}}}
\end{array}
$$

commutes. Consequently,

$$
\nabla_{X}(\alpha \wedge \beta)=\nabla_{X} \alpha \wedge \beta+\alpha \wedge \nabla_{X} \beta .
$$

Rappel: The exterior derivative

$$
\mathrm{d}: \Lambda^{\mathrm{P}_{\mathrm{M}}} \rightarrow \Lambda^{\mathrm{p}+1}{ }_{\mathrm{M}}
$$

is given by

$$
\begin{aligned}
& d a\left(x_{1}, \ldots, x_{p+1}\right) \\
= & \sum_{1 \leq i \leq p+1}(-1)^{i+1} x_{x_{i}} a\left(x_{1}, \ldots, \hat{x}_{i}, \ldots, x_{p+1}\right) \\
+ & \sum_{i<j}(-1)^{i+j_{a}}\left[\left[x_{i}, x_{j}\right], x_{1}, \ldots, \hat{x}_{i}, \ldots, \hat{x}_{j}, \ldots, x_{p+1}\right) .
\end{aligned}
$$

There is a triangle

but d $\ddagger$ Alt $\circ$. .

LEMMA Suppose that $\nabla$ is torsion free -- then on $\Lambda^{\mathrm{P}} \mathrm{M}_{\text {, }}$

$$
\text { Alt } \circ \nabla=\frac{(-1)^{\mathrm{p}}}{\mathrm{p}+1} \mathrm{~d}
$$

[Note: Under the assumption that $\nabla$ is torsion free, $\forall a \in \Lambda^{P}{ }^{M}$, we have

$$
\begin{aligned}
& d \alpha\left(x_{1}, \ldots, x_{p+1}\right) \\
= & \sum_{1 \leq i \leq p+1}(-1)^{i+1}\left(\nabla_{x_{i}}^{\alpha}\right)\left(x_{1}, \ldots, \hat{x}_{i}, \ldots, x_{p+1}\right),
\end{aligned}
$$

thus locally

$$
\text { (da) } j_{1} \cdots j_{p+1}=\sum_{a=1}^{p+1}(-1)^{a+1} \nabla_{a} \alpha_{j_{1}} \cdots \hat{j}_{a} \cdots j_{p+1}
$$

E.g., take $\mathrm{p}=1$-- then

$$
d a(\mathrm{X}, \mathrm{Y})=\nabla a(\mathrm{Y}, \mathrm{X})-\nabla a(\mathrm{X}, \mathrm{Y}),
$$

thus $\nabla a$ is symmetric iff $a$ is closed.]

FACT Let $X, Y \in \mathcal{D}^{1}(M)$ - then

$$
\nabla_{X} \circ \iota_{Y}-\iota_{Y} \circ \nabla_{X}=\iota_{\nabla_{X}}
$$

Let $I$ be a connection on LM. Suppose that $\rho$ is a representation of $\underline{G L}(\mathrm{n}, \underline{\mathrm{R}})$ on a finite dimensional vector space W . Form the vector bundle

$$
E=L M \times \underline{G L}(n, \underline{R})^{W} .
$$

Then $\Gamma$ induces a connection on $E$.
Specialize and take $W=T_{q}^{p}(n), \rho=\rho_{W}-$ then one may attach to each $X \in \mathcal{D}^{I}(M)$ a covariant derivative

$$
\nabla_{\mathrm{X}}: \mathrm{w}-\nabla_{\mathrm{q}}^{\mathrm{p}}(\mathrm{M}) \rightarrow \mathrm{w}-D_{\mathrm{q}}^{\mathrm{p}}(\mathrm{M})
$$

Locally, $\nabla_{X} T$ has the same form as a tensor of type ( $p, q$ ) except that there is one additional term, namely

$$
-w X^{a_{1} b}{ }_{a b^{T}}{ }^{i_{l} \cdots i_{p}}{ }_{j_{l} \cdots j_{q}}
$$

[Note: If

$$
\int_{-}^{T \in W-D_{q}^{p}(M)} \begin{gathered}
T^{\prime} \in W^{\prime}-D_{q^{\prime}}^{p^{\prime}}(M)
\end{gathered}
$$

then

$$
T \otimes T^{\prime} \in\left(w+w^{\prime}\right)-D_{q^{\prime}+q^{\prime}}^{p+p^{\prime}}(M)
$$

and

$$
\left.\nabla_{X}\left(T \otimes T^{\prime}\right)=\nabla_{X} T \otimes T^{\prime}+T \otimes \nabla_{X^{\prime}} T^{\prime} \cdot\right]
$$

Remark: Given $\omega \in \Lambda^{n} \mathrm{M}$, write

$$
\omega=\omega_{1} \ldots n^{d x^{1} \wedge \cdots \wedge d x^{n} .}
$$

Then

$$
\begin{aligned}
& \nabla_{X^{\omega}}=\left(\nabla_{X^{\omega}}{ }_{1} \ldots n_{n}\right) d x^{1} \wedge \cdots \wedge d x^{n} \\
& +\omega_{1} \ldots n^{\nabla} X^{d x} x^{1} \wedge \cdots \wedge d x^{n} \\
& +\cdots+\omega_{1} \cdots n^{d x^{1} \wedge \cdots \wedge \nabla_{X} d x^{n}, ~} \\
& =\left(\nabla_{X}{ }^{\omega} \ldots n\right) d x^{1} \wedge \cdots \wedge d x^{n}
\end{aligned}
$$

$$
\begin{aligned}
& =\left(x^{a} \omega_{1} \ldots n, a-x^{a} \Gamma_{a b}^{\omega_{1}} \ldots n\right) d x^{1} \wedge \cdots \wedge d x^{n} .
\end{aligned}
$$

Example: Let $T$ be the upper Levi-Civita symbol (a tensor of type ( $n, 0$ ) and weight 1) or the lower Levi-Civita symbol (a tensor of type ( $0, \mathrm{n}$ ) and weight -1) -- then $\nabla_{X} T=0$.
[To discuss the upper Levi-Civita symbol, note that

$$
\begin{aligned}
& \nabla_{X} \varepsilon^{i_{1} \cdots i_{n}} \\
& =x^{a}{ }_{\varepsilon}{ }^{i_{1} \cdots i_{n}}, a \\
& +x^{a}{ }_{\Gamma}{ }^{i_{1}}{ }_{a b}{ }^{b i_{2}} \cdots i_{n}+\cdots+x^{a}{ }_{\Gamma}{ }^{i_{n}}{ }_{a b}{ }^{i_{1}} \cdots i_{n-1} b \\
& -x^{a} r^{b}{ }_{a b}{ }^{i_{1} \cdots i_{n}} \\
& =x^{a}{ }_{\Gamma}{ }^{i_{l}}{ }_{a i_{l}}{ }^{\varepsilon_{l}}{ }^{i_{n} i_{n}}+\cdots+x^{a}{ }_{\Gamma}{ }^{i}{ }_{n i_{n}}{ }^{\varepsilon_{l}}{ }^{i_{1} i_{n}} \\
& -x^{a} \Gamma^{b}{ }_{a b^{\varepsilon}} i_{1} \cdots i_{n}
\end{aligned}
$$

$$
\begin{gathered}
\left.=x^{a}{ }^{i^{i_{l}}}{ }_{a i_{1}}+\cdots+\Gamma^{i_{n}}{ }_{a i_{n}}-\Gamma_{a b}^{b}\right) \varepsilon^{i_{l} \cdots i_{n}} \\
=0.1
\end{gathered}
$$

[Note: The terms involving three identical indices are not summed.]
Example: Let $T \in 1-D_{0}^{1}(M)--$ then

$$
\nabla_{a} T^{i}=T^{i}, a+\Gamma_{a b}^{i} T^{b}-\Gamma_{a b}^{b} T^{i}
$$

Now contract over the indices a and i to get

$$
\begin{aligned}
\nabla_{a} T^{a} & =T_{, a}^{a}+\Gamma_{a b}^{a} T^{b}-\Gamma_{a b}^{b} T^{a} \\
& =T_{, a}^{a}+\left(\Gamma_{a b}^{a}-\Gamma_{b a}^{a}\right) T^{b}
\end{aligned}
$$

hence

$$
\nabla_{\mathrm{a}^{\mathrm{T}}} \mathrm{~T}^{\mathrm{a}}=\mathrm{T}_{, \mathrm{a}}^{\mathrm{a}}
$$

provided $\nabla$ is torsion free.
There is no difficulty in extending the theory to densities of weight $r$ or twisted densities of weight $r$, hence to tensors $T$ of class I or II.
[Note: $\nabla_{X}$ respects the class of $\left.T.\right]$
Locally, $\nabla_{X} T$ has the same form as a tensor of type ( $p, q$ ) except that there is one additional term, namely

$$
-r x^{a_{T} b}{ }_{a b}{ }^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}}
$$

Reality Check If $\phi$ is a density of weight $r$ and $\psi$ is a density of weight $-r$, then $\phi \psi \in C^{\infty}(M)$ and we have

$$
\nabla_{\mathrm{a}}(\phi \psi)=\left(\nabla_{\mathrm{a}} \phi\right) \psi+\phi\left(\nabla_{\mathrm{a}} \psi\right)
$$

$$
\begin{aligned}
& =\left(\phi, a-r \Gamma_{a b^{\phi}}^{b} \psi+\phi\left(\psi, a+r \Gamma_{a b}^{b} \psi\right)\right. \\
& =\phi, a \psi+\phi \psi, a \\
& =a_{a}(\phi \psi) .
\end{aligned}
$$

Example: If $\phi$ is a scalar density of weight 1 and $\psi$ is a density of weight -1 , then $\phi \psi$ is a twisted density of weight 0 and

$$
\nabla_{a}(\phi \psi)=\partial_{a}(\phi \psi)
$$

Section 8: Parallel Transport Let $M$ be a connected $C^{\infty}$ manifold of dimension n. Suppose that

$$
\begin{aligned}
\mathrm{G} \rightarrow & \mathrm{P} \\
& \downarrow \pi \\
& \mathrm{M}
\end{aligned}
$$

is a principal bundle with structure group $G$ (which we shall take to be a Lie group) and let $\Gamma$ be a connection on $P$.

Convention: Curves are piecewise smooth.

THEOREM Let $\gamma:[0,1] \rightarrow M$ be a curve. Fix a point $p_{0} \in \pi^{-1}(\gamma(0))$-- then there is a unique curve $\gamma^{\uparrow}:[0,1] \rightarrow P$ such that (i) $\gamma^{\uparrow}(0)=p_{0}$, (ii) $\pi \circ r^{\uparrow}=\gamma$, (iii) $\dot{\gamma}^{\uparrow}(t) \in \mathbb{T}^{h}(t) \quad P(0 \leq t \leq 1)$.

It follows from the theorem that there is a diffeomorphism

$$
\tau_{\gamma}: \pi^{-1}(\gamma(0)) \rightarrow \pi^{-1}(\gamma(1))
$$

called parallel transport from $\gamma(0)$ to $\gamma(1)$.
Let $\rho$ be a representation of $G$ on a finite dimensional vector space $W$. Put

$$
\mathrm{E}=\mathrm{P} \times_{G} \mathrm{~W} .
$$

Then E is a vector bundle and there is a commutative diagram

| $\mathrm{P} \times \mathrm{W}$ | $\mathrm{pr}_{\mathrm{P}}$ | P |
| :---: | :--- | :--- |
| pro $\downarrow$ |  | $\downarrow \pi$ |
| E | $\rightarrow_{\mathrm{E}}$ | M. |

Here

$$
\pi_{E}([p, w])=\pi(p) .
$$

Let $e_{0} \in E$. Take any point $\left(p_{0}, w_{0}\right) \in \operatorname{pro}^{-1}\left(e_{0}\right)$ and define

$$
f_{w_{0}}: P \rightarrow E
$$

by

$$
f_{w_{0}}(p)=\left[p, w_{0}\right] .
$$

Set

$$
T_{e_{0}}^{h} E=\left(f_{w_{0}}\right) * T_{p_{0}}^{h} P \subset T e_{0}^{E}
$$

Then $T_{e_{0}}^{h} E$ is independent of the choice of $\left(p_{0}, w_{0}\right)$ and is called the horizontal subspace of $T_{e_{0}} E$ (per the choice of $\Gamma$ ).

THEOREM Let $\gamma:[0,1] \rightarrow M$ be a curve. Fix a point $e_{0} \in \pi_{E}^{-l}(\gamma(0))$-- then there is a unique curve $\gamma^{\uparrow}:[0,1] \rightarrow E$ such that (i) $\gamma^{\uparrow}(0)=e_{0}$, (ii) $\pi_{E} \circ \gamma^{\uparrow}=\gamma$, (iii) $\dot{\gamma}^{\uparrow}(t) \in \mathbb{r}^{\mathrm{h}}(\mathrm{t}) \mathrm{E}(0 \leq t \leq 1)$.

It follows from the theorem that there is an isomorphism

$$
\left.\tau_{\gamma}: \pi_{E}^{-1}(\gamma(1))\right) \rightarrow \pi_{E}^{-1}(\gamma(1))
$$

called parallel transport from $\gamma(0)$ to $\gamma(1)$.
Denote by $\nabla^{\Gamma}$ the connection on $E$ determined by $\Gamma$. Fix $x \in M$ and let $X \in D^{l}$ (M). Choose any curve $\gamma:[-\varepsilon, \varepsilon] \rightarrow M$ such that $\gamma(0)=x$ and $\dot{\gamma}(0)=x_{x}$. Modify the
notation and write

$$
\tau_{h}: \pi_{E}^{-1}(\gamma(0)) \rightarrow \pi_{E}^{-1}(\gamma(h))
$$

for the parallel transport from $\gamma(0)$ to $\gamma(h)$.
FACT $\forall \mathbf{s} \in \sec (\mathrm{E})$,

$$
\left.\nabla_{X}^{\Gamma} s\right|_{X}=\lim _{h \rightarrow 0} \frac{1}{h}\left[\tau_{h}^{-1}(s(r(h)))-s(r(0))\right]
$$

Specialize to $P=L M$ and $W=T_{q}^{P}(n)$-- then, with the obvious choice for $\rho$, these generalities are applicable to the sections of $T_{q}^{P}(M)$, i.e., to $D_{q}^{p}(M)$, or, replacing $\rho$ by $\rho_{w}$, to the sections of $T_{q}^{p}(M) \otimes L^{W}(M)$, i.e., to $w-D_{q}^{p}(M)$.

Section 9: Curvature Let $M$ be a connected $C^{\infty}$ manifold of dimension $n$. Definition: Let $\nabla$ be a connection on TM -- then the curvature of $\nabla$ is the map

$$
\mathrm{R}: D^{1}(\mathrm{M}) \times D^{1}(\mathrm{M}) \rightarrow \operatorname{Hom}_{\underline{R}}\left(D^{1}(\mathrm{M}), D^{1}(\mathrm{M})\right)
$$

defined by

$$
R(X, Y)=\nabla_{X} \nabla_{Y}-\nabla_{Y} \nabla_{X}-\nabla_{[X, Y]}
$$

Obviously,

$$
R(X, Y)=-R(Y, X)
$$

It is also easy to check that

$$
R(f X, g Y) h Z=f g h R(X, Y) Z \quad\left(f, g, h \in C^{\infty}(M)\right) .
$$

Therefore the assigmment

$$
\left[\begin{array}{l}
D_{1}(\mathrm{M}) \times D^{\mathrm{l}}(\mathrm{M}) \times D^{1}(\mathrm{M}) \times D^{1}(\mathrm{M}) \rightarrow C^{\infty}(\mathrm{M}) \\
(\Lambda, \mathrm{Z}, \mathrm{X}, \mathrm{Y})
\end{array}\right) \mathrm{\Lambda(R(X,Y)Z)}
$$

is a tensor, the curvature tensor attached to $\nabla$.
Remark: The Lie derivative $L_{X} \nabla$ of the connection $\nabla$ is the $C^{\infty}(M)$-multilinear map

$$
\left[\begin{array}{r}
D^{1}(\mathrm{M}) \times D^{1}(\mathrm{M}) \rightarrow D^{1}(\mathrm{M}) \\
(\mathrm{Y}, \mathrm{Z}) \rightarrow\left(L_{X} \nabla\right)(\mathrm{Y}, \mathrm{Z})
\end{array}\right.
$$

where

$$
\left(L_{X} \nabla\right)(Y, Z)=L_{X}\left(\nabla_{Y} Z\right)-\nabla_{L_{X}} Y^{Z}-\nabla_{Y} L_{X} Z
$$

Operationally,

$$
\begin{array}{r}
\left.\left(L_{X} \nabla\right)(Y,-)=\left[L_{X}, \nabla_{Y}\right]-\nabla_{[X, Y]}\right] \\
=R(X, Y)+\left[L_{X}-\nabla_{X}, \nabla_{Y}\right]
\end{array}
$$

[Note: A vector field $X$ is said to be an infinitesimal affine transformation if $\left.L_{X} \nabla=0.\right]$

Let $\nabla$ be a connection on TM -- then $\nabla$ is flat provided each $x \in M$ admits a connected neighborhood $U$ such that $\forall y \in M$, the parallel transport $\tau: T X_{X} \rightarrow T Y^{M}$ is independent of the curve joining $x$ and $y$.

FACT $\nabla$ is flat iff its curvature tensor is identically zero. Convention: Given a $C^{\infty}(\mathrm{M})$-multilinear map

$$
\frac{\mathrm{C}}{\mathrm{~K}: D^{I}(\mathrm{M}) \times \cdots \times D^{1}(\mathrm{M})} \rightarrow D^{1}(\mathrm{M})
$$

define

$$
\nabla_{\mathrm{X}} \mathrm{~K}: \stackrel{\mathrm{D}}{D^{1}(\mathrm{M}) \times \cdots \times D^{1}(\mathrm{M})} \rightarrow D^{1}(\mathrm{M})
$$

by

$$
\begin{aligned}
\left(\nabla_{X} K\right)\left(X_{1}, \ldots, X_{q}\right) & =\nabla_{X}\left(K\left(X_{1}, \ldots, X_{q}\right)\right) \\
& -\sum_{j=1}^{q} K\left(x_{1}, \ldots, \nabla_{X} x_{j}, \ldots, x_{q}\right) .
\end{aligned}
$$

Example: Suppose that $\nabla$ is a torsion free connection on TM. Let $X$ be a vector field -- then $\nabla X \in \mathcal{D}_{1}^{1}$ (M) or, equivalently,

$$
\mathrm{VX}_{\mathrm{C}^{\infty}(\mathrm{M})}\left(D^{1}(\mathrm{M}), D^{1}(\mathrm{M})\right),
$$

where

$$
\nabla \mathrm{X}(\mathrm{Y})=\nabla_{\mathrm{Y}} \mathrm{X} .
$$

Assume now that X is an infinitesimal affine transformation, thus $L_{X} \nabla=0$, hence

$$
R(X, Y) Z=\left[\nabla_{X}-L_{X}, \nabla_{Y}\right] Z
$$

$$
\begin{aligned}
& =\left(\nabla_{X}-L_{X}\right) \nabla_{Y} Z-\nabla_{Y}\left(\nabla_{X}-L_{X}\right) Z \\
& =\nabla_{\nabla_{Y}} Z^{X}-\nabla_{Y} \nabla_{Z} X .
\end{aligned}
$$

On the other hand,

$$
\begin{gathered}
\left(\nabla_{Y} \nabla X\right) Z=\nabla_{Y}(\nabla X(Z))-\nabla X\left(\nabla_{Y} Z\right) \\
=\nabla_{Y} \nabla_{Z} X-\nabla_{\nabla_{Y}} Z^{X} .
\end{gathered}
$$

Therefore

$$
R(X, Y) Z+\left(\nabla_{Y} \nabla X\right) Z=0
$$

In particular:

$$
\begin{aligned}
\mathrm{R}(\mathrm{Y}, \mathrm{X}) \mathrm{X} & =-\mathrm{R}(\mathrm{X}, \mathrm{Y}) \mathrm{X} \\
=\left(\nabla_{\mathrm{Y}} \nabla \mathrm{X}\right) \mathrm{X} & =\nabla_{\mathrm{Y}} \nabla_{\mathrm{X}} \mathrm{X}-\nabla \mathrm{X}\left(\nabla_{\mathrm{Y}} \mathrm{X}\right) \\
& =\nabla_{\mathrm{Y}} \nabla_{\mathrm{X}} \mathrm{X}-(\nabla \mathrm{X})^{2} \mathrm{Y},
\end{aligned}
$$

$(\nabla \mathrm{X})^{2}$ being the composite $\nabla \mathrm{X} \circ \nabla \mathrm{X}$.
FACT Suppose that $\nabla$ is a torsion free connection on TM. Let $X$ be an infinitesimal affine transformation -- then $L_{X} \nabla^{k} R=0(k=1,2, \ldots)$.

IFEMMA (Bianchi's First Identity) We have

$$
\begin{aligned}
& R(X, Y) Z+R(Y, Z) X+R(Z, X) Y \\
& =T(T(X, Y), Z)+\left(\nabla_{X} T\right)(Y, Z) \\
& \quad+T(T(Y, Z), X)+\left(\nabla_{Y} T\right)(Z, X) \\
& \\
& +T(T(Z, X), Y)+\left(\nabla_{Z} T\right)(X, Y) .
\end{aligned}
$$

[Note: Consequently, if $\nabla$ is torsion free, then

$$
R(X, Y) Z+R(Y, Z) X+R(Z, X) Y=0 .]
$$

Write

$$
\begin{aligned}
& \left(\nabla_{Z} R\right)(X, Y)=\left[\nabla_{Z^{\prime}} R(X, Y)\right] \\
& \quad-R\left(\nabla_{Z} X, Y\right)-R\left(X, \nabla_{Z} Y\right),
\end{aligned}
$$

the bracket standing for a commutator of operators on vector fields.
[Note: To see where this is coming from, think of $R$ as an element of

$$
\operatorname{Hom}_{C^{\infty}(\mathrm{M})}\left(D^{1}(\mathrm{M}) \times D^{1}(\mathrm{M}) \times D^{I}(\mathrm{M}), D^{I}(\mathrm{M})\right) .
$$

Then, in view of the foregoing convention,

$$
\begin{aligned}
& \left(\nabla_{Z} R\right)(W, X, Y)=\nabla_{Z}(R(X, Y) W) \\
- & R\left(\nabla_{Z} W, X, Y\right)-R\left(W, \nabla_{Z} X, Y\right)-R\left(W, X, \nabla_{Z} Y\right) \\
= & {\left[\nabla_{Z}, R(X, Y)\right](W) } \\
& \left.-R\left(W, \nabla_{Z} X, Y\right)-R\left(W, X, \nabla_{Z} Y\right) \cdot\right]
\end{aligned}
$$

LEMMA (Bianchi's Second Identity) We have

$$
\begin{aligned}
& \left(\nabla_{Z} R\right)(X, Y)+R(T(X, Y), Z) \\
& +\left(\nabla_{X} R\right)(Y, Z)+R(T(Y, Z), X) \\
& +\left(\nabla_{Y} R\right)(Z, X)+R(T(Z, X), Y) \\
& =0 \text {. }
\end{aligned}
$$

[Note: Consequently, if $\nabla$ is torsion free, then

$$
\left.\left(\nabla_{Z} R\right)(X, Y)+\left(\nabla_{X} R\right)(Y, Z)+\left(\nabla_{Y} R\right)(Z, X)=0 .\right]
$$

Since

$$
\mathrm{R}(\mathrm{X}, \mathrm{Y}) \in \mathrm{Hom}_{\mathrm{C}_{(\mathrm{M})}^{\infty}}\left(\mathcal{D}^{1}(\mathrm{M}), D^{l}(\mathrm{M})\right) \approx D_{1}^{1}(\mathrm{M}),
$$

there exists a unique derivation

$$
\mathrm{D}_{\mathrm{R}(\mathrm{X}, \mathrm{Y})}: D(\mathrm{M}) \rightarrow D(\mathrm{M})
$$

which is zero on $C^{\infty}(M)$ and equals $R(X, Y)$ on $D^{1}(M)$.

LEMMA (The Ricci Identity) Let $T \in D_{q}^{p}(M)$-- then

$$
\begin{aligned}
& \nabla^{2} T(-, X, Y)-\nabla^{2} T(-, Y, X) \\
= & \left(-D_{R(X, Y)}+\nabla_{T(X, Y)}\right) T,
\end{aligned}
$$

where $\nabla_{T(X, Y)}$ is the covariant derivative at the torsion $T(X, Y)$ of $\nabla$.
[We have

$$
\begin{aligned}
& {\left[\begin{array}{l}
\nabla^{2} T(-, X, Y)=\nabla_{Y}\left(\nabla_{X} T\right)-\nabla_{\nabla_{Y}} X^{T} \\
\nabla^{2} T(-, Y, X)=\nabla_{X}\left(\nabla_{Y} T\right)-\nabla_{\nabla_{X}} Y^{T}
\end{array}\right.} \\
& \Rightarrow \\
& \quad \nabla^{2} T(-, X, Y)-\nabla^{2} T(-, Y, X) \\
& = \\
& \left(\nabla_{Y} \nabla_{X}-\nabla_{X} \nabla_{Y}\right) T+\left(\nabla_{\nabla_{X} Y}-\nabla_{\nabla_{Y} X}\right) T
\end{aligned}
$$

$$
\begin{aligned}
= & \left(\nabla_{Y} \nabla_{X}-\nabla_{X} \nabla_{Y}+\nabla_{[X, Y]}\right) T \\
& +\left(\nabla_{\nabla_{X}}-\nabla_{Y} X-[X, Y]\right) T \\
= & \left.\left(-D_{R(X, Y)}+\nabla_{T(X, Y)}\right) T .\right]
\end{aligned}
$$

Remark: Let $T \in D_{q}^{0}(M)$-- then

$$
\begin{aligned}
& \left(-D_{R(X, Y)} T\right)\left(X_{1}, \ldots, X_{q}\right) \\
= & \sum_{j=1}^{q} T\left(X_{1}, \ldots, R(X, Y) X_{j}, \ldots, X_{q}\right)
\end{aligned}
$$

So, if $\nabla$ is torsion free, then

$$
\begin{gathered}
\nabla^{2} T\left(X_{1}, \ldots, X_{q^{\prime}}, X, Y\right)-\nabla^{2} T\left(X_{1}, \ldots, X_{q}, Y, X\right) \\
\quad=\sum_{j=1}^{q} T\left(X_{1}, \ldots, R(X, Y) X_{j}, \ldots, X_{q}\right)
\end{gathered}
$$

Working locally, write

$$
R\left(\frac{\partial}{\partial x^{k}}, \frac{\partial}{\partial x^{\ell}}\right) \frac{\partial}{\partial x^{j}}=R_{j k \ell}^{i} \frac{\partial}{\partial x^{i^{\prime}}}
$$

thus

$$
\begin{aligned}
R_{j k \ell}^{i} & =R\left(d x^{i}, \frac{\partial}{\partial x^{j}}, \frac{\partial}{\partial x^{k}} \frac{\partial}{\partial x^{\ell}}\right) \\
& =d x^{i}\left(R\left(\frac{\partial}{\partial x^{k}}, \frac{\partial}{\partial x^{\ell}}\right) \frac{\partial}{\partial x^{j}}\right) \\
& =d x^{i}\left(\left(\nabla_{k} \nabla_{\ell}-\nabla_{\ell} \nabla_{k}\right) \frac{\partial}{\partial x^{j}}\right)
\end{aligned}
$$

$$
=\Gamma_{\ell j, k}^{i}-\Gamma_{k j, \ell}^{i}+\Gamma_{\ell j}^{\Gamma_{k a}^{i}}-\Gamma_{k j}^{a} \Gamma_{l a}^{i} .
$$

And

$$
R_{j k \ell}^{i}=-R_{j \ell k}^{i} .
$$

Curvature Formulas Assume that $\nabla$ is torsion free.
Bianchi's First Identity:

$$
R_{j k \ell}^{i}+R_{k \ell j}^{i}+R_{\ell j k}^{i}=0 .
$$

## Bianchi's Second Identity:

$$
R_{j k \ell ; m}^{i}+R_{j \ell m ; k}^{i}+R_{j m k ; \ell}^{i}=0 .
$$

One can also write down local expressions for the Ricci identity.
Example: Let $X \in D^{l}(M)$, say $X=X^{j} \frac{\partial}{\partial x^{j}}-$ then $\nabla^{2} X \in D_{2}^{1}(M)$ and

$$
\begin{aligned}
& \nabla_{b} \nabla_{a} x^{i}-\nabla_{a} \nabla_{b} x^{i} \\
& =x_{; a ; b}^{i}-X_{; b ; a}^{i} \\
& =\nabla^{2} x\left(d x^{i}, \frac{\partial}{\partial x^{a}}, \frac{\partial}{\partial x^{b}}\right)-\nabla^{2} x\left(d x^{i}, \frac{\partial}{\partial x^{b}}, \frac{\partial}{\partial x^{a}}\right) \\
& =-d x^{i}\left(R\left(\frac{\partial}{\partial x^{a}}, \frac{\partial}{\partial x^{b}}\right) x\right)+d x^{i}\left(\nabla_{T\left(\frac{\partial}{\partial x^{a}}, \frac{\partial}{\partial x^{b}}\right)}^{X}\right) \\
& =-d x^{i}\left(X^{j} R\left(\frac{\partial}{\partial x^{a}}, \frac{\partial}{\partial x^{b}}\right) \frac{\partial}{\partial x^{j}}\right) \\
& +d x^{i}\left(\nabla_{T}{ }_{a b} \frac{\partial}{\partial x^{k}}\right)
\end{aligned}
$$

$$
\begin{aligned}
&=-d x^{i}\left(x^{j}{ }_{R}^{k}{ }_{j a b} \frac{\partial}{\partial x^{k}}\right) \\
&+d x^{i}\left(T^{k}{ }_{a b} \nabla_{k} X\right) \\
&=-x^{j^{\prime} R^{i}}{ }_{j a b}+T^{k}{ }_{a b} d x^{i}\left(\nabla_{k} X\right) \\
&= R^{i}{ }_{j b a} X^{j}+T_{a b}^{k} X_{; k}^{i} .
\end{aligned}
$$

Consider $R$ as an element of $D_{3}^{1}(M)$-- then the Ricci tensor Ric is the image of $R$ under the contraction $C_{2}^{l}: D_{3}^{1}(M) \rightarrow D_{2}^{0}(M)$ of the second slot in the covariant index.

Agreeing to write $R_{j \ell}$ in place of $\operatorname{Ric}\left(\frac{\partial}{\partial x^{j}}, \frac{\partial}{\partial x^{\prime}}\right)$, it follows that

$$
\begin{aligned}
& R_{j \ell}=R_{j i \ell}^{i} \\
= & \Gamma_{\ell j, i}^{i}-\Gamma_{i j, \ell}^{i}+\Gamma_{\ell j}^{a} \Gamma_{i a}^{i}-\Gamma_{i j}^{a} \Gamma_{\ell a}^{i} .
\end{aligned}
$$

Example: Since covariant differentiation commutes with contraction, we have

$$
\begin{aligned}
R_{j \ell ; i}=\nabla_{i} R_{j \ell} & =\nabla_{i}\left(C_{2}^{1} R\right) \\
& =\left(C_{2 \ell}^{1} \nabla_{i}\right)_{j \ell} \\
& =R_{j a \ell ; i}^{a}
\end{aligned}
$$

But

$$
\begin{aligned}
& R_{j a \ell ; i}^{a}+R_{j \ell i ; a}^{a}+R_{j i a ; \ell}^{a}=0 \\
& \Rightarrow \\
& R_{j \ell i ; a}^{a}=-R_{j a \ell ; i}^{a}-R_{j i a ; \ell}^{a}
\end{aligned}
$$

$$
\begin{aligned}
& =R_{j a i ; \ell}^{a}-R_{j a \ell ; i}^{a} \\
& =\nabla_{\ell} R_{j i}-\nabla_{i} R_{j \ell}
\end{aligned}
$$

In general, the Ricci tensor is not symmetric:

$$
\operatorname{Ric}(X, Y) \neq \operatorname{Ric}(Y, X)
$$

Notation: Define [Ric] $\in \Lambda^{2} M$ by

$$
[\operatorname{Ric}](X, Y)=\operatorname{Ric}(X, Y)-\operatorname{Ric}(Y, X) .
$$

Bearing in mind that $R(X, Y) \in D_{1}^{1}(M)$, put

$$
\operatorname{tr}(\mathrm{R}(\mathrm{X}, \mathrm{Y}))=\mathrm{C}_{1}^{1} \mathrm{R}(\mathrm{X}, \mathrm{Y}) \in \mathrm{C}^{\infty}(\mathrm{M})
$$

where

$$
C_{1}^{1}: D_{1}^{1}(M) \rightarrow C^{\infty}(M)
$$

is the contraction.

LEEMMA If $\nabla$ is torsion free, then

$$
[R i c](X, Y)=\operatorname{tr}(R(X, Y)) .
$$

[In fact,

$$
\begin{aligned}
{[R i c] } & \left(\frac{\partial}{\partial x^{\prime}}, \frac{\partial}{\partial x^{\ell}}\right) \\
& =R_{j \ell}-R_{\ell j} \\
& =R_{j i \ell}^{i}-R_{\ell i j}^{i}
\end{aligned}
$$

10. 

On the other hand,

$$
\begin{aligned}
& R_{k j \ell}^{i}=d x^{i}\left(R\left(\frac{\partial}{\partial x^{j}}, \frac{\partial}{\partial x^{\ell}}\right) \frac{\partial}{\partial x^{j}}\right) \\
& \Rightarrow \quad \operatorname{tr}\left(R\left(\frac{\partial}{\partial x^{j}}, \frac{\partial}{\partial x^{\ell}}\right)\right)=R_{i j \ell}^{i} \\
&=-R_{j \ell i}^{i}-R_{\ell i j}^{i} \\
&\left.=R_{j i \ell}^{i}-R_{\ell i j}^{i} \cdot\right]
\end{aligned}
$$

Observation: We have

$$
\begin{aligned}
& R^{i}{ }_{i j \ell} \\
& =\Gamma_{\ell i, j}^{i}-\Gamma_{j i, \ell}^{i}+\Gamma_{\ell i^{a}} \Gamma_{j a}^{i}-\Gamma_{j i}^{a} \Gamma^{i}{ }_{l a} \\
& =\Gamma_{\ell i, j}^{i}-\Gamma_{j i, \ell}^{i}+\Gamma_{\ell i^{a}} \Gamma_{j a}^{i}-\Gamma_{j a}^{i} \Gamma^{\mathrm{a}}{ }_{\ell i} \\
& =\Gamma_{\ell i, j}^{i}-\Gamma_{j i, \ell}^{i} \\
& =\frac{\partial \Gamma^{i} \ell i}{\partial x^{j}}-\frac{\partial \Gamma^{i} j i}{\partial x^{l}} .
\end{aligned}
$$

So, if $\exists a C^{\infty}$ function $f$ of the coordinates such that

$$
\frac{\partial f}{\partial x^{k}}=r_{k i}^{i}
$$

then

$$
\begin{aligned}
& {\left[\begin{array}{l}
\frac{\partial^{2} f}{\partial x^{l} \partial x^{j}}=\frac{\partial \Gamma^{i} \ell i}{\partial x^{j}} \\
\frac{\partial^{2} f}{\partial x^{j} \partial x^{l}}=\frac{\partial \Gamma^{i} j i}{\partial x^{l}} \\
\Rightarrow \quad R_{i j \ell}^{i}=0 .
\end{array}\right.}
\end{aligned}
$$

Thus, on this chart, Ric is symmetric.
Maintaining the assumption that $\nabla$ is torsion free, let us globalize these considerations.

LEMMA Suppose that $\phi$ is a strictly positive density of weight 1 such that $\nabla \phi=0$-- then Ric is symmetric.
[In fact,

$$
0=\nabla_{\mathrm{a}} \phi=\phi, \mathrm{a}-\mathrm{r}_{\mathrm{ab}}{ }^{\phi}
$$

$\Rightarrow$

$$
\left.\Gamma_{a b}^{b}=\frac{\partial}{\partial x^{a}} \log \phi \cdot\right]
$$

[Note: This can also be read the other way in that the relation

$$
\Gamma_{a b}^{b}=\frac{\partial}{\partial x^{a}} \log \phi
$$

obviously implies that $\nabla \phi=0$.

By way of notation, put

$$
\Gamma_{a}=\Gamma_{a b}^{b}
$$

Then

$$
\operatorname{tr}\left(R\left(\frac{\partial}{\partial x^{a}}, \frac{\partial}{\partial x^{b}}\right)\right)=\Gamma_{b, a}-\Gamma_{a, b} .
$$

If now $\phi$ is a density of weight $r$, then

$$
\begin{gathered}
\nabla_{a} \phi=\partial_{a} \phi-r \Gamma_{a} \phi \\
= \\
\nabla_{b} \nabla_{a} \phi=\partial_{b} \nabla_{a} \phi-r \Gamma_{b} \nabla_{a} \phi \\
=\partial_{b} \partial_{a} \phi-r \partial_{b}\left(\Gamma_{a} \phi\right)-r \Gamma_{b}\left(\partial_{a} \phi-r \Gamma_{a} \phi\right) \\
=\partial_{b} \partial_{a} \phi-r \phi \Gamma_{a, b}-r \Gamma_{a} \partial_{b} \phi-r \Gamma_{b} \partial_{a} \phi+r^{2} \Gamma_{b} \Gamma_{a} \phi \cdot
\end{gathered}
$$

Therefore

$$
\begin{aligned}
\nabla_{b} \nabla_{a} \phi & -\nabla_{a} \nabla_{b} \phi \\
& =r\left(\Gamma_{b, a}-\Gamma_{a, b}\right) \phi \\
= & r\left(\operatorname{tr}\left(R\left(\frac{\partial}{\partial x^{a}}, \frac{\partial}{\partial x^{b}}\right)\right) \phi\right.
\end{aligned}
$$

Section 10: Semiriemannian Manifolds Let $M$ be a connected $C^{\infty}$ manifold of dimension n .

Definition: A semiriemannian structure on M is a symmetric tensor $\mathrm{g} \in \mathrm{D}_{2}^{0}(\mathrm{M})$ such that $\forall x$,

$$
g_{x}: T_{x} M \times T_{x}^{M} \rightarrow \underline{R}
$$

is a scalar product.
[Note: A riemannian structure on $M$ is a positive definite semiriemannian structure.]

Notation: $M$ is the set of semiriemannian structures on $M$, thus

$$
\underline{M}=\underset{0 \leq k \leq n^{\underline{M}}}{M_{k, n-k}},
$$

where $\underline{M}_{k, n-k}$ is the set of semiriemannian structures on $M$ of signature ( $k, n-k$ )
(so $\underline{M}_{0, n}$ is the set of riemannian structures on $M$ ).
Let $g \in \mathbb{M}$-- then one may attach to $g$ its orthonormal frame bundle

[Note: Therefore LM(g) is a reduction of LM and the set of reductions of LM per the inclusion $\underline{O}(k, n-k) \rightarrow \underline{G}(n, R)$ is in a one-to-one correspondence with $M_{k, n-k} \cdot$ ]

Rappel: LM is either connected or has two components.

- $M$ is nonorientable if LM is connected.
- $M$ is orientable if LM has two components.
[Note: If $M$ is orientable, then the components of LM are called orientations and to orient $M$ is to make a choice of one of them, in which case $M$ is said to
be oriented. Agreeing to write

$$
\mathrm{LM}=\mathrm{LM}^{+} \Perp \mathrm{LM}^{-},
$$

it follows that there are reductions

$$
\begin{aligned}
\mathrm{Gu}_{0}(\mathrm{n}, \underline{\mathrm{R}}) & \rightarrow \\
& \not \mathrm{M}^{ \pm} \\
& \downarrow \pi \\
& \left.\mathrm{M}_{\mathrm{H}}\right]
\end{aligned}
$$

Remark: Let $g \in M_{k, n-k}$.

- If $\mathrm{k}=0$ or $\mathrm{k}=\mathrm{n}$, then $\mathrm{LM}(\mathrm{g})$ has at most two components. In the presence of an orientation $\mu, L M(g)$ admits a reduction

$$
\begin{aligned}
\underline{S O}(\mathrm{n}) & \rightarrow \quad \mu \mathrm{M}(\mathrm{~g}) \\
& \downarrow \pi \\
& M
\end{aligned}
$$

to the oriented orthonormal frame bundle.

- If $0<\mathrm{k}<\mathrm{n}$, then $\mathrm{LM}(\mathrm{g})$ has at most four components. In the presence of an orientation $\mu, L M(g)$ admits a reduction

$$
\begin{aligned}
\underline{S O}(k, n-k) & \quad \mu \mathrm{M}(\mathrm{~g}) \\
& \psi \pi \\
& M
\end{aligned}
$$

to the oriented, orthonormal frame bundle and in the presence of an orientation $\mu$ plus a time orientation $T, L M(g)$ admits a reduction

$$
\begin{aligned}
\mathrm{SO}_{0}(\mathrm{k}, \mathrm{n}-\mathrm{k}) & \rightarrow \quad \mu_{\mathrm{T}}^{\mathrm{LM}(\mathrm{~g})} \\
& \downarrow \pi \\
& \mathrm{M}
\end{aligned}
$$

to the oriented, time oriented, orthonormal frame bundle.

Given $g \in \mathbb{M}$, a connection $\nabla$ on $T M$ is said to be a $\underline{g-c o n n e c t i o n ~ i f ~} \nabla g=0$, i.e., if $\forall X, Y, Z \in D^{l}(M)$,

$$
X g(Y, Z)=g\left(\nabla_{X} Y, Z\right)+g\left(Y, \nabla_{X} Z\right)
$$

Among all g-connections, there is exactly one with zero torsion, the metric connection, its defining property being the relation

$$
\begin{aligned}
& g\left(\nabla_{X} Y, Z\right) \\
= & \frac{1}{2}[X g(Y, Z)+Y g(Z, X)-Z g(X, Y) \\
+ & g([X, Y], Z)-g([X, Z], Y)-g([Y, Z], X) \cdot]
\end{aligned}
$$

FACT Every connection on IM(g) extends uniquely to a connection on LM, these extensions being precisely the g-connections.

Let con ${ }_{g}$ TM stand for the set of $g$-connections on TM.
Denote by $D_{2}^{1}(M)$ the subspace of $D_{2}^{1}(M)$ consisting of those $Y$ such that $\forall X, Y, Z \in \mathcal{D}^{1}(M)$,

$$
g(\mathrm{Y}(\mathrm{X}, \mathrm{Y}), \mathrm{Z})+\mathrm{g}(\mathrm{Y}, \mathrm{Y}(\mathrm{X}, \mathrm{Z}))=0 .
$$

- Let $\nabla^{\prime}, \nabla^{\prime \prime} \in \operatorname{con}_{\mathrm{g}} \mathrm{TM}$-- then the assignment

$$
\left[\begin{array}{l}
D_{1}(\mathrm{M}) \times D^{\perp}(\mathrm{M}) \times D^{\perp}(\mathrm{M}) \rightarrow \mathrm{C}^{\infty}(\mathrm{M}) \\
(\Lambda, \mathrm{X}, \mathrm{Y}) \rightarrow \Lambda\left(\nabla_{\mathrm{X}}^{\mathrm{Y}}-\nabla_{\mathrm{X}}^{\prime \prime \mathrm{Y}}\right)
\end{array}\right.
$$

defines an element of $D_{2}^{1}(M) g$.
[In fact,

$$
g\left(\nabla_{X}^{\prime} \mathrm{Y}-\nabla_{\mathrm{X}}^{\prime \prime} \mathrm{Y}, \mathrm{Z}\right)+\mathrm{g}\left(\mathrm{Y}, \nabla_{\mathrm{X}}^{\prime} \mathrm{Z}-\nabla_{\mathrm{X}}^{\mathrm{Z}}\right)
$$

$$
\begin{aligned}
& =g\left(\nabla_{X}^{\prime} Y, Z\right)+g\left(Y, \nabla_{X}^{\prime} Z\right) \\
& \quad \quad-g\left(\nabla_{X}^{\prime \prime} Y, Z\right)-g\left(Y, \nabla_{X}^{\prime \prime Z}\right) \\
& = \\
& X g(Y, Z)-X g(Y, Z) \\
& =
\end{aligned}
$$

- Let $\nabla \in C o n_{g} T M$ - then $\forall Y \in D_{2}^{1}(M) g$, the assigmment

$$
D^{1}(\mathrm{M}) \times D^{1}(\mathrm{M}) \rightarrow \nabla_{X} \mathrm{Y}+\mathrm{Y}(\mathrm{X}, \mathrm{Y})
$$

is a g-connection.
[In fact,

$$
\begin{aligned}
& g\left(\nabla_{X} Y+Y(X, Y), Z\right)+g\left(Y, \nabla_{X} Z+Y(X, Z)\right) \\
& =g\left(\nabla_{X} Y, Z\right)+g\left(Y, \nabla_{X} Z\right) \\
& \quad+g(Y(X, Y), Z)+g(Y, Y(X, Z)) \\
& = \\
& \quad X g(Y, Z) .]
\end{aligned}
$$

Scholium: cong ${ }_{\mathrm{g}} \mathrm{TM}$ is an affine space with translation group $D_{2}^{1}(\mathrm{M}) \mathrm{g}^{\text {. }}$
[The action $\nabla \cdot \Psi=\nabla+\Psi$ is free and transitive.]
Notation: $g^{b}: D^{l}(M) \rightarrow D^{l}(M)$ is the arrow defined by the rule

$$
g^{b} X(Y)=g(X, Y)
$$

It is an isomorphism and one writes $g^{\#}$ in place of $\left(g^{b}\right)^{-1}$.
Example: The gradient grad $f$ of a function $f \in C^{\infty}(M)$ is $g^{\#}(d f)$. So, $\forall X \in \mathcal{D}^{1}(M)$,

$$
g(\operatorname{grad} f, X)=g\left(g^{\#}(d f), X\right)
$$

$$
\begin{aligned}
& =g^{b}\left(g^{\#}(d f)\right)(X) \\
& =d f(X) \\
& =x f
\end{aligned}
$$

Example: Let $\nabla$ be the metric connection -- then $\forall \omega \in D_{1}(M)$,

$$
\nabla \omega=\frac{1}{2}\left(L_{g^{\#} \omega} g-d \omega\right)
$$

[Write

$$
\nabla \omega(X, Y)=\frac{1}{2}(\nabla \omega(X, Y)+\nabla \omega(Y, X))+\frac{1}{2}(\nabla \omega(X, Y)-\nabla \omega(Y, X)) .
$$

Then

$$
\left[\begin{array}{rl}
\nabla \omega(\mathrm{X}, \mathrm{Y}) & =\mathrm{Y} \omega(\mathrm{X})-\omega\left(\nabla_{\mathrm{Y}} \mathrm{X}\right) \\
\nabla \omega(\mathrm{Y}, \mathrm{X}) & =\mathrm{X} \omega(\mathrm{Y})-\omega\left(\nabla_{\mathrm{X}} \mathrm{Y}\right)
\end{array}\right.
$$

Therefore

$$
\nabla \omega(X, Y)-\nabla \omega(Y, X)=-d \omega(X, Y) .
$$

To discuss the sum, let $K=g^{\#} \omega-$ then $\forall Z \in D^{1}(M)$,

$$
\begin{aligned}
\omega(Z) & =g^{b} g^{\#} \omega(Z) \\
& =g^{b} K(Z)=g(K, Z)
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& \nabla \omega(\mathrm{X}, \mathrm{Y})+\nabla \omega(\mathrm{Y}, \mathrm{X}) \\
= & \mathrm{X} \omega(\mathrm{Y})+\mathrm{Y} \omega(\mathrm{X})-\omega\left(\nabla_{\mathrm{X}} \mathrm{Y}+\nabla_{\mathrm{Y}} \mathrm{X}\right) \\
= & \mathrm{Xg}(\mathrm{~K}, \mathrm{Y})+\mathrm{Yg}(\mathrm{~K}, \mathrm{X})-\mathrm{g}\left(\mathrm{~K}, \nabla_{\mathrm{X}} \mathrm{Y}+\nabla_{\mathrm{Y}} \mathrm{X}\right) .
\end{aligned}
$$

But

$$
\left(L_{K} g\right)(X, Y)=K g(X, Y)-g([K, X], Y)-g(X,[K, Y])
$$

$$
\begin{aligned}
&= K g(X, Y)-g\left(\nabla_{K} X, Y\right)-g\left(X, \nabla_{K} Y\right) \\
&+g\left(\nabla_{X} K, Y\right)+g\left(X, \nabla_{Y} K\right) \\
&= g\left(\nabla_{X} K, Y\right)+g\left(X, \nabla_{Y} K\right) \\
&=X g(K, Y)-g\left(K, \nabla_{X} Y\right)+Y g(X, K)-g\left(\nabla_{Y} X, K\right) \\
&=\left.X g(K, Y)+Y g(K, X)-g\left(K, \nabla_{X} Y+\nabla_{Y} X\right) \cdot\right]
\end{aligned}
$$

FACT Fix $\varphi \in C^{\infty}(M): \varphi>0$ and put $\tilde{g}=\varphi g$. Let

$$
\left.\right|_{-} ^{\nabla} \begin{array}{ll}
\tilde{\nabla} & \text { be the metric connection associated with }\left.\right|_{-} ^{g} \\
\tilde{g} .
\end{array}
$$

Then

$$
\begin{aligned}
& \widetilde{\nabla}_{X} Y=\nabla_{X} Y \\
& + \\
& \frac{1}{2}[X(\log \varphi) Y+Y(\log \varphi) X \\
&
\end{aligned}
$$

LEMMA Let $\nabla$ be a $g$-connection -- then $\forall X \in D^{1}(M)$, the diagram

$$
\begin{array}{lll}
D^{1}(\mathrm{M}) & \stackrel{g^{b}}{\rightarrow} & D_{1}(\mathrm{M}) \\
\nabla_{\mathrm{X}} \downarrow & & \downarrow \nabla_{\mathrm{X}} \\
D^{1}(\mathrm{M}) & \underset{\mathrm{g}}{ } \mathrm{\rightarrow} & D_{1}(\mathrm{M})
\end{array}
$$

commates.
[In fact,

$$
g^{b}\left(\nabla_{X} Y\right)(Z)
$$

$$
\begin{aligned}
& =g\left(\nabla_{X} Y, Z\right) \\
& =X g(Y, Z)-g\left(Y, \nabla_{X} Z\right) \\
& =X\left(g^{b} Y(Z)\right)-g^{b_{Y}}\left(\nabla_{X} Z\right) \\
& \left.=\left(\nabla_{X} g^{b} Y\right)(Z) \cdot\right]
\end{aligned}
$$

Notation: $\mathrm{g}^{-1} \in D_{0}^{2}(\mathrm{M})$ is characterized by the condition

$$
g^{-1}\left(g^{b} X, g^{b_{Y}}\right)=g(X, Y)
$$

Therefore $\mathrm{g}^{-1} \otimes \mathrm{~g} \in D_{2}^{2}(\mathrm{M})$ and the contraction $\mathrm{C}_{1}^{2}\left(\mathrm{~g}^{-1} \otimes \mathrm{~g}\right) \in D_{1}^{l}(\mathrm{M})$ is the Kronecker tensor K.

Observation: Let $\nabla$ be a $g$-connection -- then $\nabla g^{-1}=0$.
[We have

$$
\begin{aligned}
& \left(\nabla_{X} g^{-1}\right)\left(g^{b} y^{\prime} g_{Z}\right) \\
& =X g^{-1}\left(g^{b}, g^{b_{2}}\right) \\
& -g^{-1}\left(\nabla_{X} g^{b_{Y}} g^{t_{Z}}\right)-g^{-1}\left(g^{b_{Y}}, \nabla_{X} g^{b_{Z}}\right) \\
& =X g^{-1}\left(g^{b_{Y}}, g^{t_{Z}}\right) \\
& -g^{-1}\left(g^{b} \nabla_{X} Y, g^{b} Z\right)-g^{-1}\left(g^{b} X_{,} g^{b} \nabla_{X}\right) \\
& =X g(Y, Z)-g\left(\nabla_{X} Y, Z\right)-g\left(Y, \nabla_{X} Z\right) \\
& =\left(\nabla_{X} g\right)(Y, Z) \\
& =0 .]
\end{aligned}
$$

Locally,

$$
\left[\begin{array}{c}
g=g_{i j} d x^{i} \otimes d x^{j} \\
g^{-1}=g^{i j} \frac{\partial}{\partial x^{i}} \otimes \frac{\partial}{\partial x^{j}}
\end{array}\right.
$$

where $\left[g^{i j}\right]$ is the matrix inverse to $\left[g_{i j}\right]$.
Example: Given $f \in C^{\infty}(\mathrm{M})$,

$$
d f=f, i x^{i} \Rightarrow \operatorname{grad} f=g^{i j^{j}}, i \frac{\partial}{\partial x^{j}} .
$$

Example: Let $\nabla$ be the metric connection -- then the hessian $H_{f}$ of a function $f \in C^{\infty}(M)$ is $\nabla^{2} f$, thus $H_{f} \in \mathcal{D}_{2}^{0}(M)$ is symmetric (the metric connection being torsion free). Locally,

$$
\left(H_{f}\right)_{i j}=\frac{\partial^{2} f}{\partial x^{i} \partial x^{j}}-\Gamma_{i j}^{k} \frac{\partial f}{\partial x^{k}} .
$$

[Note: Since

$$
\begin{aligned}
& X g(\operatorname{grad} f, Y) \\
= & g\left(\nabla_{X} \operatorname{grad} f, Y\right)+g\left(\operatorname{grad} f, \nabla_{X} Y\right),
\end{aligned}
$$

it follows that

$$
\begin{aligned}
& g\left(\nabla_{X} \operatorname{grad} f, Y\right) \\
& =X g(\operatorname{grad} f, Y)-g\left(\operatorname{grad} f, \nabla_{X} Y\right) \\
& =X Y f-\left(\nabla_{X} Y\right) f \\
& \left.=H_{f}(X, Y) \cdot\right]
\end{aligned}
$$

FACT Let $\nabla$ be the metric connection. Fix $x \in M, X_{x} \in T_{x}$, and let $t \rightarrow \gamma(t)$
be the geodesic such that $\gamma(0)=x$ and $\dot{\gamma}(0)=x_{x}-$ then

$$
H_{f}\left|x\left(X_{x} X_{x}\right)=\frac{d^{2} f(y(t))}{d t^{2}}\right|_{t=0}
$$

Let $\nabla \in \operatorname{con}_{g} \mathrm{TM}$-- then $\nabla$ commutes with the operations of lowering or raising indices.
[Note: The point is that

$$
\left[\begin{array}{rl}
\nabla_{a} g_{i j} & =0 \\
\nabla_{a} g^{i j} & =0
\end{array}\right.
$$

So, e.g.,

$$
\left[\begin{array}{rl}
\nabla_{a} g_{i k} T^{k j} & =g_{i k} \nabla_{a} T^{k j} \\
\nabla_{a} g^{i k} T_{k j} & \left.=g^{i k} \nabla_{a} T_{k j} \cdot\right]
\end{array}\right.
$$

LEMMA The connection coefficients of the metric connection are given by

$$
\Gamma_{i j}^{k}=\frac{1}{2} g^{k \ell}\left(g_{\ell i, j}+g_{\ell j, i}-g_{i j, \ell}\right)
$$

Put

$$
|g|=\left|\operatorname{det}\left(g_{i j}\right)\right|
$$

Then $|g|$ is a density of weight 2 , hence $|g|^{1 / 2}$ is a density of weight 1 .
Returning to the lemma, contract over $k$ and $i$ to get

$$
r_{i j}^{i}=\frac{1}{2} g^{i \ell}\left(g_{\ell i, j}+g_{\ell j, i}-g_{i j, \ell}\right)
$$

But

$$
\begin{aligned}
g^{i \ell} g_{\ell j, i} & =g^{\ell i} g_{i j, \ell} \\
& =g^{i \ell} g_{i j, \ell}
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& \Gamma_{i j}^{i}=\frac{1}{2} g^{\ell i^{\prime}} g_{\ell i, j} \\
& =\frac{1}{2}(\text { det } g)^{-1}\left(\text { cof } g_{\ell i}\right) g_{\ell i, j} \\
& =\frac{1}{2}(\text { det } g)^{-1} \frac{\partial \operatorname{det} g}{\partial x^{j}} \\
& =\frac{1}{2} \frac{\partial}{\partial x^{j}} \log |g| \\
& =\frac{\partial}{\partial x^{j}} \log |g|^{1 / 2} \\
& =\frac{1}{|g|^{1 / 2}} \frac{\partial|g|^{1 / 2}}{\partial x^{j}} .
\end{aligned}
$$

Example: Let $\nabla$ be the metric connection. Suppose that $X \in \mathcal{D}^{l}(M)$-- then $\nabla \mathrm{X} \in \mathcal{D}_{1}^{\mathrm{I}}(\mathrm{M})$ and, by definition, the divergence div X of X is

$$
\operatorname{div} \mathrm{X}=\mathrm{C}_{1}^{1} \nabla \mathrm{X}(=\operatorname{tr} \nabla \mathrm{X})
$$

Locally,

$$
\operatorname{div} x=x_{; i}^{i}=x_{, i}^{i}+x^{j} \Gamma_{i j}^{i}
$$

or still,

$$
\operatorname{div} x=\frac{1}{|g|^{1 / 2}} \partial_{i}\left(x^{i}|g|^{1 / 2}\right)
$$

[Note: The laplacian $\Delta f$ of $f \in C^{\infty}(M)$ is the divergence of its gradient:

$$
\Delta f=\operatorname{div}(\operatorname{grad} f)
$$

Locally,

$$
\Delta f=\frac{1}{|g|^{1 / 2}} \partial_{i}\left(g^{i j}|g|^{1 / 2} \partial_{j} f\right)
$$

or still,

$$
\left.\Delta f=g^{i j}\left\{\partial_{i} \partial_{j} f-\Gamma_{i j}^{k} \partial_{k} f\right\}\left(\equiv g^{i j}\left(H_{f}\right)_{i j}\right) \cdot\right]
$$

FACT Let $f \in C^{\infty}(M)$ - then

$$
\begin{gathered}
\frac{1}{2} \Delta(g(\operatorname{grad} f, \operatorname{grad} f)) \\
=g\left[\begin{array}{l}
0 \\
2
\end{array}\right]\left(H_{f}, H_{f}\right)+g(\operatorname{grad} f, \operatorname{grad} \Delta f)+\operatorname{Ric}(\operatorname{grad} f, \operatorname{grad} f) .
\end{gathered}
$$

Let $\nabla$ be a connection on TM -- then

$$
\begin{aligned}
\nabla_{j}|g|^{1 / 2} & =|g|_{, j}^{1 / 2}-\Gamma_{j}|g|^{1 / 2} \\
& =|g|_{, j}^{1 / 2}-\Gamma_{j i}^{i}|g|^{1 / 2} .
\end{aligned}
$$

Now take for $\nabla$ the metric connection:

$$
\begin{aligned}
\Gamma_{j} & =\Gamma_{j i}^{i} \\
& =\Gamma_{i j}^{i} \\
& =\frac{1}{|g|^{1 / 2}} \frac{\left.\partial \lg \right|^{1 / 2}}{\partial x^{j}} \\
& =\frac{1}{|g|^{1 / 2}}|g|_{, j}^{1 / 2} \\
\Rightarrow & \nabla_{j}|g|^{1 / 2}=0 .
\end{aligned}
$$

[Note: Write

$$
1=|g|^{1 / 2}|g|^{-1 / 2}
$$

Then

$$
\begin{aligned}
& 0=\left(\nabla_{j}|g|^{1 / 2}\right)|g|^{-1 / 2}+|g|^{1 / 2}\left(\nabla_{j}|g|^{-1 / 2}\right) \\
&=|g|^{1 / 2}\left(\nabla_{j}|g|^{-1 / 2}\right) \\
& \Rightarrow \\
&\left.\quad \nabla_{j}|g|^{-1 / 2}=0 .\right]
\end{aligned}
$$

Remark: It follows that the Ricci tensor associated with the metric connection is necessarily symmetric (see the discussion at the end of the last section), hence $\forall X, Y \in \mathcal{D}^{\perp}(M)$,

$$
\operatorname{tr}(R(X, Y))=0 .
$$

Put

$$
e^{\bullet}=\frac{1}{|g|^{1 / 2}} \cdot \varepsilon^{\bullet}
$$

where $\varepsilon$ is the upper Levi-Civita symbol. Then $e^{\bullet}$ is a twisted tensor of type ( $\mathrm{n}, 0$ ).
[Note: Analogous considerations apply to the lower Levi-Civita symbol
$\varepsilon$. : The product

$$
e_{\bullet}=|g|^{1 / 2} \cdot \varepsilon
$$

is a twisted tensor of type $(0, \mathrm{n})$.

LEMMA Let $\nabla$ be the metric connection -- then we have

$$
\left[\begin{array}{l}
\nabla e^{\bullet}=0 \\
\nabla \mathrm{e}_{\bullet}=0 .
\end{array}\right.
$$

[To discuss $e^{\bullet}$, simply note that

$$
\begin{aligned}
\nabla_{j} e^{\bullet} & =\nabla_{j}\left(\frac{1}{|g|^{1 / 2} \cdot \varepsilon}\right) \\
& =\nabla_{j}|g|^{-1 / 2} \cdot e^{\bullet}+|g|^{-1 / 2} \cdot \nabla_{j} \epsilon^{\bullet} \\
& =0 .]
\end{aligned}
$$

Let $\nabla$ be a connection on TM -- then the assignment

$$
(W, Z, X, Y) \rightarrow g(R(X, Y) Z, W)
$$

is a tensor of type $(0,4)$.
[Note: Obviously,

$$
\begin{array}{r}
g(R(X, Y) Z, W)=g(W, R(X, Y) Z) \\
\left.=g^{b} W(R(X, Y) Z) .\right]
\end{array}
$$

Locally,

$$
\begin{aligned}
R_{i j k \ell} & =g_{i a} R_{j k \ell}^{a} \\
& =g\left(\partial_{i}, \partial_{a}\right) R_{j k \ell}^{a} \\
& =g\left(\partial_{i}, R^{a}{ }_{j k \ell} \partial_{a}\right) \\
& =g\left(\partial_{i}, R\left(\partial_{k}, \partial_{\ell}\right) \partial_{j}\right)
\end{aligned}
$$

Specialize again to the case when $\nabla$ is the metric connection -- then

$$
g(R(X, Y) Z, W)=g(R(Z, W) X, Y)
$$

and

$$
g(R(X, Y) Z, W)=-g(R(X, Y) W, Z)
$$

$$
\begin{aligned}
& R_{i j k \ell}=-R_{j i k \ell} \\
& R_{i j k \ell}=-R_{i j \ell k} \\
& R_{i j k \ell}+R_{i k \ell j}+R_{i \ell j k}=0 \\
& R_{i j k \ell}=R_{k \ell i j}
\end{aligned}
$$

[Note: Recall too that

$$
\left.R_{i j k \ell ; m}+R_{i j \ell m ; k}+R_{i j m k ; \ell}=0 .\right]
$$

Example: The Kretschmann curvature invariant $k_{R}$ is, by definition,

$$
R^{i j k} R_{i j k \ell}
$$

THEOREM Let $\nabla$ be the metric connection. Fix a point $x_{0} \in M$ and let $x^{1}, \ldots, x^{n}$ be normal coordinates at $x_{0}$-- then

$$
g_{i j}(x)=g_{i j}\left(x_{0}\right)+\frac{l}{2}\left[-\frac{1}{3}\left(R_{i k j \ell}+R_{j k i \ell}\right)\left(x_{0}\right)\right] x^{k} x^{\ell}+\cdots
$$

Let $\nabla$ be a torsion free connection on TM -- then

$$
\begin{aligned}
& \left(L_{X} g\right)(Y, Z)=\left(\nabla_{X} g\right)(Y, Z) \\
& \quad+g\left(\nabla_{Y} X, Z\right)+g\left(Y, \nabla_{Z} X\right)
\end{aligned}
$$

In particular, when $\nabla$ is the metric connection,

$$
\left(L_{X} g\right)(Y, Z)=g\left(\nabla_{Y} X, Z\right)+g\left(Y, \nabla_{Z} X\right) .
$$

Observation: Let $\nabla$ be the metric connection -- then

$$
\begin{aligned}
& {\left[\begin{array}{rl}
Z g(X, Y) & =g\left(\nabla_{Z} X, Y\right)+g\left(X, \nabla_{Z} Y\right) \\
Y g(X, Z) & =g\left(\nabla_{Y} X, Z\right)+g\left(X, \nabla_{Y} Z\right) \\
\Rightarrow \\
\left(L_{X} g\right)(Y, Z) & =Z g(X, Y)-g\left(X, \nabla_{Z} Y\right) \\
+ & Y g(X, Z)-g\left(X, \nabla_{Y} Z\right) \\
& =Z g^{b} X(Y)-g^{b} X\left(\nabla_{Z} Y\right) \\
+ & Y g^{b} X(Z)-g^{b} X\left(\nabla_{Y} Z\right) \\
& =\left(\nabla_{Z} g^{b} X\right)(Y)+\left(\nabla_{Y} g^{b} X\right)(Z) \\
& =\nabla_{g^{b}}^{b} X(Y, Z)+\nabla^{b} X X(Z, Y)
\end{array}\right.}
\end{aligned}
$$

[Note: Locally,

$$
\left.L_{x} g_{i j}=x_{i ; j}+x_{j ; i}=\nabla_{j} x_{i}+\nabla_{i} x_{j} .\right]
$$

FACT $\forall X, Y \in D^{1}(M)$,

$$
\left(\nabla_{Y} X\right)^{b}=\iota_{Y}\left(\frac{1}{2} L_{X} g+\frac{1}{2} d X^{b}\right)
$$

Let $X \in D^{l}(M)$-- then $X$ is said to be an infinitesimal isometry if $L_{X} g=0$. FACT An infinitesimal isometry is necessarily an infinitesimal affine transformation.

From the definitions,

$$
\left(L_{X} g\right)(Y, Z)=X g(Y, Z)-g([X, Y], Z)-g(Y,[X, Z])
$$

## 16.

so X is an infinitesimal isometry iff

$$
\mathrm{Xg}(\mathrm{Y}, \mathrm{Z})=\mathrm{g}([\mathrm{X}, \mathrm{Y}], \mathrm{Z})+\mathrm{g}(\mathrm{Y},[\mathrm{X}, \mathrm{Z}])
$$

or still, iff

$$
\nabla g^{b} \mathrm{X}(\mathrm{Y}, \mathrm{Z})+\nabla g^{b} \mathrm{X}(\mathrm{Z}, \mathrm{Y})=0
$$

Therefore an infinitesimal isometry is divergence free:

$$
0=x_{i ; j}+x_{j ; i}
$$

$\Rightarrow$

$$
\begin{aligned}
x_{; i}^{i} & =\nabla_{i} x^{i} \\
& =\nabla_{i} g^{i k} x_{k} \\
& =g^{i k} \nabla_{i} x_{k} \\
& =g^{i k} x_{k ; i} \\
& =-g^{i k} x_{i ; k}
\end{aligned}
$$

$$
=-g^{k i^{x_{k ; i}}}
$$

$$
=-g^{i k_{k}} k_{k i}
$$

$\Rightarrow$
$\operatorname{div} \mathrm{X}=0$.
Example: Let $X$ be an infinitesimal isometry. Put $\omega_{X}=g^{b} x-$ then

$$
\left(\omega_{X} \wedge d \omega_{X}\right)(X, Y, Z)=\omega_{X}(X) d \omega_{X}(Y, Z)
$$

$$
\begin{aligned}
& +\omega_{X}(Y) d \omega_{X}(Z, X)+\omega_{X}(Z) d \omega_{X}(X, Y) \\
= & g(X, X)\left[Y \omega_{X}(Z)-Z \omega_{X}(Y)-\omega_{X}([Y, Z])\right] \\
+ & g(X, Y)\left[Z \omega_{X}(X)-X \omega_{X}(Z)-\omega_{X}([Z, X])\right. \\
+ & g(X, Z)\left[X \omega_{X}(Y)-Y \omega_{X}(X)-\omega_{X}([X, Y])\right]
\end{aligned}
$$

But

$$
\begin{gathered}
\left(L_{X} g\right)(X, Y)= \\
=0 \\
= \\
\quad X(X, Y)-g(X,[X, Y]) \\
\\
\quad X \omega_{X}(Y)=\omega_{X}([X, Y]) .
\end{gathered}
$$

Analogously

$$
X \omega_{X}(Z)=\omega_{X}([X, Z])
$$

Therefore

$$
\begin{aligned}
& \left(\omega_{X} \wedge d \omega_{X}\right)(X, Y, Z)=g(X, X) d \omega_{X}(Y, Z) \\
& \quad+g(X, Y) Z \omega_{X}(X)-g(X, Z) Y \omega_{X}(X)
\end{aligned}
$$

Assume now that

$$
\omega_{X} \wedge d \omega_{X}=0
$$

Let $\phi=g(X, X) \quad\left(=\omega_{X}(X)\right)$-- then

$$
\phi d \omega_{X}(Y, Z)+g(X, Y) d \phi(Z)-g(X, Z) d \phi(Y)=0 .
$$

I.e.:

$$
\phi \mathrm{d} \omega_{\mathrm{X}}+\omega_{\mathrm{X}} \wedge \mathrm{~d} \phi=0
$$

$\Rightarrow$

$$
d\left(\omega_{X} / \phi\right)=0 .
$$

18. 

It thus follows from the Poincare lemma that locally,

$$
\omega_{X}=g(X, X) d f \quad(\exists f) .
$$

Section 11: The Einstein Equation Let $M$ be a connected $C^{\infty}$ manifold of dimension n. Fix a semiriemannian structure $g$ on $M$ and let $\nabla \in c o n g$ gM be metric connection.

Since $|g|^{1 / 2}$ is a strictly positive density of weight 1 such that $\nabla|g|^{1 / 2}=0$, the Ricci tensor Ric is symmetric.
[Note: To check this using indices, write

$$
\begin{aligned}
R_{j \ell} & =R_{j i \ell}^{i} \\
& =g^{i k_{R_{k j i \ell}}} \\
& =g^{i k_{R_{i \ell k j}}} \\
& =g^{k i_{R_{i \ell k j}}} \\
& =R_{\ell k j}^{k} \\
& \left.=R_{\ell j} .\right]
\end{aligned}
$$

Notation: Given a symmetric tensor $T \in D_{2}^{0}(M)$, define $\operatorname{tr}(T) \in C^{\infty}(M)$ by

$$
\operatorname{tr}(T)=T_{i}^{i}=g^{i j_{T i}}{ }_{j i}
$$

Example: $\operatorname{tr}(\mathrm{g})$ is the $\mathrm{C}^{\infty}$ function on M of constant value n .
[In fact,

$$
\left.\operatorname{tr}(g)=g^{i j} g_{j i}=\delta_{i}^{i}=n .\right]
$$

Definition: The scalar curvature $S$ is tr Ric, thus

$$
S=\operatorname{Ric}_{i}^{i}
$$

or still,

$$
\begin{aligned}
S & =g^{i k_{R}^{j}}{ }_{i j k} \\
& =g^{k i_{R}}{ }_{i j k} \\
& =R_{j k}^{j k}
\end{aligned}
$$

Notation: Write

$$
\nabla^{\mathrm{a}}=g^{\mathrm{ab}} \nabla_{\mathrm{b}} .
$$

IEMMA (The Fundamental Identity) We have

$$
\nabla^{i} \mathrm{R}_{\mathrm{ki}}=\frac{1}{2} \nabla_{k} S
$$

[To begin with

$$
\begin{aligned}
0 & =R_{i j k \ell ; m}+R_{i j \ell m ; k}+R_{i j m k ; \ell} \\
& =\nabla_{m} R_{i j k \ell}+\nabla_{k} R_{i j \ell m}+\nabla_{\ell} R_{i j m k}
\end{aligned}
$$

Therefore

$$
0=g^{j \ell_{g} m i}\left(\nabla_{m} R_{i j k \ell}+\nabla_{k} R_{i j \ell m}+\nabla_{\ell} R_{i j m k}\right)
$$

Now examine each term in succession.
(1) $g^{j \ell}{ }_{g}{ }^{m i} \nabla_{m} R_{i j k \ell}$

$$
=g^{j \ell_{g} i^{i m} \nabla_{m i j k \ell}}
$$

$$
=g^{j \ell} \nabla^{i} R_{i j k \ell}
$$

$$
=\nabla^{i} g^{j \ell_{R_{i j k}}}
$$

$$
=\nabla^{i} g^{j \ell_{R_{k \ell i j}}}
$$

$$
\begin{aligned}
& =\nabla^{i}\left(-g^{\left.j \ell_{R_{\ell k i j}}\right)}\right. \\
& =\nabla^{i}\left(-R_{k i j}^{j}{ }_{k i}\right) \\
& =\nabla^{i}\left((-)(-) R_{k j i}^{j}\right) \\
& =\nabla^{i}{ }^{R_{k i}} .
\end{aligned}
$$

(2)

$$
\begin{aligned}
& g^{j \ell} g^{m i^{\nabla_{k}}} R_{i j \ell m} \\
& =\nabla_{k} g^{j \ell}{ }_{g} \mathrm{mi}_{R_{i j l m}} \\
& =\nabla_{k} g^{j \ell_{R} m}{ }_{j \ell m} \\
& =-\nabla_{k} g^{j \ell_{\mathrm{R}}{ }_{\mathrm{m}}{ }_{j \mathrm{~m} \ell}, ~} \\
& =-\nabla_{k} g^{j \ell_{R_{j \ell}}} \\
& =-\nabla_{k} S . \\
& \text { (3) } g^{j \ell}{ }_{g}{ }^{m i} \nabla_{\ell} R_{i j m k} \\
& =g^{m i}{ }_{g}{ }^{j \ell_{\nabla_{\ell}}{ }_{i j m k}} \\
& =g^{m i_{\nabla} j_{R_{i j m k}}} \\
& =\nabla^{j} g^{m i}{ }_{R_{i j m k}} \\
& =\nabla^{j}{ }_{\mathrm{R}}{ }^{\mathrm{m}}{ }_{\mathrm{jmk}} \\
& =\nabla^{j_{R}}{ }_{j k} \\
& =\nabla^{i} R_{k i} .
\end{aligned}
$$

Combining (1), (2), and (3) then gives

$$
\left.\nabla^{i_{R_{k i}}}=\frac{1}{2} \nabla_{k} S .\right]
$$

Notation: Given a symmetric tensor $T \in D_{2}^{0}(M)$, define $\operatorname{div} T \in D_{1}(M)$ by

$$
\begin{aligned}
(\operatorname{div} T)_{j} & =g^{k \ell}(\nabla T)_{k j \ell} \\
& =g^{k \ell} \nabla_{\ell} T_{k j} \\
& =g^{k \ell} T_{k j ; \ell}
\end{aligned}
$$

Scholium: We have

$$
\mathrm{dS}=2 \mathrm{div} \text { Ric. }
$$

[In fact,

$$
d S_{k}=\partial_{k} S=\nabla_{k} S
$$

On the other hand,

$$
\begin{aligned}
2 \text { (div Ric) }_{k} & =2 g^{i j_{R i c}}{ }_{i k ; j} \\
& =2 g^{i j_{R_{i k}}}{ }^{j} \\
& =2 g^{i j} \nabla_{j} R_{i k} \\
& =2 \nabla^{i} R_{i k} \\
& =2 \nabla^{i} R_{k i} . l
\end{aligned}
$$

IEEMMA Let $\mathrm{f} \in \mathrm{C}^{\infty}(\mathrm{M})$-- then

$$
\operatorname{div}(f g)=\operatorname{df}
$$

[For

$$
\begin{aligned}
\operatorname{div}(f g)_{j} & =g^{k \ell}(f g)_{k j ; \ell} \\
& =g^{k \ell} \nabla_{\ell}{ }^{(f g)_{k j}} \\
& =\nabla_{\ell} g^{k \ell}(f g)_{k j} \\
& =\nabla_{\ell} f^{l g^{l}} g_{k j} \\
& =\nabla_{\ell}\left(f \delta^{\ell}{ }_{j}\right) \\
& =\left(\nabla_{\ell} f\right) \delta_{j}^{\ell}+f\left(\nabla_{\ell} \delta_{j}^{\ell}\right) \\
& =\nabla_{j} f \\
& \left.=\partial_{j} f .\right]
\end{aligned}
$$

Application: Suppose that Ric $=\phi g\left(\phi \in C^{\infty}(M)\right)$-- then $\phi$ is a constant if $n>2$.
[To see this, note first that

$$
\begin{array}{ll} 
& \operatorname{div} \mathrm{Ric}=\operatorname{div}(\phi \mathrm{g}) \\
\Rightarrow & \frac{\mathrm{dS}}{2}=\mathrm{d} \phi \\
\Rightarrow \quad & \phi=\frac{\mathrm{S}}{2}+\mathrm{C}
\end{array}
$$

On the other hand,

$$
\operatorname{tr} \mathrm{Ric}=\operatorname{tr}(\phi \mathrm{g})
$$

$$
S=\phi n .
$$

Therefore

$$
\left.(2-\mathrm{n})_{\phi}=2 \mathrm{C} .\right]
$$

Definition: The Einstein tensor Ein is the combination

$$
\operatorname{Ein}=\operatorname{Ric}-\frac{1}{2} \mathrm{Sg}
$$

So, Ein $\in D_{2}^{0}(M)$ is symmetric and one has

$$
\begin{aligned}
\operatorname{div} \operatorname{Ein} & =\operatorname{div} \text { Ric }-\frac{1}{2} \operatorname{div}(\mathrm{Sg}) \\
& =\operatorname{div} \text { Ric }-\frac{1}{2} d S \\
& =0
\end{aligned}
$$

In addition,

$$
\begin{aligned}
\operatorname{tr} \operatorname{Ein} & =\operatorname{tr} \text { Ric }-\frac{1}{2} \operatorname{tr}(S g) \\
& =S-\frac{n}{2} S \\
\Rightarrow \quad \operatorname{tr} \operatorname{Ein} & =\left.\right|_{-} ^{\left(1-\frac{n}{2}\right) S} \quad(n \neq 2) \\
0 & (n=2)
\end{aligned}
$$

Therefore

$$
\begin{aligned}
\text { Ric } & =\operatorname{Ein}+\frac{1}{2} \mathrm{Sg} \\
& =\operatorname{Ein}+\frac{1}{2-n}(\operatorname{tr} \operatorname{Ein}) g \quad(\mathrm{n} \neq 2)
\end{aligned}
$$

[Note: When $\mathrm{n}=4$,

$$
\left[\begin{array}{l}
\text { Ric }=\operatorname{Ein}-\frac{1}{2}(\operatorname{tr} \operatorname{Ein}) g \\
\mathrm{Ein}=\mathrm{Ric}-\frac{1}{2}(\mathrm{tr} \text { Ric }) g
\end{array}\right.
$$

Thus in this case, the Einstein tensor and the Ricci tensor each has the same formal expression in terms of the other.]

Remark: Using the symmetries of $R$, it is easy to show that Ein automatically vanishes if $\operatorname{dim} M=2$.

Assume that $\operatorname{dim} M>2$ - then $M$ is said to be a vacuum if $\operatorname{Ein}=0$, the equation

$$
\operatorname{Ein}=0
$$

being the vacuum field equation of general relativity.
[Note: By the above, $M$ is a vacuum iff $M$ is Ricci flat, i.e., iff Ric $=0$. If $\operatorname{dim} M=3$, then $\operatorname{Ric}=0 \Rightarrow R=0$.

Notation: In computations, the Einstein tensor is often denoted by G.
Definition: Suppose that $\mathrm{n}>1-$ then M is said to be an Einstein manifold if $\exists$ a constant $\lambda$ such that Ric $=\lambda g$.
[Note: Matters are trivial when $n=1$ : In this situation, all $M$ are necessarily Einstein.]

If Ric $=\lambda g$, then

$$
\text { tr Ric }=S \Rightarrow S=\lambda n
$$

Therefore

$$
\begin{aligned}
\operatorname{Ein} & =\text { Ric }-\frac{1}{2} S g \\
& =\frac{1}{n} \mathrm{Sg}-\frac{1}{2} \mathrm{Sg} \\
& =\left(\frac{1}{\mathrm{n}}-\frac{1}{2}\right) \mathrm{Sg}
\end{aligned}
$$

Section 12: Decomposition Theory Let $V$ be an $n$-dimensional real vector space. Suppose that $A: V \rightarrow V$ is a linear transformation -- then

$$
A=S+T,
$$

where

$$
\left[\begin{array}{l}
S=A-\frac{\operatorname{tr}(A)}{n} I \\
T=\frac{\operatorname{tr}(A)}{n} I
\end{array}\right.
$$

and

$$
\operatorname{tr}(\mathrm{S})=0, \operatorname{tr}(\mathrm{~T})=\operatorname{tr}(\mathrm{A})
$$

Therefore

$$
\operatorname{Hom}(\mathrm{V}, \mathrm{~V})=\operatorname{Ker}(\operatorname{tr}) \oplus \underline{\mathrm{RI}} .
$$

Notation: $R$ is the set of multilinear maps

$$
\mathrm{R}: \mathrm{V} \times \mathrm{V} \times \mathrm{V} \times \mathrm{V} \rightarrow \underline{\mathrm{R}}
$$

such that
(a) $R\left(\mathrm{X}_{1}, \mathrm{X}_{2}, \mathrm{X}_{3}, \mathrm{X}_{4}\right)=-\mathrm{R}\left(\mathrm{X}_{2}, \mathrm{X}_{1}, \mathrm{X}_{3}, \mathrm{X}_{4}\right)$;
(b) $\mathrm{R}\left(\mathrm{X}_{1}, \mathrm{X}_{2}, \mathrm{X}_{3}, \mathrm{X}_{4}\right)=-\mathrm{R}\left(\mathrm{X}_{1}, \mathrm{X}_{2}, \mathrm{X}_{4}, \mathrm{X}_{3}\right)$;
(c) $\mathrm{R}\left(\mathrm{X}_{1}, \mathrm{X}_{2}, \mathrm{X}_{3}, \mathrm{X}_{4}\right)+\mathrm{R}\left(\mathrm{X}_{1}, \mathrm{X}_{3}, \mathrm{X}_{4}, \mathrm{X}_{2}\right)+\mathrm{R}\left(\mathrm{X}_{1}, \mathrm{X}_{4}, \mathrm{X}_{2}, \mathrm{X}_{3}\right)=0$;
(d) $R\left(\mathrm{X}_{1}, \mathrm{X}_{2}, \mathrm{X}_{3}, \mathrm{X}_{4}\right)=\mathrm{R}\left(\mathrm{X}_{3}, \mathrm{X}_{4}, \mathrm{X}_{1}, \mathrm{X}_{2}\right)$.

Example: Let $M$ be a connected $C^{\infty}$ manifold of dimension $n$. Fix $g \in M$ and let $\nabla$ be the metric connection -- then at each $x \in M$, the tensor

$$
(W, Z, X, Y) \rightarrow g(R(X, Y) Z, W)
$$

induces a multilinear map

$$
R_{x}: T_{x}^{M} \times T_{x} M \times T_{x} M \times T_{x} M \rightarrow \underline{R}
$$

satisfying (a) - (d).

LEMMA $R$ is a real vector space of dimension $\frac{1}{12} n^{2}\left(n^{2}-1\right)$.
[Note: Therefore

$$
\begin{aligned}
& \mathrm{n}=1 \Rightarrow \operatorname{dim} R=0 ; \\
& \mathrm{n}=2 \Rightarrow \operatorname{dim} \mathrm{R}=1 ; \\
& \mathrm{n}=3 \Rightarrow \operatorname{dim} \mathrm{R}=6 ; \\
& \mathrm{n}=4 \Rightarrow \operatorname{dim} \mathrm{R}=20 .]
\end{aligned}
$$

Definition: Let $P, Q: V \times V \rightarrow R$ be symmetric bilinear forms -- then the curvature product of $P, Q$ is the tensor $P x_{c} Q$ of type $(0,4)$ defined by

$$
\begin{aligned}
& P x_{c} Q\left(x_{1}, x_{2}, x_{3}, x_{4}\right) \\
= & P\left(x_{1}, x_{3}\right) Q\left(x_{2}, x_{4}\right)+P\left(x_{2}, x_{4}\right) Q\left(x_{1}, x_{3}\right) \\
- & P\left(x_{1}, x_{4}\right) Q\left(x_{2}, x_{3}\right)-P\left(x_{2}, x_{3}\right) Q\left(x_{1}, x_{4}\right) .
\end{aligned}
$$

Obviously,

$$
P x_{C} Q=Q \times_{c} P
$$

and it is not difficult to check that

$$
P \times{ }_{c} Q \in R .
$$

Now fix $g \in M$-- then the prescription

$$
G\left(X_{1}, X_{2}, X_{3}, X_{4}\right)=g\left(X_{1}, X_{3}\right) g\left(X_{2}, X_{4}\right)-g\left(X_{1}, X_{4}\right) g\left(X_{2}, X_{3}\right)
$$

defines an element of $R$ and

$$
g x_{c} g=2 G .
$$

$\underline{r}$ : This is the map

$$
r: R \rightarrow S y m v_{2}^{0}
$$

defined by

$$
r_{R}(X, Y)=\varepsilon_{1} R\left(E_{1}, X, E_{1}, Y\right)+\cdots+\varepsilon_{n} R\left(E_{n}, X, E_{n}, Y\right),
$$

where $E \in B(V)$ is orthonormal.
[Note: $r_{R}$ is independent of the choice of E. ]
Notation: Given $T \in S y m V_{2}^{0}$, put

$$
\operatorname{tr}(\mathrm{T})=\mathrm{g}\left[\begin{array}{l}
0 \\
2
\end{array}\right](\mathrm{g}, \mathrm{~T})
$$

We shall then agree to write $s_{R}$ in place of $\operatorname{tr}\left(r_{R}\right)$, thus

$$
s_{R}=\varepsilon_{1} r_{R}\left(E_{1}, E_{1}\right)+\cdots+\varepsilon_{n} r_{R}\left(E_{n}, E_{n}\right) .
$$

Remark: Let $M$ be a connected $C^{\infty}$ manifold of dimension n. Fix $g \in M$ and let $\nabla$ be the metric connection - then at each $x \in M$,

$$
\begin{array}{r}
r_{R_{x}}=R i c_{x} \\
S_{R_{x}}=S(x) .
\end{array}
$$

[By definition,

$$
\operatorname{Ric}_{x}: T_{x} M \times T_{x} M \rightarrow \underline{R}
$$

where

$$
\operatorname{Ric}_{X}(X, Y)=\operatorname{tr}(Z \rightarrow R(Z, X) Y)
$$

So, if $\left\{E_{1}, \ldots, E_{n}\right\}$ is an orthonormal basis for $T_{x} M$ per $g_{x}$, then

$$
\begin{aligned}
\operatorname{Ric}_{x}(X, Y) & =\varepsilon_{1} g_{x}\left(R\left(E_{1}, X\right) Y, E_{1}\right)+\cdots+\varepsilon_{n} g_{x}\left(R\left(E_{n}, X\right) Y, E_{n}\right) \\
& =\varepsilon_{1} R_{x}\left(E_{1}, Y, E_{1}, X\right)+\cdots+\varepsilon_{n} R_{x}\left(E_{n}, Y, E_{n}, X\right) \\
& =\varepsilon_{1} R_{x}\left(E_{1}, X, E_{1}, Y\right)+\cdots+\varepsilon_{n} R_{x}\left(E_{n}, X, E_{n}, Y\right)
\end{aligned}
$$

$$
=r_{R_{X}}(X, Y)
$$

And

$$
\left.S(x)=\operatorname{tr} \operatorname{Ric}_{x}=g_{x}\left[\frac{0}{2}\right]\left(g_{x}, r_{R_{x}}\right) \cdot\right]
$$

LEMMA Let $T \in \operatorname{Sym} V_{2}^{0}-$ then

$$
r_{g \times} T^{(X, Y)}=(n-2) T+\operatorname{tr}(T) g
$$

[We have

$$
\begin{aligned}
& r_{g \times{ }_{C}}(X, Y)=\sum_{k=1}^{n} \varepsilon_{k}\left(g \times_{C} T\right)\left(E_{k}, X, E_{k}, Y\right) \\
& =\sum_{k=1}^{n}\left[\varepsilon_{k} g\left(E_{k^{\prime}}, E_{k}\right) T(X, Y)+\varepsilon_{k} g(X, Y) T\left(E_{k}, E_{k}\right)\right] \\
& -\sum_{k=1}^{n}\left[\varepsilon_{k} g\left(E_{k}, Y\right) T\left(X, E_{k}\right)+\varepsilon_{k} g\left(X, E_{k}\right) T\left(E_{k}, Y\right)\right] \\
& =\sum_{k=1}^{n} \varepsilon_{k}^{2} T(X, Y)+g(X, Y) \sum_{k=1}^{n} \varepsilon_{k} T\left(E_{k}, E_{k}\right) \\
& -T\left(X, \sum_{k=1}^{n} \varepsilon_{k} g\left(E_{k}, Y\right) E_{k}\right)-T\left(\sum_{k=1}^{n} \varepsilon_{k} g\left(X, E_{k}\right) E_{k}, Y\right) \\
& =n T(X, Y)+\operatorname{tr}(T) g(X, Y)-T(X, Y)-T(X, Y) \\
& =(\mathrm{n}-2) \mathrm{T}(\mathrm{X}, \mathrm{Y})+\operatorname{tr}(\mathrm{T}) \mathrm{g} .]
\end{aligned}
$$

[Note: In particular,

$$
r_{G}=\frac{1}{2} r_{g x_{C}} g=\frac{1}{2}[(n-2) g+n g]
$$

$$
\begin{aligned}
& =\frac{1}{2}[(2 n-2) g] \\
& =(n-1) g \cdot]
\end{aligned}
$$

Example: Suppose that $n=2-$ then $\operatorname{dim} R=1$, hence $\forall R \in R, \exists C_{R} \in R$ :

$$
\begin{array}{ll} 
& R=C_{R} G \\
\Rightarrow & r_{R}=C_{R} r_{G}=C_{R} g \\
\Rightarrow & s_{R}=2 C_{R}
\end{array}
$$

Therefore

$$
\mathrm{R}=\frac{\mathrm{S}_{\mathrm{R}}}{2} \mathrm{G}
$$

Assume that $n>2$ and let $R \in R$-- then

$$
R=\frac{s_{R}}{n(n-1)} G+\frac{1}{n-2}\left[r_{R}-\frac{s_{R}}{n} g\right] \times_{C} g+C,
$$

where, by definition,

$$
C=R-\frac{S_{R}}{n(n-1)} G-\frac{1}{n-2}\left[r_{R}-\frac{s_{R}}{n} g\right] \times{ }_{C} g
$$

or still,

$$
C=R+\frac{S_{R}}{(n-1)(n-2)} G-\frac{1}{n-2} r_{R} \times_{c} g
$$

Write $\operatorname{Sym}_{0} \mathrm{~V}_{2}^{0}$ for the kernel of

$$
\operatorname{tr}: \operatorname{Sym} v_{2}^{0} \rightarrow \underline{R}
$$

Example: $\forall R \in R$,

$$
\frac{1}{n-2}\left[r_{R}-\frac{s_{R}}{n} g\right] \in \operatorname{Sym}_{0} v_{2}^{0}
$$

Write $\mathcal{C}$ for the kernel of

$$
r: R \rightarrow \operatorname{Sym}_{0} \mathrm{v}_{2}^{0}
$$

Example: $\forall R \in R, C \in C$.
[In fact,

$$
\begin{aligned}
r_{C}= & r_{R}+\frac{s_{R}}{(n-1)(n-2)} r_{G}-\frac{1}{n-2} r_{r_{R}} \times_{C} g \\
= & r_{R}+\frac{s_{R}}{(n-1)(n-2)}(n-1) g-\frac{1}{n-2}\left((n-2) r_{R}+s_{R} g\right) \\
& =0 .]
\end{aligned}
$$

LEMMA There is a direct sum decomposition

$$
R=\underline{R}\left(g \times_{c} g\right) \oplus \operatorname{Sym}_{0} v_{2}^{0} \times_{c} g \oplus C .
$$

[Note: More is true in that the decomposition is orthogonal (per $g\left[\begin{array}{l}0 \\ 4\end{array}\right]$ ).]

Remark: If $\mathrm{n}=3$, then

$$
\operatorname{dim}\left(\underline{R}\left(g x_{c} g\right) \oplus \operatorname{Sym}_{0} v_{2}^{0} x_{c} g\right)=6
$$

But

$$
\operatorname{dim} R=\frac{1}{12} 3^{2}\left(3^{2}-1\right)=6
$$

Consequently, $\mathcal{C}$ is trivial, thus in this case

$$
R=\frac{s_{R}}{12} g \times_{c} g+\left[r_{R}-\frac{s_{R}}{3} g\right] \times_{c} g
$$

Definition: The elements of $C$ are called the Weyl tensors.
Let $M$ be a connected $C^{\infty}$ manifold of dimension $n$. Fix $g \in M$ and let $\nabla$ be the metric connection -- then the preceding considerations can be globalized in the obvious way, the key new ingredient being the Weyl tensor $(\mathrm{n}>3)$ :

$$
\begin{aligned}
& C(W, Z, X, Y)=g(R(X, Y) Z, W) \\
& + \\
& \frac{S}{(n-1)(n-2)}(g(W, X) g(Z, Y)-g(W, Y) g(Z, X)) \\
& - \\
& \frac{1}{n-2}(\operatorname{Ric}(W, X) g(Z, Y)+\operatorname{Ric}(Z, Y) g(W, X) \\
& \quad-\operatorname{Ric}(W, Y) g(Z, X)-\operatorname{Ric}(Z, X) g(W, Y))
\end{aligned}
$$

Locally,

$$
\begin{gathered}
c_{i j k \ell}=R_{i j k \ell}+\frac{S}{(n-1)(n-2)}\left(g_{i k} g_{j \ell}-g_{i \ell} g_{j k}\right) \\
-\frac{1}{n-2}\left(R_{i k} g_{j \ell}+R_{j \ell} g_{i k}-R_{i \ell} g_{j k}-R_{j k} g_{i \ell}\right) .
\end{gathered}
$$

FACT We have

$$
c_{j i \ell}^{i}=0 .
$$

LEMMA Fix $\varphi \in C^{\infty}(\mathrm{M}): \varphi>0$ and put $\tilde{g}=\varphi \mathrm{g}$. Let

$$
\int_{-}^{\nabla} \text { be the metric connection associated with }\left.\right|_{-} \int_{-} \cdot
$$

Then

$$
\widetilde{\mathrm{C}}=\varphi C
$$

[Note: Therefore the Weyl tensor, when viewed as an element of $D_{3}^{1}(M)$, is a conformal invariant.]

Section 13: Bundle Valued Forms Let $M$ be a connected $C^{\infty}$ manifold of dimension $n$. Suppose that $E \rightarrow M$ is a vector bundle - then the sections of $E \otimes \Lambda^{P_{T} * M}$ are the p-forms on $M$ with values in $E$.

Notation: Put

$$
\Lambda^{P}(M ; E)=\sec \left(E \otimes \Lambda^{P_{T} * M}\right)
$$

[Note: When $p=0$,

$$
\left.\Lambda^{0}(M ; E)=\sec (E) .\right]
$$

Structurally,

$$
\Lambda^{\mathrm{P}}(\mathrm{M} ; \mathrm{E})=\Lambda^{0}(\mathrm{M} ; E) \otimes C_{(M)}^{\infty} \Lambda^{\mathrm{P}_{\mathrm{M}}},
$$

thus the elements of $\Lambda^{\mathrm{P}}(\mathrm{M} ; \mathrm{E})$ are the $\mathrm{C}^{\infty}(\mathrm{M})$-multilinear antisymmetric maps

$$
\frac{p}{D^{I}(M) \times \cdots \times D^{I}(M)} \rightarrow \sec (E) .
$$

Remark: If $E$ is a trivial vector bundle with fiber $V$, then $\Lambda^{P}(M ; E)$ is the space of p -forms on M with values in V and is denoted by $\Lambda^{\mathrm{P}}(\mathrm{M} ; \mathrm{V})$.

Example: Let

be a principal bundle with structure group $G$ (which we shall take to be a Lie group). Let $\rho$ be a representation of $G$ on a real finite dimensional vector space V -- then a p-form

$$
\alpha \in \Lambda^{P}(P ; V)
$$

is said to be of type $\rho$ if

$$
\left(\mathrm{R}_{\sigma}\right) * \alpha=\rho\left(\sigma^{-1}\right) \alpha \quad \forall \sigma \in \mathrm{G} .
$$

Write

$$
\Lambda_{\rho}^{\mathrm{P}}(\mathrm{P} ; \mathrm{V})
$$

for the space of $p$-forms on $P$ of type $\rho$ and let $E$ be the vector bundle

$$
P \times{ }_{G} V .
$$

Then there is a canonical one-to-one correspondence

$$
\Lambda_{\rho}^{\mathrm{P}}(\mathrm{P} ; \mathrm{V}) \leftrightarrow \Lambda^{\mathrm{P}}(\mathrm{M} ; \mathrm{E}) .
$$

Suppose that $E \rightarrow M$ is a vector bundle. Let $\nabla$ be a connection on $E-$ then $\nabla$ gives rise to an R -linear map

$$
\nabla: \Lambda^{0}(M ; E) \rightarrow \Lambda^{1}(M ; E)
$$

such that

$$
\nabla(f s)=s \otimes d f+f \nabla s\left(f \in C^{\infty}(M), s \in \Lambda^{0}(M ; E)\right)
$$

viz.

$$
\nabla s(X)=\nabla_{X} s
$$

Conversely, every R-linear map

$$
\nabla: \Lambda^{0}(M ; E) \rightarrow \Lambda^{1}(M ; E)
$$

such that

$$
\nabla(f s)=s \otimes d f+f \nabla s\left(f \in C^{\infty}(M), s \in \sec (E)\right)
$$

determines a connection on $E$. Thus let $X \in \mathcal{D}^{1}(M)$-- then $X$ induces a $C^{\infty}(M)$-linear map $\mathrm{ev}_{\mathrm{X}}: \Lambda^{1} \mathrm{M} \rightarrow \mathrm{C}^{\infty}(\mathrm{M})$, hence there is an arrow

$$
\begin{aligned}
\Lambda^{1}(M ; E)= & \Lambda^{0}(M ; E) \otimes{ }^{\infty}(M) \\
& \Lambda^{1} M \\
& \psi i d \otimes \mathrm{Ev}_{X} \\
& \Lambda^{0}(M ; E) \otimes{ }^{\otimes} C^{\infty}(M) C^{\infty}(M)=\Lambda^{0}(M ; E),
\end{aligned}
$$

call it $E V_{X}$. This said, the definitions then imply that the composite

$$
\begin{aligned}
\Lambda^{0}(M ; E) \xrightarrow{\nabla} \quad & \Lambda^{l}(M ; E) \\
& \downarrow E V_{X} \\
& \Lambda^{0}(M ; E)
\end{aligned}
$$

defines an operator

$$
\nabla_{X}: \sec (E) \rightarrow \sec (E)
$$

with the properties required of a connection.
Let $f: M^{\prime} \rightarrow M$ be a smooth map and suppose that $E \rightarrow M$ is a vector bundle -then there is a pullback square

$$
\begin{array}{llll}
E^{\prime} & \rightarrow & E & \\
\psi & & \psi & \left(E^{\prime}=E^{\star} E\right) \\
M^{\prime} & \rightarrow & M &
\end{array}
$$

and arrows

$$
\left[\begin{array}{l}
\Lambda^{0}(M ; E) \rightarrow \Lambda^{0}\left(M^{\prime} ; E^{\prime}\right) \\
\Lambda^{1} M \rightarrow \Lambda^{1} M^{\prime}
\end{array}\right.
$$

which can be tensored to give an arrow

$$
\Lambda^{0}(M ; E) \otimes_{C^{\infty}(M)} \Lambda^{1} M \rightarrow \Lambda^{0}\left(M^{\prime} ; E^{\prime}\right) \otimes_{C^{\infty}\left(M^{\prime}\right)}^{\Lambda^{1} M^{\prime}}
$$

or still, an arrow

$$
\Lambda^{I}(M ; E) \rightarrow \Lambda^{I}\left(M^{\prime} ; E^{\prime}\right) .
$$

LEMMA Let $\nabla$ be a connection on $\mathrm{E}-$ - then there exists a unique connection $\nabla^{\prime}$ on $E^{\prime}$ such that the diagram

$$
\begin{array}{ccc}
\Lambda^{0}(M ; E) & \xrightarrow{\rightarrow} & \Lambda^{I}(M ; E) \\
\downarrow & & \downarrow \\
\Lambda^{0}\left(M^{\prime} ; E^{\prime}\right) & \rightarrow & \Lambda^{I}\left(M^{\prime} ; E^{\prime}\right)
\end{array}
$$

conmutes.

The constructions $\mathrm{E}^{*}, \mathrm{E} \otimes \mathrm{F}$, and $\mathrm{Hom}(\mathrm{E}, \mathrm{F})$ can be extended to constructions on vector bundles equipped with a connection.
$\nabla^{\star}$ : Let $\nabla$ be a connection on $\mathrm{E}-$ then $\nabla$ induces a connection $\nabla^{*}$ on $\mathrm{E}^{\star}$ with the property that $\forall s \in \Lambda^{0}(M ; E) \& \forall s^{*} \in \Lambda^{0}\left(M ; E^{*}\right)$,

$$
d\left(s, s^{\star}\right)=\left(\nabla s, s^{\star}\right)+\left(s, \nabla^{*} s^{\star}\right),
$$

this being an equality of elements of $\Lambda^{1} M$.
[Note: Since

$$
\Lambda^{0}\left(M ; E^{\star}\right)=\operatorname{Hom}_{C^{\infty}(M)}\left(\Lambda^{0}(M ; E), C^{\infty}(M)\right),
$$

it follows that there is a nonsingular pairing

$$
(,): \Lambda^{0}(M ; E) \times \Lambda^{0}\left(M ; E^{\star}\right) \rightarrow C^{\infty}(M)
$$

viz. evaluation. Analogously, there are nonsingular pairings

$$
\left[\begin{array}{l}
\Lambda^{1}(M ; E) \times \Lambda^{0}\left(M ; E^{\star}\right) \rightarrow \Lambda^{1} M \\
\left.\Lambda^{0}(M ; E) \times \Lambda^{1}\left(M ; E^{\star}\right) \rightarrow \Lambda^{1} M .\right]
\end{array}\right.
$$

$\nabla_{E} \otimes \nabla_{F}$ : If $\nabla_{E}$ is a connection on $E$ and $\nabla_{F}$ is a connection on $F$, then $\nabla_{E} \otimes \nabla_{F}$ is the connection on $E \otimes F$ defined by

$$
\left(\nabla_{E} \otimes \nabla_{F}\right)(s \otimes t)=\nabla_{E} s \otimes t+s \otimes \nabla_{F} t
$$

[Note: The tensor products on the right are elements of $\Lambda^{l}(M ; E \otimes F)$. For example,

$$
\begin{aligned}
& \Lambda^{1}(M ; E) \otimes C_{(M)}^{\infty} \Lambda^{0}(M ; F) \\
&= \Lambda^{0}(M ; E) \otimes C_{(M)}^{\infty} \Lambda^{1} M \otimes C^{\infty}(M) \\
& \Lambda^{0}(M ; F) \\
&= \Lambda^{0}(M ; E) \otimes C_{(M)}^{\Lambda^{0}}(M ; F) \otimes_{C^{\infty}(M)} \Lambda^{1} M \\
&= \Lambda^{0}(M ; E \otimes F){ }^{\otimes} C^{\infty}(M) \\
& \Lambda^{1} M \\
&=\left.\Lambda^{1}(M ; E \otimes F) .\right]
\end{aligned}
$$

$\bar{\nabla}_{\text {Hom (E,F) }}$ : Let $\nabla_{E}$ be a connection on $E$ and let $\nabla_{F}$ be a connection on $F$ then the pair $\left(\nabla_{E}, \nabla_{F}\right)$ induces a connection $\nabla_{H o m(E, F)}$ on $\operatorname{Hom}(E, F)$ with the property that $\forall \phi \in \Lambda \Lambda^{0}(M ; \operatorname{Hom}(E, F)) \& \forall s \in \Lambda{ }^{0}(M ; E)$,

$$
\nabla_{F}(\phi, s)=\left(\phi, \nabla_{E} s\right)+\left(\nabla_{\mathrm{Hom}(E, F)}{ }^{\phi}, s\right),
$$

this being an equality of elements of $\Lambda^{1}(M ; F)$.
[Note: First, there is a nonsingular pairing

$$
(, \quad): \Lambda^{0}(M ; \operatorname{Hom}(E, F)) \times \Lambda^{0}(M ; E) \rightarrow \Lambda^{0}(M ; F) .
$$

Second, there is a nonsingular pairing

$$
(,): \Lambda^{0}(M ; \operatorname{Hom}(E, F)) \times \Lambda^{1}(M ; E) \rightarrow \Lambda^{1}(M ; F) .
$$

Third, there is a nonsingular pairing

$$
\left.(,): \Lambda^{1}(M ; \operatorname{Hom}(E, F)) \times \Lambda^{0}(M ; E) \rightarrow \Lambda^{1}(M ; F) .\right]
$$

Remark: Under the identification $E \leftrightarrow E^{* *}$, we have $\nabla \leftrightarrow \nabla^{* *}$, and under the identification $E^{*} \otimes \mathrm{~F} \leftrightarrow \operatorname{Hom}(E, F)$, we have $\nabla_{E^{*} \otimes F} \leftrightarrow \nabla_{H o m(E, F)}{ }^{\bullet}$

FACT A connection $\nabla$ on $E$ induces a connection $\nabla_{\Lambda}^{k}$ E on $\Lambda^{k} E$ such that $\nabla_{\Lambda E}=\nabla$ and

$$
\nabla_{X}(s \wedge t)=\nabla_{X} s \wedge t+(-1)^{k} s \wedge \nabla_{X} t
$$

where $s \in \sec \left(\Lambda^{k} E\right), t \in \sec \left(\Lambda^{\ell} E\right)$.
[Note: We have

$$
\left.\sec \left(\Lambda^{k} E\right)=\Lambda^{k} \sec (E) .\right]
$$

Let $\nabla_{1}, \nabla_{2}$ be connections on $E-$ then $\forall f \in C^{\infty}(M) \& \forall s \in \Lambda^{0}(M ; E)$,

$$
\left(\nabla_{1}-\nabla_{2}\right)(f s)=f\left(\nabla_{1}-\nabla_{2}\right) s
$$

Therefore

$$
\left.\nabla_{1}-\nabla_{2} \in \mathrm{Hom}_{\mathrm{C}}^{(\mathrm{M})} \mathrm{( } \mathrm{\Lambda}(\mathrm{M} ; \mathrm{E}), \Lambda^{1}(\mathrm{M} ; E)\right) .
$$

On the other hand,

$$
\begin{aligned}
& \operatorname{Hom}_{C^{\infty}(M)}\left(\Lambda^{0}(M ; E), \Lambda^{1}(M ; E)\right) \\
& =\operatorname{Hom}_{C^{\infty}(M)}\left(\Lambda^{0}(M ; E), \Lambda^{0}(M ; E) \otimes_{C^{\infty}(M)} \Lambda^{1} M\right) \\
& =\operatorname{Hom}_{C^{\infty}(M)}\left(\Lambda^{0}(M ; E), \Lambda^{0}(M ; E)\right) \otimes_{C^{\infty}(M)} \Lambda^{1} M \\
& =\Lambda^{0}(M ; \operatorname{Hom}(E, E)) \otimes_{C^{\infty}(M)} \Lambda^{1} M \\
& =\Lambda^{1}(M ; \operatorname{Hom}(E, E)) .
\end{aligned}
$$

So, under this identification,

$$
\nabla_{1}-\nabla_{2} \in \Lambda^{1}(M ; \operatorname{Hom}(E, E))
$$

Conversely, if $\Gamma \in \Lambda^{l}(M ; H o m(E, E))$, then for any connection $\nabla, \nabla+\Gamma$ is again a connection.

Let con E stand for the set of connections on E.
Scholium: con $E$ is an affine space with translation group $\Lambda^{1}(M ; H o m(E, E))$.
[The action $\nabla \cdot \Gamma=\nabla+\Gamma$ is free and transitive.]
Reality Check Take E = TM -- then

$$
\begin{aligned}
& \Lambda^{1}(\mathrm{M} ; \mathrm{Hom}(\mathrm{TM}, \mathrm{TM})) \\
= & \Lambda^{0}(\mathrm{M} ; \mathrm{Hom}(\mathrm{TM}, \mathrm{TM})) \otimes_{C^{\infty}(\mathrm{M})}^{\Lambda^{1} \mathrm{M}} \\
= & \mathrm{Hom}_{\mathrm{C}^{\infty}(\mathrm{M})}\left(D^{1}(\mathrm{M}), D^{1}(\mathrm{M})\right) \otimes_{C^{\infty}(\mathrm{M})} D_{1}(\mathrm{M}) \\
= & D_{1}^{1}(\mathrm{M}) \mathrm{C}^{\infty}(\mathrm{M}) D_{1}(\mathrm{M}) \\
= & \Lambda^{0}\left(\mathrm{M} ; \mathrm{T}_{1}^{1}(\mathrm{M})\right) \otimes_{\mathrm{C}^{\infty}(\mathrm{M})}^{\Lambda^{0}\left(\mathrm{M} ; \mathrm{T}_{1}(\mathrm{M})\right)} \\
= & \Lambda^{0}\left(\mathrm{M} ; \mathrm{T}_{1}^{1}(\mathrm{M}) \otimes \mathrm{T}_{1}(\mathrm{M})\right) \\
= & \Lambda^{0}\left(\mathrm{M} ; \mathrm{T}_{2}^{1}(\mathrm{M})\right) \\
= & D_{2}^{1}(\mathrm{M}) .
\end{aligned}
$$

Projection Principle Suppose that $E=E_{1} \oplus E_{2}$-- then there are canonical arrows

$$
\left[\begin{array}{lll}
-\operatorname{con} E & \rightarrow \operatorname{con} E_{1} & \left(\nabla \rightarrow \nabla^{1}\right) \\
-\operatorname{con} E & \rightarrow \operatorname{con} E_{2} & \left(\nabla \rightarrow \nabla^{2}\right),
\end{array}\right.
$$

viz.

$$
\left[\begin{array}{ll}
\nabla_{X}^{1} s_{1}=\mathrm{pr}_{1}\left(\nabla_{X} s_{1}\right) & \left(s_{1} \in \sec \left(\mathrm{E}_{1}\right)\right) \\
\nabla_{X}^{2} s_{2}=\operatorname{pr}_{2}\left(\nabla_{X} s_{2}\right) & \left(s_{2} \in \sec \left(\mathrm{E}_{2}\right)\right)
\end{array}\right.
$$

Let $E \rightarrow M, F \rightarrow M$ be vector bundles -- then there is a $C^{\infty}(M)$-bilinear product

$$
\Lambda: \Lambda^{p}(M ; E) \otimes C_{(M)}^{\infty} \Lambda^{q}(M ; F) \rightarrow \Lambda^{p+q}(M ; E \otimes F)
$$

which is characterized by the condition

$$
(s \otimes \alpha) \wedge(t \otimes \beta)=(s \otimes t) \otimes(\alpha \wedge \beta)
$$

[Note: We have
and

$$
\Lambda^{0}(M ; E \otimes F)=\Lambda^{0}(M ; E) \otimes C_{(M)}^{\infty} \Lambda^{0}(M ; F)
$$

Therefore $s \otimes t$ is an element of $\left.\Lambda^{0}(M ; E \otimes F).\right]$

Example: Take $\mathrm{F}=\varepsilon=\mathrm{M} \times \underline{\mathrm{R}}$, the trivial line bundle -- then

$$
\Lambda^{\mathrm{P}}(\mathrm{M} ; \varepsilon)=\Lambda^{\mathrm{P}} \mathrm{M}
$$

Since

$$
\Lambda: \Lambda^{0}(M ; E) \otimes{ }_{C}^{\infty}(M) \Lambda^{\mathrm{p}}(M ; \varepsilon) \rightarrow \Lambda^{\mathrm{p}}(M ; E \otimes \varepsilon)
$$

and $\mathrm{E} \otimes \varepsilon=\mathrm{E}$, it follows that

$$
\mathbf{s} \wedge \alpha=s \otimes \alpha
$$

in $\Lambda^{\mathrm{P}}(\mathrm{M} ; \mathrm{E})$.
Suppose that $\mathrm{E} \rightarrow \mathrm{M}$ is a vector bundle. Given $\nabla \in \mathrm{con} \mathrm{E}$, let

$$
\mathrm{d}^{\nabla}: \Lambda^{\mathrm{P}}(\mathrm{M} ; \mathrm{E}) \rightarrow \Lambda^{\mathrm{p}+1}(\mathrm{M} ; \mathrm{E})
$$

be the R-linear operator defined by the rule

$$
d^{\nabla}(s \otimes a)=s \otimes d \alpha+\nabla s \wedge a
$$

[Note: Recall that $\nabla s \in \Lambda^{l}(M ; E)$. Now view $\alpha \in \Lambda^{p} M$ as an element of $\Lambda^{p}(M ; \varepsilon)$-then

$$
\left.\nabla s \wedge \alpha \in \Lambda^{p+1}(M ; E \otimes \varepsilon)=\Lambda^{p+l}(M ; E) .\right]
$$

It is easy to check that $d^{\nabla}=\nabla$ when $p=0$.

LEMMA Let $\alpha \in \Lambda{ }^{p}{ }_{M}, \beta \in \Lambda{ }^{q_{M}}$-- then

$$
d^{\nabla}((s \otimes \alpha) \wedge \beta)=d^{\nabla}(s \otimes \alpha) \wedge \beta+(-1)^{p}(s \otimes \alpha) \wedge d \beta .
$$

[We have

$$
\begin{aligned}
& d^{\nabla}((s \otimes \alpha) \wedge \beta)=d^{\nabla}(s \otimes(\alpha \wedge \beta)) \\
& =s \otimes d(\alpha \wedge \beta)+\nabla s \wedge(\alpha \wedge \beta) \\
& =s \otimes\left(d \alpha \wedge \beta+(-1)^{p} \alpha \wedge d \beta\right)+(\nabla s \wedge \alpha) \wedge \beta \\
& =(s \otimes d \alpha+\nabla s \wedge \alpha) \wedge \beta+(-1)^{p}(s \otimes \alpha) \wedge d \beta \\
& \left.=d^{\nabla}(s \otimes \alpha) \wedge \beta+(-1)^{p}(s \otimes \alpha) \wedge d \beta .\right]
\end{aligned}
$$

[Note: This, of course, is an equality of elements in $\left.\Lambda^{p+q+l}(M ; E).\right]$

Example: Take $E=\varepsilon$, so $\forall p, \Lambda^{P}(M ; \varepsilon)=\Lambda^{p} M$. Consider the map

$$
\left.\right|_{-} ^{C^{\infty}(M)} \rightarrow \begin{array}{ll}
\Lambda^{1} M \\
f & \rightarrow d f .
\end{array}
$$

Then $d$ is a connection $\nabla$ and $d^{\nabla}$ is the usual exterior differentiation.
FACT Let $E \rightarrow M, F \rightarrow M$ be vector bundles -- then there is an R-linear map

$$
d^{\nabla_{E} \otimes \nabla_{F}}: \Lambda^{p}(M ; E \otimes F) \rightarrow \Lambda^{p+1}(M ; E \otimes F)
$$

and

$$
\begin{aligned}
& \forall \int_{-}^{-} \int_{t \in \Lambda}{ }^{p}(M ; E),
\end{aligned}
$$

Suppose that E is a vector bundle and let $\nabla$ be a connection on E -- then there is a sequence
which, in general, is not a complex since it need not be true that $d^{\nabla} \circ \nabla=0$ (likewise for $d^{\nabla} \circ d^{\nabla}$ ).

Put $F^{\nabla}=d^{\nabla} \circ \nabla$-- then $F^{\nabla}$ is a map from $\Lambda^{0}(M ; E)$ to $\Lambda^{2}(M ; E)$ and is $C^{\infty}(M)$-linear. Indeed,

$$
\begin{aligned}
d^{\nabla} \circ \nabla(f s) & =d^{\nabla}(s \otimes d f+f \nabla s) \\
& =d^{\nabla}(s \otimes d f)+d^{\nabla}(f \nabla s) \\
& =s \otimes d^{2} f+\nabla s \wedge d f+d f \wedge \nabla s+f \wedge d^{\nabla}(\nabla s) \\
& =f \wedge d^{\nabla}(\nabla \mathbf{s}) \\
& =f\left(d^{\nabla} \circ \nabla(s)\right) .
\end{aligned}
$$

On the other hand,

$$
\begin{aligned}
& \operatorname{Hom}_{C^{\infty}(M)}\left(\Lambda^{0}(M ; E), \Lambda^{2}(M ; E)\right) \\
= & \operatorname{Hom}_{C^{\infty}(M)}\left(\Lambda^{0}(M ; E), \Lambda^{0}(M ; E) \otimes_{C^{\infty}(M)} \Lambda^{2} M\right)
\end{aligned}
$$

$$
\begin{aligned}
& =\operatorname{Hom} C^{\infty}(M)\left(\Lambda^{0}(M ; E), \Lambda^{0}(M ; E)\right) \otimes C^{\infty}(M) \\
& =\Lambda^{0}(M ; \operatorname{Hom}(E, E)) \otimes C^{2} M \\
& C^{\infty}(M) \\
& \Lambda^{2} M \\
& =\Lambda^{2}(M ; \operatorname{Hom}(E, E)) .
\end{aligned}
$$

Definition: The curvature of $\nabla$ is

$$
F^{\nabla} \in \Lambda^{2}(M ; \operatorname{Hom}(E, E)) .
$$

Let $s \otimes \alpha \in \Lambda^{p}(M ; E)-$ then

$$
\begin{gathered}
d^{\nabla} \circ d^{\nabla}(s \otimes \alpha)=d^{\nabla}(s \otimes d a+\nabla s \wedge a) \\
=s \otimes d^{2} \alpha+\nabla s \wedge d a+d^{\nabla}(\nabla s) \wedge \alpha-\nabla s \wedge d \alpha \\
=d^{\nabla} \circ \nabla(s) \wedge \alpha \\
=F^{\nabla}(s) \wedge \alpha .
\end{gathered}
$$

Therefore

$$
0 \rightarrow \Lambda^{0}(M ; E) \xrightarrow{\nabla} \Lambda^{1}(M ; E) \xrightarrow{d^{\nabla}} \Lambda^{2}(M ; E) \stackrel{d^{\nabla}}{\rightarrow} \cdots
$$

is a complex provided $\mathrm{F}^{\nabla}=0$.

LEMMA We have

$$
d^{\nabla} F^{\nabla}=0,
$$

where $\mathrm{d}^{\nabla}$ is associated with $\nabla_{\text {Hom(E,E) }}$.
$\left[\forall \phi \in \Lambda{ }^{2}(\mathrm{M} ; \operatorname{Hom}(\mathrm{E}, \mathrm{E})) \& \forall \mathrm{~s} \in \Lambda^{0}(\mathrm{M} ; \mathrm{E})\right.$,

$$
d^{\nabla}(\phi, s)=(\phi, \nabla s)+\left(d_{\phi, s}^{\nabla}\right),
$$

this being an equality of elements of $\Lambda^{3}(M ; E)$. Take $\phi=F^{\nabla}$-- then

$$
\begin{aligned}
& \left(d^{\nabla} F^{\nabla}, s\right)=d^{\nabla}\left(F^{\nabla}, s\right)-\left(F^{\nabla}, \nabla s\right) \\
& =d^{\nabla} \circ\left(d^{\nabla} \circ \nabla s\right)-\left(d^{\nabla} \circ d^{\nabla}\right) \circ \nabla s \\
& =0.1
\end{aligned}
$$

Given $X, Y \in \mathcal{D}^{1}(M)$, put

$$
R(X, Y)=\nabla_{X} \circ \nabla_{Y}-\nabla_{Y} \circ \nabla_{X}-\nabla_{[X, Y]} \cdot
$$

Then

$$
R(X, Y): \Lambda^{0}(M ; E) \rightarrow \Lambda^{0}(M ; E)
$$

and $\forall \mathrm{f} \in \mathrm{C}^{\infty}(\mathrm{M}) \& \forall \mathrm{~s} \in \Lambda^{0}(\mathrm{M} ; \mathrm{E})$,

$$
\begin{aligned}
f R(X, Y) s & =R(X, Y)(f s) \\
& =R(f X, Y) s=R(X, f Y) s .
\end{aligned}
$$

There is also an arrow $e v_{X, Y}: \Lambda^{2} M \rightarrow C^{\infty}(M)$ which can be tensored over $C^{\infty}(M)$ with $\Lambda^{0}(\mathrm{M} ; \operatorname{Hom}(\mathrm{E}, \mathrm{E}))$ to give an arrow

$$
E V_{X, Y}: \Lambda^{0}(M ; \operatorname{Hom}(E, E)) \otimes_{C^{\infty}(M)} \Lambda^{2} M \rightarrow \Lambda^{0}(M ; \operatorname{Hom}(E, E)),
$$

i.e., an arrow

$$
E V_{X, Y}: \Lambda^{2}(M ; \operatorname{Hom}(E, E)) \rightarrow \Lambda^{0}(M ; \operatorname{Hom}(E, E))
$$

Put

$$
F_{X, Y}^{\nabla}=E v_{X, Y}\left(F^{\nabla}\right)
$$

$$
\in \Lambda^{0}(M ; \operatorname{Hom}(E, E))=\operatorname{Hom}_{C^{\infty}(M)}\left(\Lambda^{0}(M ; E), \Lambda^{0}(M ; E)\right) .
$$

FACT We have

$$
F_{X, Y}^{\nabla}=R(X, Y)
$$

Define $\tau_{X}$ on $\Lambda^{p}(M ; E)(p>0)$ by

$$
\iota_{X}(s \otimes \alpha)=s \otimes \iota_{X} \alpha
$$

[Note: Take $c_{X}=0$ on $\left.\Lambda^{0}(M ; E).\right]$

LEMMA Let $X, Y \in \mathcal{D}^{1}(M)$-- then $\forall \mathbf{s \in \Lambda}{ }^{0}(M ; E)$,

Reality Check Take $E=\varepsilon-$ then $d^{2}=0$ and $\forall f \in C^{\infty}(M)$,

$$
\begin{aligned}
& \iota_{X} d \iota_{Y} d f-\iota_{Y} d \iota_{X} d f-[X, Y] f \\
& \quad=\iota_{X} d(Y f)-\iota_{Y} d(X f)-(X Y-Y X) f \\
& \quad=X Y f-Y X f-X Y f+Y X f \\
& \quad=0
\end{aligned}
$$

Remark: The lemma is merely a restatement of the fact that

$$
F_{X, Y}^{\nabla}=R(X, Y)
$$

Rappel: In the exterior algebra $\Lambda * M$,

$$
L_{X}=\iota_{X} \circ d+d \circ \iota_{X}
$$

Motivated by this, given $\nabla \in \operatorname{con} E$, put

$$
L_{X}^{\nabla}=\iota_{X} \circ d^{\nabla}+d^{\nabla} \circ \iota_{X},
$$

thus

$$
L_{X}^{\nabla}: \Lambda^{\mathrm{P}}(\mathrm{M} ; \mathrm{E}) \rightarrow \Lambda^{\mathrm{P}}(\mathrm{M} ; \mathrm{E})
$$

[Note: When $\mathrm{p}=0$,

$$
\begin{aligned}
L_{X}^{\nabla_{s}} & =\iota_{X} \circ d^{\nabla} s \\
& \left.=\iota_{X} \nabla s=\nabla s(X)=\nabla_{X} s .\right]
\end{aligned}
$$

FACT We have

$$
L_{X}(s \otimes \alpha)=\nabla_{X} s \otimes \alpha+s \otimes L_{X} \alpha
$$

Specialize now to the vector bundle

$$
T_{q}^{p}(M)=L M \times \underline{G L}(n, \underline{R})^{T_{q}^{p}}(n)
$$

Then the elements of

$$
\Lambda^{\mathrm{k}}\left(\mathrm{M} ; \mathrm{T}_{\mathrm{q}}^{\mathrm{p}}(\mathrm{M})\right)
$$

are the $C^{\infty}(M)$-multilinear antisymmetric maps

$$
\frac{\mathrm{k}}{D^{\mathrm{I}}(\mathrm{M}) \times \cdots \times D^{\mathrm{I}}(\mathrm{M})} \rightarrow D_{\mathrm{q}}^{\mathrm{p}}(\mathrm{M})
$$

[Note: Bear in mind that

$$
\left.\Lambda^{0}\left(M ; T_{q}^{p}(M)\right)=D_{q}^{p}(M) \cdot\right]
$$

Remark: Working locally, each $a \in \Lambda^{k}\left(M ; T_{q}^{p}(M)\right)$ defines a $k$-form

$$
{ }_{a}^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}}
$$

namely

$$
\begin{aligned}
& { }^{i_{1}}{ }^{\cdots i_{p}}{ }_{j_{1}} \cdots j_{q}\left(x_{1}, \ldots, x_{k}\right) \\
= & \alpha\left(x_{1}, \ldots, x_{k}\right)\left(d x^{i_{1}}, \ldots, d x^{i_{p}}, \frac{\partial}{j_{1}}, \ldots, \frac{\partial}{j_{1}}\right),
\end{aligned}
$$

these being the components of $\alpha$.
Let $\nabla$ be a connection on TM -- then $\nabla$ induces a connection on $T_{q}^{p}(M)$, which again will be denoted by $\nabla$. Accordingly, there is an R-linear operator

$$
d^{\nabla}: \Lambda^{\mathrm{k}}\left(M ; \mathrm{T}_{\mathrm{q}}^{\mathrm{P}}(\mathrm{M})\right) \rightarrow \Lambda^{\mathrm{k}+1}\left(\mathrm{M} ; \mathrm{T}_{\mathrm{q}}^{\mathrm{p}}(\mathrm{M})\right)
$$

with the property that

$$
d^{\nabla}(\alpha \wedge \beta)=d^{\nabla} \alpha \wedge \beta+(-1)^{k_{\alpha \wedge} \nabla^{\nabla} \beta .}
$$

[Note: Here,

$$
\begin{aligned}
& (\alpha \wedge \beta)\left(\mathrm{X}_{1}, \ldots, \mathrm{x}_{\mathrm{k}+\ell}\right) \\
= & \frac{1}{\mathrm{k}!\ell!} \sum_{\sigma \in S_{k+\ell}}(\operatorname{sgn} \sigma) \alpha\left(\mathrm{x}_{\sigma(1)}, \ldots, \mathrm{x}_{\sigma(\mathrm{k})}\right) \\
& \left.\otimes \beta\left(\mathrm{x}_{\sigma(\mathrm{k}+1)}, \ldots, x_{\sigma(k+\ell)}\right) \cdot\right]
\end{aligned}
$$

Example: Take $p=q=0$-- then $D_{0}^{0}(M)=C^{\infty}(M)$ and

$$
\Lambda^{\mathrm{k}}\left(\mathrm{M}_{;} \mathrm{C}^{\infty}(\mathrm{M})\right)=\Lambda^{\mathrm{k}} \mathrm{M}
$$

In this situation, $d^{\nabla}=d$, hence is the same for all $\nabla$.
Example: Let $T \in D_{\mathrm{q}}^{\mathrm{p}}(\mathrm{M})$-- then

$$
d^{\nabla} T \in \Lambda{ }^{1}\left(M ; T_{q}^{p}(M)\right)
$$

and $\forall X \in D^{1}(M)$,

$$
\begin{aligned}
& d^{\nabla_{T}(X)\left(\Lambda^{l}, \ldots, \Lambda^{p}, x_{1}, \ldots, x_{q}\right)} \\
& \quad=\left(\nabla_{X} T\right)\left(\Lambda^{l}, \ldots, \Lambda^{p}, x_{1}, \ldots, x_{q}\right) \\
& \quad=\nabla T\left(\Lambda^{1}, \ldots, \Lambda^{p}, x_{1}, \ldots, x_{q}, X\right) .
\end{aligned}
$$

[Note: Recall that, in general, if $E \rightarrow M$ is a vector bundle, then for any $\nabla \in$ con $E$, on $\left.\Lambda^{0}(M ; E), \nabla=d^{\nabla}.\right]$

Section 14: The Structural Equations Let $M$ be a connected $C^{\infty}$ manifold of dimension $n$.

Assume: $M$ is parallelizable, i.e., that the frame bundle LM is trivial. [Note: Accordingly,

$$
L M \approx M \times \underline{G L}(n, \underline{R}),
$$

thus IM has two components, hence $M$ is orientable.]
Therefore IM admits global sections, these being the frames.
[Note: A frame $E=\left\{E_{1}, \ldots, E_{n}\right\}$ is, by definition, a basis for $D^{l}$ (M) (as a module over $\left.C^{\infty}(M)\right)$. The associated coframe is the set $\omega=\left\{\omega^{1}, \ldots, \omega^{n}\right\}$, where the l-forms $\omega^{i}$ are characterized by $\omega^{i}\left(E_{j}\right)=\delta^{i}{ }_{j}$. So, $\forall X \in D^{l}(M)$, we have $\left.X=\omega^{i}(X) E_{i}.\right]$

Remark: The components of a tensor $T \in D_{q}^{p}$ (M) relative to a frame arise in exactly the same way as for a coordinate system. I.e.:

$$
\begin{aligned}
& T=T^{i_{1} \cdots i_{p}}{ }_{j_{l} \cdots j_{q}}\left(E_{i_{l}} \otimes \cdots \otimes E_{i_{p}}\right) \\
& \otimes\left(\omega^{j_{l}} \otimes \ldots \otimes \omega^{j}{ }^{q}\right),
\end{aligned}
$$

where

$$
T^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}}=T\left(\omega^{i_{1}}, \ldots, \omega^{i_{p}}, E_{j_{1}}, \ldots, E_{j_{q}}\right) .
$$

Let $\nabla$ be a connection on $T M-$ then its connection l-forms $\omega^{i}{ }_{j}$ are defined by the requirement

$$
\nabla_{X} E_{j}=\omega_{j}^{i}(X) E_{i}
$$

Agreeing to let

$$
\nabla_{E_{i}} E_{j}=\Gamma_{i j}^{k} E_{k^{\prime}}
$$

it follows that

$$
\omega_{j}^{i}=\Gamma_{k j}^{i} \omega^{k} .
$$

Given $X \in D^{1}(M)$, write

$$
x=X^{i} E_{i}
$$

Then

$$
\nabla X=E_{i} \otimes\left(d X^{i}+X^{k} \omega_{k}^{i}\right) .
$$

Given $\alpha \in D_{1}(M)$, write

$$
\alpha=\alpha_{i} \omega^{i} .
$$

Then

$$
\nabla \alpha=\omega^{i} \otimes\left(d \alpha_{i}-\alpha_{k} \omega_{i}^{k}\right)
$$

Definition: Let $\nabla$ €con TM.
(T) The torsion forms $\Theta^{i}$ of $\nabla$ are defined by

$$
T(X, Y)=\theta^{i}(X, Y) E_{i} .
$$

(R) The curvature forms $\Omega_{j}^{i}$ of $\nabla$ are defined by

$$
R(X, Y) E_{j}=\Omega_{j}^{i}(X, Y) E_{i} .
$$

THEOREM (The Structural Equations) We have

$$
\left[\begin{array}{l}
\theta^{i}=d \omega^{i}+\omega_{j}^{i}{ }_{j} \omega^{j} \\
\Omega_{j}^{\mathbf{i}}=d \omega_{j}^{i}+\omega_{k}^{i}{ }^{\wedge} \omega_{j}^{k}
\end{array}\right.
$$

[Consider the first relation. Thus

$$
\begin{aligned}
\theta^{i} & (X, Y) E_{i}=\nabla_{X} Y-\nabla_{Y} X-[X, Y] \\
= & \nabla_{X}\left(\omega^{j}(Y) E_{j}\right)-\nabla_{Y}\left(\omega^{j}(X) E_{j}\right)-\omega^{j}([X, Y]) E_{j} \\
= & \left\{X \omega^{j}(Y)-Y \omega^{j}(X)-\omega^{j}([X, Y])\right\} E_{j} \\
& +\left\{\omega^{j}(Y) \omega_{j}^{i}(X)-\omega^{j}(X) \omega_{j}^{i}(Y)\right\} E_{i} \\
= & d \omega^{i}(X, Y) E_{i}+\left(\omega_{j}^{i}{ }_{j} \omega^{j}\right)(X, Y) E_{i} .
\end{aligned}
$$

Consider the second relation. Thus

$$
\begin{aligned}
& \Omega_{j}^{i}(X, Y) E_{i}=\nabla_{X} \nabla_{Y} E_{j}-\nabla_{Y} \nabla_{X} E_{j}-\nabla_{[X, Y]} E_{j} \\
& =\nabla_{X}\left(\omega_{j}^{i}(Y) E_{i}\right)-\nabla_{Y}\left(\omega_{j}^{i}(X) E_{i}\right)-\omega_{j}^{i}([X, Y]) E_{i} \\
& =\left\{X \omega_{j}^{i}(Y)-Y \omega_{j}^{i}(X)-\omega_{j}^{i}([X, Y])\right\} E_{i} \\
& \quad+\left\{\omega_{j}^{i}(Y) \omega_{i}^{k}(X)-\omega_{j}^{i}(X) \omega_{i}^{k}(Y)\right\} E_{k} \\
& \left.=d \omega_{j}^{i}(X, Y) E_{i}+\left(\omega_{k}^{i} \omega_{j}^{k}\right)(X, Y) E_{i} \cdot\right]
\end{aligned}
$$

Remark: If $\nabla$ is torsion free, then

$$
d \omega^{i}=-\omega^{i}{ }_{j} \Lambda \omega^{j} .
$$

[Note: Put

$$
\omega^{k_{1} \cdots k_{r}}=\omega^{k_{1}} \wedge \ldots \wedge \omega^{k_{r}}
$$

Then in the presence of zero torsion,

FACT Suppose that $\nabla$ is torsion free -- then $\forall \alpha \in \Lambda{ }^{\mathrm{P}} \mathrm{M}$,

$$
d \alpha=\omega^{i} \wedge \nabla_{E_{i}} \alpha
$$

Write

$$
d \omega^{i}=\frac{1}{2} C_{j k}^{i} \omega_{\wedge \omega}^{j}{ }^{j} \quad\left(C_{j k}^{i}=-C_{k j}^{i}\right) .
$$

Then the $c^{i}{ }_{j k}$ are the objects of anholonomity.
[Note: Their transformation behavior is nontensorial.]
Observation: We have

$$
\begin{aligned}
& {\left[E_{j}, E_{k}\right]=\omega^{i}\left(\left[E_{j}, E_{k}\right]\right) E_{i}} \\
& =-\left(d \omega^{i}\left(E_{j}, E_{k}\right)-E_{j} \omega^{i}\left(E_{k}\right)+E_{k} \omega^{i}\left(E_{j}\right)\right) E_{i} \\
& =-C^{i}{ }_{j k} E_{i} .
\end{aligned}
$$

- There is an expansion

$$
\theta^{i}=\frac{1}{2} T^{i}{ }_{k \ell}{ }^{\omega}{ }^{k} \wedge \omega \quad\left(T_{k \ell}^{\ell}=-T_{\ell k}^{i}\right)
$$

and

$$
\mathrm{T}_{k \ell}^{\mathrm{i}}=\Gamma_{k \ell}^{\mathrm{i}}-\Gamma_{\ell k}^{\mathrm{i}}+\mathrm{C}_{\mathrm{k} \ell}^{\mathrm{i}} .
$$

[Note: By definition,

$$
\left.T_{k \ell}^{i}=T\left(\omega^{i}, E_{k}, E_{\ell}\right) .\right]
$$

- There is an expansion

$$
\Omega_{j}^{i}=\frac{1}{2} R_{j k \ell}^{i}{ }^{k}{ }_{\wedge \omega}^{\ell} \quad\left(R_{j k \ell}^{i}=-R_{j \ell k}^{i}\right)
$$

and

$$
\begin{aligned}
& R_{j k \ell}^{i}=E_{k} \Gamma_{\ell j}^{i}-E_{\ell} \Gamma_{k j}^{i} \\
& +\Gamma_{\ell j}^{a} \Gamma_{k a}^{i}-\Gamma_{k j}^{a} \Gamma_{\ell a}^{i}+C_{k \ell \Gamma^{a}}^{\Gamma^{i}}
\end{aligned}
$$

[Note: By definition,

$$
\left.R_{j k \ell}^{i}=R\left(\omega^{i}, E_{j}, E_{k}, E_{\ell}\right) \cdot\right]
$$

Put

$$
\operatorname{Ric}_{j}=\iota_{E_{i}} \Omega_{j}^{i}
$$

Then

$$
\begin{aligned}
& R \operatorname{Ric}_{j}=\tau_{E_{i}}\left[\frac{1}{2} R^{i}{ }_{j k} \ell^{\omega}{ }^{k} \wedge \omega^{\ell}\right] \\
& =\frac{1}{2}\left[R^{\mathrm{i}}{ }_{j k \ell \ell^{\omega}}{ }^{\mathrm{k}}\left(\mathrm{E}_{\mathrm{i}}\right) \omega^{\ell}-\mathrm{R}^{\mathrm{i}}{ }_{j k \ell} \omega^{\ell}\left(\mathrm{E}_{\mathrm{i}}\right) \omega^{\mathrm{k}}\right] \\
& =\frac{1}{2}\left[R^{\mathrm{i}}{ }_{\mathrm{ji} \ell^{\omega}}{ }^{\ell}-\mathrm{R}^{\mathrm{i}}{ }_{\mathrm{jki}} \omega^{\mathrm{k}}\right] \\
& =\frac{1}{2}\left[R^{i}{ }_{j i \ell} \ell^{\ell}+R^{i}{ }_{j i k^{\omega}}{ }^{k}\right] \\
& =\frac{1}{2}\left[\mathrm{R}^{\mathrm{i}}{ }_{\mathrm{ji} \ell} \ell^{\ell}+\mathrm{R}^{\mathrm{i}}{ }_{\mathrm{ji} \ell} \ell^{\ell}\right] \\
& =R^{i}{ }_{j i \ell}{ }^{\boldsymbol{L}} \\
& =R_{j} \ell^{\omega^{\ell}} .
\end{aligned}
$$

6. 

The Ric ${ }_{j}(j=1, \ldots, n)$ are called the Ricci 1 -forms. Obviously,

$$
\left[\begin{array}{l}
\operatorname{Ric}_{j}\left(E_{i}\right)=R_{j i} \\
\operatorname{Ric}_{i}\left(E_{j}\right)=R_{i j}
\end{array}\right.
$$

but, in general, $\mathrm{R}_{\mathrm{ji}} \neq \mathrm{R}_{\mathrm{ij}}$.

Section 15: Transition Formalities Let M be a connected $C^{\infty}$ manifold of dimension n .

Rappel: There is a one-to-one correspondence

$$
\left[\begin{array}{rl}
\Gamma & \rightarrow \nabla^{\Gamma} \\
\nabla & \rightarrow \Gamma^{\nabla}
\end{array}\right.
$$

between the connections $\Gamma$ on the frame bundle

$$
\begin{aligned}
\underline{G L}(\mathrm{n}, \underline{\mathrm{R})} \rightarrow & \mathrm{LM} \\
& \downarrow \pi \\
& \mathrm{M}
\end{aligned}
$$

and the connections $\nabla$ on the tangent bundle

$$
T M=L M \times{ }_{\underline{G}(n, \underline{R})} \underline{R}^{n} .
$$

Assume now that $M$ is parallelizable. Fix a frame $E=\left\{E_{1}, \ldots, E_{n}\right\}$ and let $s: M \rightarrow$ LM be the section thereby determined, thus $\forall x \in M$,

$$
s(x)=\left\{E_{1}\left|x_{x}, \ldots, E_{n}\right| x\right\}
$$

is a basis for $\mathrm{T}_{\mathrm{x}} \mathrm{M}$.
FACT Fix $x \in M$ and let $\zeta_{x}: \underline{R}^{n} \rightarrow T_{X} M$ be the nonsingular linear transformation

$$
\left.\left(a_{1}, \cdots, a_{n}\right) \rightarrow a_{1} E_{1}\right|_{x}+\cdots+\left.a_{n} E_{n}\right|_{x}
$$

Suppose that $X, Y \in D^{1}(M)$-- then

$$
\nabla_{X}^{\Gamma} Y_{X}=\zeta_{x} \omega_{\Gamma}\left(d s_{x} X_{x}\right) \zeta_{x}^{-1} Y_{x}+\left.\left(X Y^{i}\right)(x) E_{i}\right|_{x}
$$

The correspondence $\Gamma \leftrightarrow \omega_{\Gamma} \rightarrow s^{*} \omega_{\Gamma}$ identifies con LM with $\Lambda^{l}(M ; \underline{g}(n, \underline{R}))$.

And each $\nabla \epsilon_{\text {con }} T M$ gives rise to an element $\omega_{\nabla} \in \Lambda^{1}(M ; \underline{g}(n, \underline{R}))$, viz.

$$
\omega_{\nabla}=\left[\omega_{j}^{i}\right]
$$

LEMMA $\forall \Gamma \in \operatorname{con}$ LM,

$$
\omega_{\nabla} \Gamma=s^{\star} \omega_{\Gamma}
$$

[By definition,

$$
\left.\nabla_{X} \Gamma_{j}\right|_{x}=\left(\omega_{j}^{i}\right)^{\Gamma}\left(X_{x}\right) E_{i} \mid x
$$

On the other hand,

$$
\left.\nabla_{X}^{\Gamma} E_{j}\right|_{x}=\left.\zeta_{x} \omega_{\Gamma}\left(d s_{x} X_{x}\right) \zeta_{x}^{-1} E_{j}\right|_{x}
$$

Here

$$
\left.\zeta_{x}^{-1} E_{j}\right|_{x}=e_{j}
$$

and

$$
\omega_{\Gamma}\left(d s_{X} X_{x}\right)=s^{*} \omega_{\Gamma}\left(X_{x}\right)
$$

But

$$
\begin{array}{ll} 
& s^{\star} \omega_{\Gamma}\left(x_{x}\right) e_{j}=s^{\star} \omega_{\Gamma}\left(x_{x}\right)^{i}{ }_{j} e_{i} \\
\Rightarrow \quad & \zeta_{x} s^{\star} \omega_{\Gamma}\left(x_{x}\right) e_{j}=\left.s^{\star} \omega_{\Gamma}\left(x_{x}\right)^{i}{ }_{j} E_{i}\right|_{x} \\
\Rightarrow \quad & \\
& \left(\omega^{i}{ }_{j}\right)^{\Gamma}\left(x_{x}\right)=s^{\star} \omega_{\Gamma}\left(x_{x}\right)_{j}^{i}
\end{array}
$$

Therefore

$$
\left.\omega_{\nabla} \Gamma=\mathbf{s}^{\star} \omega_{\Gamma} \cdot\right]
$$

Given $\nabla €$ con TM, put

$$
\Omega_{\nabla}=\left[\Omega_{j}^{i}\right] \in \Lambda^{2}(M ; \underline{g \ell}(n, \underline{R})) .
$$

Then $\forall \Gamma \in$ con $L M$,

$$
\Omega_{\nabla} \Gamma=s^{*} \Omega_{\Gamma}
$$

In fact,

$$
\Omega_{\Gamma}=d \omega_{\Gamma}+\omega_{\Gamma} \wedge \omega_{\Gamma}
$$

$\Rightarrow$

$$
\begin{aligned}
& s^{*} \Omega_{\Gamma}=d s^{\star} \omega_{\Gamma}+s^{*} \omega_{\Gamma} \wedge s^{\star} \omega_{\Gamma} \\
& =d \omega{ }_{\nabla} \Gamma^{+}+\omega{ }_{\nabla} \Gamma^{\wedge \omega}{ }_{\nabla} \Gamma \\
& =\Omega_{\nabla^{\Gamma}}{ }^{\circ}
\end{aligned}
$$

Definition: A gauge transformation is a $C^{\infty}$ map

$$
g: M \rightarrow \underline{G L}(n, \underline{R}) .
$$

Notation: GAU is the set of gauge transformations.
With respect to pointwise operations, GAU is a group and there is a right action

$$
\left[\begin{array}{rl}
\sec L M \times \underline{G A U} & \rightarrow \sec L M \\
(E, g) & \rightarrow E \cdot g
\end{array}\right.
$$

where

$$
(E \cdot g)_{j}=E_{i} g_{j}^{i}
$$

LEMMA Let $\nabla \in$ con TM - then under a change of frame

$$
E \rightarrow E \cdot g \quad(g \in G A U),
$$

the matrix

$$
\omega_{\nabla} \in \Lambda^{l}(M ; \underline{g}(n, R))
$$

of connection l-forms becomes

$$
g^{-1} \omega_{\nabla} g+g^{-1} d g
$$

[Note: The products are matrix products and dg is the entrywise exterior derivative of $g: M \rightarrow \underline{G L}(n, \underline{R})$.]

Remark: The transformation property of $\Omega \nabla$ is simpler, viz.

$$
\Omega_{\nabla} \rightarrow g^{-1} \Omega_{\nabla} g \quad(g \in G A U) .
$$

[Invoke the lemma and observe that

$$
\begin{array}{ll} 
& g^{-1} g=I \\
\Rightarrow & g^{-1}(d g)+\left(d g^{-1}\right) g=0 \\
\Rightarrow & g^{-1}(d g)=-\left(d g^{-1}\right) g \\
\Rightarrow & \left.g^{-1}(d g) g^{-1}=-d g^{-1} .\right]
\end{array}
$$

In matrix notation, the relation

$$
\nabla_{X} E_{j}=\omega_{j}^{i}(X) E_{i}
$$

can be written

$$
\nabla_{X} \mathrm{E}=\mathrm{E} \omega_{\nabla}(\mathrm{X})
$$

So, $\forall \mathrm{g} \in \mathrm{GAU}$,

$$
\nabla_{X} E \cdot g=E \cdot g\left(g^{-1} \omega_{\nabla}(X) g+g^{-1} d g(X)\right)
$$

Let $\nabla$ be a connection on $T M$ and consider the $R$-linear operator

$$
d^{\nabla}: \Lambda^{k}\left(M ; T_{q}^{p}(M)\right) \rightarrow \Lambda^{k+1}\left(M ; T_{q}^{p}(M)\right)
$$

Then $\forall a \in \Lambda^{k}\left(M ; T_{q}^{p}(M)\right)$, one has

In what follows, use matrix notation.

## Example:

(1) Take $\mathrm{p}=1, \mathrm{q}=0$-- then

$$
\left(d^{\nabla} \alpha\right)^{i}=d \alpha^{i}+\omega_{j^{\wedge}}^{i} \alpha^{j}
$$

$$
\Rightarrow
$$

$$
d^{\nabla} \alpha=d a+\omega_{\nabla} \wedge a .
$$

(2) Take $\mathrm{p}=1, \mathrm{q}=1$ - then

$$
\begin{aligned}
\left(d^{\nabla} a\right)_{j}^{i} & =d a_{j}^{i}+\omega^{i}{ }_{a} \wedge a^{a}{ }_{j}-\omega^{b}{ }_{j} \wedge a_{b}^{i} \\
& =d a_{j}^{i}+\omega^{i} a^{\wedge} a^{a}{ }_{j}-(-1)^{k} a^{i}{ }_{b} \wedge \omega^{b}{ }_{j}
\end{aligned}
$$

$$
\begin{aligned}
& \left(d^{\nabla_{\alpha}}\right)^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}}=d a^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}} \\
& +\omega^{i_{l}}{ }_{a}{ }^{\wedge \alpha}{ }^{a i_{2} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}}+\cdots \\
& -\omega_{j_{1}}{ }^{{ }^{\wedge}}{ }^{i_{1} \cdots i_{p}}{ }_{b j_{2} \cdots j_{q}}-\cdots \cdot
\end{aligned}
$$

$$
\begin{aligned}
& \Rightarrow \\
& \quad d^{\nabla}{ }_{\alpha}=d \alpha+\omega_{\nabla} \wedge \alpha-(-1)^{k_{\alpha \wedge \omega_{\nabla}}} .
\end{aligned}
$$

The $\omega^{i} \in \Lambda^{1} M$ are the components of an element

$$
\omega \in \Lambda^{l}\left(M ; T_{0}^{l}(M)\right) .
$$

Explicated: $\forall X \in \mathcal{D}^{1}(M)$,

$$
\begin{aligned}
& {\left[\begin{array}{c}
\omega: D^{l}(\mathrm{M}) \rightarrow D^{1}(\mathrm{M}) \\
\omega(\mathrm{X})=\mathrm{X}
\end{array}\right.} \\
& \Rightarrow \\
& \begin{array}{c}
\omega(\mathrm{X})^{\mathrm{i}}=\omega(\mathrm{X})\left(\omega^{i}\right) \\
\\
=\omega^{i}(\mathrm{X}) .
\end{array}
\end{aligned}
$$

Analogously, the

$$
\left[\begin{array}{ll}
\theta^{i} & \\
& \\
\Omega^{i} & \\
& \\
&
\end{array}\right.
$$

are the components of an element

$$
\left[\begin{array}{l}
\theta_{\nabla} \in \Lambda^{2}\left(M ; T_{0}^{1}(M)\right) \\
\Omega_{\nabla} \in \Lambda^{2}\left(M ; T_{1}^{1}(M)\right) .
\end{array}\right.
$$

Example: The $\omega_{j}^{i} \in \Lambda^{1} M$ are not the components of an element $\omega_{\nabla} \in \Lambda^{1}\left(M ; T_{1}^{1}(M)\right)$.
[Suppose that $T \in \Lambda^{l}\left(M ; T_{1}^{1}(M)\right)$-- then

$$
T=T^{i}{ }_{j} E_{i} \otimes \omega^{j} .
$$

Replacing E by E•g changes $T_{j}^{i}$ to

$$
\left(g^{-1}\right)^{i} k^{T^{k}} \ell^{g^{\ell}}{ }_{j}
$$

But this tensor transformation rule is not satisfied by $\omega_{\nabla}$ since

$$
\left.\omega_{\nabla} \rightarrow g^{-1} \omega_{\nabla} g+g^{-1} d g .\right]
$$

$\underline{\mathrm{a}^{\nabla} \omega}$ : We have

$$
\begin{aligned}
d^{\nabla} \omega & =d \omega+\omega_{\nabla} \wedge \omega \\
& =\Theta_{\nabla}
\end{aligned}
$$

$\underline{\mathrm{d}^{\nabla} \theta_{\nabla}}:$ We have

$$
\begin{aligned}
d^{\nabla^{\theta_{\nabla}}} & =d \Theta_{\nabla}+\omega_{\nabla} \wedge \Theta_{\nabla} \\
& =d\left(d^{\nabla} \omega\right)+\omega_{\nabla} \wedge d^{\nabla} \omega \\
& =d\left(d \omega+\omega_{\nabla} \wedge \omega\right)+\omega_{\nabla} \wedge\left(d \omega+\omega_{\nabla} \wedge \omega\right) \\
& =d \omega_{\nabla} \wedge \omega-\omega_{\nabla} \wedge d \omega+\omega_{\nabla} \wedge d \omega+\omega_{\nabla} \wedge \omega_{\nabla} \wedge \omega \\
& =d \omega_{\nabla} \wedge \omega+\omega_{\nabla} \wedge \omega_{\nabla} \wedge \omega \\
& =\left(d \omega_{\nabla}+\omega_{\nabla} \wedge \omega_{\nabla}\right) \wedge \omega \\
& =\Omega_{\nabla} \wedge \omega .
\end{aligned}
$$

I.e.:

$$
d^{\nabla} \Theta_{\nabla}=\Omega_{\nabla} \wedge \omega .
$$

$\underline{d^{\nabla} \Omega_{\nabla}:}$ We have

$$
\begin{aligned}
d^{\nabla_{\Omega_{\nabla}}=} & d \Omega_{\nabla}+\omega_{\nabla} \wedge \Omega_{\nabla}-\Omega_{\nabla} \wedge \omega_{\nabla} \\
= & d \Omega_{\nabla}+\omega_{\nabla} \wedge\left(d \omega_{\nabla}+\omega_{\nabla} \wedge \omega_{\nabla}\right) \\
& -\left(d \omega_{\nabla}+\omega_{\nabla} \wedge \omega_{\nabla}\right) \wedge \omega_{\nabla} \\
= & d \Omega_{\nabla}+\omega_{\nabla} \wedge d \omega_{\nabla}-d \omega_{\nabla} \wedge \omega_{\nabla} \\
= & d\left(d \omega_{\nabla}+\omega_{\nabla} \wedge \omega_{\nabla}\right)+\omega_{\nabla} \wedge d \omega_{\nabla}-d \omega_{\nabla} \wedge \omega_{\nabla} \\
= & d \omega_{\nabla} \wedge \omega_{\nabla}-\omega_{\nabla} \wedge d \omega_{\nabla}+\omega_{\nabla} \wedge d \omega_{\nabla}-d \omega_{\nabla} \wedge \omega_{\nabla} \\
= & 0 .
\end{aligned}
$$

I.e.:

$$
d^{\nabla} \Omega_{\nabla}=0
$$

Remark: The symbol $\Omega_{\nabla}$ has two meanings, namely as an element of

$$
\Lambda^{2}(M ; \underline{g \ell}(n, \underline{R}))
$$

or as an element of

$$
\Lambda^{2}\left(M ; T_{1}^{1}(M)\right)
$$

Of course, if $\Omega_{\nabla}$ is viewed in the second sense, viz, as a map

$$
\Omega_{\nabla}: D^{1}(\mathrm{M}) \times D^{1}(\mathrm{M}) \rightarrow D_{1}^{1}(\mathrm{M}),
$$

then, upon taking components, $\Omega_{\nabla}$ reappears in the first sense as a matrix, viz. $\forall X, Y \in \mathcal{D}^{1}(M)$,
9.

$$
\Omega_{\nabla}(X, Y)\left(\omega^{i}, E_{j}\right)=\Omega_{\nabla}(X, Y)_{j}^{i}=\Omega_{j}^{i}(X, Y) .
$$

## Summary:

- Unwound, the relation

$$
d^{\nabla} \theta_{\nabla}=\Omega_{\nabla} \wedge \omega
$$

becomes

$$
d \theta^{i}+\omega_{j}^{i}{ }_{j} \Theta^{j}=\Omega_{j}^{i}{ }_{j} \omega^{j}
$$

Unwound, the relation

$$
d^{\nabla} \Omega_{\nabla}=0
$$

becomes

$$
\mathrm{d} \Omega_{j}^{i}+\omega_{k^{\wedge} \Omega_{j}^{k}}^{j}-\Omega_{k^{i}}{ }^{\mathrm{i}}{ }^{\mathrm{k}}{ }_{j}=0
$$

Let $\alpha \in \Lambda{ }^{k}\left(M ; T_{q}^{p}(M)\right)$-- then

$$
\begin{aligned}
& \left.\left(\alpha^{\nabla} \alpha^{\nabla}\right)^{i}\right)^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}} \\
& =\Omega^{i_{1}}{ }_{a} \wedge a{ }^{a i_{2} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}}+\cdots \\
& -\Omega_{j_{1}}{ }^{\wedge a}{ }^{i_{1} \cdots i_{p}}{ }_{b j_{2} \cdots j_{q}}-\cdots .
\end{aligned}
$$

So, when $\mathrm{R}=0$,

$$
d^{\nabla} \circ d^{\nabla}=0
$$

Section 16: Metric Considerations Let $M$ be a connected $C^{\infty}$ manifold of dimension $n$. Fix a semiriemannian structure $g \in M_{k, n-k}$.

Assume: The orthonormal frame bundle $\mathrm{LM}(\mathrm{g})$ is trivial.
Therefore $L M(g)$ admits global sections, these being the orthonormal frames.
Example: If $M$ is parallelizable and if $E=\left\{E_{1}, \ldots, E_{n}\right\}$ is a frame, then the prescription

$$
g_{E}(X, Y)=\left.\eta_{i j} X^{i} Y^{j}\right|_{-Y=Y^{j} E_{j}} ^{-X=X^{i} E_{i}}
$$

defines a semiriemannian structure $g_{E}{ }^{\in M}, n-k$ having $E$ as an orthonormal frame. And

$$
g_{E}=g_{E \cdot A}
$$

for all

$$
A \in C^{\infty}(M ; \underline{O}(k, n-k))
$$

Suppose that $E=\left\{E_{1}, \ldots, E_{n}\right\}$ is an orthonormal frame. Put

$$
\varepsilon_{i}=g\left(E_{i}, E_{i}\right)
$$

Then

$$
\varepsilon_{i}= \begin{cases}-1 & (1 \leq i \leq k) \\ +1 & (k+1 \leq i \leq n) .\end{cases}
$$

[Note: Let $\omega=\left\{\omega^{1}, \ldots, \omega^{n}\right\}$ be the associated coframe -- then

$$
\left.g=\sum_{i} \varepsilon_{i} \omega^{i} \otimes \omega^{i} \cdot\right]
$$

Example: Let $X \in \mathcal{D}^{l}(M)$-- then $\forall \nabla \in$ con $T M$,

$$
C_{1}^{1} \mathrm{VX}=\varepsilon_{j} g\left(\nabla_{E_{j}} X, E_{j}\right) .
$$

[To see this, recall that

$$
\nabla X=E_{i} \otimes\left(d x^{i}+x^{k} \omega_{k}^{i}\right)
$$

or still,

$$
\begin{aligned}
\nabla X= & \left(E_{j} X^{i}\right) E_{i} \otimes \omega^{j}+\left(X^{k} \Gamma_{j k}^{i}\right) E_{i} \otimes \omega^{j} \\
\Rightarrow \quad & C_{l}^{l} \nabla X=E_{i} X^{i}+X^{k} \Gamma_{i k}^{i} \\
& =E_{i} X^{i}+X^{j} \Gamma_{i j}^{i}
\end{aligned}
$$

On the other hand,

$$
\begin{aligned}
& \varepsilon_{j} g\left(\nabla_{E_{j}} X, E_{j}\right)=\varepsilon_{j} g\left(\nabla_{E_{j}}\left(X_{E_{i}}^{i}\right), E_{j}\right) \\
= & \varepsilon_{j} g\left(\left(E_{j} x^{i}\right) E_{i}+X^{i} \nabla_{E_{j}} E_{i}, E_{j}\right) \\
= & \varepsilon_{j} g\left(\left(E_{j} x^{i}\right) E_{i}+x^{i} \omega_{i}^{k}\left(E_{j}\right) E_{k}, E_{j}\right) \\
= & \left(\varepsilon_{i}\right)^{2} E_{i} x^{i}+\left(\varepsilon_{j}\right)^{2} x^{i} \omega_{i}^{j}\left(E_{j}\right) \\
= & E_{i} x^{i}+x^{i} \Gamma_{j i}^{j} \\
= & \left.E_{i} x^{i}+x^{j} \Gamma_{i j}^{i} \cdot\right]
\end{aligned}
$$

Remark: To lower or raise an index $i$ of a component of a tensor $T \in D_{q}^{p}(M)$, one has only to multiply by $\varepsilon_{i}$. E.g.: If $T \in D_{2}^{l}(M)$, then

$$
T_{i j k}=g_{i a^{T}}{ }^{a}{ }_{j k}=\delta^{i}{ }_{a} \varepsilon_{a} T^{T^{a}}{ }_{j k}=\varepsilon_{i} T^{i}{ }_{j k} \text { (no sum). }
$$

Fix $\nabla \in \operatorname{con}_{g}$ TM.

LEMMA We have

$$
\omega_{j}^{i}=-\varepsilon_{i} \varepsilon_{j} \omega_{i}^{j} \quad \text { (no sum) }
$$

[In fact, $\forall X \in \mathcal{D}^{l}(M)$,

$$
\begin{aligned}
0 & =X g\left(E_{i}, E_{i}\right) \\
& =g\left(\nabla_{X} E_{i}, E_{j}\right)+g\left(E_{i}, \nabla_{X} E_{j}\right) \\
& =g\left(\omega_{i}^{k}(X) E_{k^{\prime}} E_{j}\right)+g\left(E_{i}^{\prime} \omega_{j}^{k}(X) E_{k}\right) \\
& =\omega_{i}^{k}(X) g_{k j}+\omega_{j}^{k}(X) g_{i k} \\
& =g_{i k} \omega_{j}^{k}(X)+g_{j k} \omega_{i}^{k}(X) \\
& =\varepsilon_{i} \omega_{j}^{i}(X)+\varepsilon_{j} \omega_{i}^{j}(X) \quad \text { (no sum).] }
\end{aligned}
$$

[Note: If $E=\left\{E_{1}, \ldots, E_{n}\right\}$ is an arbitrary frame, then

$$
\left.\omega_{i j}+\omega_{j i}=d g_{i j} .\right]
$$

In particular:

$$
\omega_{i}^{i}=0
$$

LEMMA We have

$$
\Omega_{j}^{i}=-\varepsilon_{i} \varepsilon_{j} \Omega_{i}^{j} \quad \text { (no sum) }
$$

[In fact,

$$
-\varepsilon_{i} \varepsilon_{j} \Omega_{i}^{j}=-\varepsilon_{i} \varepsilon_{j}\left[d \omega_{i}^{j}+\omega_{k}^{j}{ }_{i}^{k}{ }_{i}\right]
$$

$$
\begin{aligned}
& =-\varepsilon_{i} \varepsilon_{j}\left[d\left(-\varepsilon_{i} \varepsilon_{j} \omega_{j}^{i}\right)+\left(-\varepsilon_{j} \varepsilon_{k}\right) \omega_{j}^{k}{ }_{j}^{\left.\wedge\left(-\varepsilon_{k} \varepsilon_{i}\right) \omega_{k}^{i}\right]}\right. \\
& =-\varepsilon_{i} \varepsilon_{j}\left[-\varepsilon_{i} \varepsilon_{j} d \omega_{j}^{i}-\varepsilon_{i} \varepsilon_{j}\left(\omega_{k}^{i} \wedge \omega_{j}^{k}\right)\right] \\
& \left.=\left(\varepsilon_{i} \varepsilon_{j}\right)^{2}\left[d \omega_{j}^{i}+\omega_{k}^{i}{ }_{k} \omega_{j}^{k}\right]=\Omega_{j}^{i}{ }_{j}\right]
\end{aligned}
$$

In particular:

$$
\Omega_{i}^{i}=0
$$

Scholium: Let $E=\left\{E_{1}, \ldots, E_{n}\right\}$ be an orthonormal frame. Suppose that $\nabla$ is a g-connection -- then

$$
\omega_{\nabla} \in \Lambda^{1}(M ; \underline{s o}(k, n-k))
$$

and

$$
\Omega_{\nabla} \in \Lambda^{2}(M ; \underline{s o}(k, n-k)) .
$$

[This is just a restatement of the fact that

$$
\omega_{j}^{i}=-\varepsilon_{i} \varepsilon_{j} \omega_{i}^{j} \quad \text { (no sum) }
$$

and

$$
\Omega_{j}^{i}=-\varepsilon_{i} \varepsilon_{j} \Omega_{i}^{j} \quad \text { (no sum).] }
$$

Assume now that $\nabla$ is the metric connection -- then, since $\nabla$ has zero torsion,

$$
d \omega^{i}+\omega_{j}^{i} \wedge \omega^{j}=0 .
$$

LEMMA We have

$$
\Gamma_{k j}^{i}=\frac{1}{2} \varepsilon_{i}\left(\varepsilon_{i} d \omega^{i}\left(E_{j}, E_{k}\right)+\varepsilon_{j} d \omega^{j}\left(E_{k}, E_{i}\right)-\varepsilon_{k} d \omega^{k}\left(E_{i}, E_{j}\right)\right)
$$

[Obviously,

$$
\begin{aligned}
& d \omega^{i}\left(E_{j}, E_{k}\right)=-\omega_{k}^{i}\left(E_{j}\right)+\omega_{j}^{i}\left(E_{k}\right) \\
\Rightarrow \quad & \varepsilon_{i} d \omega^{i}\left(E_{j}, E_{k}\right)=-\varepsilon_{i} \omega_{k}^{i}\left(E_{j}\right)+\varepsilon_{i} \omega_{j}^{i}\left(E_{k}\right) .
\end{aligned}
$$

Next, cyclically permute $\mathrm{i}, j, \mathrm{k}$ and use the relations developed above to get

$$
\varepsilon_{j} \mathrm{~d} \omega{ }^{j}\left(E_{k^{\prime}}, E_{i}\right)=\varepsilon_{i} \omega_{j}^{i}\left(E_{k}\right)+\varepsilon_{j} \omega_{k}^{j}\left(E_{i}\right)
$$

Repeating the procedure then gives

$$
\varepsilon_{k} d \omega^{k}\left(E_{i}, E_{j}\right)=\varepsilon_{j} \omega_{k}^{j}\left(E_{i}\right)-\varepsilon_{i} \omega_{k}^{i}\left(E_{j}\right)
$$

Now subtract the last equation from the sum of the first two.]
[Note: It follows that the connection l-forms $\omega_{j}^{i}$ are the unique l-forms satisfying

$$
d \omega^{i}+\omega_{j}^{i}{ }_{j} \omega^{j}=0
$$

and

$$
\omega_{j}^{i}=-\varepsilon_{i} \varepsilon_{j} \omega_{i}^{j} \quad \text { (no sum).] }
$$

Remark: In the RHS of this formula, the indices $i, j, k$ are not summed! Let $E=\left\{E_{1}, \ldots, E_{n}\right\}$ be an arbitrary frame.

Notation: Write

$$
d g_{i j}=g_{i j, k^{\omega}}{ }^{k}
$$

where

$$
g_{i j, k}=E_{k} g_{i j}
$$

Then

$$
\begin{array}{ll} 
& \omega_{i j}+\omega_{j i}=d g_{i j} \\
\Rightarrow \quad & g_{i j, k}=g_{i a^{\Gamma}{ }_{k j}}+g_{j a^{\prime}} \Gamma_{k i}^{a}
\end{array}
$$

FACI We have

$$
\begin{aligned}
\Gamma_{k j}^{i}= & \frac{1}{2}\left(-c_{k j}^{i}+g_{j a} g^{i b} C_{k b}^{a}+g_{k a} g^{i b} C_{j b}^{a}\right) \\
& +\frac{1}{2} g^{i b}\left(g_{j b, k}+g_{b k, j}-g_{k j, b}\right)
\end{aligned}
$$

Reality Check If the frame is orthonormal, then the second term vanishes leaving

$$
\Gamma_{k j}^{i}=\frac{I}{2}\left(-C_{k j}^{i}+\varepsilon_{j} \varepsilon_{i} C_{k i}^{j}+\varepsilon_{k} \varepsilon_{i} C_{j i}^{k}\right)
$$

But

$$
\left[\begin{array}{l}
c_{k j}^{i}=d \omega^{i}\left(E_{k^{\prime}} E_{j}\right) \\
c_{k i}^{j}=d \omega^{j}\left(E_{k^{\prime}}, E_{i}\right) \\
c_{j i}^{k}=d \omega^{k}\left(E_{j}, E_{i}\right)
\end{array}\right.
$$

Therefore

$$
\Gamma_{k j}^{i}=\frac{1}{2}\left(d \omega^{i}\left(E_{j}, E_{k}\right)+\varepsilon_{j} \varepsilon_{i} d \omega^{j}\left(E_{k}, E_{i}\right)-\varepsilon_{k} \varepsilon_{i} d \omega^{k}\left(E_{i}, E_{j}\right)\right)
$$

or still,

$$
\Gamma_{k j}^{i}=\frac{1}{2} \varepsilon_{i}\left(\varepsilon_{i} d \omega^{i}\left(E_{j}, E_{k}\right)+\varepsilon_{j} d \omega^{j}\left(E_{k^{\prime}}, E_{i}\right)-\varepsilon_{k} d \omega^{k}\left(E_{i}, E_{j}\right)\right)
$$

as desired.
Remark:

- Take $\mathrm{i}=\mathrm{k}$-- then

$$
\begin{aligned}
\Gamma_{i j}^{i} & =\frac{1}{2}\left(-C_{i j}^{i}+\varepsilon_{j} \varepsilon_{i} C_{i i}^{j}+\varepsilon_{i} \varepsilon_{i} C_{j i}^{i}\right) \\
& =\frac{1}{2}\left(-C_{i j}^{i}+C_{j i}^{i}\right) \\
& =-C_{i j}^{i} .
\end{aligned}
$$

- Take $i=j-$ then

$$
\begin{aligned}
\Gamma_{k i}^{i} & =\frac{1}{2}\left(-C_{k i}^{i}+\varepsilon_{i} \varepsilon_{i} C_{k i}^{i}+\varepsilon_{k} \varepsilon_{i} C_{i i}^{k}\right) \\
& =\frac{1}{2}\left(-C_{k i}^{i}+C_{k i}^{i}\right) \\
& =0
\end{aligned}
$$

Section 17: Submanifolds Let $M$ be a connected $C^{\infty}$ manifold of dimension $n, \Sigma \subset M$ an embedded connected submanifold of dimension $d, i: \Sigma \rightarrow M$ the inclusion. Fix a semiriemannian structure $g$ on $M$.

Assumption: $\overline{\mathrm{g}} \equiv \mathrm{i}^{*} \mathrm{~g}$ is a semiriemannian structure on $\Sigma$.
So, $\forall x \in \Sigma, g_{x} \mid T x^{\Sigma}$ is nondegenerate and

$$
T_{x} M=T_{x} \Sigma \oplus T_{x} \Sigma^{\perp}
$$

In the category of vector bundles, there is a pullback square

$$
\begin{array}{ccc}
\mathrm{i} * \mathrm{TM} & \rightarrow & \text { TM } \\
\downarrow & & \psi \pi_{M} \\
\Sigma & \overrightarrow{\mathrm{i}} & \mathrm{M}
\end{array}
$$

and a split short exact sequence

$$
0 \rightarrow \mathrm{~T} \mathrm{\Sigma} \rightarrow \mathrm{i}^{*} \mathrm{TM} \rightarrow \mathrm{~T} \mathrm{\Sigma}{ }^{\perp} \rightarrow 0
$$

where $T \Sigma^{\perp}$ is the normal bundle of $\Sigma$.
Definition: A vector field along $\Sigma$ is a section of $i * T M$, i.e., a smooth map $X: \Sigma \rightarrow T M$ such that the triangle

commutes.
Notation: $D^{l}(\Sigma: M)$ stands for the set of vector fields along $\Sigma$.
[Note: $D^{l}(\Sigma: M)$ is a module over $C^{\infty}(\Sigma)$. Furthermore, there is an arrow
of restriction

$$
D^{I}(\mathrm{M}) \rightarrow D^{I}(\Sigma: \mathrm{M})
$$

and an arrow of insertion

$$
\left.D^{1}(\Sigma) \rightarrow D^{l}(\Sigma: M) .\right]
$$

Let

$$
\begin{aligned}
& \tan : D^{l}(\Sigma: M) \rightarrow D^{l}(\Sigma) \\
& \text { nor: }: D^{l}(\Sigma: M) \rightarrow D^{l}(\Sigma)^{\perp}
\end{aligned}
$$

be the projections, so $\forall X \in D^{1}(\Sigma: M)$,

$$
x=\tan x+\operatorname{nor} x
$$

[Note: Both tan and nor are $C^{\infty}(\Sigma)$-linear.]
Rappel: Let $\nabla$ be a connection on TM -- then $\nabla$ induces a connection $i^{*} \nabla$ on i*TM, i.e., a map

$$
\left[\begin{array}{rl}
D^{1}(\Sigma) & \times D^{1}(\Sigma: M) \\
& \rightarrow D^{l}(\Sigma: M) \\
(\mathrm{V}, \mathrm{X}) & \\
& i^{*} \nabla_{V} \mathrm{X}
\end{array}\right.
$$

with the usual properties.

LEMMA The assignment

$$
\left[\begin{array}{rl}
D^{1}(\Sigma) \times D^{1}(\Sigma) & \rightarrow D^{1}(\Sigma) \\
(V, W) & \longrightarrow \tan i^{*} \nabla_{V} W
\end{array}\right.
$$

defines a connection $\bar{\nabla}$ on TL.

Definition: The function

$$
\Pi_{\nabla}: D^{1}(\Sigma) \times D^{1}(\Sigma) \rightarrow D^{1}(\Sigma)^{\perp}
$$

given by the rule

$$
\Pi_{\nabla}(\mathrm{V}, \mathrm{~W})=\text { nor } \mathrm{i}^{*} \nabla_{V} \mathrm{~W}
$$

is called the shape tensor.
[Note: $\Pi_{\nabla}$ is $C^{\infty}(\Sigma)$-bilinear. To see this, observe first that $i{ }^{*} \nabla_{V} W$ is $C^{\infty}(\Sigma)$-linear in $V$, hence so is $\Pi_{\nabla}$. On the other hand,

$$
i * \nabla_{V}(f W)=(V f) W+f i * \nabla_{V} W,
$$

thus

$$
\begin{aligned}
\Pi_{\nabla}(\mathrm{V}, \mathrm{fW}) & =\operatorname{nor} i^{*} \nabla_{V}(\mathrm{fW}) \\
& =\operatorname{nor}\left(f i^{*} \nabla_{V} \mathrm{~W}\right) \\
& \left.=f \operatorname{nor}\left(\mathrm{i}^{*} \nabla_{V} \mathrm{~W}\right)=\mathrm{fI}_{\nabla}(\mathrm{V}, \mathrm{~W}) \cdot\right]
\end{aligned}
$$

Summary: $\forall V, W \in \mathcal{D}^{1}(\Sigma)$,

$$
i^{*} \nabla V_{V} W=\bar{\nabla}_{V} W+\Pi_{\nabla}(V, W)
$$

LEMMA If $\nabla$ is torsion free, then $\forall V, W \in D^{1}(\Sigma)$,

$$
i * \nabla_{V}^{W}-i * \nabla_{W} V=[V, W]
$$

Since

$$
\begin{aligned}
& i^{*} \nabla_{V} W-i{ }^{*} \nabla_{W} V-[V, W] \\
= & \bar{\nabla}_{V} W-\bar{\nabla}_{W} V-[V, W]+\Pi_{\nabla}(V, W)-\Pi_{\nabla}(W, V),
\end{aligned}
$$

it follows that if $\nabla$ is torsion free, then $\bar{\nabla}$ is also torsion free and $\Pi_{\nabla}$ is symmetric.

LEEMMA Suppose that $\nabla \in \operatorname{con} \mathrm{g}^{\text {TM }}-$ then $\forall V \in \mathcal{D}^{1}(\Sigma), \forall X, Y \in \mathcal{D}^{1}(\Sigma: M)$,

$$
V g(X, Y)=g\left(i * \nabla_{V} X, Y\right)+g\left(X, i * \nabla_{V} Y\right) .
$$

Application: We have

$$
\nabla \in \operatorname{con}_{\mathrm{g}} \mathrm{TM} \Rightarrow \bar{\nabla} \in \mathrm{con} \overline{\mathrm{~g}} \mathrm{~T} \Sigma .
$$

Therefore, if $\nabla$ is the metric connection associated with $g$, then $\bar{\nabla}$ is the metric connection associated with $\bar{g}$.

LEMMA The assignment
defines a connection $\nabla^{\perp}$ on $T \Sigma^{\perp}$.

Given $N \in D^{1}(\Sigma)^{\perp}$, write

$$
i^{\star} \nabla_{V} N=\tan i^{*} \nabla_{V} N+\operatorname{nor} i^{\star} \nabla_{V} N
$$

or still,

$$
{ }^{i *} \nabla_{V} N=-S_{N} v+\nabla_{V}^{1} N
$$

where

$$
\begin{aligned}
& S_{N}: D^{1}(\Sigma) \rightarrow D^{1}(\Sigma) \\
& S_{N} V=-\tan i^{*} \nabla_{V} N .
\end{aligned}
$$

5. 

LEMMA Suppose that $\nabla \in$ con ${ }_{g}$ TM -- then

$$
S_{N} V=g^{\#}\left(g\left(N, \Pi_{\nabla}(V, \ldots)\right)\right)
$$

$\left[\forall W \in \mathcal{D}^{1}(\Sigma)\right.$,

$$
\begin{aligned}
\bar{g}\left(S_{N} V, W\right) & =-g\left(i^{*} \nabla_{V} N, W\right) \\
= & -V g(N, W)+g\left(N, i^{*} \nabla_{V} W\right) \\
= & g\left(N, i^{*} \nabla_{V} W\right) \\
= & g\left(N, \text { nor } i^{*} \nabla_{V} W\right) \\
& =g\left(N, \Pi_{\nabla}(V, W)\right)
\end{aligned}
$$

Therefore, as elements of $D_{1}(\Sigma)$,

$$
\bar{g}\left(S_{N} V, \ldots\right)=g\left(N, \Pi_{\nabla}(V, \ldots)\right) .
$$

Consequently,

$$
\begin{aligned}
S_{N} V & =\bar{g}^{\#}\left(\bar{g}\left(S_{N} V, \ldots\right)\right) \\
& \left.=\bar{g}^{\#}\left(g\left(N, \Pi_{\nabla}(V, \ldots)\right)\right) .\right]
\end{aligned}
$$

Remark: If $\nabla$ is the metric connection associated with $g$, then $\Pi_{\nabla}$ is symmetric, hence

$$
\begin{aligned}
\bar{g}\left(S_{N} V, W\right) & =g\left(N, \Pi_{\nabla}(V, W)\right) \\
& =g\left(N, \Pi_{\nabla}(W, V)\right) \\
& =\bar{g}\left(S_{N} W, V\right) \\
& =\bar{g}\left(V, S_{N} W\right)
\end{aligned}
$$

I.e.: $S_{N}$ is selfadjoint.

Let $\nabla \in$ con TM be arbitrary -- then $\forall \mathrm{V}_{1}, \mathrm{~V}_{2} \in \mathcal{D}^{1}(\Sigma) \& \quad \forall \mathrm{~W} \in D^{1}(\Sigma)$,

$$
\begin{aligned}
& \mathrm{R}\left(\mathrm{~V}_{1}, \mathrm{~V}_{2}\right) \mathrm{W} \\
& \left.=i^{*} \nabla_{V_{1}} i^{*} \nabla_{V_{2}}{ }^{W}-i^{*} \nabla_{V_{2}} i^{*} \nabla_{V_{1}} W-i^{*} \nabla V_{1}, V_{2}\right]^{W} \\
& =i^{*} \nabla_{V_{1}}\left(\bar{\nabla}_{V_{2}} W+\Pi_{\nabla}\left(\mathrm{V}_{2}, \mathrm{~W}\right)\right) \\
& -i * \nabla_{V_{2}}\left(\bar{\nabla}_{V_{1}} W+\Pi_{\nabla}\left(V_{1}, W\right)\right) \\
& -\bar{\nabla}_{\left[\mathrm{V}_{1}, \mathrm{~V}_{2}\right]}{ }^{\mathrm{W}-\Pi_{\nabla}\left(\left[\mathrm{V}_{1}, \mathrm{~V}_{2}\right], \mathrm{W}\right)} \\
& =\bar{\nabla}_{V_{1}} \bar{\nabla}_{V_{2}} \mathrm{~W}+\Pi_{\nabla}\left(\mathrm{V}_{1}, \bar{\nabla}_{\mathrm{V}_{2}} \mathrm{~W}\right) \\
& -S_{\Pi_{\nabla}}\left(V_{2}, W\right) V_{1}+\nabla_{V_{1}}^{\perp} \Pi_{\nabla}\left(V_{2}, W\right) \\
& -\bar{\nabla}_{\mathrm{V}_{2}} \bar{\nabla}_{\mathrm{V}_{1}} \mathrm{~W}-\Pi_{\nabla}\left(\mathrm{V}_{2}, \bar{\nabla}_{\mathrm{V}_{1}} \mathrm{~W}\right) \\
& +S_{\Pi_{\nabla}}\left(\mathrm{V}_{1}, \mathrm{~W}\right) \mathrm{V}_{2}-\nabla_{\mathrm{V}_{2}}^{\perp} \Pi_{\nabla}\left(\mathrm{V}_{1}, \mathrm{~W}\right) \\
& -\bar{\nabla}_{\left[\mathrm{V}_{1}, \mathrm{~V}_{2}\right]}{ }^{\mathrm{W}-\Pi_{\nabla}\left(\left[\mathrm{V}_{1}, \mathrm{~V}_{2}\right], \mathrm{W}\right)} \\
& =\bar{R}\left(V_{1}, V_{2}\right) W-S_{\Pi_{\nabla}}\left(V_{2}, W\right) V_{1}+S_{\Pi_{\nabla}}\left(V_{1}, W\right) V_{2} \\
& +\Pi_{\nabla}\left(\mathrm{V}_{1}, \bar{\nabla}_{\mathrm{V}_{2}} \mathrm{~W}\right)-\Pi_{\nabla}\left(\mathrm{V}_{2}, \bar{\nabla}_{\mathrm{V}_{1}} \mathrm{~W}\right)-\Pi_{\nabla}\left(\left[\mathrm{V}_{1}, \mathrm{~V}_{2}\right], \mathrm{W}\right) \\
& +\nabla_{\mathrm{V}_{1}}^{\perp} \Pi_{\nabla}\left(\mathrm{V}_{2}, \mathrm{~W}\right)-\nabla_{\mathrm{V}_{2}}^{\perp} \Pi_{\nabla}\left(\mathrm{V}_{1}, \mathrm{~W}\right) .
\end{aligned}
$$

Write

$$
\begin{aligned}
& \left(\nabla_{\mathrm{V}_{1}}^{\perp} \Pi_{\nabla}\right)\left(\mathrm{V}_{2}, \mathrm{~W}\right) \\
= & \nabla_{\mathrm{V}_{1}}^{\perp} \Pi_{\nabla}\left(\mathrm{V}_{2}, \mathrm{~W}\right)-\Pi_{\nabla}\left(\bar{\nabla}_{\mathrm{V}_{1}} \mathrm{~V}_{2}, \mathrm{~W}\right)-\Pi_{\nabla}\left(\mathrm{V}_{2}, \bar{\nabla}_{\mathrm{V}_{1}} \mathrm{~W}\right)
\end{aligned}
$$

and

$$
\begin{aligned}
& \left(\nabla_{\mathrm{V}_{2}}^{\perp} \Pi_{\nabla}\right)\left(\mathrm{V}_{1}, \mathrm{~W}\right) \\
= & \nabla_{\mathrm{V}_{2}}^{\perp} \Pi_{\nabla}\left(\mathrm{V}_{1}, \mathrm{~W}\right)-\Pi_{\nabla}\left(\bar{\nabla}_{\mathrm{V}_{2}} \mathrm{~V}_{1}, \mathrm{~W}\right)-\Pi_{\nabla}\left(\mathrm{V}_{1}, \bar{\nabla}_{\mathrm{V}_{2}} \mathrm{~W}\right)
\end{aligned}
$$

Then

$$
\begin{aligned}
& \left(\nabla_{\mathrm{V}_{1}}^{\perp} \Pi_{\nabla}\right)\left(\mathrm{V}_{2}, \mathrm{~W}\right)+\Pi_{\nabla}\left(\bar{\nabla}_{\mathrm{V}_{1}} \mathrm{~V}_{2}, \mathrm{~W}\right) \\
& \quad=\nabla_{\mathrm{V}_{1}}^{\perp} \Pi_{\nabla}\left(\mathrm{V}_{2}, \mathrm{~W}\right)-\Pi_{\nabla}\left(\mathrm{V}_{2}, \bar{\nabla}_{\mathrm{V}_{1}} \mathrm{~W}\right)
\end{aligned}
$$

and

$$
\begin{aligned}
& -\left(\nabla_{\mathrm{V}_{2}}^{\perp} \Pi_{\nabla}\right)\left(\mathrm{V}_{1}, \mathrm{~W}\right)-\Pi_{\nabla}\left(\bar{\nabla}_{\mathrm{V}_{2}} \mathrm{~V}_{1}, \mathrm{~W}\right) \\
& \quad=-\nabla_{\mathrm{V}_{2}}^{\perp} \Pi_{\nabla}\left(\mathrm{V}_{1}, \mathrm{~W}\right)+\Pi_{\nabla}\left(\mathrm{V}_{1},{\overline{{ }_{\mathrm{V}}^{2}}} \mathrm{~W}\right) .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& R\left(\mathrm{~V}_{1}, \mathrm{~V}_{2}\right) \mathrm{W} \\
= & \overline{\mathrm{R}}\left(\mathrm{~V}_{1}, \mathrm{~V}_{2}\right) \mathrm{W}-\mathrm{S}_{\Pi_{\nabla}}\left(\mathrm{V}_{2}, \mathrm{~W}\right) \mathrm{V}_{1}+\mathrm{S}_{\Pi_{\nabla}}\left(\mathrm{V}_{1}, \mathrm{~W}\right) \mathrm{V}_{2} \\
& +\left(\nabla_{V_{1}}^{\perp} \Pi_{\nabla}\right)\left(\mathrm{V}_{2}, \mathrm{~W}\right)-\left(\nabla_{V_{2}}^{\perp} \Pi_{\nabla}\right)\left(\mathrm{V}_{1}, \mathrm{~W}\right) \\
+ & \Pi_{\nabla}\left(\bar{\nabla}_{V_{1}} \mathrm{~V}_{2}, W\right)-\Pi_{\nabla}\left(\bar{\nabla}_{V_{2}} V_{1}, W\right)-\Pi_{\nabla}\left(\left[\mathrm{V}_{1}, \mathrm{~V}_{2}\right], \mathrm{W}\right)
\end{aligned}
$$

or still,

$$
\begin{aligned}
& \mathrm{R}\left(\mathrm{~V}_{1}, \mathrm{~V}_{2}\right) \mathrm{W} \\
& =\overline{\mathrm{R}}\left(\mathrm{~V}_{1}, \mathrm{~V}_{2}\right) \mathrm{W}-\mathrm{S}_{\Pi_{\nabla}\left(\mathrm{V}_{2}, W\right)} \mathrm{V}_{1}+\mathrm{S}_{\Pi_{\nabla}\left(\mathrm{V}_{1}, W\right)} \mathrm{V}_{2} \\
& \quad+\left(\nabla_{V_{1}}^{\perp} \Pi_{\nabla}\right)\left(\mathrm{V}_{2}, \mathrm{~W}\right)-\left(\nabla_{V_{2}}^{\perp} \Pi_{\nabla}\right)\left(\mathrm{V}_{1}, \mathrm{~W}\right) \\
& \\
& \quad+\Pi_{\nabla}\left(\overline{\mathrm{T}}\left(\mathrm{~V}_{1}, \mathrm{~V}_{2}\right), \mathrm{W}\right)
\end{aligned}
$$

## Corollaries

- Suppose that $\nabla \in \operatorname{con}_{g} \mathrm{TM}$-- then $\forall W_{1}, W_{2} \in D^{\perp}(\Sigma)$,

$$
\begin{aligned}
& g\left(W_{1}, R\left(V_{1}, V_{2}\right) W_{2}\right) \\
= & \bar{g}\left(W_{1}, \bar{R}\left(V_{1}, V_{2}\right) W_{2}\right) \\
+ & g\left(\Pi_{\nabla}\left(V_{1}, W_{2}\right), \Pi_{\nabla}\left(V_{2}, W_{1}\right)\right)-g\left(\Pi_{\nabla}\left(V_{1}, W_{1}\right), \Pi_{\nabla}\left(V_{2}, W_{2}\right)\right)
\end{aligned}
$$

- Suppose that $\nabla \in \operatorname{con} \mathrm{g}_{\mathrm{g}} \mathrm{TM}-$ then $\forall N \in D^{l}(\Sigma)^{\perp}$,

$$
\begin{aligned}
& g\left(N, R\left(V_{1}, V_{2}\right) W\right) \\
&=g(N,\left.\left(\nabla_{V_{1}}^{\perp} \Pi_{\nabla}\right)\left(V_{2}, W\right)\right)-g\left(N,\left(\nabla_{V_{2}}^{\perp} \Pi_{\nabla}\right)\left(V_{1}, W\right)\right) \\
&+\bar{g}\left(S_{N} \bar{T}\left(V_{1}, V_{2}\right), W\right) .
\end{aligned}
$$

Let $\nabla \in \operatorname{con}$ TM be arbitrary -- then $\forall \mathrm{V}_{1}, \mathrm{~V}_{2} \in \mathcal{D}^{\mathrm{l}}(\Sigma) \& \forall N \in \mathcal{D}^{l}(\Sigma)^{1}$,

$$
\begin{aligned}
& R\left(V_{1}, V_{2}\right) N \\
& =i^{*} \nabla_{V_{1}} i^{*} \nabla_{V_{2}} N-i * \nabla_{V_{2}}^{\left.i * \nabla_{V_{1}} N-i * \nabla_{\left[V_{1}\right.}, V_{2}\right]^{N}} \\
& =i^{*} \nabla_{V_{1}}\left(-S_{N} V_{2}+\nabla_{V_{2}}^{1} N\right)
\end{aligned}
$$

$$
\begin{aligned}
& -i{ }^{*} \nabla_{V_{2}}\left(-S_{N} V_{1}+\nabla_{V_{1}}^{\perp} N\right) \\
& +S_{N}\left[\mathrm{~V}_{1}, \mathrm{~V}_{2}\right]-\nabla_{\left[\mathrm{V}_{1}, \mathrm{~V}_{2}\right]^{\mathrm{N}}} \\
& =-\bar{\nabla}_{\mathrm{V}_{1}} \mathrm{~S}_{\mathrm{N}} \mathrm{~V}_{2}-\Pi_{\nabla}\left(\mathrm{V}_{1}, \mathrm{~S}_{\mathrm{N}} \mathrm{~V}_{2}\right) \\
& -\mathrm{S}_{\nabla_{\mathrm{V}_{2}}^{\perp} \mathrm{N}^{\prime}} \mathrm{V}_{1}+\nabla_{\mathrm{V}_{1}}^{\perp} \nabla_{\mathrm{V}_{2}}^{\perp} \mathrm{N} \\
& +\bar{\nabla}_{\mathrm{V}_{2}} \mathrm{~S}_{\mathrm{N}} \mathrm{~V}_{1}+\Pi_{\nabla}\left(\mathrm{V}_{2}, \mathrm{~S}_{\mathrm{N}} \mathrm{~V}_{1}\right) \\
& +\underset{\nabla_{V_{1}}^{\perp}}{ } \mathrm{V}_{2}-\nabla_{V_{2}}^{\perp} \nabla_{V_{1}}^{\perp} N \\
& \left.+S_{N}\left[V_{1} V_{2}\right]-\nabla_{\left[V_{1}\right.}^{\perp}, V_{2}\right]^{N} \\
& =R^{\perp}\left(V_{1}, V_{2}\right) N-\bar{T}_{S_{N}}\left(V_{1}, V_{2}\right) \\
& +\mathrm{s}_{\nabla_{\mathrm{V}_{1}}^{\perp} \mathrm{N}^{2}} \mathrm{~V}_{2}-\mathrm{S}_{\nabla_{\mathrm{V}_{2}}^{\perp} \mathrm{N}^{2}}^{\mathrm{V}_{1}} \\
& +\Pi_{\nabla}\left(\mathrm{V}_{2}, \mathrm{~S}_{\mathrm{N}} \mathrm{~V}_{1}\right)-\Pi_{\nabla}\left(\mathrm{V}_{1}, \mathrm{~S}_{\mathrm{N}} \mathrm{~V}_{2}\right),
\end{aligned}
$$

where, by definition,

$$
\overline{\mathrm{T}}_{\mathrm{S}_{\mathrm{N}}}\left(\mathrm{~V}_{1}, \mathrm{~V}_{2}\right)=\bar{\nabla}_{\mathrm{V}_{1}} \mathrm{~S}_{\mathrm{N}} \mathrm{~V}_{2}-\bar{\nabla}_{\mathrm{V}_{2}} \mathrm{~S}_{\mathrm{N}} \mathrm{~V}_{1}-\mathrm{S}_{\mathrm{N}}\left[\mathrm{~V}_{1}, \mathrm{~V}_{2}\right]
$$

Corollaries

- Suppose that $\nabla \in C o n_{g}{ }^{T M}-$ then $\forall N_{1}, N_{2} \in D^{l}(\Sigma)^{\perp}$,

$$
g\left(N_{1}, R\left(V_{1}, V_{2}\right) N_{2}\right)
$$

$+\bar{g}\left(S_{N_{1}} V_{2}, S_{N_{2}} V_{1}\right)-\bar{g}\left(S_{N_{1}} V_{1}, S_{N_{2}} V_{2}\right)$.

- Suppose that $\nabla \in \operatorname{con}_{\mathrm{g}}^{\mathrm{TM}}-$ then $\forall W \in \mathcal{D}^{l}(\Sigma)$,

$$
\begin{aligned}
& g\left(W_{r} R\left(V_{1}, V_{2}\right) N\right) \\
= & g\left(\nabla_{V_{1}}^{\perp} N, \Pi_{\nabla}\left(V_{2}, W\right)\right)-g\left(\nabla_{V_{2}}^{\perp} N_{r} \Pi_{\nabla}\left(V_{1}, W\right)\right) \\
& -\bar{g}\left(\bar{T}_{S_{N}}\left(V_{1}, V_{2}\right), W\right) .
\end{aligned}
$$

Section 18: Extrinsic Curvature Let $M$ be a connected $C^{\infty}$ manifold of dimension $n$. Maintaining the assumptions and notation of the previous section, specialize and take for $\Sigma$ a hypersurface (thus $d=n-1$ ) -- then the fibers of $T \Sigma^{\perp}$ are l-dimensional and there are just two possibilities:

$$
\left[\begin{array}{l}
(+): g \mid T \Sigma^{\perp}>0 \\
(-1): g \mid T \Sigma^{\perp}<0
\end{array}\right.
$$

Definition: A unit normal to $\Sigma$ is a section $\underline{n}: \Sigma \rightarrow T \Sigma^{\perp}$ such that

$$
\left[\begin{array}{l}
(+): g(\underline{n}, \underline{n})=+1 \\
(-): g(\underline{n}, \underline{n})=-1
\end{array}\right.
$$

Assumption: $\Sigma$ admits a unit normal.
[Note: $\underline{n}$ always exists locally but the Möbius strip in $\underline{R}^{3}$ shows that $\underline{n}$ need not exist globally.]

Criterion If $M$ is orientable, then $\Sigma$ is orientable iff $\Sigma$ admits a unit normal.

Definition: Let $\nabla \in c o n$ TM -- then the extrinsic curvature of the pair $(\Sigma, \nabla)$ is the tensor $x_{\nabla} \in D_{2}^{0}(\Sigma)$ given by the rule

$$
\Pi_{\nabla}(\mathrm{V}, \mathrm{~W})=x_{\nabla}(\mathrm{V}, \mathrm{~W}) \underline{n} .
$$

[Note: $x_{\nabla}$ depends on $\underline{n}$ (replacing $\underline{n}$ by $\underline{-n}$ changes the sign of $x_{\nabla}$ ).]
Remark: If $\nabla$ is torsion free, then $\Pi_{\nabla}$ is symmetric, thus so is $x_{\nabla}$.

IEMMA Suppose that $\nabla \in$ Con $_{\mathrm{g}} \mathrm{TM}-$ then $\nabla_{\mathrm{V}}^{1} \underline{\underline{n}}=0$, hence

$$
i^{*} \nabla_{V} V^{n}=-S_{\underline{n}} V .
$$

[This is because

$$
\left.0=\operatorname{Vg}(\underline{n}, \underline{n})=2 g\left(\nabla_{V}^{1} \underline{n}, \underline{n}\right) .\right]
$$

Let $\nabla \in$ con $_{\mathrm{g}} \mathrm{TM}$ - then

$$
g\left(\Pi_{\nabla}(V, W), \underline{n}\right)=x_{\nabla}(V, W) g(\underline{n}, \underline{n})
$$

or still,

$$
\begin{aligned}
& \bar{g}\left(S_{\underline{n}} V, W\right) \\
\Rightarrow \quad & x_{\nabla}(V, W) g(\underline{n}, \underline{n}) \\
& x_{\nabla}(V, W)=\bar{g}\left(S_{\underline{n}} V, W\right) g(\underline{n}, \underline{n}) .
\end{aligned}
$$

To simplify, at this point we shall assume that $\exists$ an orthonormal frame $\left\{E_{0}, E_{1}, \ldots, E_{n-1}\right\}$ such that $\forall x \in \mathcal{E},\left\{\left.E_{1}\right|_{x}, \ldots,\left.E_{n-1}\right|_{x}\right\}$ is an orthonormal basis for $\mathrm{T}_{\mathrm{x}} \Sigma$ and $\left.\underline{R E}_{0}\right|_{\mathrm{x}}=\mathrm{T}_{\mathrm{x}} \Sigma^{\perp}$.
[Note: In what follows, $\left.\underline{n}=E_{0} \mid \Sigma.\right]$
Notation: Indices $a, b, c$ run from 1 to $n-1$.
Agreeing to use an overbar for pullback to $\Sigma$, let $\nabla \in \operatorname{con}_{g}$ IM -- then $\forall V \in \mathcal{D}^{1}(\Sigma)$,

$$
\left[\begin{array}{c}
\bar{\nabla}_{V} E_{b}=\bar{\omega}_{b}^{a}(V) E_{a} \\
\Pi_{\nabla}\left(V, E_{b}\right)=\bar{\omega}_{b}^{0}(V) E_{0} \\
S_{E_{0}} V=-\bar{\omega}_{0}^{a}(V) E_{a}
\end{array}\right.
$$

Put

$$
x_{a b}=x_{\nabla}\left(E_{a}, E_{b}\right)
$$

Then

$$
\begin{aligned}
& x_{a b}=\bar{g}\left(S_{E_{0}} E_{a}, E_{b}\right) \varepsilon_{0} \\
&=-\bar{g}\left(\bar{\omega}_{0}^{c}\left(E_{a}\right) E_{c}, E_{b}\right) \varepsilon_{0} \\
&=-\varepsilon_{0} \varepsilon_{b} \bar{\omega}_{0}^{b}\left(E_{a}\right) \\
& \Rightarrow \quad \bar{\omega}_{0} \\
&=\bar{\omega}_{0}\left(E_{a}\right) \bar{\omega}^{a} \\
&=-\varepsilon_{0} \varepsilon_{b} x_{a b} \bar{\omega}^{a} \\
& \Rightarrow \quad{ }^{-0}=-\varepsilon_{0} \varepsilon_{b} \bar{\omega}_{0}=x_{a b} \bar{\omega}^{-a} .
\end{aligned}
$$

Remark: Suppose that $\nabla$ is the metric connection associated with $g$-- then

$$
d \bar{\omega}^{-0}=-\bar{\omega}^{0} a^{-\bar{\omega}}=0
$$

$\Rightarrow$

$$
\bar{\omega}_{a}^{0}(V) \bar{\omega}^{-\mathrm{a}}(\mathrm{~W})=\bar{\omega}_{a}^{-0}(\mathrm{~W}) \bar{\omega}^{-\mathrm{a}}(\mathrm{~V})
$$

Therefore

$$
\begin{aligned}
x_{\nabla}(V, W) & =\varepsilon_{0} \bar{g}\left(S_{E_{0}} V, W\right) \\
& =-\varepsilon_{0} \bar{g}\left(\bar{\omega}_{0}^{a}(V) E_{a}, \bar{\omega}^{\mathrm{b}}(\mathrm{~W}) E_{b}\right) \\
& =-\varepsilon_{0} \varepsilon_{a} \bar{\omega}_{0}^{\mathrm{a}}(\mathrm{~V}) \bar{\omega}^{-\mathrm{a}}(\mathrm{~W}) \\
& =\bar{\omega}_{a}^{0}(\mathrm{~V}) \bar{\omega}^{-\mathrm{a}}(\mathrm{~W})
\end{aligned}
$$

$$
\begin{aligned}
& =\bar{\omega}_{a}^{0}(\mathrm{~W}) \bar{\omega}^{\mathrm{a}}(\mathrm{~V}) \\
& =-\varepsilon_{0} \varepsilon_{a} \bar{\omega}_{0}^{\mathrm{a}}(\mathrm{~W}) \bar{\omega}^{-\mathrm{a}}(\mathrm{~V}) \\
& \quad=x_{\nabla}(\mathrm{W}, \mathrm{~V}),
\end{aligned}
$$

which confirms what we already know to be the case.
[Note: Similar considerations imply that the tensor

$$
(\mathrm{V}, \mathrm{~W}) \rightarrow \sum_{\mathrm{a}} \bar{\omega}_{0}^{\mathrm{a}}(\mathrm{~V}) \bar{\omega}_{0}^{\mathrm{a}}(\mathrm{~W})
$$

is symmetric.]
In anticipation of later developments, assume henceforth that $g \in M_{1, n-1}$ and $\bar{g}>0\left(\right.$ so $\left.\varepsilon_{0}=-1, \varepsilon_{a}=1\right)$.

Let $\nabla \in \operatorname{con}_{\mathrm{g}} \mathrm{TM}$-- then

- $\bar{\Omega}_{0}^{\mathrm{a}}=\mathrm{d} \bar{\omega}_{0}^{\mathrm{a}}+\bar{\omega}^{\mathrm{a}}{ }_{\mathrm{b}}{ }^{\wedge} \bar{\omega}_{0}^{\mathrm{b}}{ }_{0}$.
[Note: The $\bar{\omega}_{\mathrm{b}}$ are the connection l-forms of $\bar{\nabla}$ but the $\bar{\Omega}_{\mathrm{a}}^{\mathrm{a}}$ are not the curvature forms of $\bar{\nabla}$, these being the ${ }^{(n-1)} \Omega_{a} b^{\cdot]}$

Suppose now that $\nabla$ is the metric connection associated with $g$ (thus $\bar{\nabla}$ is the metric connection associated with $\overline{\mathrm{g}}$ ) .

Let $G$ be the Einstein tensor -- then

$$
\begin{aligned}
& G_{00}=\frac{1}{2} \Omega_{b}^{a}\left(E_{a}, E_{b}\right) \\
& G_{0 a}=\Omega_{0}^{b}\left(E_{b}, E_{a}\right)
\end{aligned}
$$

[The second relation is trivial. To check the first, note that

$$
\begin{aligned}
G_{00} & =R_{00}-\frac{1}{2} g_{00} S \\
& =R_{00}+\frac{1}{2} S \\
& =R_{00}+\frac{1}{2}\left(g^{i j} R_{i j}\right) \\
& =R_{00}+\frac{1}{2}\left(-R_{00}+\sum R_{a a}\right) \\
& =\frac{1}{2} R_{00}+\frac{1}{2} \underset{a}{\sum R_{a a}} .
\end{aligned}
$$

On the other hand,

$$
\frac{1}{2} \Omega_{b}^{a}\left(E_{a}, E_{b}\right)=\frac{1}{2} R_{b a b}^{a}
$$

And

$$
\begin{gathered}
R_{b a b}^{a}+R_{b 0 b}^{0}-R_{b 0 b}^{0} \\
= \\
=R_{b b}-R_{b 0 b}^{0} \\
\frac{1}{2} R_{b a b}^{a}=\frac{1}{2}\left[\underset{b}{\left[R R_{b b}-\right.}-\sum R_{b}^{0}{ }_{b 0 b}\right] .
\end{gathered}
$$

But

$$
\begin{aligned}
R_{b 0 b}^{0} & =-\varepsilon_{0} \varepsilon_{b} R_{00 b}^{b} \\
& =R_{00 b}^{b} \\
& =-R_{0 b 0}^{b}
\end{aligned}
$$

Therefore

$$
\begin{gathered}
-\sum_{b}^{\sum R_{b 0 b}^{0}}=\sum_{b}^{\sum R^{b}} 0 b 0 \\
=R_{000}^{0}+\sum_{b}^{\sum R_{0 b 0}} \\
=R_{00} \\
\Rightarrow \quad \frac{1}{2} \Omega_{b}^{a}\left(E_{a}, E_{b}\right) \\
\quad=\frac{1}{2} R_{00}+\frac{1}{2} \quad \underset{a}{\Sigma R_{a a}} \\
=G_{00 .}
\end{gathered}
$$

Set $q=\bar{g}$ and given symmetric tensors $T, S \in \mathcal{D}_{2}^{0}(\Sigma)$, put

$$
[T, S]_{q}=q\left[\frac{0}{2}\right](T, S)=T^{a b} S_{a b}
$$

In particular:

$$
\operatorname{tr}_{q}(T)=T_{a}^{a}=q^{a b} T_{a b}=[q, T]_{q} .
$$

Observation: If $T \in \mathcal{D}_{2}^{0}(\Sigma)$ is symmetric, then

$$
\begin{aligned}
{[T, T]_{q} } & =T_{b}^{a}{ }^{T}{ }^{b} a \\
& =\sum_{a, b}\left(T_{a b}\right)^{2}
\end{aligned}
$$

Returning to G, in terms of the extrinsic curvature, we have

$$
\left[\begin{array}{l}
\quad \bar{G}_{00}=\frac{1}{2} s(q)+\frac{1}{2}\left[\left(\operatorname{tr}_{q}\left(x_{\nabla}\right)\right)^{2}-\left[x_{\nabla}, x_{\nabla}\right]_{q}\right] \\
\bar{G}_{0 a}=\bar{\nabla}_{b} x_{a b}-\bar{\nabla}_{a} \operatorname{tr}_{q}\left(x_{\nabla}\right)
\end{array}\right.
$$

[Note: $S(q)$ is the scalar curvature of q.]

To begin with,

$$
\overline{\mathrm{G}}_{00}=\frac{1}{2} \bar{\Omega}_{\mathrm{b}}\left(\mathrm{E}_{\mathrm{a}}, \mathrm{E}_{\mathrm{b}}\right)
$$

or still,

$$
\overline{\mathrm{G}}_{00}=\frac{1}{2}(\mathrm{n}-1)_{\Omega}{ }_{b}\left(E_{a}, E_{b}\right)+\frac{1}{2}\left(\bar{\omega}_{0}{ }_{0} \bar{\omega}_{b}^{-0}\right)\left(E_{a}, E_{b}\right) .
$$

From the definitions,

$$
\frac{1}{2}{ }^{(n-1)} \Omega_{b} a_{a}\left(E_{b}\right)=\frac{1}{2} S(q) .
$$

In addition,

$$
\begin{aligned}
& \left(\bar{\omega}_{0}^{\mathrm{a}}{ }_{0} \bar{\omega}_{b}^{0}\right)\left(E_{a}, E_{b}\right) \\
& \left.\quad=\bar{\omega}_{0}^{a}\left(E_{a}\right) \bar{\omega}_{b}^{0}\left(E_{b}\right)-\bar{\omega}_{0}^{a}\left(E_{b}\right)\right)_{b}^{0}\left(E_{a}\right) \\
& \quad=x_{a a} x_{b b}-x_{b a} x_{a b} \\
& \quad=x_{a a} x_{b b}-\left(x_{a b}\right)^{2} \\
& \quad=\left(\operatorname{tr}_{q}\left(x_{\nabla}\right)\right)^{2}-\left[x_{\nabla}, x_{\nabla}\right]_{q} .
\end{aligned}
$$

Turning to the formula for $\bar{G}_{0 a}$, write

$$
\begin{gathered}
\bar{\Omega}_{0}^{b}\left(E_{b^{\prime}} E_{a}\right) \\
=d \bar{\omega}_{0}^{b}\left(E_{b^{\prime}}, E_{a}\right)+\left(\bar{\omega} c^{\wedge} \bar{\omega}_{0}^{c}\right)\left(E_{b^{\prime}}, E_{a}\right) \\
=d\left(x_{c b} \bar{\omega}^{-c}\right)\left(E_{b^{\prime}}, E_{a}\right)+x_{c^{\prime} c}\left(\bar{\omega} c^{\wedge} \bar{\omega}^{c^{\prime}}\right)\left(E_{b^{\prime}}, E_{a}\right) \\
=\left(d x_{c b} \wedge \bar{\omega}^{c}\right)\left(E_{b^{\prime}}, E_{a}\right)+x_{c b} d^{-c}\left(E_{b^{\prime}}, E_{a}\right) \\
\left.+x_{c} c^{\left(\omega^{b}\right.} c^{\wedge \omega^{c}}\right)\left(E_{b^{\prime}}, E_{a}\right) .
\end{gathered}
$$

- We have

$$
\begin{aligned}
& \left(d x_{c b} \bar{\mu}^{-c}\right)\left(E_{b}, E_{a}\right) \\
& \quad=d x_{c b}\left(E_{b}\right) \omega^{-c}\left(E_{a}\right)-d x_{c b}\left(E_{a}\right) \omega^{-c}\left(E_{b}\right) \\
& \quad=d x_{a b}\left(E_{b}\right)-d x_{b b}\left(E_{a}\right) \\
& \quad=E_{b} x_{\nabla}\left(E_{a}, E_{b}\right)-E_{a} x_{\nabla}\left(E_{b}, E_{b}\right)
\end{aligned}
$$

${ }^{\omega}$ We have

$$
\begin{aligned}
& x_{c b} d \omega^{c}\left(E_{b}, E_{a}\right) \\
&=x_{c b}\left(E_{b}{ }^{-}{ }^{c}\left(E_{a}\right)-E_{a} \bar{\omega}^{c}\left(E_{b}\right)-\omega^{c}\left(\left[E_{b}, E_{a}\right]\right)\right) \\
&=-x_{c b}{ }^{-c}\left(\left[E_{b}, E_{a}\right]\right) \\
&=-x_{c b}\left[E_{b}, E_{a}\right] c \\
&=x_{c b}\left[E_{a}, E_{b}\right] c \\
&=x_{\nabla}\left(E_{c}, E_{b}\right)\left[E_{a}, E_{b}\right] \\
&=x_{\nabla}\left(E_{b}, E_{c}\right)\left[E_{a}, E_{b}\right]{ }^{c} \\
&=x_{\nabla}\left(E_{b},\left[E_{a}, E_{b}\right] E_{c}\right) \\
&=x_{\nabla}\left(E_{b},\left[E_{a}, E_{b}\right]\right) \\
&=x_{\nabla}\left(E_{b}, \bar{\nabla}_{E_{a}} E_{b}-\bar{\nabla}_{E_{b}} E_{a}\right) \\
&=x_{\nabla}\left(E_{b}, \bar{\nabla}_{E_{a}} E_{b}\right)-x_{\nabla}\left(E_{b}, \bar{\nabla}_{E_{b}}^{E_{a}}\right)
\end{aligned}
$$

- We have

$$
\begin{aligned}
& \left.x_{c} c^{\left(\omega^{-b}\right.} c^{-\omega^{\prime}}\right)\left(E_{b}, E_{a}\right) \\
& \left.=x_{c^{\prime}} c^{\left(\omega^{-b}\right.}{ }_{c}\left(E_{b}\right) \omega^{-c^{\prime}}\left(E_{a}\right)-\bar{\omega}_{c}^{-b}\left(E_{a}\right)^{-\omega^{\prime}}\left(E_{b}\right)\right) \\
& =x_{a c^{\omega}}{ }^{-b} c\left(E_{b}\right)-x_{b c}{ }^{-\quad}{ }_{c}^{b}\left(E_{a}\right) \\
& =x_{\nabla}\left(E_{a} E_{c}\right)^{-b}{ }_{c}\left(E_{b}\right)-x_{\nabla}\left(E_{b}, E_{c}\right){ }^{-b}{ }_{c}\left(E_{a}\right) \\
& =x_{\nabla}\left(E_{a}, \bar{\omega}_{c}^{b}\left(E_{b}\right) E_{c}\right)-x_{\nabla}\left(E_{b}, \bar{\omega}_{c}{ }_{c}\left(E_{a}\right) E_{c}\right) \\
& =x_{\nabla}\left(E_{b},{ }^{-c}{ }_{b}\left(E_{a}\right) E_{c}\right)-x_{\nabla}\left(E_{a},{ }^{-c}{ }_{b}\left(E_{b}\right) E_{c}\right) \\
& =x_{\nabla}\left(\mathrm{E}_{\mathrm{b}}, \overline{\mathrm{E}}_{\mathrm{E}} \mathrm{E}_{\mathrm{b}}\right)-x_{\nabla}\left(\mathrm{E}_{\mathrm{a}}, \bar{\nabla}_{\mathrm{E}_{\mathrm{b}}} \mathrm{E}_{\mathrm{b}}\right) .
\end{aligned}
$$

Therefore $\bar{\Omega}_{0}{ }_{0}\left(E_{b}, E_{a}\right)$ equals

$$
\mathrm{E}_{\mathrm{b}} x_{\nabla}\left(\mathrm{E}_{\mathrm{a}}, \mathrm{E}_{\mathrm{b}}\right)-x_{\nabla}\left(\mathrm{E}_{\mathrm{b}}, \bar{\nabla}_{\mathrm{E}_{\mathrm{b}}} \mathrm{E}_{\mathrm{a}}\right)-x_{\nabla}\left(\mathrm{E}_{\mathrm{a}}, \bar{\nabla}_{\mathrm{E}_{\mathrm{b}}} \mathrm{E}_{\mathrm{b}}\right)
$$

minus

$$
E_{a} x_{\nabla}\left(E_{b}, E_{b}\right)-x_{\nabla}\left(E_{b}, \bar{\nabla}_{E_{a}} E_{b}\right)-x_{\nabla}\left(E_{b}, \bar{\nabla}_{E_{a}} E_{b}\right)
$$

Since $x_{\nabla}$ is symmetric,

But

$$
\left[\begin{array}{l}
x_{\nabla}\left(\mathrm{E}_{\mathrm{b}}, \bar{\nabla}_{\mathrm{E}_{\mathrm{b}}} \mathrm{E}_{\mathrm{a}}\right)=x_{\nabla}\left(\bar{\nabla}_{\mathrm{E}_{\mathrm{b}}} \mathrm{E}_{\mathrm{a}}, \mathrm{E}_{\mathrm{b}}\right) \\
x_{\nabla}\left(\mathrm{E}_{\mathrm{b}}, \bar{\nabla}_{\mathrm{E}_{\mathrm{a}}} \mathrm{E}_{\mathrm{b}}\right)=x_{\nabla}\left(\bar{\nabla}_{\mathrm{E}_{\mathrm{a}}} \mathrm{E}_{\mathrm{b}}, \mathrm{E}_{\mathrm{b}}\right)
\end{array}\right.
$$

$$
\left[\begin{array}{l}
\left(\bar{\nabla}_{E_{b}} x_{\nabla}\right)\left(E_{a}, E_{b}\right)=E_{b} x_{\nabla}\left(E_{a}, E_{b}\right)-x_{\nabla}\left(\bar{\nabla}_{E_{b}} E_{a}, E_{b}\right)-x_{\nabla}\left(E_{a}, \bar{\nabla}_{E_{b}} E_{b}\right) \\
\left(\bar{\nabla}_{E_{a}} x_{\nabla}\right)\left(E_{b}, E_{b}\right)=E_{a} x_{\nabla}\left(E_{b}, E_{b}\right)-x_{\nabla}\left(\bar{\nabla}_{E_{a}} E_{b}, E_{b}\right)-x_{\nabla}\left(E_{b}, \bar{\nabla}_{E_{a}} E_{b}\right)
\end{array}\right.
$$

$$
\begin{aligned}
& \text { Therefore } \bar{\Omega}_{0}^{b}\left(E_{b}, E_{a}\right) \text { equals } \\
& \qquad\left(\bar{\nabla}_{E_{b}}^{x_{\nabla}}\right)\left(E_{a}, E_{b}\right)-\left(\bar{\nabla}_{E_{a}}^{x_{\nabla}}\right)\left(E_{b}, E_{b}\right) \\
& \text { or still, } \\
& \\
& \bar{\nabla}_{b} x_{a b}-\bar{\nabla}_{a} x_{b b} .
\end{aligned}
$$

I.e.:

$$
\overline{\mathrm{G}}_{0 \mathrm{a}}=\bar{\nabla}_{\mathrm{b}} x_{a b}-\bar{\nabla}_{a} \operatorname{tr}_{q}\left(x_{\bar{\nabla}}\right)
$$

Section 19: Hodge Conventions Let $M$ be a connected $C^{\infty}$ manifold of dimension n .

Rappel: If $\varphi$ is a density of weight l, i.e., if $\varphi$ is a section of the density line bundle $L_{\text {den }}(M) \rightarrow M$, then one can associate with $\varphi$ a Radon measure $m_{\varphi}$ :

$$
\int_{M} \mathrm{fdm}_{\varphi}=\int_{M} \mathrm{f}_{\mathrm{M}} \quad\left(\mathrm{f} \in \mathrm{C}_{\mathrm{C}}(\mathrm{M})\right) .
$$

Let $g \in \mathbb{M}$-- then $|g|^{1 / 2}$ is a density of weight 1 , from which $m|g|^{1 / 2^{.}}$ Assume now that $M$ is orientable with orientation $\mu$-- then there is a unique $n$-form vol ${ }_{g} \in \Lambda^{n} M$ such that $\forall x \in M$ and every oriented orthonormal basis for $T_{x} M$,

$$
\operatorname{vol}_{g} \mid x\left(E_{1}, \ldots, E_{n}\right)=1
$$

[Note: In a connected open set UCM equipped with coordinates $x^{1}, \ldots, x^{n}$ consistent with $\mu$, i.e., such that
we have

$$
\left[\left.\frac{\partial}{\partial x^{1}}\right|_{x}, \ldots,\left.\frac{\partial}{\partial x^{n}}\right|_{x}\right]_{-} \in \mu_{x} \forall x \in U,
$$

$$
\left.\operatorname{vol}_{g}=|g|^{1 / 2} d x^{1} \wedge \ldots \wedge d x^{n} .\right]
$$

FACT $\forall f \in C_{C}(M)$,

$$
\int_{M} \mathrm{fdm}|g|^{1 / 2}=\int_{M} \text { fvol }_{g} .
$$

Remark: Let $\Sigma$ be a hypersurface (subject to the standing assumption that $\bar{g}$ is a semiriemannian structure on $\Sigma$ ). Suppose that $\Sigma$ admits a unit normal $\underline{n}$-- then the pair ( $\mu, \underline{n}$ ) determines an orientation $\bar{\mu}$ of $\Sigma$ and

$$
\operatorname{vol}_{\bar{g}}=i *\left(c_{\underline{n}^{201}}^{g}\right)
$$

FACT $\forall X \in \mathcal{D}^{I}(\Sigma: M)$,

$$
i^{*}\left(e_{X} \operatorname{vol}_{g}\right)=g(\underline{n}, \underline{n}) g(x, \underline{n}) \operatorname{vol}_{\bar{g}} .
$$

LEMMA Let $X \in \mathcal{D}^{1}(M)$-- then

$$
L_{X} \mathrm{vol}_{g}=(\operatorname{div} X) \operatorname{vol}_{g}
$$

[Working locally, we have

$$
\begin{aligned}
& L_{X}\left(|g|^{1 / 2} d x^{1} \wedge \ldots \wedge d x^{n}\right) \\
& =x|g|^{1 / 2} d x^{1} \wedge \ldots \wedge d x^{n}+|g|^{1 / 2} \sum_{i} d x^{1} \wedge \ldots \wedge d\left(x x^{i}\right) \wedge \ldots \wedge d x^{n} \\
& =x^{i}|g|_{, i}^{l / 2} d x^{l} \wedge \ldots \wedge d x^{n} \\
& +|g|^{l / 2} \sum_{i} d x^{l} \wedge \ldots \wedge d\left(X^{j} \frac{\partial}{\partial x^{j}} x^{i}\right) \wedge \ldots \wedge d x^{n} \\
& =\left(X^{i}|g|_{, i}^{l / 2}+|g|^{l / 2 X_{i}^{i}}\right) d x^{l} \wedge \ldots \wedge d x^{n} \\
& =\frac{1}{|g|^{1 / 2}}\left(x^{i}|g|^{1 / 2}\right), i^{\operatorname{vol}_{g}} \\
& \left.=(\operatorname{div} \mathrm{X}) \operatorname{vol}_{\mathrm{g}} \cdot\right]
\end{aligned}
$$

[Note: By contrast,

$$
\nabla_{\mathrm{X}} \mathrm{vol}_{\mathrm{g}}=0
$$

if $\nabla$ is the metric connection. Proof:

$$
\nabla_{x}\left(|g|^{1 / 2} d x^{l} \wedge \ldots \wedge d x^{n}\right)
$$

$$
\begin{gathered}
=\left(x^{a}|g|_{, a}^{l / 2}-x_{1}^{a} b_{a b}|g|^{1 / 2}\right) d x^{l} \wedge \ldots \wedge d x^{n} \\
=\left(x^{a}|g|_{, a}^{1 / 2}-x^{a}\left(\frac{1}{|g|^{1 / 2}}|g|_{, a}^{1 / 2}\right)|g|^{l / 2}\right) d x^{l} \wedge \ldots \wedge d x^{n} \\
=0 .]
\end{gathered}
$$

Application: Suppose that $X$ has compact support -- then

$$
\int_{M}(\operatorname{div} X) \operatorname{vol}_{g}=0
$$

[In fact,

$$
\begin{aligned}
& \int_{M}(\operatorname{div} X) \operatorname{vol}_{g}=\int_{M} L_{X} \mathrm{vol}_{g} \\
& \quad=\int_{M}\left(\iota_{X} \circ d+d \circ \iota_{X}\right) \mathrm{vol}_{g} \\
& \quad=\int_{M} d\left(\iota_{X} \mathrm{Vol}_{g}\right)
\end{aligned}
$$

But $\iota_{X} \mathrm{vol}_{\mathrm{g}}$ is a compactly supported ( $\mathrm{n}-\mathrm{l}$ )-form, hence

$$
\int_{M} d\left(c_{X} \operatorname{vol}_{g}\right)=0
$$

by Stokes ${ }^{\text { }}$ theorem.]
[Note: Let $f \in C_{C}^{\infty}(M)$-- then $\forall X \in \mathcal{D}^{1}(M)$, fX has compact support, so

$$
0=\int_{M} \operatorname{div}^{(f X)} \mathrm{vol}_{g}=\int_{M}(X f+f(\operatorname{div} X)) \operatorname{vol}_{g^{\prime}}
$$

or, in index notation,

$$
\left.0=\int_{M} \nabla_{i}\left(f X^{i}\right) \operatorname{vol}_{g}=\int_{M}\left(\left(\nabla_{i} f\right) X^{i}+f\left(\nabla_{i} X^{i}\right)\right) \operatorname{vol}_{g} \cdot\right]
$$

Example (Yano's Formula): Working with the metric connection, let
let $X \in D^{1}(M)$ - then

$$
\nabla_{b} \nabla_{a} x^{i}-\nabla_{a} \nabla_{b} x^{i}
$$

$$
=x_{; a ; b}^{i}-x_{; b ; a}^{i}
$$

$$
=\mathrm{R}_{\mathrm{jba}}^{\mathrm{i}} \mathrm{X}^{\mathrm{j}}
$$

$$
\Rightarrow
$$

$$
x_{; a ; i}^{i}-x_{; i ; a}^{i}
$$

$$
=R_{j i a}^{i} X^{j}
$$

$$
=R_{j a} X^{j}=R_{i a} X^{i}=R_{a i} X^{i}
$$

$\Rightarrow$

$$
\begin{aligned}
& x^{a} x_{; a ; i}^{i}-x^{a} x_{; i ; a}^{i} \\
& =R_{a i} x^{a} x^{i}=\operatorname{Ric}(x, x) .
\end{aligned}
$$

In the relation

$$
\operatorname{div}(f X)=f d i v x+X f
$$

take $\mathrm{f}=\operatorname{div} \mathrm{X}$ to get

$$
\begin{aligned}
\operatorname{div}((\operatorname{div} \mathrm{X}) \mathrm{X}) & =(\operatorname{div} \mathrm{X})^{2}+\mathrm{X}(\operatorname{div} \mathrm{X}) \\
& =(\operatorname{div} \mathrm{X})^{2}+\mathrm{d}(\operatorname{div} \mathrm{X})(\mathrm{X})
\end{aligned}
$$

Since $\operatorname{div} x=X_{i j}^{i}$ it follows that

$$
d(\operatorname{div} X)(X)=X^{a} X_{i j ; a}^{i}
$$

Therefore

$$
\operatorname{Ric}(X, X)=X^{a} X_{; a ; i}^{i}-d(\operatorname{div} X)(X)
$$

or still,

$$
\begin{aligned}
& \operatorname{Ric}(x, X)-(\operatorname{div} x)^{2} \\
& \quad=x^{a} x_{; a ; i}^{i}-\operatorname{div}((\operatorname{div} x) x)
\end{aligned}
$$

Write

$$
\begin{aligned}
& \nabla_{i}\left(x^{a}\left(\nabla_{a} x^{i}\right)\right)-\left(\nabla_{i} x^{a}\right)\left(\nabla_{a} x^{i}\right) \\
&=\left(\nabla_{i} x^{a}\right)\left(\nabla_{a} x^{i}\right) \\
&+x^{a} \nabla_{i} \nabla_{a} x^{i}-\left(\nabla_{i} x^{a}\right)\left(\nabla_{a} x^{i}\right) \\
&=x^{a} x_{; a ; i}^{i}
\end{aligned}
$$

and then note that

$$
\begin{aligned}
\operatorname{div}\left(\nabla_{X} X\right) & =\nabla_{i}\left(\left(\nabla_{X} X\right)^{i}\right) \\
& =\nabla_{i}\left(\left(\nabla_{X^{a} \partial_{a}} x^{i}\right)\right. \\
& =\nabla_{i}\left(\left(X^{a} \nabla_{\partial_{a}} X\right)^{i}\right) \\
& =\nabla_{i}\left(X^{a}\left(\nabla_{\partial_{a}} x^{i}\right)\right. \\
& =\nabla_{i}\left(X^{a}\left(x_{; a}^{i}\right)\right) \\
& =\nabla_{i}\left(X^{a}\left(\nabla_{a} x^{i}\right)\right)
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& \operatorname{Ric}(X, X)-(\operatorname{div} X)^{2} \\
= & \operatorname{div}\left(\nabla_{X} X\right)-\left(\nabla_{i} X^{a}\right)\left(\nabla_{a} X^{i}\right)-\operatorname{div}((\operatorname{div} X) X) .
\end{aligned}
$$

## I.e.:

$$
\begin{aligned}
& \operatorname{Ric}(X, X)-(\operatorname{div} X)^{2}+\left(\nabla_{i} X^{a}\right)\left(\nabla_{a} X^{i}\right) \\
& =\operatorname{div}\left(\nabla_{X} X\right)-\operatorname{div}((\operatorname{div} X) X)
\end{aligned}
$$

To understand the term

$$
\left(\nabla_{i} x^{a}\right)\left(\nabla_{a} x^{i}\right),
$$

recall that $\nabla X \in \mathcal{D}_{1}^{1}(M)$ or, equivalently,

$$
\left[\begin{array}{l}
\nabla \mathrm{X} \in \mathrm{Hom}_{\mathrm{C}^{\infty}(\mathrm{M})}\left(\mathcal{D}^{\mathrm{l}}(\mathrm{M}), D^{1}(\mathrm{M})\right) \\
\nabla \mathrm{X}(\mathrm{Y})=\nabla_{\mathrm{Y}} \mathrm{X}
\end{array}\right.
$$

thus

$$
\left[\begin{array}{c}
\nabla \mathrm{X} \circ \nabla \mathrm{X} \in \mathrm{Hom}_{\mathrm{C}^{\infty}(\mathrm{M})}\left(D^{1}(\mathrm{M}), D^{1}(\mathrm{M})\right) \\
(\nabla \mathrm{X} \circ \nabla \mathrm{X})(\mathrm{Y})=\nabla_{\nabla_{Y} X^{X}}
\end{array}\right.
$$

Claim:

$$
\operatorname{tr}(\nabla X \circ \nabla X) \quad\left(\text { a.k.a. } \quad C_{l}^{1}(\nabla X)^{2}\right)
$$

equals

$$
\left(\nabla_{i} x^{a}\right)\left(\nabla_{a} x^{i}\right)
$$

Indeed

$$
\begin{gathered}
(\nabla X \circ \nabla X)\left(\partial_{i}\right)=\nabla_{\nabla_{i}} X X \\
=\nabla_{X_{; i a_{a}}^{a}} X
\end{gathered}
$$

$$
\begin{aligned}
&=x_{; i}^{a} \nabla_{a} x \\
&=x_{; i}^{a} x_{; a}^{j} \partial_{j} \\
& \Rightarrow \quad \\
& \operatorname{tr}(\nabla x \circ \nabla X)=x_{; i}^{a} x_{; a}^{i}=\left(\nabla_{i} x^{a}\right)\left(\nabla_{a} x^{i}\right) .
\end{aligned}
$$

So, if X has compact support, then

$$
\int_{\mathrm{M}}\left[\operatorname{Ric}(\mathrm{X}, \mathrm{X})-(\operatorname{div} \mathrm{X})^{2}+\operatorname{tr}(\nabla \mathrm{X} \circ \nabla \mathrm{X})\right] \mathrm{vol}_{\mathrm{g}}=0
$$

Remark: We have

$$
\left[\begin{array}{l}
\left(L_{x} g\right)_{i j}=\nabla_{j} X_{i}+\nabla_{i} x_{j} \\
\left(L_{x}\right)^{i j}=\nabla^{j} x^{i}+\nabla^{i} x^{j} .
\end{array}\right.
$$

Therefore

$$
\begin{aligned}
& g\left[{ }_{2}^{0}\right]\left(L_{x} g, L_{x} g\right)=\left(L_{x} g\right)^{i j}\left(L_{x} g\right)_{i j} \\
& =\sum_{i, j}\left(\nabla^{j} x^{i}+\nabla^{i} x^{j}\right)\left(\nabla_{j} X_{i}+\nabla_{i} x_{j}\right) \\
& =\sum_{i, j}\left(\nabla^{j} X^{i}\right)\left(\nabla_{j} X_{i}\right)+\underset{i, j}{\sum}\left(\nabla^{i} x^{j}\right)\left(\nabla_{i} X_{j}\right) \\
& +\underset{i, j}{\sum}\left(\nabla^{j} X^{i}\right)\left(\nabla_{i} X_{j}\right)+\underset{i, j}{\Sigma}\left(\nabla^{i} X^{j}\right)\left(\nabla_{j} X_{i}\right) \\
& =2 \sum_{i, j}\left(\nabla^{j} X^{i}\right)\left(\nabla_{j} X_{i}\right)+2 \sum_{i, j}\left(\nabla^{j} X^{i}\right)\left(\nabla_{i} X_{j}\right) .
\end{aligned}
$$

- From the definitions,

$$
(\nabla \mathrm{X})^{i}{ }_{j}=\nabla_{j} x^{i}
$$

$$
\begin{aligned}
g\left[\frac{1}{l}\right](\nabla X, \nabla X) & =(\nabla X)^{i j}(\nabla X)_{i j} \\
& =\left(\nabla^{j} X^{i}\right)\left(\nabla_{j} X_{i}\right)
\end{aligned}
$$

- From the definitions,

$$
\begin{aligned}
& \left(\nabla_{i} X^{j}\right)\left(\nabla_{j} x^{i}\right) \\
= & \nabla_{i} g^{j k} x_{k} \nabla_{j} x^{i} \\
= & \nabla_{i} x_{k} g^{j k} \nabla_{j} x^{i} \\
= & \nabla_{i} X_{k} g^{k j} \nabla_{j} x^{i} \\
= & \nabla_{i} x_{k} \nabla^{k} x^{i} \\
= & \left(\nabla_{i} X_{j}\right)\left(\nabla^{j} X^{i}\right) \\
\Rightarrow \quad \operatorname{tr}(\nabla x \circ & \nabla x)=\left(\nabla_{i} X_{j}\right)\left(\nabla^{j} x^{i}\right)=\left(\nabla^{j} X^{i}\right)\left(\nabla_{i} X_{j}\right)
\end{aligned}
$$

Therefore

$$
\operatorname{tr}(\nabla X \circ \nabla X)=\frac{1}{2} g\left[\begin{array}{l}
0 \\
2
\end{array}\right]\left(L_{X} g, L_{X} g\right)-g\left[\frac{1}{1}\right](\nabla X, \nabla X) .
$$

FACT We have

$$
\operatorname{tr}(\nabla X \circ \nabla X)=g\left[\frac{1}{1}\right](\nabla X, \nabla X)-\frac{1}{2} g\left[\begin{array}{l}
0 \\
2
\end{array}\left(d g^{b} X, d g^{b} X\right) .\right.
$$

[Observe that

$$
\left.\left(d g^{b} x\right)_{j i}=\nabla_{j} x_{i}-\nabla_{i} x_{j} .\right]
$$

The material in Section 3 can be applied to the triple $(M, g, \mu)$ pointwise, hence need not be repeated here.

This said, consider the star operator

$$
\star: \Lambda^{P_{M}} \rightarrow \Lambda^{n-P_{M}}
$$

Then

$$
\left\{\begin{array}{l}
\alpha \wedge * \beta=g(\alpha, \beta) \operatorname{vol}_{g} \\
\quad * * \alpha=(-1)^{2}(-1)^{\mathrm{p}(\mathrm{n}-\mathrm{p})_{\alpha}}
\end{array}\right.
$$

and

$$
\left.\right|_{-} \quad * f=\mathrm{fvol}_{g} .
$$

Example: $\forall X \in \mathcal{D}^{1}(\mathrm{M})$,

$$
*(\operatorname{div} X)=(\operatorname{div} X) \operatorname{vol}_{g}=L_{X} \operatorname{vol}_{g}
$$

LEMMA Let $\nabla$ be the metric connection -- then $\forall X \in \mathcal{D}^{\mathcal{1}}$ (M), the diagram

$$
\begin{array}{rll}
\Lambda^{\mathrm{p}_{\mathrm{M}}} & \stackrel{*}{\rightarrow} & \Lambda^{\mathrm{n}-\mathrm{p}_{\mathrm{M}}} \\
\nabla_{\mathrm{X}} \downarrow & & \psi^{\nabla} \mathrm{X} \\
\Lambda^{\mathrm{p}_{\mathrm{M}}} & & \rightarrow \\
\star & \Lambda^{\mathrm{n}-\mathrm{p}_{\mathrm{M}}}
\end{array}
$$

commutes.
[Fix $\beta \in \Lambda{ }^{P_{M}}$-- then $\forall a \in \Lambda{ }^{P_{M}}$,

$$
\alpha \wedge * \beta=g(\alpha, \beta) \operatorname{vol}_{g}
$$

$\Rightarrow$

$$
\nabla_{X}(\alpha \wedge * \beta)=\nabla_{X}\left(g(\alpha, \beta) \operatorname{vol}_{g}\right)
$$

$$
\begin{gathered}
=\nabla_{X}(g(\alpha, \beta)) \mathrm{vol}_{g}+g(\alpha, \beta) \nabla_{X} \mathrm{vol}_{g} \\
=\nabla_{X}(g(\alpha, \beta)) \mathrm{vol}_{g} \\
\Rightarrow \quad \nabla_{X} \alpha \wedge * \beta+\alpha \wedge \nabla_{X} \star \beta \\
=g\left(\nabla_{X} \alpha, \beta\right) v o l_{g}+g\left(\alpha, \nabla_{X} \beta\right) \mathrm{vol}_{g} \\
=\nabla_{X} \alpha \wedge * \beta+\alpha \wedge \star \nabla_{X} \beta \\
\Rightarrow \quad \alpha \wedge \nabla_{X} * \beta=\alpha \wedge * \nabla_{X} \beta \\
\left.\Rightarrow \quad \nabla_{X} \star \beta=\star \nabla_{X} \beta \cdot\right]
\end{gathered}
$$

Definition: The interior derivative

$$
\delta: \Lambda^{P_{M}} \rightarrow \Lambda^{\mathrm{p}-1} \mathrm{M}
$$

is

$$
\delta=(-1)^{c}(-1)^{n p+n+1} * \circ d \circ *
$$

[Note: Therefore $\left.\delta f=0 \quad\left(f \in C^{\infty}(M)\right).\right]$
Observation: $\delta \circ \delta=0$.
[This is because $* \circ *= \pm 1$ and $d \circ d=0$.

Example: Take $M=\underline{R}^{1,3}$ - then

$$
(-1)^{c}(-1)^{n p+n+1}=(-1)^{1}(-1)^{4 p+4+1}=1
$$

so in this case,

$$
\delta \alpha=\star \mathrm{d} \star \alpha .
$$

Remark: The exterior derivative d does not depend on $g$. By contrast, the interior derivative $\delta$ depends on $g$ (and $\mu$ ).

Notation: Write $\Lambda_{C}^{p_{M}}$ for the space of compactly supported p-forms on $M$ and put

$$
\left.<a, a^{\prime}\right\rangle_{g}=\int_{M} g\left(a, a^{\prime}\right) v^{v o l} g \quad\left(a, a^{\prime} \in \Lambda_{c}^{p_{M}} .\right.
$$

Definition: A linear operator $A: \Lambda_{C}^{P_{M}} \rightarrow \Lambda_{C}^{P_{M}}$ is said to admit an adjoint if $\exists$ a linear operator $A^{*}: \Lambda_{C} P_{M} \rightarrow \Lambda_{C} P_{M}$ such that $\forall \alpha, a \in \Lambda_{C}{ }_{M}$,

$$
\left.<A \alpha, a^{\prime}\right\rangle_{g}=\left\langle\alpha, A^{*} a^{\prime}\right\rangle_{g} .
$$

Example: Let $\nabla$ be the metric connection -- then $\forall a, a^{\prime} \in \Lambda_{c}^{P_{M}}$,

$$
\mathrm{Xg}\left(\alpha, \alpha^{\prime}\right)=\mathrm{g}\left(\nabla_{\mathrm{X}}{ }^{\alpha, \alpha^{\prime}}\right)+\mathrm{g}\left(\alpha, \nabla_{\mathrm{X}} \alpha^{\prime}\right) .
$$

On the other hand,

$$
0=\int_{M}\left(X g\left(\alpha, \alpha^{\prime}\right)+g\left(\alpha, \alpha^{\prime}\right) \operatorname{div} X\right) \operatorname{vol}_{g}
$$

$\Rightarrow$

$$
\begin{aligned}
& <\nabla_{X} \alpha^{\prime} \alpha^{\prime}>_{g}=\int_{M} g\left(\nabla_{X} \alpha^{\alpha} \alpha^{\prime}\right) \mathrm{vol}_{g} \\
& =\int_{M}\left(X g\left(\alpha, \alpha^{\prime}\right)-g\left(\alpha, \nabla_{X^{\prime}} \alpha^{\prime}\right)\right) \mathrm{vol}_{g} \\
& =-\int_{M}\left[g\left(\alpha, \nabla_{X} \alpha^{\prime}\right)+g\left(\alpha,(\operatorname{div} \mathrm{X}) \alpha^{\prime}\right)\right] \mathrm{vol}_{g}
\end{aligned}
$$

$$
=<a,-\nabla_{\mathrm{X}} a^{\prime}-(\operatorname{div} \mathrm{X}) a^{\prime}>_{\mathrm{g}} .
$$

Accordingly, $\nabla_{\mathrm{X}}$ admits an adjoint, namely

$$
\nabla_{X}^{*}=-\nabla_{X}-\operatorname{div} X
$$

LFMMA Let $\alpha \in \Lambda_{C}^{P_{M}}, \beta \in \Lambda_{C}^{p+1} M$-- then

$$
\left.<d a, \beta\rangle_{g}=<\alpha, \delta \beta\right\rangle_{g} .
$$

[We have

$$
\begin{aligned}
& g(\alpha, \delta \beta) v_{o l}=\alpha \wedge * \delta \beta \\
= & -(-1)^{\ell}(-1)^{n(p+2)} \alpha \wedge * * d * \beta \\
= & -(-1)^{\imath}(-1)^{n p_{\alpha \wedge(-1)^{l}(-1)}^{(n-p) p_{d * \beta}}} \\
= & -(-1)^{p_{\alpha \wedge d * \beta}^{2}} \\
= & -(-1)^{p_{\alpha \wedge d * \beta}}
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& g(d \alpha, \beta) v o l_{g}-g(\alpha, \delta \beta) v^{\prime} l_{g} \\
& \quad=d \alpha \wedge * \beta+(-1)^{p_{\alpha \wedge \alpha * \beta}} \\
& \quad=d(\alpha \wedge * \beta)
\end{aligned}
$$

And, by Stokes' theorem,

$$
\int_{M} d(\alpha \wedge * \beta)=0,
$$

from which the result.]

Example: The Lie derivative $L_{X}: \Lambda_{C}^{P_{M}} \rightarrow \Lambda_{C}^{P_{M}}$ admits an adjoint. Thus put

$$
\varepsilon_{X}=g^{b} X \wedge \ldots
$$

Then

$$
\begin{aligned}
& \left.<L_{X}{ }^{\alpha, \alpha^{\prime}}\right\rangle_{g}=\int_{M} g\left(L_{X}, \alpha^{\prime}\right) \text { vol }_{g} \\
& =\int_{M} g\left(\left(\varepsilon_{X} \circ d+d \circ \iota_{X}\right) a, a^{\prime}\right) \operatorname{vol}_{g} \\
& =\int_{M} g\left(\iota_{X} d \alpha, a^{\prime}\right) \operatorname{vol}_{g}+\int_{M} g\left(d \iota_{X} \alpha^{\prime} a^{\prime}\right) \operatorname{vol}_{g} \\
& =\int_{M} g\left(d \alpha, \varepsilon_{X^{\alpha}}\right) \operatorname{vol}_{g}+\left\langle d \iota_{X}{ }^{\alpha, \alpha^{\prime}}\right\rangle_{g} \\
& =\left\langle d \alpha, \varepsilon_{X}{ }^{\prime}\right\rangle_{g}+\left\langle\iota_{X}{ }^{\left.\alpha, \delta \alpha^{\prime}\right\rangle_{g}}\right. \\
& =\left\langle\alpha, \delta \varepsilon_{X^{\alpha}}{ }^{\prime}\right\rangle_{g}+\int_{M} g\left(\iota_{X}, \delta \alpha^{\prime}\right) \operatorname{vol}_{g} \\
& \left.=<\alpha, \delta \varepsilon_{X} \alpha^{\prime}\right\rangle_{g}+\int_{M} g\left(\alpha, \varepsilon_{X} \delta \alpha^{\prime}\right) \mathrm{vol}_{\mathrm{g}} \\
& =\left\langle\alpha, \delta \varepsilon_{X^{\alpha}}\right\rangle_{g}+\left\langle\alpha, \varepsilon_{X} \delta \alpha^{\prime}\right\rangle_{g} \\
& =\left\langle a_{r}\left(\delta \circ \varepsilon_{X}+\varepsilon_{X} \circ \delta\right) \alpha^{\prime}\right\rangle_{g} \\
& L_{X}^{*}=\delta \circ \varepsilon_{X}+\varepsilon_{X} \circ \delta .
\end{aligned}
$$

[Note: Up to a sign, the composite

$$
\Lambda^{p-1} \stackrel{*}{\rightarrow} \Lambda^{n-p+1} \stackrel{l_{x}}{\rightarrow} \Lambda^{n-p} \xrightarrow{*} \Lambda^{p}
$$

is $\varepsilon_{X^{*}}$. To see this, let $\beta \in \Lambda^{p-1} M$ - then

$$
\begin{aligned}
{ }^{\imath} x^{* \beta} & =\iota_{X} \iota_{\beta}{ }^{\mathrm{vol}} g \\
& =\iota_{g} b_{x} \iota_{\beta}{ }^{\mathrm{vol}} g \\
& =\iota_{\beta \wedge g} b_{x}{ }^{\mathrm{vol} g}
\end{aligned}
$$

$$
\begin{aligned}
{ }^{* c} x^{\star \beta} & =*\left(c_{\left.\beta \wedge g^{b} x^{v o l} g^{\prime}\right)}\right. \\
& =(-1)^{p(n-p)} *\left(\operatorname{vol}_{g}\right) \wedge \beta \wedge g^{b} x \\
& =(-1)^{c}(-1)^{p(n-p)} \beta \wedge g^{b} x \\
& =(-1)^{l}(-1)^{p(n-p)}(-1)^{p-1} g^{b} x \wedge \beta \\
& \left.=(-1)^{c}(-1)^{n p-1} \varepsilon_{x} \beta \cdot\right]
\end{aligned}
$$

LEEMMA Let $X \in D^{1}(M)$-- then

$$
\begin{aligned}
& \qquad \text { div } x=-\delta g^{b x} \\
& \text { [In fact, } \forall f \in C_{C}^{\infty}(M), \\
& \quad<f, \delta g^{b} x>_{g}=<d f, g^{b} x>_{g} \\
& =\int_{M} g\left(d f, g^{b} x\right) v o l_{g} \\
& \quad=\int_{M} g\left(g^{b} g^{\#} d f, g^{b} x\right) v o l_{g}
\end{aligned}
$$

$$
\begin{aligned}
& =\int_{M} g\left(g^{b} g r a d f, g^{b} x\right) v o l_{g} \\
& =\int_{M} g(g r a d f, X) v o l_{g} \\
& =\int_{M} X f v o l_{g} \\
& =-\int_{M} f(\operatorname{div} X) v o l_{g} \\
& =-<f, \operatorname{div} X>_{g} \\
& \left.\operatorname{div} X=-\delta g^{b} X .\right]
\end{aligned}
$$

Consequently, if $\alpha \in D_{1}(M)$, then locally

$$
\delta \alpha=-\nabla^{\mathbf{i}_{i}} \alpha_{i}
$$

Thus write $a=g^{b} x-$ then

$$
\begin{aligned}
\delta \alpha & =\delta g^{b} x=-\operatorname{div} x \\
& =-x_{; a}^{a}=-\nabla_{a} x^{a}=-\nabla_{a} g^{a i_{\alpha_{i}}} \\
& =-g^{a i} \nabla_{a} \alpha_{i}=-g^{i a} \nabla_{a} \alpha_{i}=-\nabla^{i} \alpha_{i} .
\end{aligned}
$$

To generalize this, let $\alpha \in \Lambda{ }^{P_{M}}(p>1)--$ then locally

$$
{ }^{(d \alpha)} j_{1} \cdots j_{p+1}=\sum_{a=1}^{p+1}(-1)^{a+1}{ }_{j_{a}} j_{1} \cdots \hat{j}_{a} \cdots j_{p+1}
$$

hence

$$
\begin{aligned}
& (\mathrm{da}){ }^{\mathrm{i}_{1}}{ }^{\cdots i_{p+1}} \\
& =g^{i_{1} j_{1}} \cdots g^{i_{p+1}{ }^{j_{p+1}}(d a)}{ }_{j_{l}} \cdots j_{p+l} \\
& =\sum_{a=1}^{p+1}(-1)^{a+1}{ }_{\nabla} i_{a_{a}} i_{1} \cdots \hat{i}_{a} \cdots i_{p+1} .
\end{aligned}
$$

So, from the definitions, $\forall \beta \in \Lambda^{p+1} M$,

$$
\begin{aligned}
& g(d \alpha, \beta)=\frac{1}{(p+1)!}(d \alpha)^{i_{1} \cdots i_{p+1}}{ }_{i_{1} \cdots i_{p+1}} \\
& =\frac{1}{(p+1)!} \sum_{a=1}^{p+1}(-1)^{a+1}{ }_{\nabla}{ }^{i_{a}}{ }_{\alpha} i_{1} \cdots \hat{i}_{a} \cdots{ }^{i_{p+1}}{ }_{\beta_{i_{1}}} \cdots i_{p+1} \\
& =\frac{1}{(p+1)!} \sum_{a=1}^{p+1}(-1)^{a+1}\left[-\alpha^{i_{l} \cdots \hat{i}_{a} \cdots{ }^{i_{p+1}}{ }^{i_{a^{\prime}}}{ }_{i_{1}} \cdots i_{p+1}}\right. \\
& \left.\left.+\nabla^{i_{a}}{ }_{(\alpha} i_{1} \cdots \hat{i}_{a} \cdots{ }^{i_{p+1}}{ }_{\beta_{i_{1}} \cdots i_{p+1}}\right)\right] \\
& =\frac{1}{p!}{ }^{i_{1}}{ }^{\cdot i^{i_{p}}}{ }_{\beta_{i_{1}} \cdots i_{p}} \\
& \left.+\frac{1}{(p+1)!} \sum_{a=1}^{p+1}(-1){ }^{a+1}{\underset{\nabla}{ }}_{i_{a}}{ }_{(a}^{i_{1}} \cdots \hat{i}_{a} \cdots{ }^{i_{p+1}}{ }_{\beta_{i_{1}} \cdots i_{p+1}}\right),
\end{aligned}
$$

where

$$
\widetilde{\beta}_{i_{1}} \cdots_{i_{p}}=-\nabla^{a} \beta_{a i_{1}} \cdots_{i_{p}} .
$$

I.e.:

$$
\begin{aligned}
& g(d a, \beta)=g(a, \tilde{\beta}) \\
& \left.+\frac{1}{(p+1)!} \sum_{a=1}^{p+1}(-1){ }^{a+1} i^{i_{a}}{ }_{(a}^{i_{1}} \cdots \hat{i}_{a} \cdots i_{p+1} \beta_{i_{1}} \cdots i_{p+1}\right)
\end{aligned}
$$

But

$$
\nabla^{i_{a}}{ }_{(\alpha}^{i_{l} \cdots \hat{i}_{a} \cdots{ }^{i_{p+1}}}{\left.\beta_{i_{1}} \cdots i_{p+l}\right)}
$$

is a divergence, hence integrates to zero. Therefore $\tilde{\beta}=\delta \beta$.
Restated, these considerations lead to the conclusion that locally,

$$
{ }^{(\delta \alpha)_{i_{1}} \cdots i_{p-1}}=-\nabla^{a} \alpha_{a i_{1}} \cdots i_{p-1} .
$$

FACT $\forall f \in C^{\infty}(M)$,

$$
\delta(f a)=-\iota_{d f} f^{\alpha}+f \delta a .
$$

Recall now that

$$
\begin{aligned}
\Delta & =\operatorname{div} \circ \text { grad } \\
& =\operatorname{div} \circ g^{\#} \circ \mathrm{~d}
\end{aligned}
$$

Therefore

$$
\begin{aligned}
\Delta & =-\delta \circ g^{b} \circ g^{\#} \circ \mathrm{~d} \\
& =-\delta \circ \mathrm{d}
\end{aligned}
$$

or still,

$$
\begin{aligned}
\Delta & =-\left[(-1)^{i}(-1)^{n+n+1} * \circ d \circ *\right] \circ d \\
& =(-1)^{i} * \circ d \circ * \circ d .
\end{aligned}
$$

Definition: The laplacian

$$
\Delta: \Delta^{P_{M}} \rightarrow \Delta^{P_{M}}
$$

is

$$
\Delta=-(d \circ \delta+\delta \circ d)
$$

Properties: (1) $\Delta=\Delta^{*}$; (2) $d \circ \Delta=\Delta \circ d ;(3) \delta \circ \Delta=\Delta \circ \delta$;
(4) $* \circ \Delta=\Delta \circ *$.

FACT Let $f \in C^{\infty}(M), a \in \Lambda{ }^{P_{M}}$-- then

$$
\Delta(f a)=(\Delta f) a+f(\Delta a)+2 \nabla_{\text {grad }} f^{a} .
$$

[Note: On functions,

$$
\left.\Delta\left(f_{1} f_{2}\right)=\left(\Delta f_{1}\right) f_{2}+f_{1}\left(\Delta f_{2}\right)+2 g\left(\operatorname{grad} f_{1}, \operatorname{grad} f_{2}\right) \cdot\right]
$$

Definition: The connection laplacian

$$
\Delta_{\mathrm{con}}: D_{\mathrm{q}}^{0}(\mathrm{M}) \rightarrow D_{\mathrm{q}}^{0}(\mathrm{M})
$$

is

$$
\Delta_{c o n}=\nabla^{a} \nabla_{a}
$$

[Note: In other words,

$$
\left(\Delta_{c o n}{ }^{T}\right) j_{1} \cdots j_{q}=\nabla^{a_{i}}{ }^{T} j_{1} \cdots j_{q}
$$

which makes it clear that $\Delta_{\text {con }}$ is a metric contraction of $\nabla^{2} \mathrm{~T}$.] Let $\mathrm{f} \in \mathrm{C}^{\infty}$ (M) -- then

$$
\begin{aligned}
\Delta f & =g^{i j}\left(H_{f}\right)_{i j} \\
& =g^{i j}\left(\nabla^{2} f{ }_{i j}\right. \\
& =g^{i j} \nabla_{\nabla_{j}} \nabla_{i} f
\end{aligned}
$$

$$
\begin{aligned}
& =\nabla^{i} \nabla_{i} f \\
& =\Delta_{\text {con }} f .
\end{aligned}
$$

I.e.:

$$
\Delta=\Delta_{\text {con }}
$$

on $\Lambda^{0} \mathrm{M}$ but, in general, $\Delta \neq \Delta_{\text {con }}$ on $\Lambda^{\mathrm{P}} \mathrm{M}(\mathrm{p}>0)$.
To understand this, let $a \in \Lambda^{P} M(p>0)-$ then

$$
{ }^{(d \delta \alpha)_{i_{1}} \cdots i_{p}}=\sum_{k=1}^{p}(-1)^{k} \nabla_{i_{k}} \nabla^{a}{ }_{a i_{1}} \cdots \hat{i}_{k} \cdots i_{p}
$$

and

$$
\begin{aligned}
& { }^{(\delta d \alpha)} i_{l} \cdots i_{p}=-\nabla^{a} \nabla_{a} \alpha_{i_{l}} \cdots i_{p} \\
& -\sum_{k=1}^{p}(-1)^{k} \nabla^{a^{\prime}} \nabla_{i_{k}}{ }_{k} a i_{l} \cdots \hat{i}_{k} \cdots i_{p} \\
& \Rightarrow \\
& { }^{(\Delta \alpha)}{ }_{i_{1}} \cdots i_{p}=-\left[(d \delta \alpha){ }_{i_{1}} \cdots i_{p}+(\delta d \alpha){ }_{i_{1}} \cdots i_{p}\right] \\
& =\nabla^{a} \nabla_{a}{ }_{i_{1}} \cdots i_{p} \\
& +\sum_{k=1}^{p}(-1)^{k}\left(\nabla^{a} \nabla_{i_{k}}-\nabla_{i_{k}} \nabla^{a}\right) \alpha{ }_{a i_{1}} \cdots \hat{i}_{k} \cdots i_{p} .
\end{aligned}
$$

Rappel: Thanks to the Ricci identity,

$$
\begin{aligned}
& \left(\nabla_{a} \nabla_{b}-\nabla_{b} \nabla_{a}\right) a_{j_{l}} \cdots j_{p} \\
& =\sum_{\ell=1}^{p} R^{i} j_{\ell} a^{\alpha} j_{j_{1}} \cdots j_{\ell-1}{ }^{i j_{\ell+1}} \cdots j_{p}
\end{aligned}
$$

or still,

$$
\begin{aligned}
& \left(\nabla^{a} \nabla_{b}-\nabla_{b} \nabla^{a}\right) a_{j_{1}} \cdots j_{p} \\
& =\sum_{\ell=1}^{p} R^{i}{ }_{j \ell}{ }^{b}{ }^{a}{ }^{\alpha}{ }_{j_{1}} \cdots j_{\ell-1}{ }^{i j}{ }_{\ell+1} \cdots j_{p} \\
& \Rightarrow \\
& \left(\nabla^{a} \nabla_{b}-\nabla_{b} \nabla^{a}\right) a_{a j_{2}} \cdots j_{p} \\
& =R_{a b}^{i}{ }^{a}{ }^{\alpha_{i j_{2}}}{ }^{\cdots j_{p}} \\
& +\sum_{\ell=2}^{p} R^{i}{ }_{j_{\ell} b^{b}}{ }^{a_{a j}}{ }_{2} \cdots j_{\ell-1}{ }^{i j j_{\ell+1}} \cdots j_{p} \\
& =R_{a b}{ }^{i}{ }^{a} \alpha_{i j_{2}} \cdots j_{p} \\
& +\sum_{\ell=2}^{p}(-1)^{\ell}{ }_{R}{ }^{i}{ }_{j}{ }_{l}{ }^{a_{a}}{ }_{a i j_{2}} \cdots \hat{j}_{\ell} \cdots j_{p} .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& \sum_{k=1}^{p}(-1)^{k}\left(\nabla^{a} \nabla_{i_{k}}-\nabla_{i_{k}} \nabla^{a}\right) a{ }_{a i_{l}} \cdots \hat{i}_{k} \cdots i_{p} \\
& \quad=\sum_{k=1}^{p}(-1)^{k}{ }_{R}{ }_{a i_{k}}{ }_{k} a_{a}{ }_{i i_{l}} \cdots \hat{i}_{k} \cdots i_{p} \\
& +2 \sum_{k<l}(-1)^{\ell+k_{R}}{ }^{i}{ }_{i_{l} i_{k}}{ }^{a_{\alpha}}{ }_{a i i_{l}} \cdots \hat{i}_{k} \cdots \hat{i}_{l} \cdots{ }_{i_{p}} .
\end{aligned}
$$

[Note: This is the so-called Weitzenboeck formula.]
Example: Take $\mathrm{p}=1$ - then

$$
(\Delta a)_{j}=\nabla^{a} \nabla_{a} \alpha_{j}-R_{a j}^{i} a_{i}
$$

Since the Ricci tensor is given by

$$
R_{j \ell}=R_{j a \ell^{\prime}}^{a}
$$

we have

$$
\begin{aligned}
R_{j}^{i} & =g^{i \ell} R_{j \ell} \\
& =R_{j a}^{a}
\end{aligned}
$$

But

$$
\begin{aligned}
R_{a j}^{i} a & =g^{i k} g^{a b} R_{k a j b} \\
& =g^{i k} g^{a b} R_{j b k a} \\
& =g^{i k} g^{a b} R_{b j a k} \\
& =R_{j a}^{a}{ }^{i} \\
& =R_{j}^{i}
\end{aligned}
$$

Therefore

$$
(\Delta a)_{j}=\nabla^{a^{\nabla_{a}} a_{j}}-R_{j}^{i} \alpha_{i} .
$$

FACT On forms of degree $n, \Delta=\Delta_{\text {con }}$.

Section 20: Star Formulae Let $M$ be a connected $C^{\infty}$ manifold of dimension $n$, which we shall take to be orientable with orientation $\mu$. Fix a semiriemannian structure g. on $M_{\text {s }}$.

Assume: The orthonormal frame bundle $L M(g)$ is trivial.
Suppose that $E=\left\{E_{1}, \ldots, E_{n}\right\}$ is an oriented frame (not necessarily orthonormal). Let $\omega=\left\{\omega^{1}, \ldots, \omega^{n}\right\}$ be its associated coframe -- then

$$
\operatorname{vol}_{g}=|g|^{1 / 2} \omega^{1} \wedge \ldots \wedge \omega^{n}
$$

or still,

$$
\operatorname{vol}_{g}=\frac{l}{n!} e_{j_{1}} \ldots j_{n} \omega^{j_{1}} \wedge \ldots \wedge \omega^{j_{n}}
$$

where

$$
e_{\bullet}=|g|^{1 / 2} \cdot \varepsilon_{\bullet} .
$$

Rappel: The star operator is the isomorphism

$$
\star: \Lambda_{M} \mathrm{P}_{\mathrm{M}} \Lambda^{\mathrm{n}-\mathrm{P}_{M}}
$$

given by

$$
\star \alpha=\iota_{\alpha} \operatorname{vol}_{g}
$$

Therefore

$$
\star a=\frac{1}{p!(n-p)!} a^{i_{1} \cdots i_{p}} e_{i_{1}} \cdots i_{p j_{1}} \cdots j_{n-p} \omega^{j_{1}} \wedge \ldots \wedge \omega^{j_{n-p}}
$$

Another point to bear in mind is that

$$
\begin{gathered}
*\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i_{p}}\right. \\
=\frac{|g|^{1 / 2}}{(n-p)!} g^{i_{1} j_{1}} \ldots g^{i_{p} j_{p}} \varepsilon_{j_{1}} \ldots j_{n} \omega^{j_{p+1}} \wedge \ldots \wedge \omega^{j_{n}} .
\end{gathered}
$$

[Note: If E is orthonormal, then $|g|=1$ and

$$
*\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i^{i}}\right)
$$

2. 

$$
\left.=\frac{1}{(n-p)!} \varepsilon_{i_{1}} \cdots \varepsilon_{i_{p}} \varepsilon_{i_{1}} \cdots i_{p} j_{p+1} \ldots j_{n} \omega^{j_{p+1}} \wedge \ldots \wedge \omega^{j_{n}} .\right]
$$

LEEMA Assume: $p>1-$ then

$$
\begin{aligned}
& (p-1) \delta\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i_{p}}\right) \\
& \left.=\sum_{k=1}^{p}(-1)^{k} \omega_{\omega}^{i_{k}}{ }_{\wedge \delta\left(\omega^{i}\right.}^{i_{1}} \wedge \ldots \wedge \omega^{i_{k}} \wedge \ldots \wedge \omega^{i_{p}}\right) \\
& \quad+(-1)^{i}(-1)^{n p+p_{\omega}}{ }^{i_{\wedge *}\left(d \omega_{i} \wedge *\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i_{p}}\right)\right)}
\end{aligned}
$$

[We have

$$
\begin{aligned}
& c_{E_{i}} \delta\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i} p\right) \\
& =(-1)^{c}(-1)^{n p+n+1}{ }_{l_{E_{i}}} *\left(d *\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i^{p}}\right)\right) \\
& =(-1)^{l}(-1)^{n p+n+1} *\left(d *\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i^{p}}\right) \wedge g^{b_{E_{i}}}\right) \\
& =(-1)^{\ell}(-1)^{n p+n+1} *\left(d *\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i} p\right) \wedge \omega_{i}\right) \\
& =(-1)^{\iota}(-1)^{n p+n+1}(-1)^{n-p+1} \star\left(\omega_{i} \wedge d *\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{\mathrm{i}^{\mathrm{n}}} \mathrm{p}_{)}\right)\right. \\
& =(-1)^{\iota}(-1)^{n p+p_{*}}\left(\omega_{i} \wedge d_{*}\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i_{p}}\right)\right) \\
& \left.=(-1)^{l}(-1)^{n p+p_{*}\left(-d\left(\omega _ { i } \wedge * \left(\omega^{i}\right.\right.\right.}{ }^{i} \wedge \ldots \wedge \omega^{i} p_{)}\right) \\
& +d \omega_{i} \wedge *\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i^{p}} p_{)}\right) .
\end{aligned}
$$

But

$$
\begin{aligned}
& \omega_{i} \wedge *\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i_{p}}\right) \\
& \left.=(-1)^{n-p_{*}}{ }^{i_{1}} \wedge \ldots \wedge \omega^{i_{p}}\right) \wedge \omega_{i} \\
& =(-1)^{n-p}(-1)^{n-1} \star \omega_{\omega_{i}}\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i_{p}}\right) \\
& =(-1)^{p+1} \sum_{\sum_{k=1}^{p}(-1)^{k+1}\left(\iota_{\omega_{i}} \omega^{i_{k}}\right) \omega^{i_{1}} \wedge \ldots \wedge \omega^{k} \wedge \ldots \wedge \omega^{i_{p}} .}
\end{aligned}
$$

Write $\omega_{i}=g_{i a} \omega^{a}-$ then

$$
\begin{aligned}
\iota_{\omega_{i}} \omega^{i_{k}} & =g\left(\omega_{i}, \omega^{i_{k}}\right) \\
& =g_{i a} g\left(\omega^{a}, \omega^{i_{k}}\right) \\
& =g_{i a} g^{a i_{k}}=g^{i_{k}} g_{a i}=\delta_{i}^{i_{k}} .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& { }^{\iota_{E_{i}}}{ }^{\delta\left(\omega^{i_{1}}\right.} \wedge \ldots \wedge \omega^{i^{i}} p \\
& =(-1)^{c}(-1)^{n p+p}(-1)^{p+1} *(-d) * \sum_{k=1}^{p}(-1)^{k+1} \delta^{i_{k}}{ }_{i^{\omega}}{ }^{i_{1}} \wedge \ldots \wedge \omega^{\hat{i}_{k}} \wedge \ldots \wedge \omega^{i_{p}} \\
& +(-1)^{\ell}(-1)^{n p+p_{*}}\left(d \omega_{i} \wedge *\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i_{p}}\right)\right) \\
& =(-1)^{\ell}(-1)^{n(p-1)+n+1} * d * \sum_{k=1}^{p}(-1)^{k_{\delta}}{ }^{i_{k}}{ }_{i^{\omega}}{ }^{i_{1}} \wedge \ldots \wedge \omega^{\hat{i}_{k}} \wedge \ldots \wedge \omega^{i_{p}} \\
& \left.+(-1)^{\imath}(-1)^{n p+p_{\star}\left(d \omega _ { i } \wedge * \left(\omega^{i}\right.\right.}{ }^{i_{1}} \wedge \ldots \wedge \omega^{i} p_{)}\right)
\end{aligned}
$$

$$
\begin{aligned}
& \left.=\sum_{k=1}^{p}(-1)\right)^{k}{ }_{\delta}{ }_{k}{ }_{i} \delta\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{\hat{i} k} \wedge \ldots \wedge \omega^{i_{p}}\right) \\
& +(-1)^{\imath}(-1)^{n p+p_{*}}\left(d \omega_{i} \wedge *\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i} p^{\prime}\right)\right) .
\end{aligned}
$$

Since in general

$$
\omega^{i} \wedge c_{E_{i}} a=(p-1) \alpha \quad\left(\alpha \in \Lambda^{p-1} M\right),
$$

it thus follows that

$$
\begin{aligned}
& (p-1) \delta\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i_{p}}\right) \\
& =\sum_{k=1}^{p}(-1)^{k}{ }_{\omega}{ }^{i_{k}} \wedge \delta\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i^{i}} \wedge \ldots \wedge \omega^{i^{p}}\right) \\
& \left.\quad+(-1)^{l}(-1)^{n p+p} \omega^{i} \wedge *\left(d \omega_{i} \wedge *\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i^{i}}\right)\right) .\right]
\end{aligned}
$$

Remark: In principle, the lemma allows one to compute

$$
\delta\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i_{p}}\right)
$$

by iteration provided that $p>1$. As for $p=1$,

$$
\begin{aligned}
\delta \omega^{i} & =\delta g^{b} E^{i} \\
& =-\operatorname{div} E^{i} \\
& =-\operatorname{div} g^{i j_{E_{j}}} \\
& =-g^{i j} \operatorname{div}_{E_{j}} \\
& =-g^{i j} \sum_{k}^{k} k j
\end{aligned}
$$

So, if E is orthonormal, then

$$
\begin{aligned}
\delta \omega^{i} & =-\varepsilon_{i} \Gamma_{j}^{j}{ }_{j i}^{j} \\
& =-\varepsilon_{i}^{\Sigma}-C_{j i}^{j} \\
& =-\varepsilon_{i i_{j}}^{\Sigma C^{j}}{ }_{i j} \\
& \equiv-\varepsilon_{i} C_{i} \quad \text { (no sum) } \\
& \equiv-C^{i}
\end{aligned}
$$

Example: Take $p=2$ and suppose that $E$ is orthonormal -- then

$$
\begin{gathered}
\left.\stackrel{i}{1}_{1}{ }_{\wedge \omega}^{i_{2}}\right)=-\omega^{i_{1}}{ }_{\wedge \delta \omega}{ }^{i_{2}}+\omega^{i_{2}}{ }_{\wedge \delta \omega} i_{1} \\
+(-1)^{i} \omega^{i}{ }_{\wedge *}\left(d \omega_{i} \wedge *\left(\omega^{i_{1}}{ }_{\wedge \omega}^{i_{2}}\right)\right)
\end{gathered}
$$

or still,

$$
\begin{aligned}
& \delta\left(\omega^{i_{1}}{ }_{\wedge \omega}^{i_{2}}\right)=c^{i_{2}}{ }_{\omega}^{i_{1}}-c^{i_{1}}{ }_{\omega}^{i_{2}} \\
& \quad+(-1)^{i} \omega^{i} \wedge *\left(d \omega_{i} \wedge *\left(\omega^{i_{1}}{ }_{\wedge \omega}^{i_{2}}\right)\right) .
\end{aligned}
$$

Write

$$
\begin{aligned}
d \omega_{i} & =\varepsilon_{i} d \omega^{i} \\
& =\varepsilon_{i} \frac{1}{2} C_{j k}^{i} \omega^{j} \wedge \omega^{k}
\end{aligned}
$$

Then

$$
\begin{aligned}
& *\left(d \omega_{i} \wedge *\left(\omega^{i_{1}}{ }_{\wedge \omega}^{i_{2}}\right)\right) \\
& \left.=\frac{1}{2} \varepsilon_{i} C^{i}{ }_{j k}^{*\left(\omega^{j}\right.}{ }_{\wedge \omega}{ }^{k} \wedge *\left(\omega^{i_{1}}{ }_{\wedge \omega}^{i_{2}}\right)\right)
\end{aligned}
$$

$$
\begin{aligned}
& =\frac{1}{2} \varepsilon_{i} C^{i}{ }_{j k}{ }^{*}\left(g\left(\omega^{j} \wedge \omega^{k}, \omega^{i} l_{\Lambda \omega^{\prime}}{ }^{i}\right) \operatorname{vol}_{g}\right) \\
& =(-1)^{\imath} \frac{1}{2} \varepsilon_{i} C^{i}{ }_{j k} g\left(\omega^{j}{ }_{\wedge \omega}{ }^{k}, \omega^{i_{1}}{ }_{\Lambda \omega}{ }^{i_{2}}\right) \\
& =(-1)^{2} \frac{1}{2} \varepsilon_{i} C^{i}{ }_{j k} \\
& \times \operatorname{det}\left[\begin{array}{cc}
g\left(\omega^{j}, \omega^{i_{1}}\right) & g\left(\omega^{j}, \omega^{i_{2}}\right) \\
g\left(\omega^{k}, \omega^{i_{1}}\right) & g\left(\omega^{k}, \omega^{i_{2}}\right)
\end{array}\right] \\
& =(-1)^{2} \frac{1}{2} \varepsilon_{i} C^{i}{ }_{j k} \\
& \times \operatorname{det}\left|\begin{array}{cc}
\eta^{j i_{1}} & \eta^{j i_{2}} \\
\eta^{k i_{1}} & \eta^{k i_{2}}
\end{array}\right| \\
& =(-1)^{2} \frac{1}{2} \varepsilon_{i} C^{i}{ }_{j k}\left(\eta^{j i_{1}}{ }_{\eta}{ }^{k i}{ }_{2}-\eta^{j i_{2}}{ }_{\eta}{ }^{k i_{1}}\right) \\
& =(-1)^{\iota} \frac{1}{2} \varepsilon_{i}\left(C^{i}{ }_{i_{1} i_{2}} \varepsilon_{i_{1}} \varepsilon_{i_{2}}-C^{i} i_{i_{1} i_{1}} \varepsilon_{i_{2}} \varepsilon_{i_{1}}\right) \\
& =(-1)^{c} \varepsilon_{i} \varepsilon_{i_{1}} \varepsilon_{i_{2}} c^{c^{i}} i_{1} i_{2}
\end{aligned}
$$

Therefore

$$
\delta\left(\omega{ }^{i_{1}}{ }_{\Lambda \omega}^{i_{2}}\right)=c^{i_{2}}{ }_{\omega}^{i_{1}}-c^{i^{l_{1}}}{ }^{i_{2}}+c_{i}^{i_{1} i_{2}}{ }_{\omega}^{i}
$$

[Note: Define $C^{\infty}$ functions $M^{i}$ by

$$
\Delta \omega^{i}(=-(d \circ \delta+\delta \circ d))=M_{a}^{i} \omega^{a}
$$

Then the preceding considerations enable one to express the $M_{a}^{i}$ in terms of the $C^{i}{ }_{j k}$ and the $B^{i}{ }_{j k \ell}$, where

$$
\left.\mathrm{dC}^{\mathrm{i}}{ }_{j k}=\mathrm{B}_{j k \ell^{\omega^{\ell}}} .\right]
$$

IEMMA Let $\nabla$ be a connection on TM -- then

$$
\begin{aligned}
& d *\left(\omega^{i}{ }^{1} \wedge \ldots \wedge \omega^{i}{ }^{i}\right) \\
& =\theta^{a} \wedge *\left(\omega^{i_{l}} \wedge \ldots \wedge \omega^{i^{i}} p_{\wedge \omega_{a}}\right) \\
& +\left(\omega^{a i_{1}}+d g^{a i_{1}}\right) \wedge *\left(\omega_{a} \wedge \omega^{i_{2}} \wedge \ldots \wedge \omega^{i_{p}}\right) \\
& +\cdots+\left(\omega^{a i^{i}} p+d g^{a i^{p}}\right) \wedge *\left(\omega^{i^{\prime}} \wedge \ldots \wedge \omega^{i} p-1 \omega_{a}\right) \\
& -\left(\omega^{a}{ }_{a}-\frac{1}{2} g^{a b} d g_{a b}\right) \wedge\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i^{i}}\right) .
\end{aligned}
$$

[Note: The connection l-forms of $\nabla$ per $E$ are given by

$$
\nabla_{X} E_{j}=\omega_{j}^{i}(X) E_{i}
$$

and one writes

$$
\omega^{i j}=g^{j k} \omega_{k}^{i} .
$$

Recall too that

$$
\left.\omega_{i}=g_{i j} \omega^{j} \quad\left(=g^{b} E_{i}\right) .\right]
$$

To establish this result, it will be convenient to divide the analysis

## into two parts.

Suppose first that $E$ is orthonormal -- then

$$
\begin{aligned}
& d *\left(\omega^{i^{\prime}} \wedge \ldots \wedge \omega^{i_{p}}\right) \\
& =\frac{1}{(n-p)!} \varepsilon_{i_{1}} \cdots \varepsilon_{i_{p}} \varepsilon_{i_{1}} \cdots i_{p} j_{p+1} \cdots j_{n} d\left(\omega^{j_{p+1}} \wedge \ldots \wedge \omega^{j_{n}}\right) \\
& =d \omega{ }^{a} \wedge *\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i^{i}}{ }_{\wedge \omega_{a}}\right) \\
& =\left(\theta^{a}-\omega^{a}{ }_{b} \omega^{b}\right) \wedge *\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i^{i}} p_{\wedge \omega_{a}}\right) \\
& =\theta^{a} \wedge *\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i}{ }^{i} p_{\Lambda \omega_{a}}\right. \\
& -\omega_{b}^{a}{ }_{b} \omega^{b} \wedge_{*}\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i} p_{\wedge \omega_{a}}\right) .
\end{aligned}
$$

But

$$
\begin{aligned}
& \omega_{b}{ }_{b} \omega^{b}{ }_{\wedge *}\left(\omega^{i}{ }^{i} \wedge \ldots \wedge \omega^{i} p_{\wedge \omega_{a}}\right) \\
& =(-1)^{n-p-1} \omega_{b^{\wedge *}}{\left(\omega^{i}\right.}^{i_{1}} \wedge \ldots \wedge \omega^{i^{p}}{ }_{\left.\wedge \omega_{a}\right) \wedge \omega^{b}} \\
& =(-1)^{n-p-1}(-1)^{n-1} \omega_{b^{\wedge \star c} \omega_{b}}{ }^{\left(\omega^{i}\right.}{ }^{1} \wedge \ldots \wedge \omega^{i} p_{\left.\wedge \omega_{a}\right)} \\
& \left.=(-1)^{p} \omega_{b^{\wedge * L}}{ }_{\omega} b^{\left(\omega^{i}\right.}{ }^{i} \wedge \ldots \wedge \omega^{i}{ }^{i} p_{\Lambda \omega_{a}}\right) .
\end{aligned}
$$

Agreeing to write

$$
\omega_{a}^{b}=\varepsilon_{a} \varepsilon_{b} \omega^{a} \quad \text { (no sum) }
$$

it then follows that
9.

$$
\begin{aligned}
& d_{*}\left(\omega^{\mathbf{i}^{\prime}} \wedge \ldots \wedge \omega^{i}{ }^{i}\right) \\
& =\theta^{a} \wedge *\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i^{i}} p_{\wedge \omega_{a}}\right) \\
& \left.\left.+\omega_{a}{ }^{i_{1}}{ }_{\wedge *\left(\omega^{a} \wedge \omega^{i}\right.}{ }^{i_{2}} \wedge \ldots \wedge \omega^{i_{p}}\right)+\cdots+\omega_{a}{ }^{i_{p}}{ }_{\wedge *\left(\omega^{i}\right.}{ }^{i_{1}} \wedge \ldots \wedge \omega^{i_{p-1}}{ }_{\wedge \omega}{ }^{a}\right) \\
& -\omega^{a} a^{\wedge *}\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i} p^{\prime}\right) .
\end{aligned}
$$

Since $d g^{a b}=0$ and

$$
\left[\begin{array}{rl}
\omega^{a i}=\varepsilon_{a} \omega_{a}^{i} & \text { (no sum) } \\
\omega_{a}=\varepsilon_{a} \omega^{a} & \text { (no sum) }
\end{array}\right.
$$

this formula is equivalent to that of the lemma (when specialized to an oriented orthonormal frame).
[Note: If $\nabla \in \operatorname{con}_{g}$ TM, then

$$
\omega_{a}^{b}=-\varepsilon_{a} \varepsilon_{b} \omega_{b}^{a} \quad \text { (no sum) }
$$

Therefore

$$
\begin{aligned}
\omega_{a}{ }^{i_{k}} & =\varepsilon_{a} \varepsilon_{i_{k}} \omega^{a} i_{k} \\
& =\varepsilon_{a} \varepsilon_{i_{k}}\left(-\varepsilon_{a} \varepsilon_{i_{k}}\right) \omega^{i_{k}}{ }_{a} \\
& =-\omega^{i_{k}} .
\end{aligned}
$$

In addition,

$$
\omega_{a}^{a}=0 \quad \text { (no sum) }
$$

So, in this case,

$$
\begin{aligned}
& d *\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i_{p}}\right) \\
& =\theta^{a} \wedge *\left(\omega^{i} 1{ }^{i} \wedge \wedge \omega^{i} p_{\wedge \omega_{a}}\right)
\end{aligned}
$$

Moreover, the torsion term drops out if $\nabla$ is actually the metric connection.]
To handle an arbitrary oriented frame, it suffices to consider

$$
\hat{E}=\mathrm{E} \cdot \mathrm{~A},
$$

where, as above, $E=\left\{E_{1}, \ldots, E_{n}\right\}$ is orthonormal and

$$
\mathrm{A}: \mathrm{M} \rightarrow \underline{\mathrm{GL}}_{0}(\mathrm{n}, \underline{\mathrm{R}})
$$

is smooth, thus

$$
\left[\begin{array}{rl}
\hat{E}_{j} & =(E \cdot A)_{j}=A^{i}{ }_{j} E_{i} \\
\quad \hat{\omega}^{j} & =(\omega \cdot A)^{j}=\left(A^{-1}\right)^{j}{ }_{i} \omega^{i}
\end{array}\right.
$$

Now write

$$
\begin{aligned}
& d *\left(\hat{\omega}^{j_{1}} \wedge \ldots \wedge \hat{\omega}^{j} p\right) \\
& =d *\left(\left(A^{-1}\right){ }^{j_{l}}{ }_{i_{l}}{ }^{i_{1}} \wedge \ldots \wedge\left(A^{-1}\right){ }^{j_{p}}{ }_{i_{p}}{ }^{i^{i}}{ }_{p}\right) \\
& =d\left(\left(A^{-1}\right)^{j_{1}}{ }_{i_{1}} \ldots\left(A^{-1}\right){ }^{j_{p}}{ }_{i_{p}} *\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i_{p}}\right)\right) \\
& =A^{i_{1}}{ }_{j}{ }^{\alpha}\left(A^{-1}\right)^{j_{1}}{ }_{i_{1}} \wedge \star\left(\hat{\omega}^{j} \hat{\omega}^{j_{2}} \wedge \ldots \wedge \hat{\omega}^{j}{ }^{p}\right)
\end{aligned}
$$

$$
\begin{aligned}
& +\ldots+A^{i_{p}}{ }_{j}^{d\left(A^{-1}\right)}{ }^{j_{p}}{ }_{i_{p}}{ }^{\wedge *\left(\hat{\omega}^{j_{l}} \wedge \ldots \wedge \hat{\omega}^{j_{p-l}} \wedge \hat{\omega}^{j}\right)} \\
& +\left(A^{-1},{ }^{j}{ }^{j_{1}}{ }_{1} \ldots\left(A^{-1}\right){ }^{j_{p}}{ }_{i_{p}} d_{*}\left(\omega^{i_{l}} \wedge \ldots \wedge \omega^{i_{p}}\right),\right.
\end{aligned}
$$

where

$$
\begin{aligned}
& d_{*}\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i^{i}}{ }^{p}\right) \\
& =\theta^{i} \wedge *\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i^{i}} p_{\wedge \omega_{i}}\right)
\end{aligned}
$$

$$
\begin{aligned}
& -\omega_{i}{ }_{i} \wedge *\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i} p\right) .
\end{aligned}
$$

Rappel: Under a change of basis $E \rightarrow \dot{\mathrm{E}}$, the connection i-forms compute as

$$
\hat{\omega}_{j}^{i}=\left(A^{-1}\right)^{i} k^{\omega^{k}} l^{A^{l}} j+\left(A^{-1}\right)^{i} a^{d A^{a}}
$$

Consider the torsion term:

$$
\begin{aligned}
& \left.\left(A^{-1}\right)^{j}{ }_{i_{1}} \ldots\left(A^{-1}\right)^{j} p_{i_{p}} \Theta^{i}{ }_{\wedge *\left(\omega^{\prime}\right.}{ }^{i_{1}} \wedge \ldots \wedge \omega^{i^{i}}{ }_{\wedge \omega_{i}}\right) \\
& =\theta^{i} \wedge_{*}\left(\hat{\omega}^{j} 1 \wedge \ldots \wedge \hat{\omega}^{j} p_{\wedge \omega_{i}}\right) .
\end{aligned}
$$

From the definitions,

$$
\left[\begin{array}{l}
\omega_{i}=\eta_{i a} \omega^{a} \\
\hat{\omega}_{j}=\hat{g}_{j b} \hat{\omega}^{b}
\end{array}\right.
$$

12. 

And

$$
\hat{g}_{j b}=A_{j}^{i} A_{b}^{a} \eta_{i a}
$$

Therefore

$$
\begin{aligned}
\omega_{i} & =\eta_{i a} \omega^{a}=\eta_{i a} A^{a}{ }^{a} \hat{\omega}^{b} \\
& =\left(A^{-1}\right)^{j}{ }_{i} \hat{g}_{j b}{ }^{\hat{\omega}}{ }^{b}=\left(A^{-1}\right)^{j}{ }_{i} \hat{\omega}_{j} .
\end{aligned}
$$

SUBLEMMA We have

$$
\hat{\Theta}^{j}=\left(A^{-1}\right)^{j}{ }_{i} \theta^{i}
$$

[In fact,

$$
\begin{aligned}
& \theta^{i}=d \omega^{i}+\omega^{i}{ }_{j}{ }^{\prime} \omega^{j} \\
& =d\left(A^{i} a^{\hat{\omega}}\right) \\
& +\left[A^{i}{ }_{k} \hat{\omega}^{k} \ell^{\left(A^{-1}\right)}{ }^{\ell}{ }_{j}+A^{i}{ }_{a} d\left(A^{-1}\right){ }_{j}{ }_{j}\right] \wedge\left(A^{j}{ }_{b} \hat{\omega}^{b}\right) \\
& =d A^{i} a^{\wedge \hat{\omega}^{\mathrm{a}}}+A^{\mathrm{i}} a^{d \hat{\omega}^{\mathrm{a}}} \\
& +A_{k}^{i}{ }_{\left(A^{-1}\right)} \ell_{j} A^{j}{ }_{b} \hat{\omega}^{k} \ell^{\Lambda \hat{\omega}}{ }^{\hat{b}} \\
& -d A^{i}{ }_{a}\left[\left(A^{-1}\right)^{a}{ }_{j} A^{j}{ }_{b}\right] \wedge \hat{\omega}^{b} \\
& =d A^{i} a^{\wedge \hat{\omega}^{\mathrm{a}}}+A^{\mathrm{i}} a^{\alpha} \hat{\omega}^{\mathrm{a}} \\
& +A^{i}{ }_{k} \delta^{\ell} b^{\hat{\omega}}{ }^{k} \ell^{\wedge \omega} \hat{\omega}^{b}-d A^{i} a^{\delta}{ }^{a} b^{\wedge} \hat{\omega}^{b}
\end{aligned}
$$

$$
\begin{aligned}
& =A^{i} a \hat{\omega}^{\mathrm{a}}+A^{\mathrm{i}} \mathrm{k}^{\hat{\omega}} \ell^{\hat{\mu}} \hat{\omega}^{\ell} \\
& =A^{i}{ }_{j}\left(d \hat{\omega}^{j}+\hat{\omega}^{j} l^{\wedge} \hat{\omega}^{\ell}\right) \\
& =A^{i}{ }_{j} \hat{\Theta}^{j} .
\end{aligned}
$$

I.e.:

$$
\left.\hat{\theta}^{j}=\left(A^{-1}\right)_{i}^{j} \theta^{i} .\right]
$$

Therefore

$$
\begin{aligned}
& \theta^{i} \wedge *\left(\hat{\omega}^{j}{ }_{l} \wedge \ldots \wedge \hat{\omega}^{j} p_{\wedge \omega_{i}}\right) \\
& =\left(A^{-1}\right)_{i}^{j} \theta^{i} \wedge *\left(\hat{\omega}^{j}{ }^{l} \wedge \ldots \wedge \hat{\omega}^{j} p_{\wedge} \hat{\omega}_{j}\right) \\
& \left.=\hat{\theta}^{j}{ }_{\wedge *\left(\hat{\omega}^{j} 1\right.} \wedge \ldots \wedge{ }_{\hat{\omega}}{ }^{j} p_{\wedge \hat{\omega}_{j}}\right) .
\end{aligned}
$$

Next, consider

$$
\begin{aligned}
& \left(A^{-1}\right)^{j_{l}}{ }_{i_{1}} \ldots\left(A^{-1}\right)^{j_{p}}{ }_{i_{p}} \\
& \left.\left.\times\left(\omega^{i i_{1}}{ }_{\wedge *\left(\omega_{i} \wedge \omega\right.}{ }^{i_{2}} \wedge \ldots \wedge \omega^{i} p^{\prime}\right)+\cdots+\omega^{i i_{p}}{ }_{\wedge \star\left(\omega^{i}\right.}{ }^{i_{1}} \wedge \ldots \wedge \omega^{i_{p-1}}{ }_{\wedge \omega_{i}}\right)\right) .
\end{aligned}
$$

Since the treatment of each term is the same (up to notation), it suffices to deal with

$$
\left.\left(A^{-l}\right)^{j_{1}}{ }_{i_{1}} \cdots\left(A^{-1}\right)^{j_{p}}{ }_{i_{p}}\left(\omega^{i i_{1}}{ }_{\wedge *\left(\omega_{i} \wedge \omega\right.}{ }^{i_{2}} \wedge \ldots \wedge \omega^{i_{p}}\right)\right)
$$

or still,

$$
\left.\left(A^{-l}\right)^{j_{1}}{ }_{i_{l}}{ }^{i i^{1}} l_{\wedge *\left(\omega_{i} \wedge \hat{\omega}^{j_{2}}\right.} \wedge \ldots \wedge \hat{\omega}^{j}{ }^{j}\right)
$$

or still,

$$
\left(A^{-1}\right)^{j_{1}}{ }_{i_{1}} \eta^{k i_{1}}\left(A^{-1}\right){ }_{i} \omega^{i}{ }_{k} \wedge *\left(\hat{\omega}_{j} \wedge \hat{\omega}^{j_{2}} \wedge \ldots \wedge \hat{\omega}^{j_{p}}\right)
$$

We have

$$
\begin{aligned}
& \left(A^{-1}\right){ }_{i}{ }_{i}{ }^{i}{ }_{k} \\
& \left.=\left(A^{-1}\right)_{i}^{j}\left[A^{i} a^{\omega^{a}} b^{\left(A^{-1}\right)}\right)_{k}+A_{c}^{i} d\left(A^{-1}\right)_{k}^{c}\right] \\
& =\left(A^{-1}\right)^{j}{ }_{i} A^{i} a^{\hat{\omega}}{ }^{\mathrm{a}}{ }_{b}\left(A^{-1}\right)^{b}{ }_{k}+\left(A^{-1}\right)^{j}{ }_{i} A^{i}{ }_{c} d\left(A^{-1}\right)^{c}{ }_{k} \\
& =\delta^{j}{ }_{a} \hat{\omega}_{b}^{a}\left(A^{-1}\right)_{k}^{b}+\delta_{c}^{j} d^{\left(A^{-1}\right)^{c}}{ }_{k} \\
& =\hat{\omega}_{\ell}^{j}\left(A^{-1}\right)_{k}^{\ell}+d\left(A^{-1}\right)_{k}^{j} .
\end{aligned}
$$

And

$$
\begin{aligned}
& \left(A^{-1}\right)^{j}{ }_{i_{1}}{ }^{\eta}{ }^{k i_{1}}\left(A^{-l}\right)_{k}^{\ell}{ }_{\omega^{j}}{ }_{\ell} \\
& =\left(A^{-l}\right)^{j}{ }_{i_{l}}\left(A^{-l}\right)_{k}^{\ell} \eta^{i_{1}{ }^{k} \hat{\omega}_{\ell}^{j}} \\
& =\hat{g}^{j_{1}} \hat{\omega}_{\ell}{ }_{\ell}
\end{aligned}
$$

15. 

$$
=\hat{\omega}^{\mathrm{j} j_{1}}
$$

## Finally

$$
\begin{aligned}
& \hat{g}^{j j_{1}}=\left(A^{-1}\right)_{k}{ }_{k}\left(A^{-l}\right)^{j_{1}}{ }_{i_{l}}{ }^{\eta}{ }^{k i_{1}} \\
& \Rightarrow
\end{aligned}
$$

$$
\begin{aligned}
& \Rightarrow \\
& \mathrm{d}\left(\mathrm{~A}^{-1}\right)_{\mathrm{j}}^{\mathrm{j}}\left(\mathrm{~A}^{-1}\right)^{\mathrm{j}_{1}}{\mathrm{i}_{1}}^{\eta}{ }^{\mathrm{ki}}{ }_{l} \\
& =d \hat{g}^{j j_{l}}-\left(A^{-l}\right)_{k^{j}}{ }^{k i_{1}} l_{d\left(A^{-l}\right)}{ }^{j} l_{i_{1}} .
\end{aligned}
$$

Retaining the differential $d \hat{g}^{j j_{1}}$, the claim then is that

$$
\begin{aligned}
& A^{i_{1}}{ }_{j} d\left(A^{-1}\right){ }^{j_{1}}{ }_{i_{1}} \wedge *\left(\hat{\omega}^{j} \wedge \hat{\omega}^{j_{2}} \wedge \ldots \wedge \hat{\omega}^{j_{p}}\right) \\
& \left.=\left(A^{-1}\right){ }_{k^{\eta}}{ }^{k i_{1}}{ }_{d\left(A^{-1}\right)}{ }^{j_{1}}{ }_{i_{1}}^{\wedge *\left(\hat{\omega}_{j} \wedge \hat{\omega}^{j}\right.}{ }_{2} \wedge \ldots \wedge \hat{\omega}^{j} p^{j}\right) .
\end{aligned}
$$

But this is clear:

$$
\begin{aligned}
& \left(A^{-l}\right)_{k}^{j}{ }_{k}^{\eta i_{1}} \hat{\omega}_{j} \\
= & \left(A^{-l}\right)^{j}{ }_{k}^{\eta}{ }^{k i} l_{\hat{g}_{j b}{ }^{\hat{\omega}}} \\
= & \left(A^{-l}\right)^{j}{ }_{k}^{\eta}{ }^{k i} l_{A^{i}}{ }_{j} A_{b^{n}}^{a}{ }_{i a} \hat{\omega}^{b}
\end{aligned}
$$

$$
\begin{aligned}
& =A_{j}^{i}\left(A^{-1}\right)^{j}{ }_{k}^{\eta}{ }^{k i} \eta_{\eta_{i a}} A_{b^{\omega}}{ }^{\omega}{ }^{b} \\
& =\delta_{k}^{i}{ }^{\eta}{ }^{k i} I_{\eta_{i a}} A_{b}^{a}{ }^{\omega}{ }^{\mathrm{b}} \\
& =\eta^{i i_{1}} \eta_{i a^{A}}{ }_{b}{ }^{\text {ab }} \\
& =\eta^{i_{1}} \eta_{i a} A_{b}^{a} \hat{\omega}^{b} \\
& =\delta^{i}{ }^{i} a^{A}{ }_{b}{ }^{\omega}{ }^{\omega}{ }^{b} \\
& =A^{i}{ }_{b} \hat{\omega}^{\omega} \\
& =A^{i}{ }_{j} \hat{\omega}^{j} .
\end{aligned}
$$

It remains to consider

$$
-\left(A^{-1}\right)^{j_{1}}{ }_{i_{1}} \ldots\left(A^{-1}\right){ }^{j_{p}}{ }_{i_{p}} \omega^{i}{ }_{i} \wedge *\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i_{p}}\right)
$$

or still,

$$
-\omega_{i}^{i} \wedge *\left(\hat{\omega}^{j_{1}} \wedge \ldots \wedge \hat{\omega}^{j} p^{j}\right)
$$

To proceed from here, simply observe that

$$
\begin{aligned}
\omega_{i}^{i} & =\hat{\omega}_{j}^{j}+A_{j}^{i} d\left(A^{-1}\right)_{i}^{j} \\
& =\hat{\omega}_{j}^{j}-d A_{j}^{i}\left(A^{-1}\right)_{i}^{j} \\
& =\hat{\omega}_{j}^{j}-\frac{1}{2} \hat{g}^{a b} d \hat{g}_{a b}
\end{aligned}
$$

Remark: Let $\nabla \in c o n g T M-$ then in an arbitrary oriented frame,
[To see this, recall that

$$
g_{i k} \omega_{j}^{k}+g_{j \ell^{\omega}}^{i}=d g_{i j}
$$

There are then two points:

$$
\begin{gathered}
\bullet\left(\omega^{a i_{1}}+d g^{a i^{\prime}}\right) g_{a b}=-\omega_{b}^{i_{l}} \\
\text { Proof: } \quad \omega^{a i_{1}} g_{a b}=g_{b a} \omega^{a i_{1}}=\omega_{b} i^{i_{1}}
\end{gathered}
$$

\&

$$
=-\delta^{i_{l}}{ }_{k}^{\omega^{k}} \mathrm{~b}-g_{b \ell^{\omega}}{ }^{\ell i_{l}}
$$

$$
=-\omega_{b}^{i_{l}}-\omega_{b}^{i} l
$$

$$
\begin{aligned}
& \mathrm{dg}^{\mathrm{ai}} l_{g_{a b}}=d g^{\mathrm{i}_{1}}{ }^{a} g_{a b} \\
& =-g^{i_{1}}{ }^{a} d g_{a b} \\
& =-g^{i_{1}}\left[g_{a k} \omega^{k}{ }_{b}+g_{b l^{\omega}}{ }_{a}^{\ell}\right] \\
& =-g^{i_{1}}{ }^{a} g_{a k} \omega_{b}^{k}-g_{b l^{g}}{ }^{i_{1} l^{a}} \omega^{\ell} a
\end{aligned}
$$

$$
\begin{aligned}
& d *\left(\omega^{i^{\prime}} \wedge \ldots \wedge \omega^{i} p\right) \\
& \left.=\theta^{a}{ }_{\wedge *\left(\omega^{i}\right.}{ }^{l^{\prime}} \wedge \ldots \wedge \omega^{i} p_{\wedge \omega_{a}}\right) \\
& \left.-\omega^{i^{\prime}}{ }_{a^{\wedge *}}\left(\omega^{a}{ }_{\wedge \omega}{ }^{i_{2}} \wedge \ldots \wedge \omega^{i_{p}}\right)-\ldots-\omega^{i_{p}}{ }_{a^{\wedge *}}{ }^{i^{i}} l \wedge \ldots \wedge \omega^{i_{p-1}} \wedge \omega^{a}\right) .
\end{aligned}
$$

- $\omega_{a}^{a}-\frac{1}{2} g^{a b} d g_{a b}=0$.

Proof: $\quad-\frac{1}{2} g^{a b} d g_{a b}$

$$
\begin{aligned}
& =-\frac{1}{2} g^{a b}\left[g_{a k} \omega_{b}^{k}+g_{b} \ell^{\omega^{\ell}}\right] \\
& =-\frac{1}{2}\left[g^{b a} g_{a k} \omega_{b}^{k}+g^{a b} g_{b \ell^{\omega}}{ }_{a}^{\ell}\right] \\
& =-\frac{1}{2}\left[\delta^{b}{ }_{k}^{\omega^{k}}{ }_{b}+\delta^{a} \ell^{\omega^{l}}{ }_{a}^{l}\right] \\
& \left.=-\frac{1}{2}\left[\omega^{b}{ }_{b}+\omega_{a}^{a}\right]=-\omega_{a}^{a}\right]
\end{aligned}
$$

Suppose that E is an oriented orthonormal frame and take for $\nabla$ the metric connection.

IEMMA Put $\omega^{i j}=\varepsilon_{j} \omega_{j}^{i}$ (no sum) -- then

$$
\begin{array}{rl}
\omega^{i j}=(-1)^{2} & *\left[* d \omega^{i} \wedge \omega^{j}-* d \omega^{j} \omega^{i}\right. \\
& \left.+\frac{1}{2}(-1)^{n} \sum_{k} \varepsilon_{k} *\left(d \omega^{k} \wedge \omega^{k}\right) \wedge \omega^{i} \wedge \omega^{j}\right]
\end{array}
$$

Since

$$
\Gamma_{k j}^{i}=\omega_{j}^{i}\left(E_{k}\right),
$$

we have

$$
\omega_{j}^{i}\left(E_{k}\right)=\frac{1}{2} \varepsilon_{i}\left(\varepsilon_{i} d \omega^{i}\left(E_{j}, E_{k}\right)+\varepsilon_{j} d \omega^{j}\left(E_{k^{\prime}} E_{i}\right)-\varepsilon_{k} d \omega^{k}\left(E_{i}, E_{j}\right)\right)
$$

So, if $X=\sum_{k} \omega^{k}(X) E_{k} \in \mathcal{D}^{l}(M)$, then

$$
\omega_{j}^{i}(X)=\frac{1}{2} \varepsilon_{i}\left(\varepsilon_{i} d \omega^{i}\left(E_{j}, X\right)+\varepsilon_{j} d \omega^{j}\left(X, E_{i}\right)-\sum_{k} \varepsilon_{k} d \omega^{k}\left(E_{i}, E_{j}\right) \omega^{k}(X)\right)
$$

Therefore, in terms of the interior product,

$$
\omega_{j}^{i}=\frac{1}{2} \varepsilon_{i}\left(\varepsilon_{i}{ }^{\iota} E_{j} d \omega^{i}-\varepsilon_{j} \varepsilon_{E_{i}} d \omega^{j}-\sum_{k} \varepsilon_{k}\left(\varepsilon_{E_{j}}{ }^{\imath} E_{i} d \omega^{k}\right) \omega^{k}\right)
$$

But

$$
\begin{aligned}
& \quad\left(d \omega^{k} \wedge \omega^{k}\right)\left(E_{i}, E_{j}, X\right) \\
& =\omega^{k}\left(E_{i}\right) d \omega^{k}\left(E_{j}, X\right)-\omega^{k}\left(E_{j}\right) d \omega^{k}\left(E_{i}, X\right)+d \omega^{k}\left(E_{i}, E_{j}\right) \omega^{k}(X) \\
& \Rightarrow \quad \\
& =-\varepsilon_{k} \omega^{k}\left(\omega^{k}\left(E_{i}\right) d \omega^{k}\left(E_{j}\right) \omega_{j}^{k}(X)\right. \\
& =\quad X)+\varepsilon_{k} \omega^{k}\left(E_{j}\right) d \omega^{k}\left(E_{i}, X\right)+\varepsilon_{k}\left(d \omega^{k} \Lambda \omega^{k}\right)\left(E_{i}, E_{j}, X\right) \\
& =-\varepsilon_{i} d \omega^{i}\left(E_{j}, X\right)+\varepsilon_{j} d \omega^{j}\left(E_{i}, X\right)+\sum_{k} \varepsilon_{k}\left(d \omega^{k} \wedge \omega^{k}\right)\left(E_{i}, E_{j}, X\right) .
\end{aligned}
$$

From this, it follows that

$$
\omega_{j}^{i}=\varepsilon_{i}\left(\varepsilon_{i}{ }^{\ell} E_{j} d \omega^{i}-\varepsilon_{j} E_{E_{i}} d \omega^{j}-\frac{1}{2} \sum_{k} \varepsilon_{k} E_{E_{j}}{ }^{\ell} E_{i}\left(d \omega^{k} \wedge \omega^{k}\right)\right)
$$

Rappel: $\forall X \in \mathcal{D}^{1}(\mathrm{M}), \forall \alpha \in \Lambda^{\mathrm{P}_{\mathrm{M}}}$,

$$
\begin{aligned}
& \quad * \tau_{x}=(-1)^{n-1} * \alpha \wedge g^{b} x \\
& \Rightarrow \quad \\
& * * \iota_{x} \\
&=(-1)^{\iota}(-1)^{(p-1)(n-p+1)} \imath_{x^{\alpha}}
\end{aligned}
$$

$$
\begin{gathered}
=(-1)^{n-1} *\left(* \alpha \wedge g^{b} \mathrm{x}\right) \\
\Rightarrow \\
{ }_{c} x^{\alpha}=(-1)^{c}(-1)^{(p-1)(n-p+1)}(-1)^{n-1} *\left(* \alpha \wedge g^{b} x\right) .
\end{gathered}
$$

Let

$$
\alpha=\left.\right|_{-} ^{\mathrm{d} \omega^{\mathrm{i}}} \mathrm{~d} \omega^{\mathrm{j}} .
$$

Then

$$
\begin{gathered}
(2-1)(n-2+1)=n-1 \\
\Rightarrow \\
\underbrace{\iota_{E_{j}} d \omega^{i}=(-1)^{i} \star\left(* d \omega^{i} \wedge \varepsilon_{j} \omega^{j}\right)}_{-} \\
{ }^{\iota_{E_{i}} d \omega^{j}=(-1)^{i} *\left(* d \omega^{j} \wedge \varepsilon_{i} \omega^{i}\right) .}
\end{gathered}
$$

[Note: Because it is a question of an orthonormal basis,

$$
\left[\begin{array}{l}
g^{b} E_{i}=\varepsilon_{i} \omega^{i} \\
g^{b} E_{j}=\varepsilon_{j} \omega^{j} \cdot 1
\end{array}\right.
$$

Let

$$
\alpha=\iota_{\mathrm{E}_{\mathbf{i}}}\left(\mathrm{d} \omega^{\mathrm{k}} \wedge \omega^{k}\right)
$$

Then

$$
(3-1)(n-3+1)=2(n-3+1)
$$

21. 

$$
{ }_{E_{i}}\left(d \omega^{k} \wedge \omega^{k}\right)=(-1)^{\imath}(-1)^{\mathrm{n}-1} *\left(*\left(d \omega^{k} \wedge \omega^{k}\right) \wedge \varepsilon_{i} \omega^{i}\right)
$$

Now put

$$
\beta=*\left(*\left(\delta \omega^{k} \wedge \omega^{k}\right) \wedge \varepsilon_{i} \omega^{i}\right) .
$$

Since $\beta$ is a 2 -form,

$$
{ }_{\iota_{E}} \beta=(-1)^{\iota} \star\left(\star \beta \wedge \varepsilon_{j} \omega^{j}\right) .
$$

However

$$
\begin{aligned}
* \beta & =\star *\left(*\left(d \omega^{k} \wedge \omega^{k}\right) \wedge \varepsilon_{i} \omega^{i}\right) \\
& =(-1)^{i}(-1)^{(n-2)(n-(n-2))} *\left(d \omega^{k} \wedge \omega^{k}\right) \wedge \varepsilon_{i} \omega^{i} \\
& =(-1)^{i} \star\left(d \omega^{k} \wedge \omega^{k}\right) \wedge \varepsilon_{i} \omega^{i} .
\end{aligned}
$$

Thus

$$
\begin{aligned}
& { }^{\iota} E_{j}{ }^{L_{E_{i}}}\left(d \omega^{k} \wedge \omega^{k}\right) \\
= & (-1)^{\imath}(-1)^{n-1} \iota_{E_{j}} \beta \\
= & (-1)^{\imath}(-1)^{n-1}(-1)^{\iota} *\left(* \beta \wedge \varepsilon_{j} \omega^{j}\right) \\
= & (-1)^{\iota}(-1)^{n-1}(-1)^{\imath}(-1)^{\iota} *\left(*\left(d \omega^{k} \wedge \omega^{k}\right) \wedge \varepsilon_{i} \omega^{i} \wedge \varepsilon_{j} \omega^{j}\right) \\
= & (-1)^{\imath}(-1)^{n-1} *\left(*\left(d \omega^{k} \wedge \omega^{k}\right) \wedge \varepsilon_{i} \omega^{i} \wedge \varepsilon_{j} \omega^{j}\right) .
\end{aligned}
$$

Putting everything together then gives

$$
\omega_{j}^{i}=\varepsilon_{i}(-1)^{i} \star\left[\varepsilon_{i}\left(* d \omega^{i} \wedge \varepsilon_{j} \omega^{j}\right)-\varepsilon_{j}\left(\star d \omega^{j} \wedge \varepsilon_{i} \omega^{i}\right)\right.
$$

$$
\left.-\frac{1}{2}(-1)^{n-1} \sum_{k} \varepsilon_{k} *\left(d \omega^{k} \wedge \omega^{k}\right) \wedge \varepsilon_{i} \omega^{i} \wedge \varepsilon_{j} \omega^{j}\right] .
$$

Therefore

$$
\begin{aligned}
& \omega^{i j}=(-1)^{l} \star\left[* d \omega^{i} \wedge \omega^{j}-\star d \omega^{j}{ }^{j} \omega^{i}\right. \\
&\left.+\frac{1}{2}(-1)^{n} \sum_{k} \varepsilon_{k} *\left(d \omega^{k} \wedge \omega^{k}\right) \wedge \omega^{i} \wedge \omega^{j}\right],
\end{aligned}
$$

as asserted.

Section 21: Metric Concomitants Let M be a connected $\mathrm{C}^{\infty}$ manifold of dimension n .

Notation:

$$
\left[\begin{array}{l}
\left(\mathrm{U},\left\{\mathrm{x}^{1}, \ldots, \mathrm{x}^{\mathrm{n}}\right\}\right) \\
\left(\overline{\mathrm{U}},\left\{\overline{\mathrm{x}}^{1}, \ldots, \mathrm{x}^{\mathrm{n}}\right\}\right)
\end{array}\right.
$$

are charts with $U n \overline{\mathrm{U}} \neq \emptyset$ such that

$$
\left[\begin{array}{rl}
\bar{x}^{k} & =\overline{\mathrm{f}}^{k}\left(\mathrm{x}^{1}, \ldots, \mathrm{x}^{n}\right) \\
\mathrm{x}^{k}=\mathrm{f}^{\mathrm{i}}\left(\bar{x}^{\mathrm{x}}, \ldots \overline{\mathrm{x}}^{\mathrm{k}}\left(\mathrm{x}^{\mathrm{n}}\right)\right) & \left(\equiv \mathrm{x}^{\mathrm{i}}\left(\overline{\mathrm{x}}^{k}\right)\right)
\end{array}\right.
$$

[Note: In this section (as well as some others to follow), it will be more convenient to use bars rather than primes to designate a generic coordinate change.]

Put

$$
J_{k}^{i}=\frac{\partial x^{i}}{\partial \bar{x}^{k}}, \bar{J}_{i}=\frac{\partial \bar{x}^{k}}{\partial x^{i}}
$$

Then

$$
\left[\begin{array}{l}
J_{k^{j}}^{i}{ }_{j}^{\mathrm{k}}=\delta_{j}^{i} \\
\mathrm{~J}_{i}^{\mathrm{k}} \mathrm{~J}_{\ell}^{\mathrm{i}}=\delta_{\ell}^{\mathrm{k}}
\end{array}\right.
$$

Assume now that $M$ is orientable -- then the set $\mathcal{C}$ of coordinate systems on subsets of $M$ splits as a disjoint union $C^{+} U C^{-}$such that within $C^{+}$or $\mathcal{C}^{-}$one always has

$$
J=\operatorname{det}\left[J_{k}^{i}\right]>0
$$

Let $T \in W-D_{q}^{p}(M)$ - then

$$
\begin{aligned}
& \mathrm{k}_{\mathrm{T}} \cdots \mathrm{p}_{\ell_{1} \cdots \ell_{q}} \\
& =J^{W_{\bar{J}}}{ }_{i_{1}}^{k_{1}} \ldots \bar{J}^{k_{p}}{ }_{i_{p}}^{j^{j_{1}}}{ }_{\ell_{1}} \ldots J_{\ell_{q}}^{j_{q}}{ }^{i_{1}} \cdots{ }^{i_{p}}{ }_{j_{1}} \cdots j_{q} .
\end{aligned}
$$

Definition: A semitensor of type ( $p, q$ ) and weight $w$ is an entity satisfying this condition within either $\mathcal{C}^{+}$or $\mathcal{C}^{-}$, i.e., for coordinate changes subject to $J>0$.

If $\mathrm{w}-\mathrm{s} \mathbb{D}_{\mathrm{q}}^{\mathrm{p}}(\mathrm{M})$ is the set of such, then

$$
w-D_{q}^{p}(M) \subset w-s D_{q}^{p}(M)
$$

[Note: The tensor transformation rule for the sections of $\mathrm{T}_{\mathrm{q}}^{\mathrm{p}}(\mathrm{M}) \otimes \mathrm{L}_{\mathrm{I}}^{\mathrm{W}}(\mathrm{M})$ involves $|J|^{\mathrm{W}}$, while the tensor transformation rule for the sections of $\mathrm{T}_{\mathrm{q}}^{\mathrm{P}}(\mathrm{M}) \otimes \mathrm{L}_{\mathrm{II}}^{\mathrm{W}}(\mathrm{M})$ involves $\operatorname{sgn} \mathrm{J} \cdot|\mathrm{J}|^{\mathrm{W}}$. Thus, in either case, a generic section is a semitensor of type ( $p, q$ ) and weight w. For example, if $g \in M$, then $L^{-} e^{\text {e. }}$ are semitensors of type $\left[_{-}^{-}(n, 0)\right.$ and weight 0 but, being twisted, are not tensors of type $\left.\right|_{-} ^{-}(n, 0)$. .]

Definition: A metric concomitant of type ( $p, q$ ), weight $w$, and order $m$ is a map

$$
\mathrm{F}: \underline{M} \rightarrow \mathrm{~W}-\mathrm{SD} \mathrm{D}_{\mathrm{q}}^{\mathrm{P}}(\mathrm{M})
$$

for which $\exists$ real valued $C^{\infty}$ functions $F^{i_{1} \cdots i_{p}}{ }_{j_{1}} \cdots j_{q}$ of real variables
$x_{a b}, x_{a b}, c_{1}, \ldots, x_{a b}, c_{1} \cdots c_{m}$ such that if ( $U,\left\{x^{1}, \ldots, x^{n}\right\}$ ) is a chart, then the components of $F(g)$ are given by

$$
\begin{aligned}
& F(g)^{i_{1} \cdots i_{p}} j_{1} \cdots j_{q} \\
= & F^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}}\left(g_{a b} \prime g_{a b}, c_{1}, \cdots, g_{a b, c_{1}} \cdots c_{m}\right)
\end{aligned}
$$

where the corma stands for partial differentiation, i.e.,

$$
g_{a b, c_{1}}=\frac{\partial g_{a b}}{c_{1}}, \ldots, g_{a b, c_{1} \cdots c_{m}}=\frac{\partial^{m} g_{a b}}{\partial c_{1} \ldots c_{m}}
$$

[Note: The functions $F^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}}$ are not unique, thus equality of two metric concomitants means their equality as maps from $\underline{M}$ to $w-s D_{q}^{p}(M)$.]

Remark: The index scheme is not set in concrete and depends on the situation, e.g., to free up $a, b, c$ one can use r,s,t:

$$
g_{r s}, g_{r s, t_{1}}, \cdots, g_{r s, t_{1}} \cdots t_{m}
$$

Notation: $M C_{n}(p, q, w, m)$ is the set of metric concomitants of type ( $\mathrm{p}, \mathrm{q}$ ), weight w , and order m . With respect to the obvious operations, MC ( $\mathrm{p}, \mathrm{q}, \mathrm{w}, \mathrm{m}$ ) is a real vector space.
[Note: In general, $M C_{n}(p, q, w, m)$ is infinite dimensional but, under certain interesting circumstances, is finite dimensional (or even trivial).]

Example: The assignment $g \rightarrow|g|^{1 / 2}$ defines an element of $\mathrm{MC}_{\mathrm{n}}(0,0,1,0)$.
[Note: If $F \in M C_{n}(p, q, w, m)$, then the assignment $g \rightarrow|g|^{W / 2} F(g) \quad(W \in Z)$
defines an element of $\left.M C_{n}(p, q, w+W, m).\right]$
Example: Given $g \in M$, view the curvature tensor $R(g)$ attached to its metric connection as an element of $\mathcal{O}_{4}^{0}(M)$ - then the assignment $g \rightarrow R(g)$ is a metric concomitant of type $(0,4)$, weight 0 , and order 2. Indeed,

$$
\begin{gathered}
R_{i j k \ell}=\frac{1}{2}\left(g_{i \ell, j k}-g_{i k, j \ell}+g_{j k, i \ell}-g_{j \ell, i k}\right) \\
+\Gamma_{a j k} \Gamma_{i \ell}^{a}-\Gamma_{a j \ell} \Gamma_{i k}^{a}
\end{gathered}
$$

Therefore $R_{i j k \ell}$ is linear in the second derivatives of $g$ (but nonlinear in the first derivatives of $g$ ).]
[Note: Recall that

$$
\Gamma_{i j}^{k}=\frac{1}{2} g^{k \ell}\left(g_{\ell i, j}+g_{\ell j, i}-g_{i j, \ell}\right)
$$

Accordingly,

$$
\begin{aligned}
\Gamma_{k i j} & =g_{k a} \Gamma_{i j}^{a} \\
& =\frac{1}{2} g^{l a} g_{a k}\left(g_{\ell i, j}+g_{\ell j, i}-g_{i j, \ell}\right) \\
& =\frac{1}{2} \delta_{k}^{\ell}\left(g_{\ell i, j}+g_{\ell j, i}-g_{i j, \ell}\right) \\
& \left.=\frac{1}{2}\left(g_{k i, j}+g_{k j, i}-g_{i j, k}\right) .\right]
\end{aligned}
$$

Remark: Entities such as $\left|R^{i j}{ }_{R}{ }_{i j}\right|^{1 / 2}$ are not metric concomitants.
To reflect the underlying symmetries of the situation (stenming from the equality $g_{a b}=g_{b a}$ ), one can assume without loss of generality that all
internal indices have been symmetrized.
Example: Suppose that $\mathrm{n}=2$ and let $\mathrm{F}(\mathrm{g})=\operatorname{det} \mathrm{g}$, a scalar density of weight 2 , thus locally

$$
F(g)=g_{11} g_{22}-g_{12} g_{21}
$$

Here we can take

$$
\begin{aligned}
\mathrm{F}\left(\mathrm{x}_{\mathrm{ab}}\right) & =\mathrm{F}\left(\mathrm{x}_{11}, \mathrm{x}_{12}, \mathrm{x}_{21}, \mathrm{x}_{22}\right) \\
& =\mathrm{x}_{11} \mathrm{x}_{22}-\mathrm{x}_{12} \mathrm{x}_{21}
\end{aligned}
$$

or, in accordance with the foregoing convention,

$$
\mathrm{F}\left(\mathrm{x}_{\mathrm{ab}}\right)=\mathrm{F}\left(\mathrm{x}_{11}, \frac{\mathrm{x}_{12}+\mathrm{x}_{21}}{2}, \frac{\mathrm{x}_{21}+\mathrm{x}_{12}}{2}, \mathrm{x}_{22}\right) .
$$

In the first situation

$$
\frac{\partial F}{\partial x_{12}}=-x_{21} \neq \frac{\partial F}{\partial x_{21}}=-x_{12}
$$

but in the second situation,

$$
\frac{\partial F}{\partial x_{12}}=-\frac{1}{2}\left(x_{12}+x_{21}\right)=\frac{\partial F}{\partial x_{21}}
$$

Let $F \in M C_{n}(p, q, w, m)$-- then the barred and unbarred components of $F(g)$ are related by

$$
\begin{aligned}
& { }_{F}{ }^{k_{1} \cdots k_{p}}{ }_{l_{1} \cdots \ell_{q}}\left(\bar{g}_{a b}, \bar{g}_{a b}, c_{1}, \cdots, \bar{g}_{a b, c_{1}} \cdots c_{m}\right) \\
& =J_{w_{\bar{J}}}^{k_{1}} i_{i_{1}} \cdots \bar{J}^{k_{p}} i_{i_{p}}^{j^{j}}{ }_{\ell_{1}} \cdots J^{j_{q}} \ell_{q} \\
& \times \mathrm{F}^{\mathrm{i}_{1} \cdots \mathrm{i}_{p}}{ }_{j_{1}} \cdots j_{q}\left(g_{a b}, g_{a b, c_{1}}, \cdots, g_{a b, c_{1}} \cdots c_{m}\right) .
\end{aligned}
$$

[Note: Differentiation of the tensor transformation rule

$$
\bar{g}_{a b}=J_{a}^{r} J^{s}{ }^{s} g_{r s}
$$

leads to the transformation law for the derivatives of $g_{a b}$. To start the process, let

$$
J_{k \ell}^{i}=\frac{\partial^{2} x^{i}}{\partial \bar{x}^{k} \partial \bar{x}^{\ell}}
$$

Then we have

$$
\begin{aligned}
\overline{\mathrm{g}}_{\mathrm{ab}, \mathrm{c}}= & \left(J_{a c}^{r} J_{b}^{s}+J_{a}^{r} J_{b c}^{s}\right) g_{r s} \\
& +J_{a}^{r} J_{b}^{s} J^{t} g_{r s, t}
\end{aligned}
$$

Next, let

$$
J_{k l m}^{i}=\frac{\partial^{3} x^{i}}{\partial \bar{x}^{k} \partial x^{l} \partial \bar{x}^{-m}}
$$

Then we have

$$
\begin{aligned}
& \bar{g}_{a b, c d}=v^{v}{ }_{a c d^{J^{s}}}^{b}+J_{a c}^{s}{ }^{J^{s}} b d \\
& +J_{a d}^{r} J_{b c}^{s}+J_{a} J_{b c d}^{s} g_{r s} \\
& +\left(J^{r} a c^{J^{s}}{ }_{b} J^{t}{ }_{d}+J^{r}{ }_{a} J^{s}{ }_{b c} J^{t}{ }_{d}+J^{r}{ }_{a d} J^{s}{ }_{b} J^{t}{ }_{c}\right. \\
& \left.+J^{r}{ }_{a} J_{b d}^{s}{ }^{J^{t}}{ }_{c}+J^{r}{ }_{a} J_{b}^{s}{ }^{t}{ }_{c d}\right) g_{r s, t} \\
& +J_{a}^{r} J_{b}^{s}{ }^{J^{t}} c^{J^{u}}{ }_{d} g_{r s, t u} .
\end{aligned}
$$

And so forth... .]
Remark: Fix indices

$$
\left[\begin{array}{l}
i_{1}, \ldots, i_{p} \\
j_{1}, \ldots, j_{q}
\end{array}\right.
$$

and suppress them from the notation. Let

$$
\Lambda^{a b}=\partial F(g)^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}} / \partial g_{a b}
$$

and

$$
\Lambda^{a b, c_{1} \cdots c_{k}}=\partial F^{\prime}(g)^{i_{1} \cdots i_{p}}{ }_{j} \cdots j_{q} / \partial g_{a b}, c_{l} \cdots c_{k}(k=1, \ldots, m)
$$

Then, in general, the derivatives

$$
\Lambda_{, \Lambda}^{a b} a b, c_{1}, \ldots, \Lambda \quad a b, c_{1} \cdots c_{m}
$$

are not tensorial. However, it is possible to construct tensorial entities

$$
\Pi_{\Pi}^{a b},{ }_{\Pi}^{a b}, c_{1}, \ldots, \Pi^{a b}, c_{1} \cdots c_{m}
$$

from certain combinations of the $\Lambda^{\mathrm{ab}}, \ldots$ which turn out to be the components of metric concomitants

$$
\mathrm{DF}(\mathrm{~g}) / \mathrm{Dg}_{\mathrm{ab}}, \mathrm{DF}(\mathrm{~g}) / \mathrm{Dg} \mathrm{ab}, \mathrm{c}_{1}, \ldots, \mathrm{DF}(\mathrm{~g}) / \mathrm{Dg} \mathrm{ab}, \mathrm{c}_{1} \cdots \mathrm{c}_{\mathrm{m}}^{\prime}
$$

these being the so-called tensorial derivatives of $F(g)$.
[Note: A particular case of the construction is detailed later on when we take up the theory of lagrangians but, in brief, the procedure is this.

Given a symmetric $h \in D_{2}^{0}(M)$, let

$$
\operatorname{PF}(g, h)=\Lambda^{a b_{h}} h_{a b}+\sum_{k=1}^{m} \Lambda a, c_{1} \cdots c_{k_{h}}{ }_{a b}, c_{1} \cdots c_{k} .
$$

With the understanding that covariant differentiation is per the metric connection of $g$, the difference

$$
h_{a b}, c_{1} \cdots c_{k}-h_{a b ;} c_{1} \cdots c_{k}
$$

involves the connection coefficients $\Gamma^{\prime}$..' their derivatives, and the $h_{a b}$, $h_{a b, c_{1}} \cdots \cdots_{\ell}(\ell<k)$. Successive substitution of these formulas (beginning with $\mathrm{k}=\mathrm{m}$ and ending with $\mathrm{k}=1$ ) then enables one to write

$$
P F(g, h)=\Pi^{a b} h_{a b}+\sum_{k=1}^{m} \Pi^{a b}, c_{1} \cdots c_{k_{h}}{ }_{a b} ; c_{1} \cdots c_{k}
$$

- $\Pi^{a b}$ : This coefficient represents an element

$$
\mathrm{DF}(\mathrm{~g}) / \mathrm{Dg} \mathrm{ab}^{\in M C_{n}(p+2, q, w, m)}
$$

and

$$
\Pi^{a b}=\Lambda^{a b}+\{\ldots\}
$$

where ... involves the connection coefficients $\Gamma^{\circ}$.., their derivatives, and the $\Lambda^{a b, c_{1} \cdots c_{k}}(k=1, \ldots, m)$.

- $\Pi^{a b}, c_{1} \cdots{ }^{\cdots} c_{k}$ : This coefficient represents an element

$$
\mathrm{DF}(\mathrm{~g}) / \mathrm{Dg}_{\mathrm{ab}, \mathrm{c}_{1}} \cdots \mathrm{c}_{\mathrm{k}} \in \mathrm{MC}_{\mathrm{n}}(\mathrm{p}+\mathrm{k}+2, \mathrm{q}, \mathrm{w}, \mathrm{~m})
$$

and

$$
\Pi_{\Pi}^{a b, c_{1} \cdots c_{k}}=\Lambda^{a b, c_{1} \cdots c_{k}}+\{\ldots\}
$$

where ... involves the connection coefficients $\Gamma^{\circ}$.. their derivatives, and the ${ }_{\Lambda}{ }^{\mathrm{ab}, \mathrm{c}_{1} \cdots^{\mathrm{C}^{\prime}} \ell_{(\ell>k)} \text {. }}$
[Note: If $\mathrm{k}=\mathrm{m}$, then

$$
\left.{ }_{\Pi}^{a b, c_{1} \cdots c_{m}}=\Lambda^{a b, c_{1} \cdots c_{m}} .\right]
$$

It is not difficult to compute the tensorial derivatives when $\mathrm{m}=1$ or 2 but matters are more complicated when $\mathrm{m}=3.1$

To avoid trivialities, in what follows we shall assume that $n>1$.

LEMMA Let $F \in \operatorname{FM}_{\mathrm{n}}(0,0,0,0)-$ then $\exists$ a constant $\lambda$ such that $F=\lambda$. [To begin with,

$$
F\left(\bar{g}_{a b}\right)=F\left(g_{a b}\right)
$$

or still,

$$
F\left(J^{r}{ }_{a} J_{b}^{S} g_{a b}\right)=F\left(g_{a b}\right)
$$

Now differentiate this relation w.r.t. $\mathrm{J}_{\mathrm{k}}^{\mathrm{i}}$ :

$$
\begin{array}{ll} 
& \frac{\partial}{\partial J_{k}^{i}} F\left(J_{a}^{r} J_{b}^{s} g_{r s}\right)=\frac{\partial}{\partial J_{k}^{i}} F\left(g_{a b}\right)=0 \\
\Rightarrow & \quad \frac{\partial F}{\partial \bar{g}_{a b}} \frac{\partial \bar{g}_{a b}}{\partial J_{k}^{i}}=0 \\
\Rightarrow &
\end{array}
$$

$$
\frac{\partial F}{\partial \bar{g}_{a b}}\left(\delta^{r}{ }_{i} \delta^{k}{ }_{a} J^{s}{ }_{b} g_{r s}+J_{a}^{r} \delta_{i}^{s}{ }_{i}{ }^{k}{ }_{b} g_{r s}\right)=0
$$

$\Rightarrow$

$$
\frac{\partial F}{\partial \bar{g}_{a b}}\left(\delta^{k}{ }_{a} J_{b}^{s} g_{i s}+J^{r}{ }_{a} \delta_{b}^{k} g_{r i}\right)=0
$$

$\Rightarrow$

$$
\frac{\partial F}{\partial \bar{g}_{a b}}\left(\delta^{k}{ }_{a}{ }^{r}{ }_{b}{ }_{i r}+J_{a}^{r} \delta^{k}{ }_{b} g_{r i}\right)=0
$$

$\Rightarrow$

$$
\frac{\partial F}{\partial \bar{g}_{a b}} g_{r i}\left(\delta^{k}{ }_{a}^{r}{ }_{b}+\delta_{b}^{k} r_{a}\right)=0
$$

$\Rightarrow$

$$
2 \frac{\partial F}{\partial \bar{g}_{k b}} g_{r i} r_{b}=0
$$

Specialize and take $\bar{x}^{i}=x^{i}$-. then $J_{b}=\delta^{r}{ }_{b}$, hence

$$
\begin{aligned}
& \frac{\partial F}{\partial g_{k b}} g_{b i}=0 \\
& \frac{\partial F}{\partial g_{k l}}=0 .
\end{aligned}
$$

Therefore $F$ is a constant, as claimed.]

Application: If $F \in M C_{n}(0,0,1,0)$, then $\exists$ a constant $\lambda$ such that
$F(g)=\lambda|g|^{1 / 2}$.
[Consider the quotient $\left.F(g) /|g|^{1 / 2}.\right]$

IEMMA If n is even and $\mathrm{p}+\mathrm{q}$ is odd, then

$$
\begin{aligned}
& M C_{n}(p, q, w, 0)=\{0\} . \\
& \text { [Let } F \in M C_{n}(p, q, w, 0) \text {-- then } \\
& \mathrm{F}^{\mathrm{k}_{1} \cdots \mathrm{k}_{\mathrm{p}}}{ }_{\ell_{1} \cdots \ell_{\mathrm{q}}}\left(\overline{\mathrm{~g}}_{\mathrm{ab}}\right) \\
& =J^{W} \bar{J}^{k_{1}}{ }_{i_{1}} \cdots \bar{J}^{k_{p}}{ }_{i_{p}}^{J^{j}{ }_{l}} \ell_{1} \ldots J^{j_{q}}{ }_{\ell} F^{i_{1}} \cdots{ }^{i_{p}}{ }_{j_{1}} \cdots j_{q}\left(g_{a b}\right) .
\end{aligned}
$$

Since n is even, we can take $\overline{\mathrm{x}}^{\mathrm{i}}=-\mathrm{x}^{\mathrm{i}}$. This gives

$$
\begin{aligned}
& { }_{F}^{k_{1} \cdots k_{p_{\ell}} \ldots \ell_{q}\left(\bar{g}_{a b}\right)} \\
= & {\left[(-1)^{n_{1}}\right]_{(-1)^{p+q_{F}}}^{k_{1} \cdots k_{p}} \ell_{1} \cdots \ell_{q}\left(g_{a b}\right) } \\
= & (-1)^{p+q_{1}}{ }_{F}^{k_{1} \cdots k_{p}} \ell_{1} \cdots \ell_{q}\left(g_{a b}\right) .
\end{aligned}
$$

But

$$
\begin{aligned}
\bar{g}_{a b} & =J_{a}^{r} J_{b}^{s} g_{r s} \\
& =\left(-\delta^{r}{ }_{a}\right)\left(-\delta^{s}{ }_{b}\right) g_{r s} \\
& =g_{a b} .
\end{aligned}
$$

Therefore $\mathrm{F}=0$. ]

FACT If $p+q$ is odd and less than $n$, then

$$
M C_{n}(p, q, w, 0)=\{0\}
$$

## Structural Considerations

- Let $F \in M C_{n}(0, q, 0,0)$. Assume: $q$ is odd and $q<n-$ then $F=0$.
- Let $F \in M C_{n}(0, n, 0,0)$. Assume: $n$ is odd -- then

$$
F(g)_{j_{1}} \cdots j_{n}=L|g|^{1 / 2} \varepsilon_{j_{1}} \cdots j_{n}^{\prime}
$$

where $L$ is a constant.
-Let $F \in M C_{n}(0, q, 0,0)$. Assume: $q$ is even and $q<n-$ then

$$
\left.\left.F(g)_{j_{1}} \cdots j_{q}=\sum_{\sigma \in S_{q}} K_{\sigma} g_{\sigma\left(j_{1}\right.}\right) \sigma\left(j_{2}\right) \cdots g_{\sigma\left(j_{q-1}\right.}\right) \sigma\left(j_{q}\right)
$$

where the $K_{\sigma}$ are constants.

- Let $F \in M C_{n}(0, n, 0,0)$. Assume: $n$ is even -- then

$$
\begin{gathered}
F(g)_{j_{1}} \cdots j_{n}=\sum_{\sigma \in S_{n}} K_{\sigma} g_{\sigma\left(j_{1}\right) \sigma\left(j_{2}\right)} \cdots g_{\sigma\left(j_{n-1}\right) \sigma\left(j_{n}\right)} \\
+L|g|^{1 / 2} \varepsilon_{j_{1}} \cdots j_{n}
\end{gathered}
$$

where the $K_{\sigma}$ and $L$ are constants.
Remark: Due to the symmetry of $g$ and the commutativity of multiplication, the decomposition

$$
\left.\sum_{\sigma \in S_{q}} K_{\sigma} g_{\sigma\left(j_{1}\right)} \sigma\left(j_{2}\right) \cdots g_{\sigma\left(j_{q-1}\right.}\right) \sigma\left(j_{q}\right)
$$

contains redundancies, there being

$$
\frac{q!}{(q / 2)!2^{q / 2}}
$$

distinct terms (after combination of the constants).
Example: Let $\mathrm{F} \in \mathrm{MC}_{4}(0,4,0,0)$-- then

$$
\begin{aligned}
& F(g)_{j_{1} j_{2} j_{3} j_{4}}=K_{1} g_{j_{1} j_{2}} g_{j_{3} j_{4}}+K_{2} g_{j_{1}} j_{3} g_{j_{2} j_{4}} \\
& +K_{3} g_{j_{1} j_{4}} g_{j_{2} j_{3}}+L|g|^{1 / 2} \varepsilon_{j_{1} j_{2} j_{3} j_{4}}
\end{aligned}
$$

where $\mathrm{K}_{1}, \mathrm{~K}_{2}, \mathrm{~K}_{3}, \mathrm{~L}$ are constants.
Example: Let $\mathrm{F} \in \mathrm{MC}_{4}(0,4,0,0)$. Suppose that

$$
{ }^{(g)}{ }_{j_{1}} j_{2} j_{3} \dot{j}_{4}=-F(g) j_{2} \dot{j}_{1} j_{3} j_{4}
$$

Then

$$
F(g)_{j_{1} j_{2} j_{3} j_{4}}=k\left(g_{j_{1} j_{3}} g_{j_{2} j_{4}}-g_{j_{1} j_{4}} g_{j_{2} j_{3}}\right)+L|g|^{l / 2} \varepsilon_{j_{1} j_{2} j_{3} j_{4}}
$$

where K and L are constants.
Remark: The situation when $q>n$ is more involved. To illustrate, $\mathrm{MC}_{2}(0,4,0,0)$ contains elements of the form

$$
g_{j_{1} j_{2}}|g|^{1 / 2} \varepsilon_{j_{3} j_{4}} \text { and }|g|^{1 / 2} \varepsilon_{j_{1} j_{2}} \cdot|g|^{l / 2} \varepsilon_{j_{3}}{ }_{j_{4}} .
$$

[Note: Using classical invariant theory, one can express an arbitrary element of $M_{n}(0, q, 0,0)(q>n)$ in terms of products of the $g_{i j}$ and lower Levi-Civita symbols.]

While formulated covariantly, all of the preceding results admit contravariant counterparts.

Example: Let $F \in M C_{n}(2,0,0,0) \quad(n>2)--$ then

$$
F(g)^{i j}=K^{i j}
$$

where K is a constant.
[Differentiate the identity

$$
J_{j}^{k}{ }_{j}{ }^{\ell}{ }_{i} F^{i j}\left(J_{s}^{r} J^{c}{ }_{d} g_{r c}\right)=F^{i j}\left(g_{s d}\right)
$$

w.r.t. $J_{b}^{a}$ and then set $\bar{x}^{i}=x^{i}$. This gives

$$
\begin{gathered}
\left(\delta^{k}{ }_{a} \delta^{b}{ }_{j} \delta^{\ell}{ }_{i}+\delta^{k}{ }_{j} \delta^{\ell}{ }_{a} \delta^{b}{ }_{i}\right) F^{i j} \\
+\delta^{k}{ }_{j} \delta^{\ell}{ }_{i}\left(\delta^{r}{ }_{a} \delta^{b}{ }_{s} \delta^{c}{ }_{d}+\delta^{r}{ }_{s} \delta^{c}{ }_{a} \delta^{b}{ }_{d}\right) g_{r c} \frac{\partial F^{i j}}{\partial g_{s d}} \\
=0
\end{gathered}
$$

or still,

$$
\delta^{k}{ }_{a}^{l b}+\delta^{\ell}{ }_{a}^{b k}+2 g_{a c} \frac{\partial F^{l k}}{\partial g_{b c}}=0
$$

from which (upon multiplying by $\mathrm{g}^{\text {ad }}$ ),

$$
g^{k d_{F} l b}+g^{l d}{ }_{F} \mathrm{bk}=-2 \frac{\partial F^{l k}}{\partial g_{b d}}
$$

But the RHS is symmetric in $b \& d$, hence

$$
g^{k d_{F} l b}+g^{l d_{F} b k}=g^{k b_{F} l d}+g^{l b_{F} d k}
$$

Now multiply through by $g_{k d}-$ then

$$
n \mathrm{~F}^{\mathrm{lb}}+\mathrm{F}^{\mathrm{bl}}=\mathrm{F}^{\mathrm{lb}}+x \mathrm{~g}^{\mathrm{lb}}
$$

where

$$
x=g_{k d}{ }^{\mathrm{F} k},
$$

15. 

or still,

$$
(n-1) F^{l b}+F^{b l}=x g^{l b} .
$$

To solve for $F^{l b}$, note that

$$
\begin{aligned}
& (n-1)^{2} F^{l b}+(n-1) F^{b l}=(n-1) x g^{l b} \\
\Rightarrow & \left(n^{2}-2 n+1\right) F^{l b}+\left(x g^{l b}-F^{l b}\right)=(n-1) x g^{l b} \\
\Rightarrow \quad & F^{l b}=\frac{1}{n} x g^{l b} .
\end{aligned}
$$

To see that $x$ is a constant, substitute back into the differential equation, thus

$$
\begin{gathered}
g^{k d_{x}}{ }^{l b}+g^{l d_{n}}{ }^{b k}=-2 \frac{\partial\left(g^{l k}\right)}{\partial g_{b d}} \\
=-2\left[\frac{\partial x}{\partial g_{b d}} g^{l k}+x \frac{\partial g^{l k}}{\partial g_{b d}}\right] \\
=-2\left[\frac{\partial x}{\partial g_{b d}} g^{l k}+x\left(-\frac{g^{l b} g^{d k_{1}}+g^{l d} g^{b k}}{2}\right)\right] \\
\Rightarrow \quad \frac{\partial x}{\partial g_{b d}}=0
\end{gathered}
$$

I.e.: $x$ is a constant.]
[Note: If $F \in M C_{n}(2,0,1,0)(n>2)$, then $\exists$ a constant $K$ such that $F(g)^{i j}=K|g|^{1 / 2} g^{i j}$ (apply the above analysis to the quotient $\left.\left.F(g) /|g|^{1 / 2}\right).\right]$

Example: Let $\mathrm{F} \in \mathrm{MC}_{2}(2,0,0,0)$ - then

$$
F(g)^{i j}=K g^{i j}+L \frac{\varepsilon^{i j}}{|g|^{1 / 2}}
$$

where $K$ and $L$ are constants.
[From the preceding example, we have

$$
F^{l b}+F^{b l}=x g^{l b}
$$

thus

$$
F^{l b}=\frac{x}{2} g^{l b}+\frac{1}{2}\left(F^{l b}-F^{b l}\right)
$$

and so ( $n=2$ ),

$$
F^{l b}=\frac{x}{2} g^{l b}+\frac{\lambda}{2} \frac{\varepsilon^{l b}}{|g|^{1 / 2}}
$$

Therefore

$$
\Rightarrow
$$

$$
\begin{aligned}
& g^{k d}\left(\frac{x}{2} g^{l b}+\frac{\lambda}{2} \frac{\varepsilon^{l b}}{|g|^{1 / 2}}\right)+g^{l d}\left(\frac{x}{2} g^{b k}+\frac{\lambda}{2} \frac{\varepsilon^{b k}}{|g|^{1 / 2}}\right) \\
=- & 2 \frac{\partial}{\partial g_{b d}}\left(\frac{x}{2} g^{\ell k}+\frac{\lambda}{2} \frac{\varepsilon^{\ell k}}{|g|^{1 / 2}}\right) \\
& \frac{\lambda}{2|g|^{1 / 2}}\left(g^{k d} \varepsilon^{l b}+g^{l d} \varepsilon^{b k}\right) \\
= & -\frac{\partial x}{\partial g_{b d}} g^{l k}-2 \frac{\partial}{\partial g_{b d}}\left(\frac{\lambda}{2} \frac{\varepsilon^{l k}}{|g|^{1 / 2}}\right) .
\end{aligned}
$$

Since the LHS of this relation is skew symmetric in $k \& \ell$, it follows that

$$
\frac{\partial x}{\partial g_{\mathrm{bd}}}=0
$$

hence $x$ is a constant. Now take $k=1, \ell=2$-- then

$$
\begin{aligned}
& \frac{\lambda}{2|g|^{1 / 2}}\left(g^{l d_{\varepsilon}^{2 b}}+g^{2 d_{\varepsilon} b l}\right) \\
&=\frac{\partial}{\partial g_{b d}}\left(\frac{\lambda}{|g|^{1 / 2}}\right)
\end{aligned}
$$

Suppose that $b=1$ :

$$
\begin{aligned}
& \frac{\lambda}{2|g|^{1 / 2}}\left(-g^{l d}\right)=\frac{\partial}{\partial g_{l d}}\left(\frac{\lambda}{|g|^{1 / 2}}\right) \\
& \quad=\frac{\partial \lambda}{\partial g_{l d}} \frac{1}{|g|^{1 / 2}}+\lambda \frac{\partial|g|^{-1 / 2}}{\partial g_{l d}} .
\end{aligned}
$$

But

$$
\begin{aligned}
\frac{\partial|g|^{-1 / 2}}{\partial g_{1 d}} & =-\frac{1}{2}|g|^{-3 / 2} \frac{\partial|g|}{\partial g_{l d}} \\
& =-\frac{1}{2}|g|^{-3 / 2}|g|^{1 d} \\
& =-\frac{1}{2} \frac{g^{1 d}}{|g|^{1 / 2}}
\end{aligned}
$$

Therefore

$$
\Rightarrow
$$

$$
\begin{gathered}
-\frac{\lambda}{2|g|^{1 / 2}} g^{1 d}=\frac{\partial \lambda}{\partial g_{1 d}} \frac{1}{|g|^{1 / 2}}-\frac{\lambda}{2|g|^{1 / 2}} g^{1 d} \\
\frac{\partial \lambda}{\partial g_{l d}}=0
\end{gathered}
$$

The same argument shows that

$$
\frac{\partial \lambda}{\partial g_{2 d}}=0
$$

Conclusion: $\lambda$ is a constant.]
[Note: If $\mathrm{F} \in \mathrm{MC}_{2}(2,0,1,0)$, then $\exists$ constants $K$ and $L$ such that $F(g)^{i j}=K|g|^{1 / 2} g^{i j}+L \varepsilon^{i j}$ (apply the above analysis to the quotient $\left.\left.F(g) /|g|^{1 / 2}\right).\right]$

Example: Let $F \in \mathrm{MC}_{4}(6,0,1,0)$. Suppose that

$$
F(g)^{\text {abcrst }}=F(g)^{\text {rstabc }}
$$

Then

$$
\begin{aligned}
F(g)^{a b c r s t}=|g|^{1 / 2}\left[K _ { 1 } \left(g^{a b} g g_{g} s t\right.\right. & \left.g^{a t_{g} b c_{g} r s}\right) \\
& +K_{2}\left(g^{a b_{g} c s_{g} r t}+g^{a c_{g} b t_{g} r s}\right) \\
& +K_{3}\left(g^{a c_{g} b r_{g} s t}+g^{a s_{g} c b_{g} r t}\right) \\
& +K_{4}\left(g^{a s_{g} c r_{g} b t}+g^{a t_{g} b r_{g} c s}\right) \\
& +K_{5} g^{a b_{g} c t_{g} r s}+K_{6} g^{a c_{g} b s_{g} r t} \\
& +K_{7} g^{a r_{g} b c_{g} s t}+K_{8} g^{a r_{g} b s_{g} c t} \\
& +K_{9} g^{a r_{g} b t_{g} c s}+K_{10} g^{a s_{g} c t} g^{b r} \\
& +K_{11} g^{a t_{g} b s_{g} c r_{1}}
\end{aligned}
$$

$$
\begin{aligned}
& +L_{1}\left(g^{a b} \varepsilon^{c r s t}+g^{r s_{\varepsilon} t a b c}\right) \\
& +L_{2}\left(g^{a c_{\varepsilon} b r s t}+g^{r t_{\varepsilon} s a b c}\right) \\
& +L_{3}\left(g^{a s_{\varepsilon} c r b t}+g^{r b}{ }_{\varepsilon}^{t a s c}\right) \\
& +L_{4}\left(g^{a t} \varepsilon_{\varepsilon} c r s b\right. \\
& \left.+g^{r c} \varepsilon_{\varepsilon}^{t a b s}\right) \\
& +L_{5}\left(g^{b c_{\varepsilon} a r s t}+g^{s t_{\varepsilon} r a b c}\right) \\
& +L_{6}\left(g^{b t}{ }_{\varepsilon}^{c r s a}+g^{s c} \varepsilon_{\varepsilon}^{t a b r}\right)
\end{aligned}
$$

whre $K_{k}(k=1, \ldots, 11)$ and $L_{\ell}(\ell=1, \ldots, 6)$ are constants.
[Note: The quantity $g^{\text {ra }}{ }^{\text {cbst }}$ has the required symmetry but there is no contradiction since

$$
\begin{aligned}
2 g^{\mathrm{ra}} \varepsilon_{\varepsilon}^{\mathrm{cbst}}= & -\left(g^{a t_{\varepsilon} \mathrm{crsb}}+g^{\mathrm{rc}} \varepsilon^{\mathrm{tabs}}\right) \\
& -\left(g^{\mathrm{as}} \mathrm{crbt}+g^{\mathrm{rb}} \varepsilon^{\text {tasc }}\right) \\
& \left.-g^{a b_{\varepsilon} r c s t}+g^{r s_{\varepsilon}^{a t b c}}\right) \\
& \left.-\left(g^{\mathrm{ac}}{ }_{\varepsilon}^{b r s t}+g^{r t_{\varepsilon} s a b c}\right) .\right]
\end{aligned}
$$

INDEPENDENCE THEOREM Let $F \in M C_{n}(p, q, w, 1)$, so that

$$
F(g)^{i_{1} \cdots i_{p}} j_{1} \cdots j_{q}=F^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}}\left(g_{a b}, g_{a b, c}\right)
$$

Then

$$
{ }_{\partial F}^{i_{1}} \cdots_{p}^{i_{1} \cdots j_{q}}\left(g_{a b} g_{a b, c}\right) / \partial g_{a b, c}=0 .
$$

Therefore the components

$$
F(g)^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}}
$$

do not depend on the $g_{a b, c}$ explicitly, thus are independent of the first partial derivatives.

Rappel: Let $g \in M$. Fix a point $x_{0} \in M$ and let $x^{l}, \ldots, x^{n}$ be normal coordinates at $x_{0}$-- then there is a Taylor expansion

$$
g_{a b}(x)=g_{a b}\left(x_{0}\right)+\frac{1}{2!} G_{a b c_{1} c_{2}}\left(x_{0}\right) x^{c_{1}} x^{c_{2}}+\frac{1}{3!} G_{a b c_{1} c_{2} c_{3}}\left(x_{0}\right) x^{c_{1}} x_{x}^{c_{2}} x^{c_{3}}+\ldots,
$$

where the coefficients

$$
\mathrm{G}_{\mathrm{abc}}^{1} \ldots \mathrm{c}_{\mathrm{k}} \in \mathrm{MC}_{\mathrm{n}}(0,2+\mathrm{k}, 0, \mathrm{k})
$$

possess the following symmetries:
(1) $G_{a b c_{1}} \cdots c_{k}=G_{b a c_{1}} \cdots c_{k}$;
(2) $\mathrm{G}_{\mathrm{ab} c_{1}} \cdots \mathrm{c}_{\mathrm{k}}=\mathrm{G}_{\mathrm{ab}}\left(\mathrm{c}_{1} \cdots \mathrm{c}_{\mathrm{k}}\right)$;
(3) $G_{a\left(b c_{1} \cdots c_{k}\right)}=0$.
[Note: By construction, $G_{a b c_{1}} \cdots c_{k}$ is a function of the curvature tensor of $g$ (viewed as an element of $\mathcal{D}_{4}^{0}(\mathrm{M})$ ) and its repeated covariant derivatives.

So, e.g.,

$$
\mathrm{G}_{\mathrm{abc}_{1} \mathrm{c}_{2}}=-\frac{1}{3}\left(\mathrm{R}_{\mathrm{ac}_{1} \mathrm{bc}}^{2} \text { }+\mathrm{R}_{\mathrm{bc}}^{1} \mathrm{ac}_{2}\right)
$$

and

$$
\begin{aligned}
& G_{a b c_{1} c_{2} c_{3}}=-\frac{1}{6}\left(R_{a_{1}} b c_{2} ; c_{3}+R_{a c_{2}}{b c_{3} ; c_{1}}+\mathrm{R}_{\mathrm{ac}_{3} \mathrm{bc}_{1} ; c_{2}}\right. \\
& \left.\left.+R_{b c_{1}} a c_{2} ; c_{3}+R_{b c_{2} a c_{3} ; c_{1}}+R_{b c_{3} a c_{1} ; c_{2}}\right) .\right]
\end{aligned}
$$

REPLACEMENT THEOREM Let $F \in M C_{n}(p, q, w, m)$-- then

$$
\begin{aligned}
& { }^{i_{1}}{ }^{\cdots i_{p}}{ }_{j_{1}} \cdots j_{q}\left(g_{a b}, g_{a b, c_{1}}, \cdots, g_{a b}, c_{1} \cdots c_{m}\right) \\
& =F^{i_{1} \cdots i_{p}}{ }_{j_{1} \cdots j_{q}}\left(g_{a b}, 0, G_{a b c_{1} c_{2}}, \cdots, G_{a b c_{1}} \cdots c_{m}\right) .
\end{aligned}
$$

Example: If n is even and q is odd, then

$$
M C_{n}(0, q, w, 2)=\{0\}
$$

[Let $F \in M C_{n}(0, q, w, 2)-$ then

$$
\begin{aligned}
& F_{\ell_{1}} \cdots \ell_{q}\left(\bar{g}_{a b}, \bar{G}_{a b c_{1} c_{2}}\right) \\
= & J^{w_{J}}{ }^{j_{l}} \ell_{1} \ldots J^{j_{q}} \ell_{q} F_{j_{1}} \cdots j_{q}\left(g_{a b}, G_{a b c_{1} c_{2}}\right) .
\end{aligned}
$$

Since n is even, we can take $\overline{\mathrm{x}}^{\mathbf{i}}=-\mathrm{x}^{\mathbf{i}}$. This gives

$$
\mathrm{F}_{\ell_{1}} \cdots \ell_{\mathrm{q}}\left(\overline{\mathrm{~g}}_{\mathrm{ab}}, \overline{\mathrm{G}}_{\mathrm{abc}_{1} \mathrm{c}_{2}}\right)
$$

$$
\begin{aligned}
& =\left[(-1)^{\mathrm{n}_{1} \mathrm{w}}(-1)^{\mathrm{q}} \mathrm{~F}_{\ell_{1}} \cdots \ell_{\mathrm{q}}\left(\mathrm{~g}_{\mathrm{ab}}, \mathrm{G}_{\mathrm{abc}_{1} c_{2}}\right)\right. \\
& =(-1)^{\mathrm{q}} \mathrm{~F}_{\ell_{1}} \ldots \ell_{\mathrm{q}}\left(\mathrm{~g}_{\mathrm{ab}}, \mathrm{G}_{\mathrm{abc}_{1} c_{2}}\right)
\end{aligned}
$$

But

$$
\bar{g}_{a b}=g_{a b}
$$

and

$$
\bar{G}_{a b c_{1} c_{2}}=G_{a b c_{1} c_{2}}
$$

Therefore $\mathrm{F}=0$.

Section 22: Lagrangians Let $M$ be a connected $C^{\infty}$ manifold of dimension $n$, which we shall assume is orientable.

Definition: A lagrangian of order $m$ is an element

$$
L \in M C_{n}(0,0,1, m)
$$

In what follows, our primary concern will be with the case $m=2$, thus

$$
\mathrm{L}\left(\overline{\mathrm{~g}}_{\mathrm{ab}}, \overline{\mathrm{~g}}_{\mathrm{ab}, \mathrm{c}}, \overline{\mathrm{~g}}_{\mathrm{ab}, \mathrm{~cd}}\right)=\mathrm{JL}\left(\mathrm{~g}_{\mathrm{ab}}, \mathrm{~g}_{\mathrm{ab}, \mathrm{c}}, \mathrm{~g}_{\mathrm{ab}, \mathrm{~cd}}\right)
$$

the basic identity.
[Note: Recall that the elements of $\mathrm{MC}_{\mathrm{n}}(0,0,1,0)$ are simply the constant multiples of $|g|^{1 / 2}$. As for the elements of $\mathrm{MC}_{\mathrm{n}}(0,0,1,1)$, say

$$
L(g)=L\left(g_{a b}, g_{a b, c}\right),
$$

the Independence Theorem implies that

$$
\frac{\partial L}{\partial g_{a b, c}}=0
$$

hence $L(g)$ depends solely on the $g_{a b}$ and not their first derivatives.]
Given an

$$
L \in M C_{n}(0,0,1,2),
$$

put

$$
\Lambda^{a b}=\frac{\partial L}{\partial g_{a b}}, \Lambda^{a b, c}=\frac{\partial L}{\partial g_{a b, c}}, \Lambda^{a b, c d}=\frac{\partial L}{\partial g_{a b, c d}} .
$$

Then

$$
\Lambda^{\mathrm{ab}}=\Lambda^{\mathrm{ba}}, \Lambda^{\mathrm{ab}, \mathrm{c}}=\Lambda^{\mathrm{ba}, \mathrm{c}}, \Lambda^{\mathrm{ab}, \mathrm{~cd}}=\Lambda^{\mathrm{ba}, \mathrm{~cd}}=\Lambda^{\mathrm{ab}, \mathrm{dc}} .
$$

Transformation Laws
(1) $J \Lambda^{a b}, c d$

$$
\begin{aligned}
& =\bar{\Lambda}^{i j, k \ell} \frac{\partial \bar{g}_{i j, k \ell}}{\partial g_{a b, c d}} \\
& =\bar{\Lambda}^{i j, k \ell}{ }_{J}{ }^{a}{ }_{i}{ }^{b}{ }_{j} J^{c}{ }_{k} J^{d}{ }_{\ell} .
\end{aligned}
$$

(2) $J \Lambda^{a b, c}$

$$
=\bar{\Lambda}^{i j, k \ell} \frac{\partial \bar{g}_{i j, k \ell}}{\partial g_{a b, c}}+\bar{\Lambda}^{i j, k} \frac{\partial \bar{g}_{i j, k}}{\partial g_{a b, c}} .
$$

(3) $J \Lambda^{a b}$

$$
=\bar{\Lambda}^{i j, k \ell} \frac{\partial \bar{g}_{i j, k \ell}}{\partial g_{a b}}+\bar{\Lambda}^{i j, k} \frac{\partial \bar{g}_{i j, k}}{\partial g_{a b}}+\bar{\Lambda}^{i j} \frac{\partial \bar{g}_{i j}}{\partial g_{a b}} .
$$

[Note: Therefore $\Lambda^{\mathrm{ab}, \mathrm{cd}}$ is tensorial but $\Lambda^{\mathrm{ab}, \mathrm{c}}$ and $\Lambda^{\mathrm{ab}}$ are not tensorial.] Denote by $S_{2}(M)$ the set of symmetric elements in $0_{2}^{0}(M)$. Definition: Let $L \in M C_{n}(0,0,1,2)$-- then its principal form is the map

$$
\mathrm{PL}: \underline{M} \times S_{2}(M) \rightarrow 1-S D_{0}^{0}(M)
$$

defined by the prescription

$$
\operatorname{PL}(g, h)=\left.\frac{\mathrm{d}}{\mathrm{~d} \varepsilon} \mathrm{~L}(\mathrm{~g}+\varepsilon \mathrm{h})\right|_{\varepsilon=0} .
$$

Locally,

$$
\left.\frac{d}{d \varepsilon} L\left(g_{a b}+\varepsilon h_{a b}, g_{a b, c}+\varepsilon h_{a b, c^{\prime}} g_{a b, c d}+\varepsilon h_{a b, c d}\right)\right|_{\varepsilon=0}
$$

$$
=\Lambda^{a b} h_{a b}+\Lambda^{a b, c_{h_{a b}, c}+\Lambda^{a b, c d_{h_{a b}}}{ }^{0 d} .}
$$

[Note: To check that $\mathrm{PL}(\mathrm{g}, \mathrm{h})$ is an element of $1-\mathrm{s} 0_{0}^{0}(\mathrm{M})$, use the foregoing transformation laws:

$$
\begin{gathered}
J \Lambda \frac{a h_{h}}{}+J \Lambda a b, c_{h_{a b, c}}+J \Lambda a b, c d_{h_{a b, c d}} \\
=\bar{\Lambda}^{i j, k \ell}\left[\frac{\partial \bar{g}_{i j, k l}}{\partial g_{a b, c d}} h_{a b, c d}+\frac{\partial \bar{g}_{i j, k \ell}}{\partial g_{a b, c}} h_{a b, c}+\frac{\partial \bar{g}_{i j, k \ell}}{\partial g_{a b}} h_{a b}\right] \\
+\bar{\Lambda}^{i j, k}\left[\frac{\partial \bar{g}_{i j, k}}{\partial g_{a b, c}} h_{a b, c}+\frac{\partial \bar{g}_{i j, k}}{\partial g_{a b}} h_{a b}\right] \\
+\bar{\Lambda}^{i j}\left[\frac{\partial \bar{g}_{i j}}{\partial g_{a b}} h_{a b}\right]
\end{gathered}
$$

Here it is necessary to keep in mind that the terms figuring in the transformation laws for $g_{a b}$ and its derivatives are precisely the terms figuring in the transformation laws for $h_{a b}$ and its derivatives. For instance,

$$
\left.\frac{\partial \bar{g}_{i j, k}}{\partial g_{a b}}=J_{i k}^{a}{ }_{j}^{b}+J_{i}^{a}{ }_{i}^{b} k^{\cdot}\right]
$$

Remark: In reality,

$$
\left.\frac{\mathrm{d}}{\mathrm{~d} \varepsilon} \mathrm{~L}(\mathrm{~g}+\varepsilon \mathrm{h})\right|_{\varepsilon=0}
$$

is meaningful only if $h$ is compactly supported, the difficulty being that, in general, $\mathrm{g}+\varepsilon \mathrm{h} \not \underline{M}$ no matter the choice of $\varepsilon \neq 0$. E.g.: Take $M=\underline{R}$, let $g$ be the usual metric, and consider $g+\varepsilon h$, where $h_{x}=x g_{x}$ - then at $x=-1 / \varepsilon$,

$$
g_{-1 / \varepsilon}+\varepsilon(-1 / \varepsilon) g_{-1 / \varepsilon}=0
$$

Thus, strictly speaking, the introduction of

$$
\left.\frac{d}{d \varepsilon} L(g+\varepsilon h)\right|_{\varepsilon=0}
$$

serves merely to motivate the definition of $\mathrm{PL}(\mathrm{g}, \mathrm{h})$.
Let $\mathrm{con}_{0} \mathrm{TM}$ stand for the set of torsion free connections on TM.
Rappel: If $\nabla \in \operatorname{con}_{0} \mathrm{TM}$ and $h \in S_{2}(M)$, then

$$
h_{i j ; k}=h_{i j, k}-\Gamma_{i k}^{a} h_{a j}-\Gamma_{j k}^{a} h_{i a}
$$

and

$$
\begin{aligned}
& h_{i j ; k \ell}=h_{i j, k \ell}-\Gamma^{a}{ }_{i k} h_{a j, \ell}-\Gamma_{j k}^{a} h_{i a, \ell}-\Gamma_{i k, \ell}{ }^{\mathrm{h}}{ }_{a j}-\Gamma_{j k, \ell}{ }^{a} h_{i a} \\
& \left.-\Gamma^{b}{ }_{i} \ell_{b j, k}+\Gamma^{b}{ }_{i} \ell^{\left(\Gamma^{c}\right.}{ }_{b k}{ }^{h} c j+\Gamma^{c}{ }_{j k} h_{b c}\right) \\
& -\Gamma_{j \ell h^{b}} h_{i b}+\Gamma_{j \ell}^{b}\left(\Gamma^{c}{ }_{i k} h_{c b}+\Gamma_{b k}^{c} h_{i c}\right) \\
& -\Gamma_{k \ell}^{b} h_{i j, b}+\Gamma_{k \ell}^{b}\left(\Gamma_{i b}^{c} h_{c j}+\Gamma_{j b}^{c} h_{i c}\right) .
\end{aligned}
$$

Given $\nabla \in$ con $0_{0} \mathrm{TM}$, define $\Pi_{\nabla}^{\mathrm{ij}, k}$ by

$$
\Pi_{\nabla}^{i j, k}=\Lambda^{i j, k}+2 \Gamma^{i} a \ell^{\Lambda^{a j}, k \ell}+2 \Gamma_{a \ell^{\Lambda}}^{a i, k \ell}+\Gamma_{b \ell^{\Lambda}}^{i j, b \ell}
$$

and define $\Pi_{\nabla}^{i j}$ by

$$
\Pi_{\nabla}^{i j}=\Lambda^{i j}+\Gamma_{a k, \ell^{\Lambda}}^{a j, k \ell}+\Gamma_{a k, \ell^{\Lambda}}^{a i, k \ell}
$$

$$
\begin{aligned}
& -\Gamma^{b} a \ell^{\Gamma^{i}}{ }_{b k} \Lambda^{a j, k \ell}-\Gamma^{b} c l^{\Gamma^{j}}{ }_{b k} \Lambda^{c i, k \ell} \\
& -\Gamma^{i}{ }^{i} \ell^{\Gamma^{j}}{ }_{\mathrm{ck}}{ }^{\mathrm{B}}{ }^{\mathrm{bc}, \mathrm{k} \ell}-\Gamma_{\mathrm{b}} \ell^{\Gamma^{\mathrm{i}} \mathrm{ck}^{\Lambda}}{ }^{\mathrm{bc}, \mathrm{k} \ell} \\
& -\Gamma_{k \ell^{\Gamma^{i}}{ }_{c b} \Lambda^{c j}, k \ell}-\Gamma_{k}^{b} \ell^{\Gamma^{j}}{ }_{c b^{\Lambda}}{ }^{\mathrm{ci}, k \ell} \\
& +\Gamma^{i} a k^{\Pi} \prod_{\nabla}^{a j} k+\Gamma_{a k}^{j} \Pi_{\nabla}^{i a, k} .
\end{aligned}
$$

Complete the picture and set

$$
\Pi_{\nabla}^{i j, k \ell}=\Lambda^{i j, k \ell}
$$

LEMMA $\forall h \in S_{2}(M)$, we have

$$
\begin{aligned}
& \Delta^{i j} h_{i j}+\Lambda^{i j}, k_{h_{i j}, k}+\Lambda^{i j, k \ell} h_{i j}, k \ell \\
= & \Pi_{\nabla}^{i j} h_{i j}+\Pi_{\nabla}^{i j}, k_{h_{i j ; k}}+\Pi_{\nabla}^{i j}, k l_{h_{i j ; k \ell}}
\end{aligned}
$$

[That these expressions are equal is simply a computational consequence of the definitions.]

FACT $\forall \nabla \in C O n_{0} T M, \Pi_{\nabla}^{i j}, \Pi_{\nabla}^{i j}, k$, and $\Pi_{\nabla}^{i j}, k \ell$ are censorial.
$\underline{D_{0}} \mathrm{~L}$ : This is the map

$$
\left[\begin{array}{lll}
\mathrm{M} \times \mathrm{con}_{0} \mathrm{TM} & \rightarrow & \mathrm{I}-\mathrm{s} D_{0}^{2}(\mathrm{M}) \\
(\mathrm{g}, \nabla) & \longrightarrow & D_{0} \mathrm{~L}(\mathrm{~g}, \nabla)
\end{array}\right.
$$

with components $\Pi_{\nabla}^{a b}$.
$D_{1}$ L: This is the map

$$
\left[\begin{array}{lll}
M \times \operatorname{con}_{0} T M & \rightarrow & 1-s D_{0}^{3}(M) \\
(g, \nabla) & \longrightarrow & D_{1} L(g, \nabla)
\end{array}\right.
$$

with components $\Pi_{\nabla}^{a b, c}$.
$\mathrm{D}_{2} \mathrm{~L}$ : This is the map

$$
\left[\begin{array}{l}
\mathrm{M} \times \mathrm{con}_{0} \mathrm{TM} \rightarrow \\
(\mathrm{~g}, \nabla) \longrightarrow \mathrm{D}_{2} \mathrm{~L}(\mathrm{~S}, \nabla)
\end{array}\right.
$$

with components $\Pi_{\nabla}^{a b, c d}$.
Rappel: Let $g \in \mathbb{M}-$ then the connection coefficients of the metric connection $\nabla^{9}$ are

$$
\Gamma_{i j}^{k}=\frac{1}{2} g^{k \ell}\left(g_{\ell i, j}+g_{\ell j, i}-g_{i j, \ell}\right) .
$$

- The tensorial derivative of $L$ w.r.t. $g_{a b}$ is the element

$$
\mathrm{DL}(\mathrm{~g}) / \mathrm{Dg}_{\mathrm{ab}} \in \mathrm{MC}_{\mathrm{n}}(2,0,1,2)
$$

defined by

$$
g \rightarrow D_{0} L\left(g, \nabla^{g}\right) .
$$

- The tensorial derivative of L w.r.t. $g_{a b, c}$ is the element

$$
\mathrm{DL}(\mathrm{~g}) / \mathrm{Dg}_{\mathrm{ab}, \mathrm{c}} \in \mathrm{NC}_{\mathrm{n}}(3,0,1,2)
$$

defined by

$$
g \rightarrow D_{1} L\left(g, \nabla^{G}\right) .
$$

- The tensorial derivative of $L$ w.r.t. $g_{a b, c d}$ is the element

$$
\mathrm{DL}(\mathrm{~g}) / \mathrm{Dg}_{\mathrm{ab}}, \mathrm{~cd} \in \mathrm{MC}_{\mathrm{n}}(4,0,1,2)
$$

defined by

$$
g \rightarrow D_{2} L\left(g, \nabla^{g}\right)
$$

When working locally, the tensorial derivatives of $L$ w.r.t. $g_{a b} g_{a b, c^{\prime}}$ $g_{a b, c d}$ will be denoted by $\Pi^{a b}, \Pi^{a b}, c, \Pi^{a b, c d}$.

On the basis of the definitions,

$$
\Pi^{a b}=\Pi^{b a}, \Pi^{a b, c}=\Pi^{b a, c}, \Pi^{a b, c d}=\Pi^{b a, c d}=\Pi^{a b, d c} .
$$

In addition to these elementary symmetries, there are two others which lie deeper, viz.

$$
\left[\begin{array}{l}
\Pi^{a b, c d}=\Pi^{c d, a b} \\
\Pi^{a b, c}=0
\end{array}\right.
$$

LEMMA We have

$$
\Pi^{a b, c d}+\Pi^{a c, d b}+\Pi^{a d, b c}=0
$$

[Consider the basic identity

$$
L\left(\bar{g}_{i j}, \bar{g}_{i j, k}, \bar{g}_{i j, k \ell}\right)=\mathrm{JL}\left(g_{i j}, g_{i j, k}, g_{i j, k \ell}\right)
$$

Using the transformation laws, express $\bar{g}_{i j}, \bar{g}_{i j, k}, \bar{g}_{i j, k \ell}$ in terms of $g_{a b}$, $g_{a b, c^{\prime}} g_{a b, c d}$ the result being an expression on the LHS involving $J_{s^{\prime}} J_{s t}{ }^{\prime}$ ${ }^{r}{ }_{\text {stu }}$ (the RHS is, of course, independent of these variables). Now differentiate
w.r.t. ${ }^{r}{ }_{\text {stu }}-$ then

$$
\bar{\Lambda}^{i j} \frac{\partial \bar{g}_{i j}}{\partial J_{s t u}^{r}}+\bar{\Lambda}^{i j, k} \frac{\partial \bar{g}_{i j, k}}{\partial J_{s t u}^{r}}+\bar{\Lambda}^{i j, k l} \frac{\partial \bar{g}_{i j, k \ell}}{\partial J_{s t u}^{r}}=0
$$

or still,

$$
\bar{\Lambda}^{i j, k \ell} \frac{\partial \bar{g}_{i j, k l}}{\partial r_{s t u}^{r}}=0,
$$

where

$$
\frac{\partial \bar{g}_{i j}, k \ell}{\partial J^{r}}=\frac{\partial}{\partial J^{r}}{ }_{\text {stu }}\left(J^{a}{ }_{i k \ell}{ }^{J^{b}}{ }_{j}+J^{a}{ }_{i}{ }^{J^{b}}{ }_{j k \ell}\right) g_{a b} .
$$

But

$$
\begin{aligned}
& \bar{\Lambda}^{i j}, k \ell \frac{\partial}{\partial J_{\text {stu }}^{r}}\left(J_{i}^{a}{ }_{i}{ }^{b}{ }_{j k \ell \ell^{g}}\right) \\
& =\bar{\Lambda}^{j i, k l} \frac{\partial}{\partial J_{s t u}^{r}}\left(J_{i}^{a}{ }^{J^{b}}{ }_{j k \ell l^{g}}\right) \\
& =\bar{\Lambda}^{i j}, k \ell \frac{\partial}{\partial J_{\text {stu }}}\left(J^{a}{ }_{j}{ }^{\mathrm{b}}{ }_{i k \ell}{ }^{g}{ }_{a b}\right) \\
& =\bar{\Lambda}^{\mathrm{ij}, k l} \frac{\partial}{\partial \widetilde{J}_{\text {stu }}}\left(\mathrm{J}_{\mathrm{j}}^{\mathrm{b}} \mathrm{~J}^{\mathrm{a}}{ }_{\left.\mathrm{i} k \ell \ell_{\mathrm{ba}}\right)}\right) \\
& =\bar{\Lambda}^{i j}, k l \frac{\partial}{\partial J_{\text {stu }}^{r}}\left(J_{j}^{b} J^{a}{ }_{i k \ell l_{a b}}\right) \\
& =\bar{\Lambda}^{i j}, k \ell \frac{\partial}{\partial J^{r}}{ }_{\text {stu }}\left(J^{a}{ }_{i k \ell^{J}}{ }_{j}{ }_{j}{ }^{g} \text { ab }\right) .
\end{aligned}
$$

Therefore

$$
\bar{\Lambda}^{-i j}, k \ell \frac{\partial}{\partial J^{r}}{ }_{\text {stu }}\left(J^{a}{ }_{i k \ell}{ }^{\mathrm{b}}{ }_{j}{ }^{g_{a b}}\right)=0 .
$$

Since

$$
J_{\text {stu }}^{r}=J_{\text {sut }}^{r}=J_{\text {tus }}^{r}=J_{\text {tsu }}^{r}=J_{\text {ust }}^{r}=J_{\text {uts' }}^{r}
$$

it follows that

$$
\begin{aligned}
& \bar{\Lambda}^{i j}, \mathrm{k} \ell{ }_{\mathrm{J}}^{\mathrm{b}}{ }_{j} \delta^{\mathrm{a}}{ }_{\mathrm{r}}\left(\delta^{s}{ }_{i} \delta^{t}{ }_{k} \delta^{\mathrm{u}}{ }_{\ell}+\delta^{s}{ }_{i} \delta^{u}{ }_{k} \delta^{t}{ }_{\ell}+\delta^{t}{ }_{i} \delta^{u}{ }_{k} \delta^{s}{ }_{\ell}\right. \\
& \\
& \left.+\delta^{t}{ }_{i} \delta^{s}{ }_{k} \delta^{u}{ }_{\ell}+\delta^{u}{ }_{i} \delta^{s}{ }_{k} \delta^{t}{ }_{\ell}+\delta^{u}{ }_{i} \delta^{t}{ }_{k} \delta^{s}{ }_{\ell}\right) g_{a b}=0
\end{aligned}
$$

Specialize and take $\bar{x}^{i}=x^{i}$, thus $J_{j}^{b}=\delta_{j}^{b}$ and matters reduce to

$$
\left(\Lambda^{\mathrm{sb}, \mathrm{tu}}+\Lambda^{\mathrm{tb}, \mathrm{us}}+\Lambda^{\mathrm{ub}, \mathrm{st})} \mathrm{g}_{\mathrm{rb}}=0,\right.
$$

from which

$$
\Lambda^{\mathrm{sb}, \mathrm{tu}}+\Lambda^{\mathrm{tb}, \mathrm{us}}+\Lambda^{\mathrm{ub}, \mathrm{st}}=0
$$

or still,

$$
\Lambda^{\mathrm{bs}, \mathrm{tu}}+\Lambda^{\mathrm{bt}, \mathrm{us}}+\Lambda^{\mathrm{bu}, \mathrm{st}}=0
$$

Put

$$
\mathrm{b}=\mathrm{a}, \mathrm{~s}=\mathrm{b}, \mathrm{t}=\mathrm{c}, \mathrm{u}=\mathrm{d}
$$

to get

$$
\Lambda^{\mathrm{ab}, \mathrm{~cd}}+\Lambda^{\mathrm{ac}, \mathrm{db}}+\Lambda^{\mathrm{ad}, \mathrm{bc}}=0
$$

or still,

$$
\Pi^{a b, c d}+\Pi^{a c, d b}+\Pi^{a d, b c}=0
$$

as desired.]

Application: $\Pi^{\mathrm{ab}, \mathrm{cd}}=\Pi^{\mathrm{cd}, \mathrm{ab}}$.
[To see this, write

$$
\Pi^{a b, c d}=-\Pi^{a c, d b}-\Pi^{a d, b c}
$$

$$
\begin{gathered}
=-\Pi^{c a, d b}-\Pi^{d a, b c} \\
=\Pi^{c d, b a}+\Pi^{c b, a d}+\Pi^{d b, c a}+\Pi^{d c, a b} \\
=\Pi^{c d, a b}+\Pi^{c d, a b}+\Pi^{c b, a d}+\Pi^{d b, c a} \\
=2 \Pi^{c d, a b}+\Pi^{c b, a d}+\Pi^{d b, c a}
\end{gathered}
$$

But

$$
\begin{aligned}
\Pi^{\mathrm{ab}, \mathrm{~cd}} & =\Pi^{\mathrm{ba}, \mathrm{dc}} \\
& =-\Pi^{\mathrm{bd}, \mathrm{ca}}-\Pi^{\mathrm{bc}, \mathrm{ad}} \\
& =-\Pi^{\mathrm{cb}, \mathrm{ad}}-\Pi^{\mathrm{db}, \mathrm{ca}}
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& \Pi^{a b, c d}=2 \Pi^{c d, a b}-\Pi^{a b, c d} \\
& \Rightarrow \\
& \left.\Pi^{a b, c d}=\Pi^{c d, a b} \cdot\right]
\end{aligned}
$$

As a preliminary to the proof of the relation

$$
\Pi^{a b, c}=0
$$

differentiate the basic identity

$$
L\left(\bar{g}_{i j}, \bar{g}_{i j, k} \bar{g}_{i j, k \ell}\right)=\pi\left(g_{i j}, g_{i j, k^{\prime}} g_{i j, k \ell}\right)
$$

w.r.t. $s^{r}{ }_{\text {st, }}$ thus

$$
\bar{\Lambda}^{i j} \frac{\partial \bar{g}_{i j}}{\partial J_{s t}^{r}}+\bar{\Lambda}^{i j, k} \frac{\partial \bar{g}_{i j, k}}{\partial J_{s t}}+\bar{\Lambda}^{i j, k \ell} \frac{\partial \bar{g}_{i j, k \ell}}{\partial J_{s t}}=0
$$

or still,

$$
\bar{\Lambda}^{i j, k} \frac{\partial \bar{g}_{i j, k}}{\partial J_{s t}}+\bar{\Lambda}^{i j, k \ell} \frac{\partial \bar{g}_{i j, k l}}{\partial J_{s t}}=0 .
$$

Here

$$
\frac{\partial \bar{g}_{i j, k}}{\partial J_{\text {st }}}=\frac{\partial}{\partial J_{\text {st }}}\left(J_{i k}^{a}{ }^{J_{j}}+J_{i}^{a} J^{b}{ }_{j k}\right) g_{a b}
$$

and

$$
\begin{aligned}
& \frac{\partial \bar{g}_{i j, k l}}{\partial J_{s t}}=\frac{\partial}{\partial J^{r}}\left(J^{a}{ }_{i k}{ }^{\mathrm{J}}{ }_{j \ell}+J^{a}{ }_{i \ell} J^{\mathrm{b}}{ }_{j k}\right) g_{a b}
\end{aligned}
$$

$$
\begin{aligned}
& \left.+J^{a}{ }_{i}{ }^{b}{ }_{j \ell} J^{c^{c}}{ }_{k}+J^{a}{ }_{i}{ }^{b}{ }_{j} J^{c}{ }_{k \ell}\right) g_{a b, c} .
\end{aligned}
$$

Now do the math and then take $\bar{x}^{i}=x^{i}$ to get

$$
\begin{aligned}
2 \Lambda^{\mathrm{sb}, \mathrm{tc}_{g_{r b}, c}} & +2 \Lambda^{\mathrm{tb}, \mathrm{sc}_{g_{r b}, c}+\Lambda^{a b, s t} g_{a b, r}} \\
& +\Lambda^{s b, t} g_{r b}+\Lambda^{t b, s_{g_{r b}}=0}
\end{aligned}
$$

Fix a point $x_{0} \in M$ and introduce normal coordinates at $x_{0}$-- then
$\left.g_{i j, k}\right|_{x_{0}}=0$ and $\left.\Gamma^{k}{ }_{i j}\right|_{x_{0}}=0$, hence at $x_{0}$,

$$
\Pi^{r s, t}=\Lambda^{r s, t},
$$

so from the above,

$$
\Pi^{s b}, t_{g_{r b}}+\Pi^{t b}, s_{g_{r b}}=0
$$

or still,

$$
\Pi^{\mathrm{sb}, \mathrm{t}}+\Pi^{\mathrm{tb}, \mathrm{~s}}=0
$$

Replace b by r -- then

$$
\begin{aligned}
\Pi^{s r, t} & =-\Pi^{t r, s} \\
& =-\Pi^{r t, s} \\
& =\Pi^{s t, r} \\
& =\Pi^{t s, r} \\
& =-\Pi^{r s, t} \\
& =-\Pi^{s r}, t \\
\Rightarrow \quad & \Pi^{s r, t}=0 \\
\Rightarrow \quad & \Pi^{r s, t}=0 .
\end{aligned}
$$

Since $\Pi^{r s, t}$ is tensorial and $x_{0}$ is arbitrary, it follows that

$$
\Pi^{r s, t}=0
$$

throughout all of M .
Remark: Suppose that

$$
L(g)=L\left(g_{a b}, g_{a b, c}\right)
$$

Then $\Delta^{a b, c d}=0$, thus $\Pi^{a b, c}=\Delta^{a b, c}$. But

$$
\Pi^{a b, c}=0
$$

Therefore

$$
\frac{\partial \mathrm{L}}{\partial \mathrm{~g}_{\mathrm{ab}, \mathrm{c}}}=0,
$$

which, as has been noted earlier, is a particular case of the Independence Theorem.

LEMMA We have

$$
\begin{aligned}
& 2 \Lambda \\
& s b, \mathrm{~cd}_{g_{r b}, c d}+2 \Lambda^{a b}, s d_{g_{a b}, r d} \\
&+ 2 \Lambda^{s b, c} g_{r b, c}+\Lambda^{a b, s} g_{a b, r}+2 \Lambda^{s b} g_{r b}=\delta_{r}^{s}{ }_{r} .
\end{aligned}
$$

[Differentiate the basic identity w.r.t. $J_{s}$ and then take $\bar{x}^{i}=x^{i}$.]

Claim:

$$
\Pi^{r s}=\frac{1}{2} g^{r s_{L}}-\frac{2}{3} \Lambda^{k \ell, r a_{R}^{s}}{ }_{k \ell a}
$$

To see this, fix a point $x_{0}$ in $M$ and introduce normal coordinates at $x_{0}$.

SUBLEMMA If $H_{i j}$ is any quantity which is symmetric in $i \& j$, then

$$
H_{i j}{ }^{\Lambda i, b j}=-\frac{1}{2} H_{i j} \Lambda^{a b, i j}
$$

[In fact,

$$
\Lambda^{a i, b j}+\Lambda^{a b, j i}+\Lambda^{a j, i b}=0
$$

$\Rightarrow$

$$
\Lambda^{a i, b j}+\Lambda^{a j, b i}=-\Lambda^{a b, i j}
$$

Therefore

$$
\begin{aligned}
H_{i j} \Lambda^{a i, b j} & =\frac{1}{2} H_{i j}\left(\Lambda^{a i, b j}+\Lambda^{a j, b i}\right) \\
& \left.=-\frac{1}{2} H_{i j} \Lambda^{a b, i j} .\right]
\end{aligned}
$$

At $x_{0}$,

$$
g_{a b, c d}=g_{c d, a b} .
$$

And at $x_{0}$,

$$
R_{i j k \ell}=\frac{1}{2}\left(g_{i \ell, j k}-g_{i k, j \ell}+g_{j k, i \ell}-g_{j \ell, i k}\right)
$$

or still,

$$
R_{i j k \ell}=g_{i \ell, j k}-g_{i k, j \ell}
$$

Step 1: At $x_{0}$,

$$
\begin{aligned}
& \Lambda^{a b, s d_{R_{b r a d}}} \\
= & \Lambda^{a b, s d}\left(g_{b d, r a}-g_{b a, r d}\right) \\
= & \Lambda^{a b, s d} g_{b d, r a}-\Lambda^{a b, s d_{g_{b a}} r d} \\
= & -\frac{1}{2} \Lambda^{a s, b d} g_{b d, r a}-\Lambda^{a b, s d} g_{b a, r d} \\
= & -\frac{1}{2} \Lambda^{b d, a s} g_{b d, r a}-\Lambda^{a b, s d_{g_{b a, r d}}} \\
= & -\frac{1}{2} \Lambda^{b a, d s_{g_{b a, r d}}-\Lambda^{a b, s d} g_{b a, r d}} \\
= & -\frac{1}{2} \Lambda^{a b, s d} d_{a b, r d}-\Lambda^{a b, s d} g_{a b, r d} \\
= & -\frac{3}{2} \Lambda^{a b, s d} g_{a b, r d}
\end{aligned}
$$

Step 2: At $\mathrm{x}_{0}$,

$$
\Lambda^{\mathrm{rs}}=\Pi^{\mathrm{rs}}-\Gamma_{\mathrm{ra}, \ell^{\Lambda}}^{\mathrm{as}, \mathrm{k} \ell}-\Gamma_{\mathrm{ak}, \ell^{\Lambda}}^{\mathrm{ar}, \mathrm{k} \ell}
$$

But

$$
\left[\begin{array}{l}
\Gamma_{a k, \ell}^{\mathrm{r}}=\frac{1}{2} \mathrm{~g}^{\mathrm{rb}}\left(\mathrm{~g}_{\mathrm{ab}, \mathrm{k} \ell}+\mathrm{g}_{\mathrm{bk}, \mathrm{al}}-\mathrm{g}_{\mathrm{ak}, \mathrm{~b} \ell}\right) \\
\Gamma_{\mathrm{ak}, \ell}^{\mathrm{s}}=\frac{1}{2} \mathrm{~g}^{\mathrm{sb}}\left(\mathrm{~g}_{\mathrm{ab}, \mathrm{k} \ell}+\mathrm{g}_{\mathrm{bk}, \mathrm{a} \ell}-\mathrm{g}_{\mathrm{ak}, \mathrm{~b} \ell}\right)
\end{array}\right.
$$

Therefore

$$
\begin{aligned}
& -\Gamma^{\mathrm{r}}{\mathrm{ak}, \ell^{\Lambda}}_{\mathrm{as}, \mathrm{k} \ell} \\
& \quad=-\frac{1}{2} g^{\mathrm{rb}} \mathrm{~g}_{\mathrm{ab}, \mathrm{k} \ell^{\Lambda}}^{\mathrm{as}, \mathrm{k} \ell} \\
& -\frac{1}{2} g^{\mathrm{rb}} \mathrm{~g}_{\mathrm{bk}, \mathrm{a} \ell^{\Lambda}}^{\mathrm{as}, \mathrm{k} \ell}+\frac{1}{2} g^{r b} \mathrm{~g}_{\mathrm{ak}, \mathrm{~b} \ell^{\Lambda}}^{\mathrm{as}, \mathrm{k} \ell}
\end{aligned}
$$

- Write

$$
\begin{aligned}
& -\frac{1}{2} g^{r b} g_{b k, a l^{\Lambda}} \mathrm{as}, k \ell \\
& =-\frac{1}{2} g^{r b} g_{b k, a \Lambda^{\Lambda}} \mathrm{sa}, \mathrm{kl} \\
& =\frac{1}{4} \mathrm{~g}^{\mathrm{rb}} \mathrm{~g}_{\mathrm{bk}, \mathrm{a} \ell^{\Lambda}} \mathrm{sk}, \mathrm{a} \ell \\
& =\frac{1}{4} g^{r b} g_{b a, k l^{\Lambda}}{ }^{\mathrm{sa}, \mathrm{k} \ell} \\
& =\frac{1}{4} g^{r b} g_{a b, k \ell^{\Lambda}}{ }^{a s, k \ell} .
\end{aligned}
$$

- Write

$$
\frac{1}{2} g^{r b} g_{a k, b \ell^{\Lambda s}} \mathrm{as}, \mathrm{kl}
$$

$$
\begin{aligned}
& =\frac{1}{2} g^{r b} g_{a k, b \ell^{\Lambda}} s a, k \ell \\
& =-\frac{1}{4} g^{r b} g_{a k, b \ell^{\Lambda}}^{s \ell, a k} \\
& =-\frac{1}{4} g^{r b} g_{\ell k, b a^{\Lambda}}^{s a, \ell k} \\
& =-\frac{1}{4} g^{r b} g_{k \ell, a b} \Lambda^{a s, k \ell} \\
& =-\frac{1}{4} g^{r b} g_{a b, k \ell^{\Lambda}}^{a s, k \ell} .
\end{aligned}
$$

Therefore

$$
-\Gamma_{a k, \ell^{\Lambda}}^{a s, k \ell}=-\frac{1}{2} g^{r b} g_{a b, k \ell^{\Lambda}}^{a s, k \ell}
$$

Interchanging $r$ and $s$, we thus conclude that at $x_{0}$,

$$
\Lambda^{r s}=\Pi^{r s}-\frac{1}{2} g^{r b} g_{a b, k \ell^{\Lambda}}^{a s, k \ell}-\frac{1}{2} g^{s b} g_{a b, k \ell^{\Lambda}} a r, k l
$$

Step 3: At $x_{0}$,

$$
\begin{gathered}
g_{a b, k \ell^{\Lambda}}{ }^{\mathrm{as}, \mathrm{k} \ell}=\Lambda^{\mathrm{kl}, \mathrm{sa}} \mathrm{~g}_{\mathrm{k} \ell, \mathrm{ba}} \\
\quad=-\frac{2}{3} \Lambda^{\mathrm{kl}, \mathrm{sa}} \mathrm{R}_{\ell \mathrm{bka}}
\end{gathered}
$$

and

$$
\begin{gathered}
g_{a b, k \ell^{\Lambda}}^{a r, k \ell}=\Lambda^{k \ell, r a} g_{k \ell, b a} \\
\quad=-\frac{2}{3} \Lambda^{k \ell, r a_{R_{\ell b k a}}}
\end{gathered}
$$

Therefore

$$
\Lambda^{r s}=\Pi^{r s}+\frac{1}{3} g^{r b_{\Lambda} k l, s a_{R_{l b k a}}+\frac{1}{3} g_{\Lambda}^{s b} k \ell, r a_{R_{l b k a}} .}
$$

Step 4: At $x_{0}$,

Here

$$
\left[\begin{array}{l}
\Lambda^{s k, \mathrm{~cd}_{g_{r k, c d}}=-\frac{2}{3} \Lambda^{c d, s k_{R_{d r c k}}}} \\
\Lambda^{k \ell, s d_{g_{k \ell, r d}}}=-\frac{2}{3} \Lambda^{k \ell, s d_{R_{k r l d}}}
\end{array}\right.
$$

In the first relation, replace $c$ by $l$, $d$ by $k$, and $k$ by $d$ to get

$$
\Lambda^{\ell k, \mathrm{sd}_{\mathrm{R}_{\mathrm{kr}} \ell d}}
$$

The net contribution is thus

$$
-\frac{4}{3} \Lambda^{k \ell, s d_{R_{k r} l d}}
$$

On the other hand,

$$
\Lambda^{s k} g_{r k}=\varepsilon_{r} \Lambda^{r s} \quad \text { (no sum) }
$$

Therefore

$$
\varepsilon_{r}{ }^{r s}=\frac{1}{2} \delta^{s}{ }_{r} L^{\prime}+\frac{4}{3} \Lambda^{k l, s d_{R_{k r} l d}}
$$

With this preparation, we are finally in a position to show that

$$
\Pi^{r s}=\frac{1}{2} g^{r s_{L}-\frac{2}{3} \Lambda^{k \ell, r a_{R}^{s}}{ }_{k \ell a} .}
$$

Continuing to work at $\mathrm{x}_{0}$,

$$
\begin{aligned}
& \left.\varepsilon_{r} \Lambda^{r s}=\varepsilon_{r} n^{r s}+\frac{1}{3} g^{r b}{ }_{\Lambda} k l_{r} s a_{R_{l b k a}}+\frac{1}{3} g^{s b} \Lambda_{\Lambda} k l, r a_{R_{l b k a}}\right] \\
& =\varepsilon_{r}\left[\Pi^{r s}+\frac{1}{3} \varepsilon_{r} \Lambda^{k \ell, s a_{R_{l r k a}}}+\frac{1}{3} \varepsilon_{s} \Lambda^{\left.k \ell, r a_{R_{l s k a}}\right]}\right.
\end{aligned}
$$

‘uoţoexqqus Kq ‘os
${ }^{4}$ TTTY
${ }^{\prime}$ trị
${ }^{\prime}$ TIȚ7

$$
\begin{aligned}
& \text { prxy }_{\text {Hes }^{\prime} y \gamma} \mathrm{~V}=
\end{aligned}
$$

And then, by addition,

$$
2 \pi^{r s}+\frac{4}{3} \Delta^{k \ell, r a_{R}^{s}} \underset{k \ell a}{ }=g^{r s_{L}}
$$

or still,

$$
\Pi^{r s}=\frac{1}{2} g^{r s_{L}}-\frac{2}{3} \Lambda^{k l, r a_{R}}{ }_{k l a}
$$

Since the issue is that of an equality of tensors, this relation is valid throughout all of M.

Summary (The Invariance Identities) :

$$
\begin{aligned}
& \Pi^{i j, k \ell}=\Pi^{k \ell, i j}, \Pi^{a b, c}=0, \\
& \Pi^{r s}=\frac{1}{2} g^{r s_{L}}-\frac{2}{3} \Delta^{k \ell, r a_{R} s_{k \ell a}} .
\end{aligned}
$$

FACT Let $L \in M C_{n}(0,0,1,2)$-- then

$$
\nabla_{a} L=\frac{2}{3} R_{i j k \ell ;} a^{i \ell, j k}
$$

Section 23: The Euler-Lagrange Equations Let $M$ be a connected $C^{\infty}$ manifold of dimension $n$, which we shall assume is orientable.

Definition: The Euler-Lagrange derivative is the map

$$
E: M C_{n}(0,0,1, m) \rightarrow M C_{n}(2,0,1,2 m)
$$

given locally by the expression

$$
\begin{aligned}
& E^{i j}(L)=-\frac{\partial L}{\partial g_{i j}} \\
+ & \sum_{p=1}^{m}(-1)^{p+1} \frac{\partial^{p}}{\partial x^{k}{ }^{\mathrm{k}} \ldots \partial x^{k}{ }_{p}}\left(\frac{\partial L}{\partial g_{i j}, k_{1} \cdots k_{p}}\right)
\end{aligned}
$$

[Note: It is clear that $\mathrm{E}^{\mathrm{ij}}(\mathrm{L})$ is symmetric. However, since the definition involves nontensorial quantities, it is not completely obvious that $\mathrm{E}^{\mathrm{ij}}(\mathrm{L})$ is actually tensorial. In the case of interest, viz, when $m=2$, this will be verified below.]

One then says that L satisfies the Euler-Lagrange equations provided $E(L)=0$.

Example: Let $\mathrm{L}=|\mathrm{g}|^{1 / 2} \mathrm{~S}$ ( S the scalar curvature of g ) -- then (cf. infra)

$$
E^{i j}(L)=|g|^{1 / 2}\left[R^{i j}-\frac{1}{2} S g^{i j}\right] .
$$

But

$$
\begin{aligned}
& R^{i j}-\frac{1}{2} S g^{i j}=G^{i j} \\
\Rightarrow & \quad(G=\operatorname{Ein}) \\
& E(L)=|g|^{1 / 2} G^{\#} .
\end{aligned}
$$

Therefore $E(L)=0$ iff the Einstein tensor of $g$ vanishes identically.
[Note: Here, $\mathrm{E}^{\mathrm{ij}}(\mathrm{L})$ is of the second order in the $g_{i j}$ and not of the fourth order (as might be expected).]

Take $m=2$-- then

$$
E^{i j}(L)=-\Lambda^{i j}+\Lambda^{i j, k} \underset{, k}{i j}-\Lambda_{, k l}^{i j, k l},
$$

where

$$
\left[\begin{array}{l}
\Delta_{, k}^{i j, k}=\frac{\partial}{\partial x^{k}} \Delta^{i j, k} \\
\Delta^{i j, k \ell}=\frac{\partial}{, k \ell}=\frac{\partial x^{k} \partial x^{l}}{} \Delta^{i j, k \ell}
\end{array}\right.
$$

LEMMA Let $L \in M C_{n}(0,0,1,2)$-- then

$$
E^{i j}(L)=-\Pi^{i j}+\Pi^{i j, k} \underset{; k}{ }-\Pi^{i j, k \ell} \underset{; k \ell}{ }
$$

[Note: This establishes that the $\mathrm{E}^{\mathrm{ij}}(\mathrm{L})$ are the components of a symmetric element $\left.E(L) \in M C_{n}(2,0,1,4).\right]$

To prove the lemma, it suffices to show that $\forall \mathrm{h} \in \mathrm{S}_{2}(\mathrm{M})$,

$$
h_{i j}\left[E^{i j}(L)-\left(-\Pi^{i j}+\Pi_{i j}^{i j, k} \underset{; k}{i j}-\Pi_{i k \ell}^{i j}, k \ell\right)\right]=0
$$

Rappel:

$$
P L(g, h)=\Lambda^{i j} h_{i j}+\Lambda^{i j, k_{h_{i j}}}+\Lambda^{i j, k l_{h_{i j}}, k \ell}
$$

To recast this, observe that

$$
h_{i j, k} \Lambda^{i j, k}=\left(h_{i j} \Lambda^{i j, k}\right), k-h_{i j} \Lambda^{i j, k}
$$

and

$$
h_{i j, k \Lambda^{i j}, k \ell}=\left(h_{i j, k} \Lambda^{i j, k \ell}\right), \ell-h_{i j, k} \Lambda^{i j, k \ell}, \ell
$$

$$
=\left(h_{i j, \ell^{\Lambda j}, k l}^{i j}, k-\left(h_{i j} \stackrel{i j, k \ell}{, l}\right), k+h_{i j}{ }^{i j, k \ell}, l k\right.
$$

Therefore

$$
\begin{aligned}
& P L(g, h)=-h_{i j} E^{i j}(L) \\
+ & {\left[h_{i j} \Lambda^{i j, k}+h_{i j, \ell} \Lambda^{i j, k \ell}-h_{i j} \Lambda^{i j, k \ell}\right]_{, k} \cdot }
\end{aligned}
$$

Rappel:

$$
P L(g, h)=\Pi^{i j_{h}}{ }_{i j}+\Pi^{i j}, k_{h_{i j ; k}}+\Pi^{i j, k \ell_{h_{i j}} k \ell}
$$

Straightforward manipulations now lead to

$$
\begin{aligned}
& \operatorname{PL}(\mathrm{g}, \mathrm{~h})=-\mathrm{h}_{\mathrm{ij}}\left(-\Pi^{\mathrm{ij}}+\Pi^{\mathrm{ij}, k} \underset{j \mathrm{k}}{\mathrm{j}}-\underset{\Pi^{i j}, \mathrm{k} \ell}{; \mathrm{k} \ell}\right) \\
& +\left[h_{i j} \Pi^{i j, k}+h_{i j} ; \ell^{\Pi^{i j, k \ell}}-h_{i j} \Pi^{i j, k \ell} ; \ell{ }^{i j}\right.
\end{aligned}
$$

or still,

$$
\left.\begin{array}{rl} 
& P L(g, h)=-h_{i j}\left(-\Pi^{i j}+\Pi^{i j}, k\right. \\
; k & -\Pi^{i j}, k \ell \\
; k \ell
\end{array}\right)
$$

[Note: The terms inside the brackets are the components of an element $1-s D_{0}^{1}(M)$. Since the indices are contracted over $k$, the covariant derivative equals the partial derivative.]

From the definitions,

$$
\begin{gathered}
h_{i j} \Pi^{i j, k}+h_{i j} ; \ell^{\Pi^{i j, k \ell}-h_{i j} \Pi^{i j, k \ell}} \boldsymbol{i \ell} \\
=h_{i j}\left(\Lambda^{i j, k}+2 \Gamma^{i} a \ell^{\Lambda^{a j, k \ell}+2 \Gamma^{j}} a \ell^{\Lambda i, k \ell}+\Gamma_{b}^{k} \ell^{i j, b \ell}\right)
\end{gathered}
$$

But

- $h_{i j} \Gamma^{j}{ }_{a \ell^{\Lambda}}^{a i, k \ell}$

$$
=h_{j i} \Gamma^{i}{ }_{a l} A^{\Lambda^{a j}, k \ell}
$$

$$
=h_{i j} r^{i} a \ell^{\Lambda^{a j}, k \ell} .
$$

- $\Gamma_{\ell j}{ }^{\mathrm{a}}{ }^{\mathrm{h}} \mathrm{ia}^{\Lambda^{i j}, k \ell}$
- $h_{i j}{ }^{r^{j}}{ }_{l a^{\Lambda}}{ }^{i a, k \ell}$

$$
\begin{aligned}
& =h_{j i} \Gamma^{\Gamma^{i}}{ }^{\Lambda^{\Lambda a}} \\
& =h_{i j} \Gamma^{i}{ }_{l a}{ }^{\text {aj}}
\end{aligned}
$$

- $r_{\ell b A^{i}}{ }^{i j}, k \ell$

$$
\begin{aligned}
& =r_{\ell i}^{a}{ }_{j a}{ }^{\Lambda^{j i}, k \ell} \\
& =r_{\ell i}^{a}{ }_{a j}{ }^{i j}{ }^{i j, k \ell} .
\end{aligned}
$$

$$
\begin{aligned}
& +\left(h_{i j, \ell}-r^{a}{ }_{\ell i}{ }^{h_{a j}}-\Gamma^{a}{ }_{\ell j}{ }_{i a}{ }_{i a} \Lambda^{i j, k \ell}\right. \\
& -h_{i j} \Lambda_{l}^{i j, k \ell}+\Gamma_{l a}^{i} \Lambda^{a j, k \ell}+\Gamma_{l a}^{j} \Lambda^{i a, k \ell} \\
& \left.+\Gamma_{l a}^{k} \Lambda^{i j}, a \ell+\Gamma_{l a}^{l} \Lambda^{i j}, k a-\Gamma_{\ell b}^{b} \Lambda^{i j, k l}\right) .
\end{aligned}
$$

$$
\begin{aligned}
& =r_{b e^{\Lambda^{i j}, k b}} \\
& =\Gamma_{a \ell^{\Lambda}}{ }^{i j, k a} \\
& =\Gamma_{\ell a^{\Lambda}}{ }^{i j, k a} .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& h_{i j} \Pi^{\Pi^{i j}, k}+h_{i j} ; \ell^{\Pi^{i j}, k \ell}-h_{i j} \Pi^{i j} ; \ell \\
& =h_{i j}\left(\Lambda^{i j, k}+4 \Gamma^{i}{ }_{a} A^{a j, k l}+\Gamma^{k}{ }_{b e^{\Lambda}}{ }^{i j, b l}\right) \\
& +\left(h_{i j, \ell^{\Lambda}}{ }^{i j, k \ell}-2 \Gamma_{\ell i}^{a}{ }_{a j} \Delta^{i j}, k \ell,\right. \\
& \left.-h_{i j} \Lambda_{, ~ i j}^{i j}, \ell \ell+2 r_{l a}^{i} \Lambda^{a j, k \ell}+r_{\ell a^{k}} \Lambda^{i j}, a \ell\right) \\
& =h_{i j} \Lambda^{i j, k}+h_{i j, \ell^{\Lambda}}^{i j, k \ell}-h_{i j} \Lambda^{i j, k \ell},
\end{aligned}
$$

Finally, then,

$$
\begin{aligned}
& 0=-\mathrm{PL}(\mathrm{~g}, \mathrm{~h})+\mathrm{PL}(\mathrm{~g}, \mathrm{~h}) \\
& =h_{i j} E^{i j}(L)-\left[h_{i j} i^{i j, k}+h_{i j, \ell^{i j}, k \ell}-h_{i j}{ }^{\Lambda^{i j}, \ell \ell}, \ell{ }^{i j}, k\right. \\
& -h_{i j}\left(-\Pi^{i j}+\Pi^{i j, k} \underset{j k}{i j}-\Pi_{i k \ell}^{i j, k \ell}\right) \\
& +\left[h_{i j} \Pi^{i j, k}+h_{i j ; \ell} \Pi^{i j, k \ell}-h_{i j} \Pi^{i j, k \ell} ; \ell, k\right. \\
& =h_{i j} E^{i j}(L)-h_{i j}\left(-\Pi^{i j}+\Pi^{i j, k} \underset{j k}{i j}-\Pi^{i j \ell \ell}\right)
\end{aligned}
$$

$$
=h_{i j}\left[E^{i j}(L)-\left(-\Pi^{i j}+\Pi^{i j, k}-\Pi^{i j, k \ell} ; k \ell .\right.\right.
$$

Since $\Pi^{i j, k}=0$, it follows that

$$
E^{i j}(L)=-\Pi^{i j}-\Pi^{i j, k \ell} ; k \ell
$$

or still,

$$
E^{i j}(L)=-\Pi^{i j}-\Lambda^{i j, k \ell} ; k \ell
$$

or still,

$$
E^{i j}(L)=-\frac{1}{2} g^{i j_{L}}+\frac{2}{3} \Lambda^{k \ell, i a_{R} j_{k l a}-\Lambda^{i j, k \ell} \underset{i k \ell}{i} . . . ~}
$$

[Note: Recall that

$$
\left.\Lambda^{\mathrm{kl}, \mathrm{ia}}=\Lambda^{i a, k \ell} .\right]
$$

The Canonical Example Let

$$
L=|g|^{1 / 2} s-2 \lambda|g|^{1 / 2},
$$

where $\lambda$ is a constant. Locally,

$$
s=g^{a c_{g} b d_{R_{a b c d}}}
$$

and

$$
\frac{\partial R_{a b c d}}{\partial g_{i j, k \ell}}=\frac{\partial}{\partial g_{i j, k l}}\left(\frac{1}{2}\left(g_{a d, b c}-g_{a c, b d}+g_{b c, a d}-g_{b d, a c}\right)\right)
$$

In accordance with our symmetrization convention, write

$$
\left[\begin{array}{l}
g_{a d, b c}=\frac{1}{4}\left(g_{a d, b c}+g_{d a, b c}+g_{a d, c b}+g_{d a, c b}\right) \\
g_{a c, b d}=\frac{1}{4}\left(g_{a c, b d}+g_{c a, b d}+g_{a c, d b}+g_{c a, d b}\right) \\
g_{b c, a d}=\frac{1}{4}\left(g_{b c, a d}+g_{c b, a d}+g_{b c, d a}+g_{c b, d a}\right) \\
g_{b d, a c}=\frac{1}{4}\left(g_{b d, a c}+g_{d b, a c}+g_{b d, c a}+g_{d b, c a}\right)
\end{array}\right.
$$

Then

$$
\frac{\partial R_{a b c d}}{\partial g_{i j}, k \ell}=I-I I+I I I-I V
$$

with

$$
\begin{aligned}
& I=\frac{1}{8}\left(\delta^{i}{ }_{a} \delta^{j}{ }_{d} \delta^{k}{ }_{b} \delta^{\delta}{ }_{c}{ }_{c}+\delta^{i}{ }_{d} \delta^{j}{ }_{a} \delta^{k}{ }_{b} \delta^{\ell}{ }_{c}+\delta^{i}{ }_{a} \delta^{j}{ }_{d} \delta^{k}{ }_{c} \delta^{\ell}{ }_{b}+\delta^{i}{ }_{d} \delta^{j}{ }_{a} \delta^{k}{ }_{c} \delta^{\ell}{ }_{b}\right), \\
& \text { II }=\frac{1}{8}\left(\delta^{i}{ }_{a} \delta^{j}{ }_{c} \delta^{k}{ }_{b} \delta^{\ell}{ }_{d}+\delta^{i}{ }_{c} \delta^{j}{ }_{a} \delta^{k}{ }_{b}{ }^{\delta}{ }^{\ell}{ }_{d}+\delta^{i}{ }_{a} \delta^{j}{ }_{c} \delta^{k}{ }_{d} \delta^{\ell}{ }_{b}+\delta^{i}{ }_{c} \delta^{j}{ }_{a} \delta^{k}{ }_{d} \delta^{\ell}{ }_{b}\right), \\
& \text { III }=\frac{1}{8}\left(\delta^{i}{ }_{b} \delta^{j}{ }_{c} \delta^{k}{ }_{a}{ }^{\delta}{ }^{\ell}{ }_{d}+\delta^{i}{ }_{c} \delta^{j}{ }_{b} \delta^{k}{ }_{a} \delta^{\ell}{ }_{d}+\delta^{i}{ }_{b} \delta^{j}{ }_{c} \delta^{k}{ }_{d} \delta^{\ell}{ }_{a}+\delta^{i}{ }_{c} \delta^{j}{ }_{b} \delta^{k}{ }_{d} \delta^{\ell}{ }_{a}\right), \\
& \text { IV }=\frac{1}{8}\left(\delta^{i}{ }_{b} \delta^{j}{ }_{d} \delta^{k}{ }_{a} \delta^{\ell}{ }_{c}+\delta^{i}{ }_{d} \delta^{j}{ }_{b} \delta^{k}{ }_{a} \delta^{\ell}{ }_{c}{ }_{c}+\delta^{i}{ }_{b} \delta^{j}{ }_{d} \delta^{k}{ }_{c} \delta^{\ell}{ }_{a}+\delta^{i}{ }_{d} \delta^{j}{ }_{b} \delta^{k}{ }_{c} \delta^{\ell}{ }_{a}\right) .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
\Lambda^{i j, k \ell} & =\frac{\partial L}{\partial g_{i j, k \ell}} \\
& =|g|^{1 / 2} g^{a c} g_{g} b \frac{\partial R_{a b c d}}{\partial g_{i j, k \ell}} \\
& =|g|^{1 / 2} g^{a c c} g^{b d}(I-I I+I I I-I V)
\end{aligned}
$$

- ${ }^{\text {ach }}{ }^{\text {bd }}{ }_{I}$

$$
\begin{gathered}
=\frac{1}{8}\left(g^{i \ell} g^{j j}+g^{j \ell} g^{k i}+g^{i k_{g} \ell j}+g^{j k_{g} l i}\right) \\
=\frac{1}{8}\left(2 g^{i k} g^{j \ell}+2 g^{i \ell} g^{j k}\right) \\
=\frac{1}{4}\left(g^{i k_{g}} g^{j \ell}+g^{i \ell} g^{j k}\right)
\end{gathered}
$$

- $g^{a c}{ }_{g}^{b d}$ II

$$
\begin{gathered}
=\frac{1}{8}\left(g^{i j_{g} k \ell}+g^{j i_{g} k \ell}+g^{i j} g^{\ell k}+g^{j i} g^{\ell k}\right) \\
=\frac{1}{8}\left(4 g^{i j_{g} k \ell}\right)=\frac{1}{2} g^{i j_{g} k \ell} .
\end{gathered}
$$

- $g^{a c_{g} b d}$ III

$$
\begin{gathered}
=\frac{1}{8}\left(g^{k j} g^{i \ell}+g^{k i} g^{j \ell}+g^{l j_{g} i k}+g^{\ell i_{g} j k}\right) \\
=\frac{1}{8}\left(2 g^{i k} g^{j \ell}+2 g^{i \ell} g^{j k}\right) \\
=\frac{1}{4}\left(g^{i k_{g} j \ell}+g^{i \ell} g^{j k}\right)
\end{gathered}
$$

- $g^{a c}{ }_{g}^{b d}$ IV

$$
\begin{aligned}
& =\frac{1}{8}\left(g^{k \ell} g^{i j}+g^{k \ell} g^{j i}+g^{l k} g^{i j}+g^{\ell k} g^{j i}\right) \\
& =\frac{1}{8}\left(4 g^{i j} g^{k \ell}\right)=\frac{1}{2} g^{i j} g^{k \ell}
\end{aligned}
$$

Combining terms thus gives

$$
\Lambda^{i j, k \ell}=-|g|^{1 / 2}\left[g^{i j} g^{k \ell}-\frac{1}{2}\left(g^{i k} g^{j \ell}+g^{i \ell} g^{j k}\right)\right]
$$

But then

$$
\Lambda^{i j, k l}=0 \Rightarrow \quad \Lambda_{i k}^{i j, k \ell} \underset{; k \ell}{i}=0
$$

Consequently,

$$
E^{i j}(L)=-\frac{1}{2} g^{i j} L+\frac{2}{3} \Lambda^{i a, k \ell_{R}^{j}}{ }_{k \ell a}
$$

$$
=-\frac{1}{2} g^{i j}\left[|g|^{1 / 2} S-2 \lambda|g|^{1 / 2}\right]
$$

$$
+\frac{2}{3}\left(-|g|^{1 / 2}\left[g^{i a} g^{k \ell}-\frac{1}{2}\left(g^{i k_{g} a l}+g^{i \ell} g^{a k}\right)\right]\right) R_{k l a}^{j}
$$

It remains to analyze

$$
\begin{aligned}
& {\left[g^{i a_{g} k \ell}-\frac{1}{2}\left(g^{i k_{g} a \ell}+g^{i \ell} g^{a k}\right)\right] R_{k \ell a}^{j} .} \\
& \text { (1) } g^{i a} g^{k \ell} R_{k l a}^{j} \\
& =g^{i a_{g} k \ell_{g}{ }^{j b_{R}}}{ }_{b k \ell a} \\
& =-g^{i a_{g}}{ }^{j b_{g} k} \ell_{R_{b k a} \ell} \\
& =-g^{i a}{ }_{g}^{j b_{g} k \ell_{R b l a}} \\
& =-g^{i a} g^{j b} R_{b a} \\
& =-g^{i a} g^{j b} R_{a b} \\
& =-R^{i j} \text {. } \\
& \text { (2) } R_{b k l a}+R_{b l a k}+R_{\text {bak } \ell}=0 \\
& \Rightarrow
\end{aligned}
$$

$$
\begin{aligned}
& =g^{i k_{g}}{ }^{a} \ell_{g}{ }^{j b_{R_{b k \ell a}}}+g^{i k_{g}}{ }^{a \ell} g^{j b_{R_{b a \ell k}}}+g^{i k_{g}} a \ell_{g} j b_{R_{b a k \ell}}
\end{aligned}
$$

$$
g^{i k_{g} a l_{g} j b_{R_{b k l a}}=0}
$$

$\Rightarrow$

$$
g^{i k_{g} a l_{R}^{j}}{ }_{k l a}=0
$$

(3) $g^{i \ell} g^{a k_{R}}{ }_{k l a}$

$$
\begin{aligned}
& =g^{i \ell} g^{a k_{g} j b_{R k l a}} \\
& =g^{i \ell} g^{j b_{g}} g^{a k} R_{b k l a} \\
& =g^{i \ell} g^{j b} g^{k a_{R b a l}} \\
& =g^{i \ell} g^{j b} R_{b l} \\
& =g^{i \ell} g^{j b} R_{\ell b} \\
& =R^{i j}
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& E^{i j}(L)=-\frac{1}{2} g^{i j}\left[|g|^{1 / 2} S-2 \lambda|g|^{1 / 2}\right] \\
- & |g|^{1 / 2} \frac{2}{3}\left[-R^{i j}-0-\frac{R^{i j}}{2}\right] \\
= & |g|^{1 / 2}\left[R^{i j}-\frac{1}{2} S g^{i j}\right]+\lambda|g|^{1 / 2} g^{i j}
\end{aligned}
$$

So, in this case, the Euler-Lagrange equations reduce to

$$
\left[R^{i j}-\frac{1}{2} S g^{i j}\right]+\lambda g^{i j}=0
$$

the vacuum field equations of general relativity (with cosmological constant $\lambda$ ). [Note: In this situation, the Euler-Iagrange equations $\mathrm{E}(\mathrm{L})=0$ are second order.]

FACT Let $F \in M C_{n}(4,0,0,0)(n>1)$. Suppose that

$$
F^{i j k \ell}=F^{j i k \ell}=F^{i j \ell k}
$$

and

$$
F^{i j k \ell}+F^{i k \ell j}+F^{i \ell j k}=0
$$

Then

$$
F^{i j k l}=K\left[g^{i j} g^{k \ell}-\frac{1}{2}\left(g^{i k_{g} j \ell}+g^{i \ell} j^{j k}\right)\right]
$$

where K is a constant.

Example: Let

$$
\mathrm{L}=|\mathrm{g}|^{1 / 2} \mathrm{~S}^{2}
$$

Then

$$
L=\frac{\left(|g|^{1 / 2} S\right)^{2}}{|g|^{1 / 2}}
$$

$\Rightarrow$

$$
\begin{aligned}
& \Delta^{i j, k l}=\frac{2|g|^{1 / 2} S}{|g|^{1 / 2}} \cdot \frac{\partial\left(|g|^{1 / 2} S\right)}{\partial g_{i j}, k l} \\
& =-2|g|^{1 / 2} S\left[g^{i j} g^{k l}-\frac{1}{2}\left(g^{i k_{g}} j^{l \ell}+g^{i \ell} g^{j k}\right)\right] \\
& \Rightarrow \\
& \Lambda_{i j l}^{i j k \ell}=-2|g|^{l / 2}\left[g^{i j} g^{k \ell}-\frac{1}{2}\left(g^{i k} g^{j \ell}+g^{i \ell} g^{j k}\right)\right] \nabla_{\ell} \nabla_{k} s .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& =-\frac{1}{2}|g|^{1 / 2} \mathrm{~g}^{\mathrm{ij}} \mathrm{~S}^{2}+2|\mathrm{~g}|^{1 / 2} \mathrm{R}^{\mathrm{ij}} \mathrm{~S} \\
& +2|\mathrm{~g}|^{1 / 2} \mathrm{~g}^{\mathrm{ij}} \mathrm{~g}^{\mathrm{k} \ell} \nabla_{\ell} \nabla_{\mathrm{k}} \mathrm{~S} \\
& -|g|^{1 / 2}\left(g^{i k} g^{j \ell}+g^{i \ell} g^{j k}\right) \nabla_{\ell} \nabla_{k} S \\
& =|g|^{1 / 2} S\left(2 R^{i j}-\frac{1}{2} S g^{i j}\right) \\
& +2|g|^{1 / 2} g^{i j} \nabla^{k} \nabla_{k} S-2|g|^{1 / 2} \nabla^{i}{ }^{i} j_{S} .
\end{aligned}
$$

[Note: In this situation, the Euler-Lagrange equations $\mathrm{E}(\mathrm{L})=0$ are fourth order.]

There are two other "quadratic" lagrangians that are sometimes considered but their introduction increases the level of complexity.

- Let

$$
L=|g|^{1 / 2} g\left[\begin{array}{l}
0 \\
2
\end{array}\right](\text { Ric }, \text { Ric })
$$

Locally,

$$
L=|g|^{1 / 2_{R} j^{i j}} R_{i j}
$$

and

$$
\begin{gathered}
E^{i j}(L)=\frac{|g|^{l / 2}}{2} g^{i j}\left[\nabla^{a_{\nabla}} S-R^{k \ell} R_{k l}\right] \\
+|g|^{1 / 2} \nabla_{\nabla} \nabla_{a} R^{i j}-|g|^{l / 2} \nabla^{i} \nabla^{j} S+2|g|^{1 / 2} R^{i k j \ell} R_{k \ell}
\end{gathered}
$$

- Let

$$
\left.L=|g|^{1 / 2} \mathrm{~g}_{4}^{0}\right](\mathrm{R}, \mathrm{R}) .
$$

Locally,

$$
L=|g|^{1 / 2_{R}{ }^{i j k} \ell_{R_{i j k \ell}}}
$$

and

$$
\begin{gathered}
E^{i j}(L)=|g|^{1 / 2}\left[4 \nabla^{a_{\nabla}} R^{i j j}-2 \nabla^{i} \nabla^{j}{ }_{S]}\right. \\
+|g|^{1 / 2}\left[2 R_{a b c}^{i} R^{j a b c}+4 R^{i k j \ell} R_{k \ell}-4 R^{i a_{R} j}{ }_{a}\right] \\
-\frac{|g|^{1 / 2}}{2}\left(R^{a b c}{ }_{R}{ }_{a b c d}\right) g^{i j}
\end{gathered}
$$

Observation: We have

$$
\begin{aligned}
& E^{i j}\left(|g|^{1 / 2}\left[S^{2}-4 R^{a b} R_{a b}+R^{a b c d_{R}}{ }_{a b c d}\right]\right) \\
= & |g|^{1 / 2}\left[2 S R^{i j}-4 R^{i k j \ell_{R}}{ }_{k \ell \ell}+2 R_{a b c}^{i} R^{j a b c}-4 R^{i a_{R}}{ }_{a}^{j}\right] \\
- & \frac{|g|^{1 / 2}}{2}\left[S^{2}-4 R^{a b} R_{a b}+R^{a b c d}{ }_{R_{a b c d}}\right] g^{i j}
\end{aligned}
$$

FACT Take $\mathrm{n}=4$-- then

$$
\begin{gathered}
2 S R^{i j}-4 R^{i k j \ell_{R}}{ }_{k \ell}+2 R_{a b c}^{i} R^{j a b c}-4 R^{i a_{R}}{ }_{a}^{j} \\
\quad=\frac{1}{2}\left[S^{2}-4 R^{a b} R_{a b}+R^{\left.a b c d_{R_{a b c d}}\right] g^{i j}} .\right.
\end{gathered}
$$

I.e.:

$$
E^{i j}\left(|g|^{1 / 2}\left[S^{2}-4 R^{a b} R_{a b}+R^{a b c d_{R}}{ }_{a b c d}\right]\right)=0
$$

Remark: Take $\mathrm{n}>3$ and let

$$
\mathrm{L}=|\mathrm{g}|^{1 / 2} \mathrm{~g}\left[\begin{array}{l}
0 \\
4
\end{array}\right](\mathrm{C}, \mathrm{C})
$$

Locally,

$$
L=|g|^{1 / 2} c^{i j k \ell} C_{i j k \ell}
$$

and

$$
\begin{aligned}
& g\left[\begin{array}{l}
0 \\
4
\end{array}\right](C, C) \\
= & g\left[\begin{array}{l}
0 \\
4
\end{array}\right](R, R)-\frac{4}{n-2} g\left[\begin{array}{l}
0 \\
2
\end{array}\right](R i c, R i c)+\frac{2}{(n-1)(n-2)} s^{2} .
\end{aligned}
$$

THEOREM Let $L \in M C_{n}(0,0,1, m)$-- then the divergence of $E(L)$ is zero, i.e.,

$$
\nabla_{j} E^{i j}(L)=0
$$

While the result is valid for any $m$, we shall settle for a proof when $m=2$.

Fix a point $x_{0} \in M$ and introduce normal coordinates at $x_{0}-$ then

$$
\text { "covariant derivative }\left.\right|_{x_{0}} "=\text { "partial derivative }\left.\right|_{x_{0}} "
$$

Therefore

$$
\nabla_{j} E^{i j}(L)\left|x_{0}=-\Lambda^{i j}, j\right| x_{0}+\Lambda^{i j, k}, k j\left|x_{0}-\Lambda_{, k l j}^{i j, k \ell}\right| x_{0}
$$

$\xrightarrow{\Lambda^{i j, k \ell}, k \ell j}$ : Differentiation of the relation

$$
\Lambda^{i j, k \ell}+\Lambda^{i k, \ell j}+\Lambda^{i \ell, j k}=0
$$

gives

$$
\Lambda_{, k \ell j}^{i j, k \ell}+\Lambda_{, k \ell j}^{i k, \ell j}+\Lambda_{, k \ell j}^{i \ell, j k}=0
$$

$$
\begin{aligned}
& =\Lambda_{\quad}^{\stackrel{i \ell, k j}{ }, k \ell j} \\
& =\Lambda_{\substack{i \ell, j k \\
, k \ell j}}^{\stackrel{c}{i}} .
\end{aligned}
$$

$$
\begin{aligned}
& =\Lambda_{\substack{i j \\
, k \ell j \\
, k \ell}} .
\end{aligned}
$$

But this implies that

$$
\Lambda_{, ~ i j, ~ k \ell}^{i j}=0 .
$$

[Note: Normal coordinates play no role in this argument.] Consequently,

$$
\left.\nabla_{j} E^{i j}(L)\right|_{x_{0}}=-\Lambda^{i j}, j\left|x_{0}+\Lambda^{i j, k}, k j\right| x_{0}
$$

We shall now discuss the two terms on the RHS, beginning with

$$
\Lambda^{i j, k}, k j \mid x_{0}
$$

By definition,

$$
\Pi^{i j, k}=\Lambda^{i j, k}+2 \Gamma^{i} a \ell^{a j, k \ell}+2 \Gamma^{j} a \ell^{\Lambda^{a i, k \ell}}+\Gamma_{b \ell^{\Lambda}}{ }^{i j, b l}
$$

But $\Pi^{i j, k}=0$, hence

$$
\Lambda^{i j, k}=-2 \Gamma^{i} a \ell^{a j, k \ell}-2 \Gamma^{j} a \ell^{\Lambda i, k \ell}-\Gamma^{k} b \ell^{i j, b \ell}
$$

16. 

Since $\left.\right|_{\Gamma^{i}} ^{\Gamma^{j} a l}$ al is symmetric in a $\& l$, it follows that

$$
\Lambda^{i j, k}=\Gamma^{i} a \ell^{\Lambda^{j k, a \ell}}+\Gamma_{a \Lambda^{j}}^{i k, a \ell}-\Gamma_{b \ell^{\Lambda}}^{i j, b \ell}
$$

Therefore

$$
\begin{aligned}
& \Lambda_{, k j}^{i j, k}=\left(\Gamma^{i} a \ell^{\Lambda k, a \ell}\right), k j \\
& +\left(\Gamma^{j} a \ell^{\Lambda^{i k, a l}}\right), k j-\left(\Gamma^{k} b \ell^{i j, b l}\right), k j
\end{aligned}
$$

or still,

$$
\Lambda_{, k j}^{i j, k}=\left(\Gamma_{a \ell^{\Lambda}}^{j k, a \ell}\right), k j
$$

as

$$
\begin{aligned}
& \left(\Gamma_{a \ell^{\Lambda}}{ }^{i k, a \ell}\right), k j=\left(\Gamma_{b l^{\Lambda}}{ }^{i k, b l}\right), k j \\
& =\left(\Gamma^{k} \ell^{\Lambda^{i j, b l}}\right), j k \\
& =\left(\Gamma_{b \ell^{\Lambda}}^{i j, b \ell}\right), k j \text {. }
\end{aligned}
$$

However $\Lambda^{j k, a \ell}=\Lambda^{k j, a \ell}=\Lambda^{a \ell, k j}$, so

$$
\begin{aligned}
& \Lambda^{i j, k}, k j=\left(\Gamma^{i} a \ell^{\Lambda l, k j}\right), k j \\
& =\left(\Gamma^{i} a \ell, k^{\Lambda} a \ell, k j+\Gamma_{a \Lambda^{\Lambda}}^{a \ell, k j}\right), j
\end{aligned}
$$

$$
\left.\left.\Lambda^{i j, k}\right|_{, k j}\right|_{x_{0}}=\left.\Gamma_{a \ell, k j}^{i} \Lambda^{a \ell, k j}\right|_{x_{0}}+2 \Gamma^{i} a \ell, k^{a \ell, k j},\left.\right|_{x_{0}}
$$

Rappel:

$$
\Gamma_{a \ell}^{i}=\frac{1}{2} g^{i b}\left(g_{b a, \ell}+g_{b \ell, a}-g_{a \ell, b}\right)
$$

Thus at $x_{0}$,

$$
\begin{aligned}
& \Gamma_{a \ell, k j^{i}}^{a l, k j} \\
= & \frac{1}{2} g^{i b}\left(g_{b a, l k j}+g_{b l, a k j}-g_{a \ell, b k j}\right) \Lambda^{a \ell, k j} \\
& =g^{i b} g_{b a, \ell k j} \Lambda^{a l, k j}-\frac{l}{2} g^{i b} g_{a \ell, b k j}
\end{aligned}
$$

and

$$
\begin{aligned}
& 2 \Gamma^{i} a \ell, k^{\Lambda} \quad \underset{, j}{a l, k j} \\
& \quad=g^{i b}\left(g_{b a, \ell k}+g_{b \ell, a k}-g_{a l, b k}\right) \Lambda_{, j}^{a \ell, k j} .
\end{aligned}
$$

Claim: We have

$$
g_{b a, l k j} \Lambda^{a l, k j}=0
$$

[Multiply the identity

$$
\Lambda^{a \ell, k j}+\Lambda^{a k, j \ell}+\Lambda^{a j, \ell k}=0
$$

by $g_{b a, ~} \ell_{k j}-$ then

- $g_{b a, l k j} \Lambda^{a k, j l}$

$$
\begin{aligned}
& =g_{b a}, k \ell j^{\Lambda} \\
& =g_{b a}, \ell k j^{\Lambda l, j k} \\
& a l, k j
\end{aligned}
$$

- $g_{b a, \ell k j}{ }^{a j, \ell k}$

$$
\begin{aligned}
& =g_{b a, j k \ell^{\Lambda}}{ }^{a l, j k} \\
& =g_{b a, l k j^{\Lambda}}{ }^{a l, k j} .
\end{aligned}
$$

Therefore

$$
3 g_{\mathrm{ba}, l \mathrm{kj}} \Lambda^{\mathrm{al}, \mathrm{kj}}=0.1
$$

Accordingly,

$$
\left.\Gamma_{a l, k j^{\Lambda}}^{a \ell, k j}\right|_{x_{0}}=-\frac{1}{2} g^{i b} g_{a l, b k j} \Lambda^{a \ell, k j}
$$

Next

$$
\begin{aligned}
& g^{i b} g_{b l, a k^{\Lambda}}^{a l, k j}, j^{a} \\
& \quad=g^{i b} g_{b a, l k} \Lambda_{, j}^{\ell a, k j} \\
& \quad=g^{i b} g_{b a, l k^{a}} \underset{, j}{a l, k j} .
\end{aligned}
$$

Thus

$$
\begin{aligned}
& 2 r^{i} a \ell, k^{a l, k j},\left.\right|_{x_{0}} \\
= & 2 g^{i b} g_{b a, l k^{\Lambda}}^{a l, k j}-g^{i b} g_{a l, b k^{\Lambda}}^{a \ell, k j}, j
\end{aligned}
$$

Taking into account that $g_{b a, l k}$ is symmetric in $\ell \& k$,

$$
\begin{aligned}
& 2 g^{i b} g_{b a, \ell k^{\Lambda}}{ }^{a l, j j} \\
& =2\left(-\frac{1}{2}\right) g^{i b} g_{b a}, \ell k^{\Lambda a j}, k \\
& =-g^{i b} g_{b a, \ell k} \Lambda^{a j, k l}, \\
& =-g^{i b} g_{b k, l a^{A j}} \quad, j \\
& =-g^{i b} g_{b k, a \ell^{\Lambda}} \quad, j
\end{aligned}
$$

or still, since we are working at $\mathrm{x}_{0}$,

$$
-g^{i b} g_{a \ell, b k^{\Lambda}} \underset{, j}{a \ell, k j}
$$

Summary: At $\mathrm{x}_{0}$,

$$
\begin{aligned}
& \Lambda^{\mathrm{ij}, \mathrm{k}}, \mathrm{kj} \\
& =-\frac{1}{2} g^{i b} g_{a l, b k j}{ }^{a l, k j}-2 g^{i b} g_{a l, b k^{\Lambda}} \underset{, j}{a \ell, k j} .
\end{aligned}
$$

It remains to explicate

$$
-\Lambda^{i j}, j \mid x_{0}
$$

To begin with,

$$
\begin{aligned}
\Lambda^{i j}= & \frac{1}{2} g^{i j_{L}}-g^{i \ell} g_{\ell b, c} \Lambda^{j b, c} \\
& -\frac{1}{2} g^{i \ell} g_{a b, \ell^{\Lambda}} a b, j-g^{i \ell}\left(g_{a b, c \ell}+g_{c l, a b}\right) \Lambda^{a b, j c}
\end{aligned}
$$

So, in view of the fact that

$$
L_{, j}=\Lambda^{a b} g_{a b, j}+\Lambda^{a b, c} g_{a b, c j}+\Lambda^{a b, c d_{g_{a b, c d j}}}
$$

20. 

at $x_{0}$ we have,

$$
\begin{aligned}
& \Lambda^{i j}{ }_{, j}=\frac{1}{2} g^{i j} \Lambda^{a b} g_{a b, j}+\frac{1}{2} g^{i j} \Lambda^{a b, c} g_{a b, c j} \\
& +\frac{1}{2} g^{i j}{ }_{\Lambda}{ }^{a b, c d} g_{a b, c d j} \\
& -g^{i \ell} g_{l b, c j}{ }^{j b, c}-g^{i \ell} g_{l b, C^{\Lambda}}{ }^{j b, c} \\
& -\frac{1}{2} g^{i \ell} g_{a b, \ell j^{\Lambda}}^{a b, j}-\frac{1}{2} g^{i \ell} g_{a b, \ell^{\Lambda}} \quad, j \\
& -g^{i \ell} g_{a b, c l j^{\Lambda}}^{a b, j c}-g^{i \ell} g_{a b, c \Lambda^{\Lambda b, j c}, j} \\
& -g^{i \ell} g_{c l, a b j} \Lambda^{a b, j c}-g^{i \ell} g_{c l, a b}^{\Lambda b, j c} .
\end{aligned}
$$

But at $x_{0}$,

$$
g_{a b, j}=0, g_{l b, c}=0, g_{a b, \ell}=0
$$

and

$$
\Lambda^{a b, c}=0, \Lambda^{j b, c}=0, \Lambda^{a b, j}=0
$$

Thus at $\mathrm{x}_{0}$,

$$
\begin{aligned}
& \Lambda^{i j}{ }_{, j}=\frac{1}{2} g^{i j \Lambda_{\Lambda} a b, o d} g_{a b, o d j} \\
& -g^{i \ell} g_{a b, c l j^{\Lambda}}^{a b, j c}-g^{i \ell} g_{a b, c l^{\Lambda}}^{a b, j c}, j \\
& -g^{i \ell} g_{c l, a b j^{\Lambda}}^{a b, j c}-g^{i \ell} g_{c \ell, a b}{ }^{a b, j c}, j
\end{aligned}
$$

Claim: We have

$$
g_{c l, a b j}{ }^{a b, j c}=0
$$

[Multiply the identity

$$
\Lambda^{a b, j c}+\Lambda^{a j, c b}+\Lambda^{a c, b j}=0
$$

by $g_{c l, a b j}-$ then

- $g_{c l, a b j}{ }^{\text {aj }}, \mathrm{cb}$

$$
\begin{aligned}
& =g_{c l, j b a^{A b}}^{a b j} \\
& =g_{c \ell, a b j}{ }^{a b, j c} .
\end{aligned}
$$

- $g_{c l, a b j}{ }^{\text {ac,bj }}$

$$
\begin{aligned}
& =g_{c l, j b a a^{j c, b a}} \\
& =g_{c l, a b j}{ }^{a b, j c} .
\end{aligned}
$$

Therefore

$$
{ }^{3 g_{c l, a b j}}{ }^{a b, j c}=0.3
$$

Summary: At $\mathrm{x}_{0}$,

$$
\begin{gathered}
\Lambda^{i j}{ }_{, j}=\frac{1}{2} g^{i j} g_{a b, c d j} \Lambda^{a b, c d} \\
-g^{i \ell} g_{a b, c \ell j^{\Lambda}}^{a b, j c}-2 g^{i \ell} g_{a b, c l^{\Lambda}}^{a b, j c} . j
\end{gathered}
$$

Recall now that

$$
\nabla_{j} E^{i j}(L)\left|x_{0}=-\Lambda^{i j}, j\right| x_{0}+\Lambda^{i j, k}, k j \mid x_{0}
$$

22. 

Obviously,

This leaves

$$
\begin{gathered}
-\frac{1}{2} g^{i j} g_{a b, c d j} \Lambda^{a b, c d}+g^{i \ell} g_{a b, c \ell j^{\Lambda}}^{a b, j c} \\
-\frac{1}{2} g^{i b} g_{a l, b k j} \Lambda^{a \ell, k j}
\end{gathered}
$$

But

$$
\text { - } g^{i b} g_{a l, b k j} \Lambda^{a l, k j}
$$

$$
\begin{aligned}
& =g^{i j} g_{a \ell, j k b^{\Lambda}} a \ell, k b \\
& =g^{i j} g_{a b, j k \ell^{\Lambda}} a b, k \ell
\end{aligned}
$$

$$
\begin{aligned}
& \text { - } g^{i \ell} g_{a b, C l j^{\Lambda b}, j c} \\
& =g^{i \ell} g_{a b, d \ell j^{\Lambda}}^{a b, j d} \\
& =g^{i \ell} g_{a b, a \ell c^{\Lambda}}{ }^{a b, c d} \\
& =g^{i j} g_{a b, d j c^{\Lambda}}{ }^{a b, c d} \\
& =g^{i j} g_{a b, c d j}{ }^{\Delta b, c d} .
\end{aligned}
$$

$$
\begin{aligned}
& g^{i \ell} g_{a b, c \ell^{\Lambda}} \underset{, j}{a b, j c} \\
& =g^{i b} g_{a l, c b}{ }^{a l, j c} \\
& =g^{i b} g_{a \ell, k b^{\Lambda}} \quad{ }^{a \ell, j k} \\
& =g^{i b} g_{a l, b k}{ }^{a l, k j} .
\end{aligned}
$$

$$
\begin{aligned}
& =g^{i j} g_{a b, j c \ell^{\Lambda}} a b, c \ell \\
& =g^{i j} g_{a b, j o d^{\Lambda}} a b, c d \\
& =g^{i j} g_{a b, c d j} \Lambda^{a b, c d} .
\end{aligned}
$$

It therefore follows that

$$
\left.\nabla_{j} E^{i j}(L)\right|_{x_{0}}=0
$$

which completes the proof of the theorem.
Example: Take $L=|g|^{1 / 2} S-$ then $E(L)=|g|^{1 / 2} G^{\#}$, hence

$$
\begin{aligned}
0 & =\nabla_{j}\left(|g|^{1 / 2} \mathrm{G}^{i j}\right) \\
& =\left(\nabla_{j}|g|^{1 / 2}\right) G^{i j}+|g|^{1 / 2} \nabla_{j} G^{i j} \\
& =|g|^{1 / 2} \nabla_{j} G^{i j}
\end{aligned}
$$

$$
\Rightarrow
$$

$$
\operatorname{div} G^{\#}=0 \Rightarrow \operatorname{div} G=0
$$

Thus the vanishing of the divergence of the Einstein tensor is just a particular case of the theorem.
[Note: Officially, $\operatorname{div} G \in D_{1}^{0}(M)$, and

$$
\operatorname{div} G^{\#}=g^{\#} \operatorname{div} G .
$$

In fact,

$$
\begin{aligned}
\left(g^{\#} \operatorname{div} G\right)^{i} & =g^{i k}(\operatorname{div} G)_{k} \\
& =g^{i k} g^{l j_{\nabla_{j}} G l}
\end{aligned}
$$

24. 

$$
\begin{aligned}
& =\nabla_{j} g^{i k_{g}}{ }^{i \ell} G_{k l} \\
& \left.=\nabla_{j} G^{i j} \cdot\right]
\end{aligned}
$$

FACT $\forall X \in D^{I}(M)$,

$$
2 \nabla_{j}\left(X_{i} E^{i j}(L)\right)=\left(L_{X} g\right)_{i j} E^{i j}(L)
$$

Section 24: The Helmholtz Condition Let $M$ be a connected $C^{\infty}$ manifold of dimension $n$, which we shall assume is orientable.

Fix a chart $\left(U,\left\{x^{l}, \ldots, x^{n}\right\}\right)$-- then a field function on $U$ is a $C^{\infty}$ function of the form

$$
F\left(g_{a b}, g_{a b, i_{1}}, \ldots, g_{a b, i_{1}} \cdots i_{m}\right) .
$$

Notation: $F(U)$ is the set of field functions on $U$.
[Note: Every field function on $U$ is of finite order in the derivatives of the $g_{a b}$ (but the order itself is not fixed).]

Example: Let $F \in M C_{n}(p, q, w, m)$-- then its components

$$
{ }_{F}^{i_{1} \cdots i_{p}}{ }_{j_{1}} \cdots j_{q}\left(g_{a b}, g_{a b, c_{1}}, \cdots, g_{a b}, c_{1} \cdots c_{m}\right)
$$

are field functions on $U$.
[Note: In general, however, field functions are definitely not tensorial.] Given $F \in F(\mathbb{U})$, abbreviate

$$
\frac{\partial F}{\partial g_{a b}, i_{1} \cdots i_{k}}
$$

to

$$
\underset{F}{a b, i_{1} \cdots i_{k}}
$$

with the understanding that

$$
F^{a b, i_{1} \cdots i_{0}}=\frac{\partial F}{\partial g_{a b}}
$$

and for each $i=1, \ldots, n$, define a differential operator $D_{i}$ on $F(U)$ by

$$
D_{i} F=\sum_{k=0}^{\infty} F^{a b, i_{1} \cdots i_{k}} g_{a b, i_{1} \cdots i_{k}}
$$

thus $\mathrm{D}_{\mathrm{i}} \mathrm{F}=\mathrm{F}, \mathrm{i}$.
[Note: Needless to say, the sum terminates at the order of F. ]
Definition: The Euler-Lagrange derivative $E^{a b}$ is the map $F(U) \rightarrow F(U)$ defined by the rule

$$
E^{a b}(F)=\sum_{k=0}^{\infty}(-1)^{k+1} D_{i_{1}} \cdots i_{k}^{F}{ }^{a b, i_{1} \cdots i_{k}}
$$

where $D_{i_{1}} \ldots i_{0} F=F$ and $D_{i_{1}} \ldots \dot{i}_{k}=D_{\mathbf{i}_{1}} \ldots \ldots D_{\mathbf{i}_{k}}(k \geq 1)$.
[Note: $\quad \forall F \in F(U)$,

$$
\begin{gathered}
F^{a b, i_{1} \cdots i_{k}=F^{b a}, i_{1} \cdots i_{k}} \\
\left.E^{a b}(F)=E^{b a}(F) \cdot\right]
\end{gathered}
$$

LEMMA Suppose that $F^{1}, \ldots, F^{n}$ are elements of $F(U)-$ then

$$
E^{a b}\left(D_{i} F^{i}\right)=0
$$

[In fact,

$$
\begin{gathered}
E^{a b}\left(D_{i} F^{i}\right)=\sum_{k=0}^{\infty}(-1)^{k+1} D_{i i_{1}} \cdots i_{k}\left(F^{i_{1}}\right)^{a b, i_{1} \cdots i_{k}} \\
\quad+\sum_{k=1}^{\infty}(-1)^{k+1} D_{i_{1}} \cdots i_{k}\left(F^{i_{k}}\right) \\
=0.1
\end{gathered}
$$

Any field function of the form

$$
D_{i} F^{i}
$$

is said to be an ordinary divergence. Therefore the lemma states that the Euler-Lagrange derivative annihilates all ordinary divergences.
[Note: In practice, when working locally, this means that one can add a possibly nontensorial ordinary divergence to a lagrangian without affecting the Euler-Lagrange derivative.]

Example: Let $L=|g|^{1 / 2} S$ - then

$$
E^{i j}(L)=|g|^{1 / 2}\left[R^{i j}-\frac{1}{2} S g^{i j}\right]
$$

Locally, there is a decomposition

$$
L=A+B_{, i}^{i}
$$

where the field functions $\mathrm{A}, \mathrm{B}^{\mathrm{i}}$ are given by

$$
\begin{aligned}
& A=|g|^{1 / 2} g^{i j}\left(\Gamma_{i \ell^{k}}{ }_{j k}^{\ell}-\Gamma_{i j^{\Gamma}}^{k}{ }_{k \ell}\right) \\
& B^{i}=|g|^{1 / 2}\left(g^{k \ell} \Gamma_{k \ell}^{i}-g^{i k_{T} \ell}{ }_{k \ell}\right) .
\end{aligned}
$$

Therefore

$$
E^{i j}(L)=E^{i j}(A)
$$

[Note: Neither A nor $\mathrm{B}^{\mathrm{i}}$ is tensorial. On the other hand,

$$
\begin{aligned}
& A=A\left(g_{a b}, g_{a b, c}\right) \\
& B^{i}=B^{i}\left(g_{a b}, g_{a b, c}\right)
\end{aligned}
$$

Since A is independent of $g_{a b, c d}$, it follows that $E^{i j}(L)$ contains no third or fourth derivatives of $g_{a b}$.]
4.

Details Working locally, write

$$
\begin{aligned}
& |g|^{1 / 2} S \\
& =|g|^{1 / 2} g^{a b} R_{a b} \\
& =|g|^{1 / 2} g^{a b}\left[\Gamma_{a b, c}^{c}-\Gamma_{a c, b}^{c}+\Gamma_{a b}^{c} \Gamma_{a d}^{d}-\Gamma_{a c}^{d} \Gamma_{b d}^{c}\right] \\
& \left.=\left(|g|^{1 / 2} g^{a b} \Gamma_{a b}^{c}\right), c^{-\left(|g|^{l / 2} g^{a b}\right.}\right), c^{\Gamma^{c}} a b \\
& -\left(|g|^{1 / 2} g^{a b} \Gamma_{a c}^{c}{ }^{\prime}, b+\left(|g|^{1 / 2} g^{a b}\right), r^{\Gamma^{c}} a c\right. \\
& +|g|^{1 / 2} g^{a b} \Gamma_{a b}^{c} \Gamma_{c d}^{d}-|g|^{1 / 2}{ }_{g} a b_{\Gamma}{ }^{d} a c^{\Gamma^{c}}{ }_{b d} \\
& =-\left(|g|^{1 / 2} g^{a b}\right), c^{\Gamma^{c}} a b+\left(|g|^{l / 2} g^{a b}\right), b^{\Gamma^{c}} a c \\
& +\left(|g|^{1 / 2} g^{a b}{ }_{\Gamma}^{c}{ }_{a b}\right), c^{-\left(|g|^{1 / 2} g^{a b} \Gamma_{a c}^{c}\right.}{ }^{\prime}, b \\
& +|g|^{1 / 2} g^{a b_{\Gamma} c}{ }_{a b} \Gamma_{c d}^{d}-|g|^{1 / 2} g^{a b_{\Gamma}}{ }^{d}{ }_{a c} \Gamma^{c} b d . \\
& \bullet\left(|g|^{1 / 2} g^{a b} \Gamma_{a b}{ }_{a b}\right), c \\
& =\left(|g|^{1 / 2}{ }_{\mathrm{g}}{ }^{\mathrm{cb}}{ }^{\mathrm{a}}{ }_{\mathrm{cb}}{ }^{\mathrm{a}}, \mathrm{a}\right. \\
& =\left(|g|^{1 / 2}{ }_{g}{ }^{b c} \Gamma_{b c}{ }_{b}{ }^{\prime}, a \cdot\right. \\
& \text { - }-\left(|g|^{l / 2} g^{a b} \Gamma^{c} a c\right), b \\
& =-\left(|g|^{l / 2} \mathrm{~g}^{\mathrm{ba}} \mathrm{C}_{\mathrm{bc}}\right), \mathrm{a} \\
& =-\left(|g|^{1 / 2} g^{a b} \Gamma_{b c}^{c}, a \cdot\right.
\end{aligned}
$$

Combining terms thus gives

$$
\begin{gathered}
\left(|g|^{1 / 2} g^{a b_{r} c}{ }_{a b}\right), c-\left(|g|^{1 / 2} g^{a b} \Gamma_{a c}^{c}\right)_{, b} \\
=\left(|g|^{1 / 2}\left(g^{b c_{\Gamma} a}{ }_{b c}-g^{a b \Gamma_{r c}^{c}}{ }_{b c}\right)\right), a \\
=B_{, a}^{a} .
\end{gathered}
$$

Next

$$
\begin{aligned}
& \nabla_{i}\left(|g|^{l / 2} g^{a b}\right)=0 \\
& \Rightarrow \\
& \left(|g|^{1 / 2} g^{a b}\right)_{c}=|g|^{1 / 2}{ }_{g} a_{\Gamma} d_{c d}-|g|^{1 / 2} g_{g} b_{\Gamma}{ }_{c d}-|g|^{1 / 2}{ }_{g} a_{\Gamma}{ }_{c d}{ }_{c d} \\
& \left(|g|^{1 / 2} g^{a b}\right)_{, b}=|g|^{1 / 2} g^{a b_{\Gamma}}{ }_{b d}-|g|^{1 / 2} g^{d b_{r}}{ }_{b d}-|g|^{1 / 2} g_{a_{r}} b_{b d} . \\
& \text { - }\left(|g|^{1 / 2} g^{a b}\right), c^{\Gamma^{c}} a b
\end{aligned}
$$

$$
\begin{aligned}
& +|g|^{1 / 2}{ }_{g} a d_{\Gamma}{ }_{a b} \Gamma^{r}{ }_{c d} \\
& =|g|^{1 / 2}\left[g^{\left.d b_{\Gamma}{ }^{c}{ }_{a b} \Gamma^{a}{ }_{c d}-g^{a b} \Gamma^{c} a b^{\Gamma^{d}}{ }_{c d}\right]}\right. \\
& +|g|^{1 / 2} g^{a d}{ }_{\Gamma}{ }^{c} a b{ }^{\Gamma}{ }^{b} c d \\
& =|g|^{1 / 2}{ }_{g}{ }^{a b}\left[\Gamma^{c}{ }_{d b} \Gamma^{\mathrm{d}}{ }_{c a}-\Gamma^{c}{ }_{a b} \Gamma^{\mathrm{d}}{ }_{c d}\right] \\
& +|g|^{1 / 2}{ }_{g}{ }^{a d}{ }_{T}{ }_{a b} \Gamma^{b}{ }_{c d}
\end{aligned}
$$

$$
\begin{aligned}
& =|g|^{1 / 2} \mathrm{~g}^{\mathrm{ab}}\left[\Gamma^{\mathrm{c}} \cdot \mathrm{ad} \Gamma^{\Gamma^{d}} \mathrm{bc}-\Gamma^{\mathrm{c}}{ }_{a b} \Gamma^{\mathrm{d}}{ }_{\mathrm{cd}}\right] \\
& +|g|^{1 / 2} \mathrm{ad}_{\Gamma}{ }^{\mathrm{c}}{ }_{a b}{ }^{\Gamma} \mathrm{b} \cdot d \\
& =A+|g|^{1 / 2} g^{a d} \Gamma^{c} \cdot{ }_{a b} \Gamma^{b} c d \\
& =A+|g|^{l / 2} \mathrm{~g}^{\mathrm{ab}} \Gamma^{\mathrm{c}} \cdot{ }_{\mathrm{ad}} \Gamma^{\mathrm{d}}{ }_{\mathrm{cb}} \\
& =A+|g|^{1 / 2}{ }_{g} a b_{\Gamma}{ }^{d} a{ }_{a c} \Gamma^{c} d b \\
& =A+|g|^{1 / 2} g^{a b} \Gamma^{d}{ }_{a c} \Gamma^{\Gamma^{c}} b d .
\end{aligned}
$$

So far then

$$
\begin{aligned}
& |g|^{1 / 2} S=A+B_{, ~}^{a} \\
& +\left(|g|^{1 / 2} g^{a b}\right),{ }_{, b^{\Gamma^{c}}{ }_{a c}+|g|^{1 / 2}{ }_{g} a_{\Gamma^{c}}{ }_{a b} \Gamma^{d}{ }_{c d} .} . \\
& \text { - }\left(|g|^{1 / 2} g^{a b}\right), b^{\Gamma^{c}} a c \\
& =|g|^{1 / 2} g^{a b} \Gamma^{c}{ }_{a c \Gamma^{d}{ }_{b d}-|g|^{1 / 2} g^{a d} \Gamma^{c}{ }_{a c^{\Gamma}}{ }^{b} b d} \\
& -|g|^{1 / 2} g^{d b} \Gamma^{c} a^{\Gamma^{a}}{ }_{b d} \\
& =|g|^{1 / 2} g^{a b} \Gamma^{c}{ }_{a c^{\Gamma}}{ }^{d}{ }_{b d}-|g|^{1 / 2} g^{a b} \Gamma^{c}{ }_{a c} \Gamma^{d}{ }_{d b} \\
& -|g|^{1 / 2} \mathrm{gb}^{\mathrm{Cb}}{ }_{\mathrm{ac}} \Gamma^{\Gamma^{\mathrm{a}}} \mathrm{bd} \\
& =-|g|^{1 / 2} g^{d b_{r}}{ }^{c} a c^{\Gamma^{a}}{ }_{b d} \\
& =-|g|^{1 / 2} g^{a b} \Gamma_{d c}^{c} \Gamma^{d} b a
\end{aligned}
$$

$$
=-|g|^{1 / 2} \mathrm{~g}^{a b_{r}}{ }_{c d^{2}}{ }^{c} \cdot a b .
$$

Therefore

$$
|g|^{1 / 2} S=A+B_{, a}^{a}
$$

Example: Take $n=4$-- then

$$
\begin{gathered}
\varepsilon^{i j k \ell_{R}{ }_{b i j}{ }^{R}{ }_{a k \ell}^{b}} \\
=-\left[2 \varepsilon^{i j k \ell_{\Gamma}^{b}}{ }_{a k} R^{R^{a}}{ }_{b i j}+\frac{4}{3} \varepsilon^{\left.i j k \ell_{\Gamma} c_{b i} \Gamma_{a j}{ }^{\Gamma}{ }_{c k}\right], \ell} .\right.
\end{gathered}
$$

[Note: It is clear that there is a lagrangian $L \in \mathrm{MC}_{4}(0,0,1,2)$ which is given locally by

$$
\varepsilon^{\mathrm{ijk} \ell_{\mathrm{R}}^{\mathrm{a}}}{ }_{\mathrm{bij}} \mathrm{R}_{\mathrm{ak} \ell}^{\mathrm{b}}
$$

so, being an ordinary divergence, $\mathrm{E}^{\mathrm{rs}}(\mathrm{L})=0$. But $\mathrm{E}(\mathrm{L})$ is tensorial, hence $E(L)=0$.

FACT Suppose that $L \in M C_{n}(0,0,1, m)$. Put

$$
\left.L=g_{i j} E^{i j}(L) \quad \text { (a.k.a. } \operatorname{tr}(E(L))\right)
$$

Then $L \in M C_{n}(0,0,1,2 m)$ and the order of $E^{a b}(L)$ is at most $2 m$ (not $4 m$ ).
[On general grounds,

$$
\operatorname{PL}(g, g)=\frac{\partial L}{\partial g_{a b}} g_{a b}+\sum_{k=1}^{m} L^{a b, i_{1} \cdots i_{k}} g_{a b}, i_{1} \cdots i_{k}
$$

is an element of $M C_{n}(0,0,1, m)$, call it $L_{0}-$ then $L+L_{0}$ is an ordinary divergence, hence

$$
E^{a b}\left(L+L_{0}\right)=E^{a b}(L)+E^{a b}\left(L_{0}\right)=0
$$

But the order of $\mathrm{E}^{\mathrm{ab}}\left(L_{0}\right)$ is $\leq 2 m$, thus the same holds for the order of $\mathrm{E}^{\mathrm{ab}}(\mathrm{L})$.] Remark: The notion of ordinary divergence is local and involves partial derivatives rather than covariant derivatives. In this connection, recall that there is one important circumstance when the two notions coincide, viz. let $X \in l-s D_{0}^{1}(M)$-- then

$$
\nabla_{i} x^{i}=x_{, i}^{i}
$$

provided $\nabla$ is torsion free.
[Note: Put

$$
\omega_{x}=\frac{x^{i}}{(n-1)!} \varepsilon_{i j_{1}} \ldots j_{n-1} d x^{j_{1}} \wedge \ldots \wedge d x^{j_{n-1}}
$$

or still,

$$
\omega_{X}=\sum_{i=1}^{n}(-1)^{i+1} X^{i} d x^{1} \wedge \ldots \wedge d \hat{x}^{i} \wedge \ldots d x^{n}
$$

Then

$$
\left.x_{, i}^{i}=0 \Rightarrow d \omega_{X}=0 .\right]
$$

Notation: Given $F \in F(U)$ and $k \geq 1$, put

$$
\mathrm{E}^{\mathrm{ab}, i_{1} \cdots i_{k}}(F)=\sum_{\ell=k}^{\infty}(-1)^{\ell+1}\left(\frac{\ell}{k}\right) D_{i_{k+1}} \cdots i_{\ell}^{F}{ }^{\mathrm{F}, i_{l} \cdots i_{\ell}}
$$

where $D_{i_{k+1}} \cdots \dot{i}_{k} F=F$.
[Note: Extend this to $k=0$ by the agreement $E^{a b, i_{1} \cdots i_{0}}(F)=E^{a b}(F)$. ]

IEMMA We have

$$
E^{a b, i_{1} \cdots i_{k}}\left(E^{a^{\prime} b^{\prime}}(F)\right)+E^{a b}(F) a^{a^{\prime} b^{\prime}, i_{1} \cdots i_{k}}=0 .
$$

[Note: When $k=0$, the equation reads

$$
\left.\mathrm{E}^{\mathrm{ab}}\left(\mathrm{E}^{\mathrm{a}^{\prime} \mathrm{b}^{\prime}}(\mathrm{F})\right)+\frac{\partial \mathrm{E}^{\mathrm{ab}}(\mathrm{~F})}{\partial \mathrm{g}_{a^{\prime} \mathrm{b}^{\prime}}}=0 .\right]
$$

While we shall make no attempt at precise characterizations, it is of interest to at least say something about the kernel and the range of the

$$
\mathrm{E}^{\mathrm{ab}}: F(\mathrm{U}) \rightarrow F(\mathrm{U}) .
$$

So, e.g., as has been shown above, all ordinary divergences are in their kernel.
Definition: Let $T^{a b} \in F(U)(a, b=1, \ldots, n)$-- then the collection $\left\{T^{a b}\right\}$ is said to satisfy the Helmholtz condition if $\forall k \geq 0$,

$$
E^{a b, i_{1} \cdots i_{k}}{\left(T^{a^{\prime}} b^{\prime}\right)+\left(T^{a b}\right)}^{a^{\prime} b^{\prime}, i_{1} \cdots i_{k}}=0
$$

Accordingly, in view of the lema, any collection $\left\{\mathrm{T}^{a b}\right\}$ in the range of the Euler-Lagrange derivative must satisfy the Helmholtz condition.

Example: We have

$$
\left[\begin{array}{l}
E^{i j}\left(|g|^{1 / 2} S\right)=|g|^{1 / 2_{G} i j} \\
E^{i j}\left(-2 \lambda|g|^{1 / 2}\right)=\lambda|g|^{1 / 2_{g} i j}
\end{array}\right.
$$

thus the entities on the RHS satisfy the Helmholtz condition.
Example: Take $\mathrm{n}=3$ and put

$$
C^{i j}=\varepsilon^{i a b_{R}^{j}} \underset{a ; b}{ }+\varepsilon^{j a b_{R}^{i}}{ }_{a ; b}
$$

Then the $C^{i j}$ are the components of a symmetric element of $\mathrm{MC}_{3}(2,0,1,3)$, the
10.

Cotton tensor. We have

$$
\left[\begin{array}{l}
\nabla_{j} C^{i j}=0 \\
g_{i j} C^{i j}=0
\end{array}\right.
$$

In addition, it can be checked by computation that the Cotton tensor satisfies the Helmholtz condition, although it will be seen in the next section that there does not exist a lagrangian

$$
L \in M C_{3}(0,0,1, m)
$$

such that

$$
E^{i j}(L)=C^{i j}
$$

Nevertheless, there are field functions $F$ such that $E^{i j}(F)=C^{i j}$, one such being

$$
F=-\varepsilon^{\mathrm{ak} \ell}\left[\frac{1}{2} \Gamma^{j}{ }_{i a^{j}} \Gamma^{\mathrm{i}}{ }_{j k, \ell}+\Gamma_{i a^{j}} \Gamma^{\mathrm{b}}{ }_{j k} \Gamma^{\mathrm{i}} \mathrm{~b} \ell\right]
$$

Product Rule Let $F, G \in F(U)$ - then

$$
\begin{aligned}
& { }_{E}^{a b, i_{1}}{ }^{\cdots i_{k}}{ }_{(F G)} \\
& =\sum_{\ell=k}^{\infty}\left(\frac{\ell}{k}\right)\left[D_{i_{k+1}} \cdots i_{\ell}(F) E^{a b, i_{1} \cdots i_{l}}(G)\right. \\
& \left.+D_{i_{k+1}} \cdots i_{\ell}(G) E^{a b, i_{1} \cdots i_{\ell}}(F)\right] .
\end{aligned}
$$

In particular:

$$
\begin{aligned}
& E^{a b}(F G) \\
& \quad=\sum_{\ell=0}^{\infty}\left[D_{i_{1}} \cdots i_{\ell}{ }^{(F) E}{ }^{a b, i_{1} \cdots i_{\ell}}(G)\right.
\end{aligned}
$$

$$
+D_{i_{1} \cdots i_{\ell}}(G) E^{a b, i_{1} \cdots i_{l}}(F)
$$

Suppose that $\left\{T^{a b}\right\}$ is a collection which satisfies the Helmholtz condition -then

$$
\begin{aligned}
& E^{a b}\left(g_{a} b^{\prime} T^{a^{\prime} b^{\prime}}\right) \\
& =\sum_{\ell=0}^{\infty}\left[D_{i_{1}} \cdots i_{\ell}\left(g_{a^{\prime} b^{\prime}}\right) E^{a b, i_{1} \cdots i^{i}} \ell_{\left(T^{a^{\prime} b^{\prime}}\right)}\right. \\
& +D_{i_{1}} \cdots i_{l}\left(T^{a^{\prime} b^{\prime}}\right) E{ }^{a b, i_{1} \cdots i_{l}}\left(g_{a^{\prime} b^{\prime}}\right) \\
& =-\sum_{\ell=0}^{\infty}\left[g_{a^{\prime} b^{\prime}, i_{1} \cdots i_{l}}\left(T^{a b}\right)^{a^{\prime} b^{\prime}, i_{1} \cdots i^{\prime}} \ell+T^{a b}\right] .
\end{aligned}
$$

Notation: Given a field function $F$, let

$$
F_{t}=F\left(\operatorname{tg}_{a b}, \operatorname{tg}_{a b, i_{1}}, \ldots, \operatorname{tg}_{a b, i_{1}} \cdots i_{m}^{\prime}\right) \quad(t>0) .
$$

We have

$$
\begin{aligned}
& \frac{d}{d t}\left(t^{2} T_{t^{2}}^{a b}\right) \\
= & 2 t T^{a b} t^{2}+t^{2}(2 t) \sum_{\ell=0}^{\infty}\left(T^{a b}\right)^{a b^{\prime}, i_{1} \cdots i_{\ell}}{g_{a} b^{\prime}, i_{1} \cdots i_{\ell}} .
\end{aligned}
$$

Therefore

$$
E^{a b}\left(g_{a^{\prime} b^{\prime}} T^{a^{\prime} b^{\prime}}\right)=-\left.\frac{1}{2} \cdot \frac{d}{d t}\left(t^{2} \mathrm{~T}^{2 \mathrm{ab}}\right)\right|_{t=1}
$$

[Note: In general,

To see this, let $E_{t}^{a b}$ be the Euler-Lagrange derivative per $t^{2} g-$ then

$$
\begin{aligned}
& E_{t}^{a b}\left(t^{2} g_{a ' b} T_{T^{\prime} b^{\prime} b^{\prime}}\right) \\
& =-\sum_{\ell=0}^{\infty}\left[t^{2} g_{a} b^{\prime}, i_{l} \cdots i_{l}{ }^{\left(T^{a b}\right)^{a ' b '}, i_{1} \cdots i_{l}}+T_{t^{2 b}}^{a b}\right. \\
& =-\frac{1}{2 t} \cdot \frac{d}{d t}\left(t^{2} \mathrm{~T}_{\mathrm{t}^{2}}^{\mathrm{ab}}\right) .
\end{aligned}
$$

On the other hand,

$$
\begin{aligned}
& E^{a b}\left(\operatorname{tg}_{a^{\prime} b^{\prime}} T^{a^{\prime} b^{\prime}}\right) \\
&= \frac{1}{t} E^{a b}\left(t^{2} g_{a^{\prime} b^{\prime}} T_{t^{a^{\prime} b^{\prime}}} t^{2}\right. \\
&= \frac{1}{t}\left(t^{2} E_{t}^{a b}\left(t^{2} g_{a^{\prime} b^{\prime}} T^{a^{\prime} b^{\prime}}\right)\right) \\
&= t\left(-\frac{1}{2 t} \cdot \frac{d}{d t}\left(t^{2} T_{t^{2}}^{a b}\right)\right) \\
&=\left.-\frac{1}{2} \frac{d}{d t}\left(t^{2} T_{2}^{a b}\right) \cdot\right] \\
& t^{2}
\end{aligned}
$$

Section 25: Applications of Homogeneity Let $M$ be a connected $C^{\infty}$ manifold of dimension $n$, which we shall assume is orientable.

Definition: Let $F \in F(U)$-- then $F$ is said to be homogeneous of degree $x$ if $\forall t>0$,

$$
\begin{aligned}
& F\left(\operatorname{tg}_{a b}, \operatorname{tg}_{a b}, i_{1}, \ldots, \operatorname{tg}_{a b}, i_{1} \cdots i_{m}\right) \\
& =t^{x} F\left(g_{a b}, g_{a b}, i_{1}, \cdots, g_{a b, i_{1}} \cdots i_{m}\right),
\end{aligned}
$$

i.e., if $\forall t>0$,

$$
F_{t}=t^{x} F .
$$

For the record,

$$
\left\{\begin{array}{l}
R_{i j k \ell} \text { is homogeneous of degree } 1 \\
R_{j \ell} \text { is homogeneous of degree } 0 \\
g^{i k_{g} j \ell_{R_{i j k \ell}} \text { is homogeneous of degree -1. }}
\end{array}\right.
$$

[Note: $|g|^{1 / 2}$ is homogeneous of degree $n / 2$.]

IEMMA Let $T^{a b} \in F(U)$ be homogeneous of degree $x \neq-1(a, b=1, \ldots, n)$. Assume: The collection $\left\{\mathrm{T}^{\mathrm{ab}}\right\}$ satisfies the Helmholtz condition - then

$$
T^{a b}=E^{a b}(L)
$$

where

$$
L=-\frac{1}{x+1} g_{a^{\prime} b^{\prime}} T^{a^{\prime} b^{\prime}}
$$

[In fact,

$$
\begin{aligned}
& \frac{d}{d t}\left(t^{2} T_{t^{2 b}}^{2}\right) \\
& =\frac{d}{d t}\left(t^{2} t^{2 x_{T} a b}\right) \\
& =2(x+1) t^{2 x+1} T_{T}^{a b}
\end{aligned}
$$

But

$$
\begin{aligned}
& E^{a b}\left(\operatorname{tg}_{a^{\prime} b^{\prime}} T_{t^{a^{\prime} b^{\prime}}}\right)=-\frac{1}{2} \cdot \frac{d}{d t}\left(t^{2} T^{a b}{ }^{2}\right) \\
& \Rightarrow \\
& t^{2 x+1} E^{a b}\left(g_{a^{\prime} b^{\prime}} \cdot T^{a^{\prime} b^{\prime}}\right)=-\frac{1}{2}-2(x+1) t^{2 x+l_{T} T^{a b}} \\
& \Rightarrow \\
& \left.E^{a b}\left(g_{a} b^{\prime} T^{a} b^{\prime}\right)=-(x+1) T^{a b} .\right]
\end{aligned}
$$

Example: Take $\mathrm{n}=4$-- then $|\mathrm{g}|^{1 / 2} \mathrm{G}^{\mathrm{ij}}$ is homogeneous of degree 0 and, as can be checked by computation, the collection $\left\{|g|^{l / 2} G^{i j}\right\}$ satisfies the Helmholtz condition. Therefore

$$
|g|^{1 / 2} G^{i j}=E^{i j}(-L)
$$

where

$$
L=|g|^{1 / 2}{ }_{g_{i j}} G^{i j}=|g|^{1 / 2}\left(S-\left(\frac{4}{2}\right) S\right)=-|g|^{1 / 2} S
$$

I.e.:

$$
|g|^{1 / 2} G^{i j}=E^{i j}\left(|g|^{1 / 2} S\right)
$$

in agreement with the general theory.
Example: Take $\mathrm{n}=3$ and let

$$
c^{i j}=\varepsilon^{i a b_{R} j}{ }_{a ; b}+\varepsilon^{j a b_{R}^{i}} \underset{a ; b}{ } .
$$

Then the collection $\left\{\mathrm{C}^{\mathrm{ij}}\right\}$ satisfies the Helmholtz condition. Still, $\mathrm{C}^{\mathrm{ij}}$ is homogeneous of degree -1 , thus the foregoing construction is not applicable.

Remark: Let $A \in M C_{n}(2,0,1, m)(n>1)$ be homogeneous of degree -1 -- then it can be shown that $m \leq 3$ if $n$ is odd and $m \leq n$ if $n$ is even.

Symbol Pushing In the literature, one will find the following assertion. Suppose that $\left\{\mathrm{T}^{\mathrm{ab}}\right\}$ is a collection which satisfies the Helmholtz condition -- then

$$
\mathrm{T}^{\mathrm{ab}}=\mathrm{E}^{\mathrm{ab}}(\mathrm{~L}),
$$

where

$$
L=-\int_{0}^{1} 2 \operatorname{tg}_{a^{\prime} b^{\prime}} T_{t^{\prime}}^{a^{\prime} b^{\prime}} d t
$$

[Formally,

$$
\begin{aligned}
E^{a b}(L) & =-\int_{0}^{l} E^{a b}\left(2 \operatorname{tg}_{a} b^{\prime}, T_{t^{\prime}}{ }^{2} b^{\prime}\right) d t \\
& =\int_{0}^{1} \frac{d}{d t}\left(t^{2} T_{t^{2}}^{a b}\right) d t \\
& =T^{a b} .
\end{aligned}
$$

However there is a tacit assumption, namely that

$$
\lim _{\varepsilon \downarrow 0} \varepsilon^{2} \mathrm{~T}_{\varepsilon}^{2 b}{ }_{2}^{2 b}=0
$$

And this is not true in general.]

Let $F \in M C_{n}(p, q, w, m)$. Take $\bar{x}^{-i}=\frac{1}{t} \times(t>0)-$ then

$$
\begin{aligned}
& { }^{i_{1} \cdots i_{p}}{ }_{j_{1}} \cdots j_{q}\left(t^{2} g_{a b}, t^{3} g_{a b, c_{1}}, \cdots, t^{2+m} g_{a b, c_{1}, \ldots c_{m}}\right) \\
= & {\left[t^{n}\right]^{w} t^{q}-p_{F} i_{1} \cdots{ }^{i_{p}}{ }_{j_{1} \cdots j_{q}}\left(g_{a b}, g_{a b, c_{1}}, \cdots, g_{a b, c_{1}} \cdots c_{m}\right) . }
\end{aligned}
$$

Specialize to the case when $q=0, w=0-$ then if $\mathrm{F}^{\mathrm{i}_{1} \cdots \mathrm{i}_{\mathrm{p}}}$ is homogeneous of degree $x$, we have

$$
\begin{aligned}
& t^{-(2 x+p)}{ }_{F} i_{1}{ }^{\cdots i_{p}}\left(g_{a b}, g_{a b}, c_{1}, \cdots, g_{a b}, c_{1} \cdots c_{m}^{\prime}\right) \\
= & \left.F^{i_{1} \cdots i_{p}}{ }_{\left(g_{a b}, t g_{a b}, c_{1}\right.}, \cdots, t^{m} g_{a b, c_{1}} \cdots c_{m}\right)
\end{aligned}
$$

or still, in view of the Replacement Theorem,

$$
\begin{aligned}
& \left.t^{-(2 x+p)}{ }_{F}{ }^{i_{1}}{ }^{\cdots i_{p}} g_{a b}, g_{a b, c_{1}}, \ldots, g_{a b}, c_{1} \ldots c_{m}\right) \\
= & F^{i_{1} \cdots i_{p}}\left(g_{a b}, 0, t^{2} G_{a b c_{1} c_{2}}, \ldots, t^{m_{G}}{a b c_{1}} \ldots c_{m}\right)
\end{aligned}
$$

## Classification

- If $2 x+p=0$, then $F^{i_{1} \cdots i_{p}}$ is a function of $g_{a b}$ alone.
- If $2 x+p$ is positive, then $F^{i_{1} \cdots i_{p}}=0$.
$\omega_{\text {If }} 2 x+p$ is negative and not an integer, then $F^{i_{1} \cdots i_{p}}=0$.
- If $2 x+p=-1$, then $F^{i_{1} \cdots i_{p}}=0$.
- If $2 x+p=-2,-3, \ldots$, then $F^{i_{1} \cdots i_{p}}$ is a polynomial in the $G_{a b c_{1}} \cdots c_{k}$.

Remark: If $F \in M C_{n}(p, 0, w, m)$ is homogeneous of degree $x$, then

$$
|g|^{-w / 2}{ }_{F \in M C_{n}}(p, 0,1, m)
$$

is homogeneous of degree $x-\left(\frac{n}{2}\right) w$. Therefore the structure of $F$ can be ascertained from the structure of $|g|^{-\mathrm{w} / 2} \mathrm{~F}$.

LEMMA If $n>1$ is odd and if $L \in M C_{n}(0,0,1, m)$ is homogeneous of degree 0 , then $\mathrm{L}=0$.

Example: The preceding lemma breaks down if n is even. For instance, when $\mathrm{n}=4$,

$$
|g|^{1 / 2} C^{i j k \ell} C_{i j k \ell}
$$

is a second order lagrangian which is homogeneous of degree 0 , as is

$$
\varepsilon^{a b c d_{C}^{i}}{ }_{j a b}^{C^{j}}{ }_{i c d}
$$

FACT Suppose that $L \in M C_{n}(0,0,1,2)$ is homogeneous of degree 0 -- then

$$
g_{i j} E^{i j}(L)=0
$$

[Recall that

$$
E^{i j}(L)=-\Pi^{i j}-\Pi^{i j, k \ell} ; k
$$

But here

$$
\left[\begin{array}{l}
g_{i j} \Pi^{i j}=0 \\
\left.g_{i j} \Pi^{i j, k l}=0 .\right]
\end{array}\right.
$$

Notation: Given a field function $F$, let

$$
F_{[t]}=F\left(g_{a b}, t g_{a b, i_{1}}, \ldots, t^{m} g_{a b, i_{1}} \ldots i_{m}\right) \quad(t>0)
$$

So, if $F \in M C_{n}(p, q, w, m)$, then

$$
F_{[t]}=t^{n \omega+q-p_{F}}{ }_{1 / t^{2}}
$$

Example: Let $L \in M C_{n}(0,0,1, m)$-- then

$$
L_{[t]}=t^{n} L_{1 / t^{2}}
$$

$\Rightarrow$

$$
\begin{aligned}
L_{[t]}\left(s^{2} g\right) & \left.=t^{n} L_{( }\left(\frac{s}{t}\right)^{2} g\right) \\
& =t^{n}\left(\frac{s}{t}\right)^{n} L_{[t / s]}(g) \\
& =s^{n} L_{[t / s]}(g)
\end{aligned}
$$

LEMMA $\forall L \in M C_{n}(0,0,1, m)$, we have

$$
E\left(L_{[t]}\right)=E(L)_{[t]}
$$

Application: Suppose that $L \in M C_{n}(0,0,1, m)$ is homogeneous of degree 0 -then $E(L) \in M C_{n}(2,0,1,2 m)$ is homogeneous of degree -1 .
[In fact, $L_{t}=L$, hence

$$
L_{[t]}=t^{n} L .
$$

Therefore

$$
E\left(L_{[t]}\right)=E\left(t^{n} L\right)=t^{n} E(L)
$$

On the other hand,

$$
E(L)_{[t]}=t^{n-2_{E(L)}} 1 / t^{2}
$$

Therefore

$$
\begin{aligned}
& t^{n} E(L)=t^{n-2} E(L) \\
\Rightarrow \quad & t^{2} E(L)=E(L) \\
\Rightarrow \quad & \\
& \quad E\left(L t^{2}\right. \\
& \\
& \left.=t^{-1} E(L) .\right]
\end{aligned}
$$

Example: Take $n=4$-- then $L=|g|^{1 / 2} S^{2}$ is homogeneous of degree 0 , hence

$$
\begin{aligned}
& E^{i j}(L)=|g|^{1 / 2} S\left(2 R^{i j}-\frac{1}{2} g^{i j_{S}}\right) \\
& +2|g|^{1 / 2} g^{i j_{\nabla} k_{\nabla_{k}} S-2|g|^{1 / 2} \nabla^{i} j_{S}}
\end{aligned}
$$

is homogeneous of degree -1 .

LEMMA Let $L \in M C_{n}(0,0,1, m)$, where $n>1$ is odd. Assume: $E(L) \neq 0-$ then $E(L)$ can not be homogeneous of degree -1 .
[If $E(L)$ were homogeneous of degree -1 , then the relation

$$
E(L)[t]=t^{n-2} E t^{2}
$$

reduces to

$$
E(L)_{[t]}=t^{n} E(L),
$$

hence

$$
t^{n} E(L)=E\left(L_{[t]}\right)
$$

But

$$
\frac{d}{d t} E\left(L_{[t]}\right)=E\left(\frac{d}{d t} L_{[t]}\right)
$$

Consequently,

$$
E(L)=E\left(L^{\prime}\right),
$$

where

$$
L^{\prime}=\lim _{t \neq 0} \frac{1}{n!}\left(\frac{d^{n}}{d t^{n}} L_{[t]}\right)
$$

is homogeneous of degree 0 :

$$
\begin{aligned}
L^{\prime}\left(s^{2} g\right) & =\lim _{t \neq 0} \frac{1}{n!}\left(\frac{d^{n}}{d t^{n}} L_{[t]}\left(s^{2} g\right)\right) \\
& =\lim _{t \not 0} \frac{1}{n!}\left(\frac{d^{n}}{d t^{n}} s^{n} L_{[t / s]}(g)\right) \\
& =\lim _{t \neq 0} \frac{1}{n!}\left(\frac{d^{n}}{d t^{n}} L_{[t]}(g)\right) \\
& =L^{\prime}(g) .
\end{aligned}
$$

Therefore, since $n>1$ is odd,

$$
L^{\prime}=0 \Rightarrow E\left(L^{\prime}\right)=0 \Rightarrow E(L)=0,
$$

a contradiction.]

By way of a corollary, there does not exist a lagrangian

$$
L \in M C_{3}(0,0,1, m)
$$

such that

$$
E^{i j}(L)=C^{i j}
$$

Remark: Let $A \in M C_{n}(2,0,1, m)$-- then in order that $A=E(L)$ for some lagrangian $L$, it is necessary that $A^{i j}=A^{j i} \& \nabla_{j} A^{i j}=0$. In addition, the collection $\left\{\mathrm{A}^{i j}\right\}$ must satisfy the Helmholtz condition. But, as the cotton
tensor shows, these requirements are not sufficient.
FACT Let $A \in M C_{n}(2,0,1, m)$. Suppose that the collection $\left\{A^{i j}\right\}$ satisfies the Helmholtz condition -- then

$$
\nabla_{j} A^{i j}=0
$$

[Note: It is not assumed that $A^{i j}=A^{j i}$, thus the condition appears to be asymmetric. Still,

$$
\left.\nabla_{j} A^{i j}=0 \quad \Leftrightarrow \quad \nabla_{i} A^{i j}=0 .\right]
$$

Section 26: Questions of Uniqueness Let $M$ be a connected $C^{\infty}$ manifold of dimension $n$, which we shall assume is orientable.

Suppose that $L \in M C_{n}(0,0,1,2)--$ then

$$
\left[\begin{array}{c}
E^{i j}(L)=E^{j i}(L) \\
\nabla_{j} E^{i j}(L)=0
\end{array}\right.
$$

and, in general,

$$
E^{i j}(L)=E^{i j}\left(g_{a b^{\prime}} g_{a b, c^{\prime}} g_{a b, c d^{\prime}} g_{a b, c d r^{\prime}} g_{a b, c d r s}\right) .
$$

However, for certain $L$ (e.g., $L=|g|^{1 / 2}$ or $L=|g|^{1 / 2} S$ ), $E^{i j}(L)$ is of the second order, i.e., $E^{i j}(L)$ depends only on $g_{a b}, g_{a b, c^{\prime}}$ and $g_{a b, c d}$.

Problem: Find all elements

$$
A \in M C_{n}(2,0,1,2)
$$

subject to

$$
\left[\begin{array}{l}
A^{i j}=A^{j i} \\
\nabla_{j} A^{i j}=0
\end{array}\right.
$$

Remarkably, this problem turns out to be tractable and a complete solution was obtained in the early 1970s by Lovelock.

Put

$$
N=\left.\right|_{n / 2 \text { if } n \text { is even }} ^{(n+1) / 2 \text { if } n \text { is odd. }}
$$

THEOREM Suppose that $A \in M C_{n}(2,0,1,2)$ satisfies the conditions
2.

$$
\left[\begin{array}{l}
A^{i j}=A^{j i} \\
\nabla_{j} A^{i j}=0
\end{array}\right.
$$

Then $\exists$ constants $C_{p}(p=1, \ldots, N-1), \lambda$ such that
$A^{i j}$
$=|g|^{1 / 2} \sum_{p=1}^{N-1} C_{p} g^{i k_{\delta} j \ell_{1} \cdots \ell_{2 p}}{ }_{k k_{1}} \cdots k_{2 p} R^{k_{1} k_{2}} \ell_{1} \ell_{2} \cdots R^{k_{2 p-1} k_{2 p}} \ell_{2 p-1} \ell_{2 p}+\lambda|g|^{1 / 2}{ }_{g} i j$.
[Note: We shall also see that

$$
\exists \operatorname{L} \in C_{n}(0,0,1,2)
$$

for which

$$
\left.E^{i j}(L)=A^{i j} .\right]
$$

Example: If $\mathrm{n}=1$ or $\mathrm{n}=2$, then

$$
A^{i j}=\lambda|g|^{l / 2}{ }_{g}^{i j}
$$

The Fundamental Consequence If dim $M=4$, then a symmetric $A \in M_{4}(2,0,1,2)$ of zero divergence has components

$$
A^{i j}=C|g|^{l / 2}\left[R^{i j}-\frac{1}{2} S g^{i j}\right]+\lambda|g|^{1 / 2} g^{i j},
$$

where $C$ and $\lambda$ are constants.
[It is a question of reducing

$$
C_{1}|g|^{1 / 2}\left[g^{\left.i k_{\delta}^{j \ell_{1} \ell_{2}}{ }_{k k_{1} k_{2}}{ }^{k_{1} k_{2}} \ell_{1} \ell_{2}\right]+\lambda|g|^{1 / 2}{ }_{g} i j}\right.
$$

to the stated form. By definition,

$$
\begin{aligned}
& =\delta_{k^{j}} \delta_{1}{ }_{1} \ell_{k_{1} k_{2}}-\delta_{k_{1}}^{j} \delta^{\ell_{1} \ell_{2}}{ }_{\mathrm{kk}_{2}}+\delta_{\mathrm{k}_{2}}^{j} \delta^{\ell_{1} \ell_{2}}{ }_{\mathrm{kk}_{1}} . \\
& \text { - } g^{i k}{ }_{8}{ }^{j}{ }_{k} \delta^{\ell_{1} \ell_{2}}{ }_{k_{1} k_{2}}{ }^{\mathrm{k}_{1} k_{2}}{ }_{\ell_{1} \ell_{2}} \\
& =g^{i k_{\delta} j_{k}\left(\delta \delta_{k_{1}} \delta_{1} \delta_{k_{2}}^{\ell_{2}}-\delta^{\ell}{ }_{k_{2}} \delta^{\ell_{2}}{ }_{k_{1}} R^{k_{1} k_{2}}{ }_{\ell_{1} \ell_{2}} .\right.} \\
& =g^{i k_{\delta}{ }^{j_{k}}}{ }_{k^{R}}{ }_{1}{ }^{k_{2}}{ }_{k_{1} k_{2}}-g^{i k_{\delta} j_{K^{R}}}{ }^{k_{1} k_{2}}{ }_{k_{2} k_{1}}
\end{aligned}
$$

$$
\begin{aligned}
& =2 g^{i j_{R}}{ }^{k_{1}{ }^{k}{ }_{2}}{ }_{k_{1}{ }^{k} 2}=2 g^{i j_{s}} \text {. }
\end{aligned}
$$

$$
\begin{aligned}
& =-\mathrm{g}_{\delta}^{\mathrm{ik} \ell_{1} \ell_{2}}{ }_{\mathrm{kk}_{2} \mathrm{R}^{\mathrm{jk}}} \ell_{1} \ell_{2}
\end{aligned}
$$

$$
\begin{aligned}
& \text { - } g^{i k_{\delta} j_{k}}{ }_{2} \delta^{\ell_{1} \ell_{2}}{ }_{k k_{1}} R^{k_{1} k_{2}}{ }_{\ell_{1} \ell_{2}} \\
& =g^{i k_{\delta}{ }^{\ell_{1} \ell_{2}}{ }_{k k_{1}}{ }^{k_{1}{ }^{j}}{ }_{\ell_{1} \ell_{2}}, ~} \\
& =-g^{i k_{\delta} \ell_{1} \ell_{2}{ }_{k k_{1}}{ }^{j k_{1}}{ }_{\ell} \ell_{1} \ell_{2}, ~} \\
& =-g^{i k_{\delta} \ell_{1} \ell_{2}}{ }_{k \ell^{R}}{ }^{j \ell} \ell_{1} \ell_{2} .
\end{aligned}
$$

And

$$
\begin{aligned}
& g^{i k_{\delta}}{ }^{\ell_{1} \ell_{2}}{ }_{k \ell^{R^{j \ell}}} \ell_{1} l_{2} \\
& =g^{i k}\left|\begin{array}{cc}
\delta_{1} & \ell_{1} \\
\delta_{k} & \ell^{2} \\
& \\
\delta_{2} & \delta^{\ell_{2}} \\
\end{array}\right|{ }^{R^{j \ell}}{ }^{\ell_{1} \ell_{2}}
\end{aligned}
$$

$$
\begin{aligned}
& =g^{i k_{R} j \ell}{ }_{k \ell}-g^{i k_{R} \ell_{\ell k}} \\
& =2 g^{i k_{R}}{ }^{j \ell} k \ell \\
& =2 R^{j \ell i} \\
& =2 R^{j i}=2 R^{i j} \text {. }
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& \mathrm{g}^{i k_{\delta}^{j \ell_{1} \ell_{2}}} \mathrm{kk}_{1} k_{2}^{R^{k_{1} k_{2}} \ell_{1} \ell_{2}} \\
& \quad=2 g^{i j_{S}}-4 R^{i j}
\end{aligned}
$$

But

$$
\begin{gathered}
G^{i j}=R^{i j}-\frac{1}{2} S g^{i j} \\
\Rightarrow \quad \\
g^{i k_{\delta}}{ }^{j \ell} \ell_{k_{1} k_{2}} R^{k_{1} k_{2}} \ell_{1} \ell_{2}=-4 G^{i j}
\end{gathered}
$$

The desired reduction is thus achieved by taking $C=-4 C_{1} .1$
Scholium: If $\operatorname{LeMC}_{4}(0,0,1, \mathrm{~m})$ and if $E(L) \in M C_{4}(2,0,1,2)$, then $E^{i j}$ ( $L$ ) necessarily has the form

$$
\mathrm{C}|g|^{1 / 2}\left[R^{i j}-\frac{1}{2} \mathrm{Sg}^{i j}\right]+\lambda|g|^{l / 2} g^{i j},
$$

where $C$ and $\lambda$ are constants.

Remark: Let $L \in \mathrm{MC}_{4}(0,0,1,2)$. Assume: $E(L) \in \mathrm{MC}_{4}(2,0,1,2)$ - then it can be shown that

$$
\begin{aligned}
L= & C|g|^{1 / 2} S-2 \lambda|g|^{1 / 2} \\
& +C^{\prime} \varepsilon^{i j k \ell_{R}{ }_{b i j} R^{b}} a k \ell \\
+ & C^{\prime \prime}|g|^{1 / 2}\left[S^{2}-4 R^{a b} R_{a b}+R^{a b c d_{R}}{ }_{a b c d}\right]
\end{aligned}
$$

where $C, C^{\prime}, C^{\prime \prime}$, and $\lambda$ are constants. However, as we have seen earlier, the
terms multiplying $C^{\prime}$ and $C^{\prime \prime}$ are annihilated by the Euler-Lagrange derivative, hence per prediction, make no contribution to the Euler-Lagrange expression

$$
C|g|^{1 / 2}\left[R^{i j}-\frac{1}{2} S g^{i j}\right]+\lambda|g|^{1 / 2} g^{i j}
$$

[Note: The analysis that gives the structure of $A^{i j}$ when $\operatorname{dim} M=4$ applies verbatim when $\operatorname{dim} M=3$. On the other hand, there is a simplification since the only $L \in M C_{3}(0,0,1,2)$ for which $E(L) \in M C_{3}(2,0,1,2)$ are the

$$
\left.c|g|^{1 / 2} s-2 \lambda|g|^{1 / 2} .\right]
$$

Example: If $\mathrm{n}=5$ or $\mathrm{n}=6$, then

$$
\begin{gathered}
A^{i j}=C|g|^{1 / 2}\left[R^{i j}-\frac{1}{2} S g^{i j}\right]+\lambda|g|^{1 / 2} g^{i j} \\
+D|g|^{1 / 2}\left[2 S R^{i j}-4 R^{i k j \ell_{R_{k l}}+2 R_{a b c}^{i} R^{j a b c}-4 R^{i a_{R}}{ }_{a}^{j}}\right. \\
-\frac{1}{2}\left(S^{2}-4 R^{a b} R_{a b}+R^{\left.\left.a b c d_{R_{a b c d}}\right) g^{i j}\right]}\right.
\end{gathered}
$$

where $C, D$, and $\lambda$ are constants.
We shall now turn to the proof of the theorem. So let

$$
A \in M C_{n}(2,0,1,2)
$$

subject to

$$
\left[\begin{array}{l}
A^{i j}=A^{j i} \\
\nabla_{j} A^{i j}=0
\end{array}\right.
$$

Put

$$
\left[\begin{array}{l}
A^{i j ; a b}=\frac{\partial A^{i j}}{\partial g_{a b}} \\
A^{i j ; a b, c}=\frac{\partial A^{i j}}{\partial g_{a b, c}} \\
A^{i j ; a b, c d}=\frac{\partial A^{i j}}{\partial g_{a b, c d}}
\end{array}\right.
$$

Then

$$
A^{i j ; a b, c d}=A^{i j ; b a, c d}=A^{i j ; a b, d c}
$$

Identities

$$
\begin{aligned}
& \bullet A^{i j ; a b, c d}+A^{i j ; a c, d b}+A^{i j ; a d, b c}=0 \\
& \bullet A^{i j ; a b, c d}=A^{i j ; c d, a b}
\end{aligned}
$$

N.B. We have

$$
\nabla_{j} A^{i j}=\frac{\partial A^{i j}}{\partial x_{j}}+\Gamma_{j a^{i}} A^{a j}+\Gamma_{j a^{j}} A^{i a}-\Gamma^{a}{ }_{j a^{A}} A^{i j}
$$

$\Rightarrow$

$$
\nabla_{j} A^{i j}=A^{i j ; a b, c d} g_{a b, c d j}+A^{i j ; a b, c} g_{a b, c j}+A^{i j ; a b} g_{a b, j}+\Gamma_{j a^{i}} A^{a j}
$$

$\Rightarrow$

$$
\frac{a\left(\nabla_{j} A^{i j}\right)}{\partial g_{a b, r s t}}=\frac{1}{3}\left(A^{i t ; a b, r s}+A^{i s ; a b, t r}+A^{i r ; a b, s t}\right)
$$

Identities
$-A^{i t ; a b, r s}+A^{i s ; a b, t r}+A^{i r ; a b, s t}=0$.

- $A^{i t ; a b, r s}=A^{r s ; a b, i t}$.

Therefore

$$
\Rightarrow
$$

$$
\begin{aligned}
& A^{i t ; a b, r s}=A^{i t ; r s, a b} \\
&=A^{a b ; r s, i t} \\
&=A^{a b ; i t, r s} \\
& A^{i t ; a b, r s}+A^{i a ; b t, r s}+A^{i b ; t a, r s} \\
&=A^{a b ; i t, r s}+A^{i a ; b t, r s}+A^{i b ; t a, r s}
\end{aligned}
$$

$$
\begin{aligned}
& =A^{a b ; r s, i t}+A^{i a ; r s, b t}+A^{i b ; r s, t a} \\
& =A^{i t ; r s, a b}+A^{b t ; r s, i a}+A^{t a ; r s, i b} \\
& =A^{t i ; r s, a b}+A^{t b ; r s, i a}+A^{t a ; r s, i b} \\
& =A^{t i ; r s, a b}+A^{t b ; r s, i a}+A^{t a ; r s, b i} \\
& =0
\end{aligned}
$$

Notation: For $p=1,2, \ldots$, write
[Note: This prescription defines an element of $\mathrm{MC}_{\mathrm{n}}(2+4 \mathrm{p}, 0,1,2)$.]
Special Case Take $p=2$-- then

$$
\begin{aligned}
& A_{A}^{a b} ;_{1} i_{1} i_{2}, i_{3} i_{4} ; i_{5} i_{6}, i_{7} i_{8} \\
& \quad=\partial A{ }^{a b ; i_{1} i_{2}, i_{3} i_{4} / \partial g_{i_{5}} i_{6}, i_{7} i_{8}} \\
& \quad=\partial^{2} A{ }^{a b} / \partial g_{i_{1} i_{2}, i_{3} i_{4}}{ }^{\partial g_{i_{5}} i_{6}, i_{7} i_{8}} .
\end{aligned}
$$

$$
\text { Properties of } A{ }^{a b ; i_{1}-i_{4 p}}
$$

(1) It is symmetric in $a b$ and $i_{2 k-1} i_{2 k}(k=1, \ldots, 2 p)$.
(2) It is symmetric under the interchange of $a b$ and $i_{2 k-1} i_{2 k}(k=1, \ldots, 2 p)$.
(3) It satisfies the cyclic identity involving any three of the four indices $(a b)\left(i_{2 k-1} i_{2 k}\right) \quad(k=1, \ldots, 2 p)$.

$$
\begin{aligned}
& { }_{A}^{a b ;} i_{1} i_{2}, i_{3} i_{4} ; \ldots ; i_{4 p-3}{ }^{i_{4 p-2}},{ }^{i_{4 p-1}}{ }^{i_{4 p}}
\end{aligned}
$$

9. 

[Note: To illustrate (3), take p=2 -- then, e.g.,

$$
\begin{aligned}
& a b ; i_{1} i_{2}, i_{3} i_{4} ; i_{5} i_{6}, i_{7} i_{8} \\
& +A_{1} ; i_{2}, i_{3} i_{4} ; i_{5} i_{6}, i_{7} i_{8} \\
& +A^{i_{1}} a_{;} b i_{2}, i_{3} i_{4} ; i_{5} i_{6}, i_{7} i_{8} \\
& =0 .]
\end{aligned}
$$

Definition: An indexed entity

$$
{ }_{B}^{j_{1} j_{2} \cdots j_{2 q-1}{ }_{2 q}}(q>1)
$$

is said to have property $S$ if:
$\left(S_{1}\right)$ It is symmetric in $j_{2 \ell-1} j_{2 \ell}(\ell=1, \ldots, q)$;
$\left(S_{2}\right)$ It is symmetric under the interchange of $j_{1} j_{2}$ and $j_{2 \ell-1} j_{2 \ell}$ $(\ell=2, \ldots, q) ;$
$\left(S_{3}\right)$ It satisfies the cyclic identity involving any three of the four indices $\left(j_{1} j_{2}\right)\left(j_{2 \ell-1} j_{2 \ell}\right) \quad(\ell=2, \ldots, q)$.

In particular:

$$
A_{A}^{a b ; i_{1}}-i_{4 p}
$$

has property $S$.

LEMMA If an indexed entity has property $S$, then it vanishes whenever three (or more) indices coincide.

Recall that

$$
N=\left\{_{-}^{n / 2 \text { if } n \text { is even }} \begin{array}{l}
(n+1) / 2 \text { if } n \text { is odd. }
\end{array}\right.
$$

LEMMA If M is any integer $\geq \mathrm{N}$ and if

$$
{ }_{B}^{j_{1} j_{2} \cdots j_{4 M+1} j_{4 M+2}}
$$

is an indexed entity with property $S$, then

$$
{ }_{B}^{j_{1} j_{2} \cdots j_{4 M+1}{ }_{4 M+2}}=0
$$

[In fact,

$$
4 \mathrm{M}+2 \geq 4 \mathrm{~N}+2>2 \mathrm{n},
$$

thus at least three of the indices

$$
j_{1}, j_{2}, \ldots, j_{4 M+1}, j_{4 M+2}
$$

coincide.]

So, as a corollary,

$$
A^{a b ; i_{1}-i_{4 N}}=0
$$

Consequently,

$$
\begin{aligned}
& A^{a b ; i_{1}}-i_{4(N-1)} \\
= & \Phi^{a b ; i_{1}}-i_{4(N-1)}\left(g_{r s}, g_{r s, t}\right)
\end{aligned}
$$

Here

$$
{ }_{\Phi}^{a b ; i_{1}}-i_{4(N-1)} \in \mathrm{MC}_{n}(4 \mathrm{~N}-2,0,1,1)
$$

has property $S$. But, thanks to the Independence Theorem,

$$
{ }_{\Phi}^{a b ; i_{1}-i_{4(N-1)}\left(g_{r s}, g_{r s, t}\right)=\Phi^{a b ; i_{1}}-i_{4(N-1)}\left(g_{r s}\right) .}
$$

Therefore

$$
\begin{aligned}
& \quad A^{a b ; i_{1}-i_{4(N-2)}} \\
& ={ }_{\Phi}^{a b ; i_{1}-i_{4(N-1)} g_{i_{4(N-1)-3} i_{4(N-1)-2}, i_{4(N-1)-1} i_{4(N-1)}}} \begin{array}{l}
\quad+\varphi^{a b}\left(g_{r s}, g_{r s, t}\right)
\end{array} .
\end{aligned}
$$

Rappel: We have

$$
R_{j k i \ell}=\frac{1}{2}\left(g_{j \ell, k i}-g_{j i, k \ell}+g_{k i, j \ell}-g_{k \ell, j i}\right)+r_{j k i \ell}
$$

where

$$
\Gamma_{j k i l}=\Gamma_{a k i} r^{a}{ }_{j l}-\Gamma_{a k l} I^{I^{a}}{ }_{j i} .
$$

Put

$$
\left[\begin{array}{rl}
i & =i_{4(N-1)-3} \\
j & =i_{4(N-1)-2} \\
k & =i_{4(N-1)-1} \\
\ell & =i_{4(N-1)}
\end{array}\right.
$$

Then

$$
{ }_{\Phi}^{a b ; i_{l}-i_{4(N-1)} R_{j k i \ell}}
$$

$$
=-\frac{3}{2} \Phi^{a b ; i_{1}-i_{4(N-1)}} g_{i j, k \ell}
$$

$$
+\Phi{ }^{a b ; i_{l}-i_{4(N-l)} \Gamma_{j k i \ell}}
$$

$\Rightarrow$

$$
\begin{gathered}
A^{a b ; i_{l}-i_{4(N-2)}} \\
=-\frac{2}{3} \Phi^{a b ; i_{l}-i_{4(N-l)}^{R_{j k i \ell}}+\psi^{a b},}
\end{gathered}
$$

where the metric concomitant

$$
\psi^{a b}=\varphi^{a b}+\frac{2}{3} \Phi^{a b ; i_{l}-i_{4(N-1)} \Gamma_{j k i l}}
$$

is at most a function of $g_{r s}$ and $g_{r s, t}$, hence is a function of $g_{r s}$ alone. Now iterate the procedure... .

Summary: We have

$$
A^{a b}=\sum_{p=1}^{N-1} C_{p}{ }^{a b ;} i_{1}-i_{4 p} \prod_{q=1}^{p} R_{i_{4 q-2}}{ }_{4 q-1} i_{4 q-3^{i} 4 q}+\Psi^{a b} .
$$

Here, the $C_{p}$ are constants,

$$
{ }_{\Phi}^{a b ; i_{1}-i_{4 p_{\in M C_{n}}}(2+4 p, 0,1,0)}
$$

has property $S$, and

$$
\Psi^{a b} \operatorname{MC}_{n}(2,0,1,0)
$$

is symmetric, thus has the form

$$
\lambda|g|^{1 / 2}{ }_{g} a b
$$

for some constant $\lambda$.

It remains to explicate the

$$
{ }_{\Phi}^{a b ; i_{1}}-i_{4 p}
$$

LEMMA Fix p:l $\leq p \leq N-1$. Denote by $S^{a b}(n, 4 p)$ the subspace of $M_{n}(2+4 p, 0,1,0)$ consisting of those entities with property $S-$ then

$$
\operatorname{dim} S^{a b}(n, 4 p)=1
$$

Notation: Put

$$
D_{a b c d}^{i j k l}=\frac{1}{2}\left(\delta^{i}{ }_{a} \delta^{j}{ }_{d}+\delta^{i}{ }_{d} \delta^{j}{ }_{a}\right)\left(\delta^{k}{ }_{b} \delta^{l}{ }_{c}+\delta^{k}{ }_{c} \delta^{\ell}{ }_{b}\right) .
$$

Maintaining the assumption that $l \leq p \leq N-l$, define

$$
\mathrm{D}_{\mathrm{ab} ; \mathrm{i}_{1}}-\mathrm{i}_{4 \mathrm{p}}^{\in \mathrm{MC}_{\mathrm{n}}}{ }^{(2+4 \mathrm{p}, 0,1,0)}
$$

by

$$
\begin{aligned}
& { }_{D}{ }^{a b ;} i_{1}-i_{4 p}
\end{aligned}
$$

$$
\begin{aligned}
& \times \mathrm{g}^{\mathrm{r}_{1} \mathrm{~s}_{1} \ldots \mathrm{r}_{2 \mathrm{p}} \mathrm{~s}_{2 \mathrm{p}}, ~}
\end{aligned}
$$

Then

$$
{ }_{D}^{a b ; i_{1}}-i_{4 p_{\in S}}{ }_{(n, 4 p)}
$$

Moreover,

$$
\mathrm{D}^{a b ; i_{1}-i_{4 p} \neq 0, ~}
$$

as can be seen by noting that

$$
\begin{aligned}
& D^{a b ; i_{1}}-i_{4 p_{g_{a b}} i_{1} i_{2}} \cdots g_{i_{4 p-1} i_{4 p}}
\end{aligned}
$$

$$
\begin{aligned}
& =(-1)^{\mathrm{p}} 2^{\mathrm{p}+1} \frac{\mathrm{n}!}{(\mathrm{n}-2 \mathrm{p}-1)!} \quad(1 \leq \mathrm{p} \leq \mathrm{N}-1 \Rightarrow \mathrm{n} \geq 2 \mathrm{p}+1) . \\
& \text { Accordingly, } \Phi^{a b ; i_{1}-i_{4 p}} \text { is a constant multiple of } D^{a b ; i_{1}} \text { - }^{i_{4 p}} .
\end{aligned}
$$

Therefore

$$
A^{a b}=\sum_{p=1}^{N-1} C_{p} D^{a b ; i_{1}}-i_{4 p} \prod_{q=1}^{p} R_{i_{4 q-2}} i_{4 q-1^{i_{4}} 4-3^{i_{4 q}}}+\lambda|g|^{1 / 2} a b
$$

after possible redefinition of the $C_{p}$.

## Observation:

$$
\begin{aligned}
& D_{D}^{a b ;} i_{1}-i_{4 p} \\
& =|g|^{1 / 2}\left(2^{-p}\right)\left(\delta^{a j_{1} \cdots j_{2 p}}{ }_{r r_{1}} \cdots r_{2 p} g^{b r}+\delta^{b j_{1} \cdots j_{2 p}}{ }_{r r_{1}} \cdots r_{2 p} g^{a r}\right) \\
& \times g^{r_{1} s_{1}} \ldots g^{r_{2 p} s_{2 p}} \\
& \times\left(D^{i_{1} i_{2} i_{3} i_{4}}{ }_{j_{1} j_{2} s_{1} s_{2}}-D^{i_{1} i_{2} i_{3} i_{4}} j_{2} j_{1} s_{1} s_{2}\right)
\end{aligned}
$$

15. 

To exploit this, note that

$$
\begin{aligned}
& =-D^{i^{i}} 4 q-3^{i_{4}} 4 q-2^{i^{i}} 4 q-1^{i^{i}} 4 q{ }_{j}{ }_{2 q-1} j_{2 q^{s}}{ }_{2 q-1} s_{2 q}{ }^{R_{i}} 4 q-1^{i} 4 q-3^{i^{4}} 4 q-2^{i_{4}} 4 q \\
& =-\left(R_{j_{2 q-1}} j_{2 q} s_{2 q-1} s_{2 q}+R_{j_{2 q-1}} s_{2 q-1} j_{2 q} s_{2 q}{ }^{\prime}\right.
\end{aligned}
$$

$$
\begin{aligned}
& \times R_{i^{i}}{ }_{q-2^{i}} 4 q-1^{i} 4 q-3^{i} 4 q \\
& =-3 R_{j q-1} j_{2 q} s_{2 q-1} s_{2 q} . \\
& \text { Now bring in }
\end{aligned}
$$

$$
g^{r_{2 q-1} s_{2 q-1}}{ }_{g}^{r_{2 q}}{ }^{s} 2 q
$$

and write

$$
\begin{gathered}
g^{r_{2 q-1} s_{2 q-1}}{ }_{g}^{r_{2 q} s^{s} 2 q_{R_{j}}}{ }_{2 q-1} j_{2 q} s_{2 q-1} s_{2 q} \\
\quad=R_{j_{2 q-1}}{ }_{2 q} r_{2 q-1} r_{2 q}
\end{gathered}
$$

$$
=R^{r_{2 q-1} r_{2 q}}{ }_{j 2 q-1} j_{2 q}
$$

Thus, after adjusting the constants, we conclude that

$$
\begin{aligned}
A^{a b}= & |g|^{1 / 2} \sum_{p=1}^{N-1} C_{p}\left(\delta^{a j_{1} \cdots j_{2 p}}{ }_{r r_{1} \cdots r_{2 p} g^{b r}+\delta^{b j_{1} \cdots j_{2 p}}{ }_{\left.r r_{1} \cdots r_{2 p} g^{a r}\right)}} \begin{array}{rl} 
& \times \prod_{q=1}^{p} R^{r}{ }_{2 q-1} r_{2 q}{ }_{j}{ }_{2 q-1} j_{2 q}+\lambda|g|^{1 / 2} g^{a b} .
\end{array}\right.
\end{aligned}
$$

But

$$
\begin{aligned}
& \delta^{a j_{1} \cdots j_{2 p}}{ }_{r r_{1}} \cdots r_{2 p} g^{b r_{R}{ }^{r} r^{r_{2}}}{ }_{j_{1} j_{2}} \cdots R^{r_{2 p-1} r_{2 p}}{ }_{j p-1} j_{2 p} \\
& =\delta^{b j_{1} \cdots j_{2 p}} \underset{r r_{1} \cdots r_{2 p}}{ } g^{a r_{R} r_{1} r_{2}}{ }_{j_{1} j_{2}} \cdots R^{r_{2 p-1} r_{2 p}} j_{2 p-1} j_{2 p} .
\end{aligned}
$$

So, modulo obvious notational changes, the proof of the theorem is complete.
Remark: The expression
is a polynomial of degree $N-1$ in the $R^{a b}$. Therefore, if $A^{i j}$ is linear in the second derivatives of the $g_{a b}$, then $C_{p}=0$ for $p>1$, hence the $A^{i j}$ must have the form

$$
C|g|^{l / 2}\left[R^{i j}-\frac{1}{2} S_{g}^{i j}\right]+\lambda|g|^{1 / 2} g^{i j}
$$

Rappel: Let

$$
L \in \mathrm{MC}_{\mathrm{n}}(0,0,1,2) .
$$

Then

$$
E^{i j}(L)=-\frac{1}{2} g^{i j} L+\frac{2}{3} \Lambda^{k \ell, i a_{R} j_{k l a}-\Lambda^{i j}, k \ell} \underset{; k \ell}{i} .
$$

THEOREM Let

$$
L=-|g|^{1 / 2} \sum_{p=1}^{N-1} 2 C_{p} \delta^{\ell_{1} \cdots \ell_{2 p}}{ }_{k_{1}} \cdots k_{2 p} R^{k_{1} k_{2}} \ell_{1} \ell_{2} \cdots R^{k_{2 p-1} k_{2 p}} \ell_{2 p-1} \ell_{2 p}-2 \lambda|g|^{1 / 2} .
$$

Then

$$
E^{i j}(L)=A^{i j}
$$

To begin with

$$
\begin{gathered}
\Lambda^{a b, c d} \\
=-|g|^{1 / 2} \sum_{p=1}^{N-1} 2 p c_{p} \delta^{\ell} \cdots \ell_{2 p} k_{1} \cdots k_{2 p} R^{k_{3} k_{4}} \ell_{3} \ell_{4} \cdots R^{k_{2 p-1} k_{2 p}} \ell_{2 p-1} \ell_{2 p} \\
\quad \times g^{k_{1} s k_{2} r}{ }_{p}^{a b c d} \ell_{1} \ell_{2} s r
\end{gathered}
$$

from which

$$
\begin{aligned}
& \Lambda_{i}^{a b, c d} \\
& =-|g|^{1 / 2}{\underset{\mathrm{p}=1}{\mathrm{~N}-1} 2 \mathrm{p}(\mathrm{p}-1) \mathrm{c}_{\mathrm{p}} \delta^{\ell_{1} \cdots \ell_{2 p}}{ }_{k_{1} \cdots \mathrm{k}_{2 \mathrm{p}}} \nabla_{\mathrm{c}^{\mathrm{R}}} \mathrm{k}_{3} \mathrm{k}_{4} \ell_{3} \ell_{4} .} \\
& \times R^{k_{5} k_{6}}{ }_{\ell_{5} \ell_{6}} \ldots R^{k_{2 p-1} k_{2 p}} \ell_{2 p-1} \ell_{2 p}{ }^{k_{1} s k_{2} r_{D}}{ }^{a b c d} \ell_{1} \ell_{2} s r \cdot
\end{aligned}
$$

Standard manipulations involving the Bianchi identities then imply that

$$
\Lambda_{;}^{\mathrm{ab}, \mathrm{~cd}}=0
$$

Matters thus reduce to consideration of

$$
-\frac{1}{2} g^{i j_{L}}+\frac{2}{3} \Lambda^{k \ell, i a_{R} j_{k \ell a}}
$$

or still, to consideration of

$$
-\frac{1}{2} \delta_{j}^{i}{ }_{j}^{L}+\frac{2}{3} \Lambda^{k l, i a_{R}}{ }_{j k l a}
$$

the claim being that this expression is equal to $A^{i}{ }_{j}$, i.e., to

$$
|g|^{1 / 2} \sum_{p=1}^{N-1} c_{p} \delta^{i \ell_{1} \cdots \ell_{2 p}}{ }_{j k_{1}} \cdots k_{2 p} R^{k_{1} k_{2}} \ell_{1} \ell_{2} \cdots R^{k_{2 p-1} k_{2 p}} \ell_{2 p-1} \ell_{2 p}+\lambda|g|^{1 / 2} \delta^{i}{ }_{j}
$$

But

$$
\begin{aligned}
& \frac{2}{3} \Lambda^{k \ell, i a_{R}}{ }_{j k \ell a} \\
= & -\frac{2}{3}|g|^{1 / 2} \sum_{p=1}^{N-1} 2 p C_{p}\left(\frac{3}{2}\right) \delta^{i \ell_{2} \cdots \ell_{2 p}} k_{1} \cdots k_{2 p} R^{k_{1} k_{2}}{ }_{j \ell_{2}} \cdots R^{k_{2 p-1} k_{2 p}} \ell_{2 p-1} \ell_{2 p}
\end{aligned} .
$$

Therefore

$$
\begin{aligned}
& -\frac{1}{2} \delta^{i}{ }_{j}{ }^{L}+\frac{2}{3} \Lambda^{k \ell, i a_{R}}{ }_{j k \ell a} \\
& =|g|^{1 / 2} \sum_{\mathrm{p}=1}^{\mathrm{N}-1} \mathrm{C}_{\mathrm{p}}\left(\delta^{\mathrm{i}}{ }_{j} \delta^{\ell_{1} \cdots \ell_{2 p}}{ }_{\mathrm{k}_{1} \cdots k_{2 p}} \mathrm{R}^{\mathrm{k}_{1} \mathrm{k}_{2}} \ell_{\ell_{1} \ell_{2}} \cdots \mathrm{R}^{\mathrm{k}_{2 p-1} \mathrm{k}_{2 p}} \ell_{2 p-1} \ell_{2 p}\right. \\
& \left.-2 p \delta^{i \ell_{2} \cdots \ell_{2 p}}{ }_{k_{1} \cdots k_{2 p}} R^{k_{1} k_{2}}{ }_{j \ell_{2}} \cdots R^{k_{2 p-1} k_{2 p}} \ell_{2 p-1} \ell_{2 p}\right)+\lambda|g|^{1 / 2} \delta^{i}{ }_{j} \\
& =A_{j}^{i},
\end{aligned}
$$

as claimed.

Remark: Let $A \in \mathrm{MC}_{3}(2,0,1,3)$ be symmetric and divergence free -- then it can be shown that

$$
A^{i j}=C|g|^{1 / 2} G_{G}^{i j}+c^{i j}+\lambda|g|^{1 / 2} g^{i j},
$$

where $C, C$, and $\lambda$ are constants. But, as we know, there does not exist a lagrangian

$$
L \in \mathrm{MC}_{3}(0,0,1, \mathrm{~m})
$$

such that $E^{i j}(L)=C^{i j}$.
Given $\mathrm{p} \geq 1$, put

$$
L_{p}=-|g|^{1 / 2}{ }_{2 \delta}^{\ell_{1} \cdots \ell_{2 p}}{k_{1} \cdots k_{2 p} R^{k_{1} k_{2}} \ell_{1} \ell_{2} \cdots R^{k_{2 p-1} k_{2 p}} \ell_{2 p-1} \ell_{2 p}}
$$

Then

$$
E^{i j}\left(L_{p}\right)=|g|^{1 / 2}{ }_{g}{ }^{i k_{\delta}}{ }^{j \ell_{1} \cdots \ell_{2 p}}{ }_{k k_{1} \cdots k_{2 p} R^{k_{1} k_{2}} \ell_{1} \ell_{2} \cdots R^{k_{2 p-1} k_{2 p}} \ell_{2 p-1} \ell_{2 p} .} .
$$

Reality Check Take $p=1$ - then

$$
\begin{aligned}
L_{1} & =-|g|^{1 / 2}{ }_{2 \delta}^{\ell_{1} \ell_{2}}{ }_{k_{1} k_{2}}{ }^{\mathrm{k}_{1} \mathrm{k}_{2}}{ }_{\ell_{1} \ell_{2}} \\
& =-|g|^{1 / 2} 4 \mathrm{~S}
\end{aligned}
$$

and

$$
\begin{aligned}
& E^{i j}\left(-|g|^{1 / 2} 4 S\right) \\
& =|g|^{1 / 2}\left[g^{i k_{\delta}}{ }^{j \ell_{1} \ell_{2}}{ }_{k k_{1} k_{2}}{ }^{k_{1} k_{2}} \ell_{1} \ell_{2}\right] \\
& =|g|^{1 / 2}\left(-4 G^{i j}\right) .
\end{aligned}
$$

I.e.:

$$
E^{i j}\left(|g|^{l / 2} S\right)=|g|^{l / 2}{ }_{G}^{i j}
$$

Example: Take $\mathrm{p}=2$-- then

$$
L_{2}=-|g|^{1 / 2} 8\left[S^{2}-4 R^{a b} R_{a b}+R^{\left.a b c d_{R_{a b c d}}\right]}\right.
$$

and

$$
E^{i j}\left(L_{2}\right)=|g|^{1 / 2} g^{i k_{8}}{ }^{j \ell_{1} \ell_{2} \ell_{3} \ell_{4}}{ }_{k k_{1} k_{2} k_{3} k_{4} R^{k_{1} k_{2}} \ell_{1} \ell_{2}^{R}{ }^{k_{3} k_{4}} \ell_{3} \ell_{4} .}
$$

Now take $\mathrm{n}=4$-- then

$$
\delta^{j \ell_{1} \ell_{2} \ell_{3} \ell_{4}}{ }_{k k_{1} k_{2} k_{3} k_{4}}=0 .
$$

Therefore in this case

$$
E^{i j}\left(|g|^{1 / 2}\left[S^{2}-4 R^{a b} R_{a b}+R_{a b c d}^{a b c d}\right]\right)=0 .
$$

FACT Suppose that $n=2 p-$ then locally, $L_{p}$ is an ordinary divergence.
Foreshadowing considerations to follow, it will be convenient to redefine $L_{p}$ as

$$
|g|^{1 / 2} \frac{1}{2^{p}}\left(\delta^{\ell_{1} \cdots \ell_{2 p}}{ }_{k_{1} \cdots k_{2 p}} R^{k_{1} k_{2}} \ell_{1} \ell_{2} \cdots R^{k_{2 p-1} k_{2 p}} \ell_{2 p-1} \ell_{2 p}\right),
$$

so that

$$
\begin{gathered}
E_{j}^{i}\left(L_{p}\right) \\
=-|g|^{1 / 2} \frac{1}{2^{p+1}}\left(\delta^{i \ell_{1} \cdots \ell_{2 p}}{ }_{j k_{1}} \cdots k_{2 p} R^{k_{1} k_{2}} \ell_{1} \ell_{2} \cdots R^{k_{2 p-1} k_{2 p}} \ell_{2 p-1} \ell_{2 p}\right)
\end{gathered}
$$

Let

$$
R_{j}^{i}(p)=\delta^{i \ell_{2} \cdots \ell_{2 p}}{k_{1} \cdots k_{2 p}}_{R^{k_{1} k_{2}}{ }_{j \ell_{2}} \cdots R^{k_{2 p-1}^{k}}{ }^{k_{2 p}} \ell_{2 p-1} \ell_{2 p} .}
$$

Then

$$
g^{i j_{R_{i j}}}(p)=S(p)
$$

where

$$
\mathrm{S}(\mathrm{p})=\delta^{\ell_{1} \cdots \ell_{2 p}}{ }_{k_{1} \cdots k_{2 p}} R^{k_{1} k_{2}}{ }_{\ell_{1} \ell_{2}} \cdots \mathrm{R}^{k_{2 p-1} k_{2 p}} \ell_{2 p-1} \ell_{2 p} .
$$

In addition,

$$
E^{i}{ }_{j}\left(L_{p}\right)=-|g|^{1 / 2} \frac{l}{2^{p+1}}\left(\delta^{i}{ }_{j} S(p)-2 p R_{j}^{i}(p)\right) .
$$

But

$$
\nabla_{j} E^{i j}\left(L_{p}\right)=0
$$

Therefore

$$
\begin{aligned}
& -|g|^{1 / 2} \frac{1}{2^{p+1}} \nabla_{j}\left(g^{i j} j_{S}(p)-2 p R^{i j}(p)\right)=0 \\
& \Rightarrow \\
& \nabla^{i} S(p)=2 p \nabla_{j} R^{i j}(p)
\end{aligned}
$$

or still,

$$
(d S(p))_{i}=\nabla_{i} S(p)=2 p \nabla^{j_{R_{i j}}}(p)
$$

[Note: We have

$$
\begin{aligned}
\nabla_{i} S(p) & =g_{i a} \nabla^{a_{S}}(p) \\
& =2 p g_{i a} \nabla_{j} R^{a j}(p) \\
& =2 p \nabla_{j} g_{i a} R^{a j}(p) \\
& =2 p \nabla_{j} R_{i}^{j}(p)
\end{aligned}
$$

$$
\begin{aligned}
& =2 p \nabla_{j} g^{j b_{R_{i b}}(p)} \\
& =2 p g^{b j_{\nabla_{j}} R_{i b}(p)} \\
& =2 p \nabla^{b} R_{i b}(p) \\
& \left.=2 p \nabla^{j} R_{i j}(p) \cdot\right]
\end{aligned}
$$

Remark: The higher order version of Ric is Ric (p):

$$
\operatorname{Ric}^{(p)}{ }_{i j}=R_{i j}(p)
$$

Ric (p) is symmetric and

$$
\operatorname{tr}_{g} \operatorname{Ric}(p)=S(p)
$$

the higher order version of the scalar curvature.
Reality Check Take $p=1$ - then $L_{1}=|g|^{1 / 2}$ S. Moreover

$$
R_{j}^{i}(1)=\delta^{i \ell_{2}}{k_{1} k_{2}}_{R^{k_{1} k_{2}}}^{j \ell_{2}}=2 R_{j}^{i}
$$

and

$$
\mathrm{S}(1)=\delta^{\ell_{1} \ell_{2}}{\mathrm{k}_{1} \mathrm{k}_{2}^{R}}_{\mathrm{k}_{1} \mathrm{k}_{2}}^{\ell_{1} \ell_{2}}=2 \mathrm{~S} .
$$

Therefore

$$
\begin{aligned}
E_{j}^{i}\left(L_{l}\right) & =-|g|^{1 / 2} \frac{1}{4}\left(\delta_{j}^{i} S(1)-2 R_{j}^{i}(1)\right) \\
& =-|g|^{1 / 2} \frac{1}{4}\left(\delta_{j}^{i} 2 S-4 R_{j}^{i}\right) \\
& =|g|^{1 / 2}\left(R_{j}^{i}-\frac{1}{2} \delta_{j}^{i} S\right) \\
& =|g|^{1 / 2}{ }_{G}{ }_{j}{ }_{j} .
\end{aligned}
$$

[Note: The relation

$$
(d S(1))_{i}=2 \nabla^{j_{R}}{ }_{i j}(1)
$$

reduces to

$$
(\mathrm{dS})_{i}=2 \nabla^{j_{R_{i j}}}
$$

in agreement with the earlier theory.]

Section 27: Globalization Let $M$ be a connected $C^{\infty}$ manifold of dimension $n$, which we shall take to be orientable with orientation $\mu$. Fix a semiriemannian structure $g$ on $M$.

Rappel: Given $x_{0} \in M$, there exists a connected open set $U \subset M$ containing $x_{0}$ and vector fields $E_{1}, \ldots, E_{n}$ on $U$ such that $\forall x \in U$,

$$
\left[\begin{array}{l}
g_{x}\left(E_{i}\left|x^{\prime}, E_{j}\right|_{x}\right)=\eta_{i j} \\
\quad\left\{\left.E_{1}\right|_{x}, \ldots,\left.E_{n}\right|_{x}\right\} \mu_{x} .
\end{array}\right.
$$

Because of this, there is no real loss of generality in assuming outright that the orthonormal frame bundle $I M(g)$ is trivial.
[Note: As a matter of convenience, in what follows we shall work with oriented orthonormal frames but all the results in this section can be formulated in terms of an arbitrary oriented frame.]

So fix an oriented orthonormal frame $E=\left\{E_{1}, \ldots, E_{n}\right\}$. Denoting by $\omega=\left\{\omega^{1}, \ldots, \omega^{\mathrm{n}}\right\}$ its associated coframe, put

$$
\theta_{i_{1}} \cdots i_{p}=\frac{1}{(n-p)!} \varepsilon_{i_{1}} \cdots i_{p} j_{p+1} \cdots j_{n} \omega^{j_{p+1}} \wedge \ldots \wedge \omega^{j_{n}} .
$$

Then

$$
\begin{aligned}
\theta^{i_{1} \cdots i_{p}} & =\varepsilon_{i_{1}} \ldots \varepsilon_{i_{p}}{ }^{\theta_{1}} \ldots i_{p} \quad \text { (no sum) } \\
& =*\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i_{p}}\right)
\end{aligned}
$$

Observation: View the $\theta_{i_{1}} \ldots i_{p}$ as the components of an element $\theta_{p}$ of $\Lambda^{\mathrm{n}-\mathrm{p}}\left(\mathrm{M} ; \mathrm{T}_{\mathrm{p}}^{0}(\mathrm{M})\right)$. Let $\nabla$ be the metric connection - then

$$
d^{\nabla} \theta_{p}=0
$$

Example: Suppose that p=2-t then

$$
d \theta_{i j}-\omega_{i}^{k} \theta_{k j}-\omega_{j}^{k}{ }_{j}^{\wedge} \theta_{i k}=0
$$

or, multiplying through by $\varepsilon_{j}$,

$$
d \theta_{i}^{j}-\omega_{i}^{k} \theta_{k}^{j}-\varepsilon_{j} \omega_{j}^{k} \wedge \theta_{i k}=0 .
$$

But

$$
\begin{aligned}
-\varepsilon_{j} \omega^{k} & { }_{j} \wedge \theta_{i k} \\
& =-\varepsilon_{j} \omega^{k}{ }_{j} \wedge \varepsilon_{k} \varepsilon_{k} \theta_{i k} \\
& =-\varepsilon_{j} \varepsilon_{k} \omega^{k}{ }_{j} \wedge \varepsilon_{k} \theta_{i k} \\
& =\omega^{j}{ }_{k} \wedge \theta_{i}
\end{aligned}
$$

Therefore

$$
d \theta_{i}^{j}-\omega_{i}^{k}{ }_{k}^{\wedge \theta_{k}}+\omega_{k^{\wedge}}^{j} \theta_{i}^{k}=0
$$

LEMMA We have

$$
\Omega^{i j} \wedge \theta_{i j}=\operatorname{Svol}_{g} \quad(=\star S)
$$

[In fact,

$$
\begin{aligned}
\Omega^{i j} \wedge \theta_{i j} & =\frac{1}{2} R^{i j}{ }_{k \ell}\left(\omega^{k} \wedge \omega^{\ell}\right) \wedge \theta_{i j} \\
& =\frac{1}{2} \varepsilon_{i} \varepsilon_{j} R_{i j k \ell}\left(\omega^{k} \wedge \omega^{\ell}\right) \wedge \theta_{i j}
\end{aligned}
$$

$$
\begin{aligned}
& =\frac{1}{2} R_{i j k \ell}\left(\omega^{\mathrm{k}} \wedge \omega^{\ell}\right) \wedge *\left(\omega^{\mathrm{i}} \wedge \omega^{\mathrm{j}}\right) \\
& =\frac{1}{2} R_{i j k \ell} g\left(\omega^{k} \wedge \omega^{\ell}, \omega^{i} \wedge \omega^{j}\right) \operatorname{vol}_{g} \\
& =\frac{1}{2} R_{i j k \ell} g\left(\omega^{i} \wedge \omega^{j}, \omega^{k} \wedge \omega^{\ell}\right) \operatorname{vol}_{g} \\
& =\frac{1}{2} R_{i j k \ell} \operatorname{det}\left[\begin{array}{ccc}
g\left(\omega^{i}, \omega^{k}\right) & g\left(\omega^{i}, \omega^{\ell}\right) \\
g\left(\omega^{j}, \omega^{k}\right) & g\left(\omega^{j}, \omega^{\ell}\right)
\end{array}\right] \mathrm{vol}_{g} \\
& =\frac{1}{2} R_{i j k \ell}\left(g^{i k_{g} j \ell}-g^{i \ell} g^{j k}\right) v o l_{g} .
\end{aligned}
$$

On the other hand,

$$
\begin{aligned}
S & =g^{j \ell_{R} k}{ }_{j k \ell} \\
& =g^{j \ell} g^{k i_{R_{i j k}}} \\
& =g^{i k_{g}}{ }^{j \ell_{R_{i j k}}}
\end{aligned}
$$

and

$$
\begin{aligned}
S & =g^{i \ell_{R} k}{ }_{i k \ell} \\
& =g^{i \ell} g^{k j j_{R_{j i k \ell}}} \\
& =-g^{i \ell} g^{\left.j k_{R_{i j k \ell}}\right]}
\end{aligned}
$$

Splitting Principle Start by writing

$$
\begin{aligned}
\star S & =\Omega^{i j}{ }_{\wedge \theta}{ }_{i j} \\
& =\varepsilon_{j} \Omega^{i j}{ }_{\wedge \varepsilon_{j}} \theta_{i j} \\
& =\Omega^{i}{ }_{j} \wedge \theta_{i}{ }^{j} \\
& =\left(d \omega^{i}{ }_{j}+\omega^{i}{ }_{k^{\wedge \omega}}{ }^{k}{ }_{j}\right) \wedge \theta_{i} \\
& =d\left(\omega^{i}{ }_{j} \wedge \theta_{i}{ }^{j}\right)+\omega^{i}{ }_{j} \wedge d \theta_{i}{ }^{j}+\omega^{i}{ }_{k}{ }^{\wedge \omega}{ }_{j}{ }_{j}{ }^{\wedge \theta_{i}}{ }^{j} .
\end{aligned}
$$

From the above

$$
d \theta_{i}^{j}-\omega_{i}^{k} \theta_{k}^{j}+\omega_{k^{\wedge}}^{j} \theta_{i}^{k}=0
$$

$\Rightarrow$

$$
\begin{aligned}
& \omega^{\mathbf{i}}{ }_{j} \wedge d \theta_{i}{ }^{j}=\omega^{i}{ }_{j}{ }^{\wedge \omega}{ }^{k}{ }_{i}{ }^{\wedge \theta_{k}}{ }^{j}-\omega^{\mathbf{i}}{ }_{j}{ }^{\wedge \omega}{ }^{j}{ }_{k}{ }^{\wedge \theta_{i}}{ }^{k} \\
& =\omega^{i}{ }_{j}{ }^{\wedge \omega^{k}}{ }_{i} \wedge \theta_{k}{ }^{j}-\omega_{k}^{i}{ }_{k}{ }^{k}{ }_{j} \wedge \theta_{i}{ }^{j} .
\end{aligned}
$$

Therefore

$$
\star S=\omega_{j}^{i}{ }_{j}{ }^{k}{ }_{i} \wedge \theta_{k}^{j}+d\left(\omega_{j}^{i} \wedge \theta_{i}^{j}\right)
$$

[Note: This is the analog of the decomposition

$$
|g|^{1 / 2} S=A+B_{, i}^{i},
$$

where the field functions $A, B^{i}$ are given by
5.

$$
\left[\begin{array}{l}
A=|g|^{1 / 2} g^{i j}\left(\Gamma_{i \ell^{\Gamma^{\ell}}}^{j k}{ }^{\ell}-\Gamma_{i j}^{k} \Gamma_{k \ell}^{\ell}\right) \\
\left.B^{i}=|g|^{1 / 2}\left(g^{k \ell} \Gamma_{k \ell}^{i}-g^{i k_{\Gamma} \ell}{ }_{k \ell \ell}\right) \cdot\right]
\end{array}\right.
$$

LEMMA We have

$$
\begin{aligned}
& \Omega^{i j} \wedge \theta_{i j}=-2 d\left(\omega_{i} \wedge * d \omega^{i}\right) \\
& -\left(d \omega^{i} \wedge \omega^{j}\right) \wedge *\left(d \omega_{j} \wedge \omega_{i}\right)+\frac{1}{2}\left(d \omega^{i} \wedge \omega_{i}\right) \wedge *\left(d \omega^{j} \wedge \omega_{j}\right)
\end{aligned}
$$

[First

$$
\begin{aligned}
& \Omega^{i j}{ }_{\wedge \theta_{j j}}=\Omega_{i j} \wedge \theta^{i j} \\
& \quad=\left(d \omega_{i j}+\omega_{i k} \wedge \omega_{j}^{k}\right) \wedge \star\left(\omega^{i} \wedge \omega^{j}\right) \\
& \quad=\left(d \omega_{i j}+\omega_{i}^{k}{ }_{\wedge \omega_{k j}}\right) \wedge \star\left(\omega^{i} \wedge \omega^{j}\right)
\end{aligned}
$$

But

$$
\begin{aligned}
& d\left(\omega_{i j} \wedge *\left(\omega^{i} \wedge \omega^{j}\right)\right) \\
& =d \omega_{i j^{\wedge *}}\left(\omega^{i} \wedge \omega^{j}\right)-\omega_{i j} \wedge d *\left(\omega^{i} \wedge \omega^{j}\right) \\
& =d \omega_{i j} \wedge *\left(\omega^{\dot{i}} \wedge \omega^{\mathfrak{j}}\right) \\
& \left.-\omega_{i j^{\wedge}}\left[-\omega^{i}{ }_{a^{\wedge *}} \omega^{a} \wedge \omega^{j}\right)-\omega_{a^{j}} \wedge *\left(\omega^{i} \wedge \omega^{a}\right)\right] \\
& =d \omega_{i j} \wedge *\left(\omega^{i} \wedge \omega^{\mathbf{j}}\right)+2 \omega_{i j}{ }^{\wedge} \omega^{i} a^{\wedge *}\left(\omega^{a} \wedge \omega^{\mathbf{j}}\right)
\end{aligned}
$$

$$
\begin{aligned}
& =d \omega_{i j} \wedge *\left(\omega^{i} \wedge \omega^{j}\right)-2 \omega_{i j^{\wedge}} \omega_{a}{ }^{i} \wedge *\left(\omega^{a} \wedge \omega^{j}\right) \\
& =d \omega_{i j^{\wedge *}}{\left(\omega^{i} \wedge \omega^{j}\right)}^{j}+2 \omega_{a}{ }^{i} \wedge \omega_{i j} \wedge *\left(\omega^{a} \wedge \omega^{j}\right) \\
& =d \omega_{i j} \wedge *\left(\omega^{i} \wedge \omega^{j}\right)+2 \omega_{i}{ }^{a} \wedge \omega_{a j} \wedge *\left(\omega^{i} \wedge \omega^{j}\right) \\
& =d \omega_{i j} \wedge *\left(\omega^{i} \wedge \omega^{j}\right)+2 \omega_{i}{ }^{\text {j}} \wedge \omega_{k j} \wedge *\left(\omega^{i} \wedge \omega^{j}\right) .
\end{aligned}
$$

Then

$$
\Omega^{i j} \wedge \theta_{i j}=d\left(\omega_{i j} \wedge *\left(\omega^{i} \wedge \omega^{j}\right)\right)-\omega_{i}^{k} \wedge \omega_{k j} \wedge *\left(\omega^{i} \wedge \omega^{j}\right) .
$$

## 1. Consider

$$
\mathrm{d}\left(\omega_{i j} \wedge *\left(\omega^{i} \wedge \omega^{j}\right)\right)
$$

Thus, as the metric connection is torsion free,

$$
\begin{aligned}
& d \omega^{i}=-\omega_{j}^{i}{ }_{j} \omega^{j} \\
& * \quad * \omega^{i}=-*\left(\omega_{j}^{i} \wedge \omega^{j}\right) \\
&=*\left(\omega^{j} \wedge \omega_{j}^{i}\right) \\
&=\varepsilon_{i} *\left(\omega^{j} \wedge \omega_{i j}\right) \\
&=\varepsilon_{i}{ }_{\omega_{i j}}{ }^{*} \omega^{j} \\
& \Rightarrow \quad \\
& \omega^{i} \wedge * d \omega^{i}=\varepsilon_{i} \omega^{i} \wedge\left(\varepsilon_{\omega_{i j}} * \omega^{j}\right)
\end{aligned}
$$

Next

$$
\omega^{i} \wedge * \omega^{\dot{j}}=g\left(\omega^{i}, \omega^{\dot{j}}\right) \mathrm{vol}_{g},
$$

7. 

where

$$
g\left(\omega^{i}, \omega^{j}\right)=\left\{^{\varepsilon_{i}} \begin{array}{c}
i=j \\
0
\end{array} \quad i \neq j .\right.
$$

Since $\tau_{\omega_{i i}}=0$, it follows that

$$
0=\imath_{\omega_{i j}}\left(\omega^{\dot{i}} \wedge \star \omega^{j}\right)=\left(\iota_{\omega_{i j}} \omega^{i}\right) \wedge \star \omega^{j}-\omega^{i} \wedge\left(\varepsilon_{\omega_{i j}} * \omega^{j}\right) .
$$

Therefore

$$
\begin{aligned}
\omega^{i} \wedge * d \omega^{i} & =\varepsilon_{i}\left(\varepsilon_{\omega_{i j}} \omega^{i}\right) \wedge * \omega^{j} \\
& =\varepsilon_{i} g\left(\omega_{i j}, \omega^{i}\right) * \omega^{j} .
\end{aligned}
$$

But

$$
\begin{aligned}
& *\left(\omega^{i} \wedge \omega^{j}\right) \wedge \omega_{i j} \\
& \quad=(-1)^{\imath}(-1)^{n-1} *\left(*\left(*\left(\omega^{i} \wedge \omega^{j}\right) \wedge \omega_{i j}\right)\right) \\
& \quad=(-1)^{\imath}(-1)^{n-1} *\left(\iota_{\omega_{i j}} * *\left(\omega^{i} \wedge \omega^{j}\right)\right) \\
& \quad=(-1)^{n-1} *\left(\iota_{\omega_{i j}}\left(\omega^{i} \wedge \omega^{j}\right)\right) \\
& \quad=(-1)^{n-1} *\left[\left(\iota_{\omega_{i j}} \omega^{i}\right) \wedge \omega^{j}-\omega^{i} \wedge\left(\iota_{\omega_{i j}} \omega^{j}\right)\right] \\
& \quad=(-1)^{n-1} *\left[g\left(\omega_{i j} \prime \omega^{i}\right) \omega^{j}-g\left(\omega_{i j}, \omega^{j}\right) \omega^{i}\right] \\
& \quad=(-1)^{n-1} *\left[g\left(\omega_{i j}, \omega^{i}\right) \omega^{j}-g\left(\omega_{j i}, \omega^{i}\right) \omega^{j}\right]
\end{aligned}
$$

$$
\begin{aligned}
= & 2(-1)^{n-1} g\left(\omega_{i j} \omega^{i}\right) * \omega^{j} \\
= & 2(-1)^{n-1} \varepsilon_{i}\left(\omega^{i} \wedge * d \omega^{i}\right) \\
= & 2(-1)^{n-1}\left(\omega_{i} \wedge * d \omega^{i}\right) \\
\Rightarrow \quad & d\left(\omega_{i j^{\wedge}}{ }^{i}\left(\omega^{i} \wedge \omega^{j}\right)\right) \\
= & (-1)^{n-2} d\left(*\left(\omega^{i} \wedge \omega^{j}\right) \wedge \omega_{i j}\right) \\
= & 2(-1)^{n-2}(-1)^{n-1} d\left(\omega_{i} \wedge * d \omega^{i}\right) \\
& =-2 d\left(\omega_{i}^{\left.\wedge * d \omega^{i}\right) .}\right.
\end{aligned}
$$

2. Consider

$$
\begin{aligned}
& -\omega_{i}{ }^{k} \wedge \omega_{k j} \wedge *\left(\omega^{i} \wedge \omega^{j}\right) \\
& =\omega_{i^{\wedge}}^{k} \omega_{k j} \wedge *\left(\omega^{i} \wedge \omega^{j}\right) \\
& =\varepsilon_{k} \omega_{k i^{\wedge}} \omega_{k j} \wedge *\left(\omega^{i} \wedge \omega^{j}\right)
\end{aligned}
$$

or still,

$$
\varepsilon_{k}\left[g\left(\omega_{k i}, \omega^{i}\right) g\left(\omega_{k j}, \omega^{j}\right)-g\left(\omega_{k i}, \omega^{j}\right) g\left(\omega_{k j}, \omega^{i}\right)\right] v o l_{g}
$$

Rappel: Let $\mathrm{a}, \mathrm{b}=1, \ldots, \mathrm{n}-$ then

$$
\omega_{a b}=\varepsilon_{a} \varepsilon_{E_{b}} d \omega^{a}-\varepsilon_{b} \varepsilon_{E_{a}}^{d \omega^{b}-\frac{1}{2}} \sum_{c}^{\Sigma} \varepsilon_{c} \ell_{E_{b}} \ell_{E_{a}}\left(d \omega^{c} \wedge \omega^{c}\right) .
$$

$$
\begin{aligned}
& \longrightarrow g\left(\omega_{k i}, \omega^{i}\right)=\iota_{\omega^{i}}{ }^{\omega_{k i}}
\end{aligned}
$$

$$
\begin{aligned}
& =-\varepsilon_{i} \varepsilon_{k^{e}}{ }_{\omega}{ }^{i}{ }_{\omega}{ }^{k}{ }^{d \omega}{ }^{i} \\
& =-\varepsilon_{i} \varepsilon_{k}{ }^{\iota}{ }_{\omega}{ }^{k}{ }^{i}{ }^{i d \omega}{ }^{i} \\
& =\varepsilon_{i} \varepsilon_{k}{ }_{\omega}{ }_{\omega}{ }_{\wedge \omega}{ }^{d}{ }^{d \omega}{ }^{i} \\
& =\varepsilon_{i} \varepsilon_{k} g\left(\omega^{i} \wedge \omega^{k}, d \omega^{i}\right) \\
& =\varepsilon_{i} \varepsilon_{k} g\left(\omega^{k}, \iota_{\omega^{i}}{ }^{\mathrm{d}}{ }^{\mathrm{i}}\right) .
\end{aligned}
$$

Analogously

$$
g\left(\omega_{k j} \omega^{j}\right)=\varepsilon_{j} \varepsilon_{k} g\left(\omega^{k},{ }_{\omega}{ }_{j}{ }^{d} \omega^{j}\right) .
$$

Therefore

$$
\begin{aligned}
& \varepsilon_{k} g\left(\omega_{k i}, \omega^{i}\right) g\left(\omega_{k j}, \omega^{j}\right) \\
& \quad=\varepsilon_{k} \varepsilon_{i} \varepsilon_{j} g\left(\omega^{k},{ }_{\omega}{ }_{i^{i}} d \omega^{i}\right) g\left(\omega^{k}, c_{\omega} d \omega^{j}\right) .
\end{aligned}
$$

Write

$$
\left[\begin{array}{l}
\imath_{\omega}{ }_{j}{ }^{\mathrm{d} \omega^{i}}=g\left(\omega^{k}, \iota_{\omega}{ }^{\left.i d \omega^{i}\right) \varepsilon_{k} \omega^{k}}\right. \\
\imath_{\omega^{j}}{ }^{\mathrm{d} \omega^{j}}=g\left(\omega^{\ell}, \iota_{\omega}{ }^{\mathrm{d}} \omega^{j}\right) \varepsilon_{\ell} \omega^{\ell} .
\end{array}\right.
$$

Then

$$
\begin{aligned}
& g\left(\iota{ }_{\omega}{ }^{\mathrm{d} \omega}{ }^{\mathrm{i}},{ }_{\omega}{ }_{\omega}{ }^{\mathrm{d}}{ }^{\mathrm{d} \omega}{ }^{\mathrm{j}}\right) \\
& =g\left(g\left(\omega^{k},{ }_{\omega}{ }_{i^{i}} \omega^{i}\right) \varepsilon_{k} \omega^{k}, g\left(\omega^{l}, \iota_{\omega}{ }^{j} d \omega^{j}\right) \varepsilon_{\ell} \omega^{l}\right) \\
& =g\left(\omega^{k}, \iota{ }_{\omega}{ }^{i}{ }^{\mathrm{d}}{ }^{\mathrm{i}}\right) \mathrm{g}\left(\omega^{\ell},{ }_{\omega}{ }_{\omega}{ }^{\mathrm{j}} \omega^{\mathrm{j}}\right) \varepsilon_{k}{ }^{\varepsilon} \ell^{g}\left(\omega^{\mathrm{k}}, \omega^{\ell}\right) \\
& =\varepsilon_{k} g\left(\omega^{k}, \iota_{\omega}{ }^{i} \omega^{i}\right) g\left(\omega^{k}, \iota_{\omega}{ }^{j} d \omega^{j}\right)
\end{aligned}
$$

$\Rightarrow$

$$
\begin{aligned}
& \varepsilon_{k} g\left(\omega_{k i}{ }^{\prime} \omega^{i}\right) g\left(\omega_{k j}, \omega^{j}\right) \\
& =\varepsilon_{i} \varepsilon_{j} g\left(\iota_{\omega^{i}}{ }^{\left.\mathrm{d} \omega^{i},{ }_{\omega}{ }_{\omega}{ }^{j} d \omega^{j}\right)}\right. \\
& =\varepsilon_{i} \varepsilon_{j} g\left(d \omega^{i}, \omega^{i} \wedge \iota_{\omega}{ }^{j} d \omega^{j}\right) \\
& =\varepsilon_{i} \varepsilon_{j} g\left(d \omega^{i}, \iota_{\omega^{j}} j^{i} \wedge d \omega^{j}-\iota_{\omega} j^{j}\left(\omega^{i} \wedge d \omega^{j}\right)\right) \\
& =\varepsilon_{i} \varepsilon_{j} g\left(d \omega^{i},{ }_{\omega}{ }_{\omega} j^{i}{ }^{i} \wedge d \omega^{j}\right)-\varepsilon_{i} \varepsilon_{j} g\left(d \omega^{i},{ }_{\omega}{ }_{\omega}{ }^{j}\left(\omega^{i} \wedge d \omega^{j}\right)\right)
\end{aligned}
$$

$$
\begin{aligned}
& =\varepsilon_{i} g\left(d \omega^{i}, d \omega^{i}\right)-\varepsilon_{i} \varepsilon_{j} g\left(\omega^{\dot{j}} \wedge d \omega^{i}, \omega^{i} \wedge d \omega^{j}\right) \\
& =\varepsilon_{i} g\left(d \omega^{i}, d \omega^{i}\right)-\varepsilon_{i} \varepsilon_{j} g\left(\omega^{i} \wedge d \omega^{j}, \omega^{j} \wedge d \omega^{i}\right) . \\
& \longrightarrow g\left(\omega_{k i}, \omega^{j}\right)
\end{aligned}
$$

$$
\begin{aligned}
& =\varepsilon_{i} \varepsilon_{k}\left(g\left(d \omega^{k}, \omega^{i} \wedge \omega^{j}\right)-g\left(d \omega^{i}, \omega^{k} \wedge \omega^{j}\right)-\frac{1}{2} \sum_{c}^{\sum} \varepsilon_{c} g\left(d \omega^{C} \wedge \omega^{c}, \omega^{k} \wedge \omega^{i} \wedge \omega^{j}\right)\right) .
\end{aligned}
$$

The term involving $\Sigma$ can be simplified:

$$
\begin{aligned}
& -\frac{1}{2} \sum_{c}^{\sum} \varepsilon_{c} g\left(d \omega{ }^{c} \wedge \omega^{c}, \omega^{k} \wedge \omega^{i} \wedge \omega^{j}\right)
\end{aligned}
$$

$$
\begin{aligned}
& =-\frac{1}{2} \sum_{c} \varepsilon_{c} g\left(d \omega^{c}, \iota{ }_{\omega} c^{\omega^{k} \wedge \omega^{i} \wedge \omega^{j}}-\omega^{k} \wedge \iota{ }_{\omega} \omega^{\omega^{i} \wedge \omega^{j}}+\omega^{k} \wedge \omega^{i} \wedge \iota{ }_{\omega}{ }^{c^{j}}\right) \\
& =-\frac{1}{2}\left(g\left(d \omega^{k}, \omega^{i} \wedge \omega^{j}\right)-g\left(d \omega^{i}, \omega^{k} \wedge \omega^{j}\right)+g\left(d \omega^{j}, \omega^{k} \wedge \omega^{i}\right)\right) .
\end{aligned}
$$

Therefore

$$
\begin{gathered}
g\left(\omega_{k i}, \omega^{j}\right) \\
=\varepsilon_{i} \varepsilon_{k} \frac{1}{2}\left(g\left(d \omega^{k}, \omega^{i} \wedge \omega^{j}\right)-g\left(d \omega^{i}, \omega^{k} \wedge \omega^{j}\right)-g\left(d \omega^{j}, \omega^{k} \wedge \omega^{i}\right)\right) .
\end{gathered}
$$

Analogously

$$
g\left(\omega_{k j}, \omega^{i}\right)
$$

$$
=\varepsilon_{j} \varepsilon_{k} \frac{1}{2}\left(g\left(d \omega^{k}, \omega^{j} \wedge \omega^{i}\right)-g\left(d \omega^{j}, \omega^{k} \wedge \omega^{i}\right)-g\left(d \omega^{i}, \omega^{k} \wedge \omega^{j}\right)\right) .
$$

The product

$$
\varepsilon_{k} g\left(\omega_{k i}, \omega^{j}\right) g\left(\omega_{k j}, \omega^{i}\right)
$$

thus equals $\varepsilon_{k} \varepsilon_{i} \varepsilon_{j}$ times \#l $+\# 2+\cdots+\# 9$, where
\#1: $\frac{1}{4} g\left(d \omega^{k}, \omega^{i} \wedge \omega^{\dot{j}}\right) g\left(d \omega^{k}, \omega^{j} \wedge \omega^{i}\right)$.
\#2: $\quad-\frac{1}{4} g\left(d \omega^{k}, \omega^{i} \wedge \omega^{j}\right) g\left(d \omega^{j}, \omega^{k} \wedge \omega^{i}\right)$.
\#3: $\quad-\frac{1}{4} g\left(d \omega^{k}, \omega^{i} \wedge \omega^{j}\right) g\left(d \omega^{i}, \omega^{k} \wedge \omega^{j}\right)$.
\#4: $\quad-\frac{1}{4} g\left(d \omega^{i}, \omega^{k} \wedge \omega^{j}\right) g\left(d \omega^{k}, \omega^{j} \wedge \omega^{i}\right)$.
\#5: $\frac{1}{4} g\left(d \omega^{i}, \omega^{k} \wedge \omega^{j}\right) g\left(d \omega^{j}, \omega^{k} \wedge \omega^{i}\right)$.
\#6: $\frac{1}{4} g\left(d \omega^{\mathbf{i}}, \omega^{k} \wedge \omega^{\mathbf{j}}\right) g\left(d \omega^{\mathbf{i}}, \omega^{\mathrm{k}} \wedge \omega^{\mathbf{j}}\right)$.
\#7: $\quad-\frac{1}{4} g\left(d \omega^{j}, \omega^{k} \wedge \omega^{i}\right) g\left(d \omega^{k}, \omega^{j} \omega^{i}\right)$.
\#8: $\frac{l}{4} g\left(d \omega^{j}, \omega^{k} \wedge \omega^{i}\right) g\left(d \omega^{j}, \omega^{k} \wedge \omega^{i}\right)$.
\#9: $\frac{1}{4} g\left(d \omega^{j}, \omega^{k} \wedge \omega^{i}\right) g\left(d \omega^{i}, \omega^{k} \wedge \omega^{j}\right)$.

Six of the terms cancel out:

$$
\left\{\begin{array}{l}
\varepsilon_{k} \varepsilon_{i} \varepsilon_{j} \times(\# 1+\# 8)=0 \\
\varepsilon_{\mathbf{k}} \varepsilon_{\mathbf{i}} \varepsilon_{j} \times(\# 2+\# 7)=0 \\
\varepsilon_{\mathbf{k}} \varepsilon_{\mathbf{i}} \varepsilon_{j} \times(\# 3+\# 9)=0
\end{array}\right.
$$

E.g.: Take \#8 and write

$$
\begin{aligned}
\varepsilon_{k} \varepsilon_{i} \varepsilon_{j} & \frac{1}{4} g\left(d \omega^{j}, \omega^{k} \wedge \omega^{i}\right) g\left(d \omega^{j}, \omega^{k} \wedge \omega^{i}\right) \\
& =\varepsilon_{j} \varepsilon_{i} \varepsilon_{k} \frac{1}{4} g\left(d \omega^{k}, \omega^{j} \wedge \omega^{i}\right) g\left(d \omega^{k}, \omega^{j} \wedge \omega^{i}\right) \\
& =-\varepsilon_{j} \varepsilon_{i} \varepsilon_{k} \frac{1}{4} g\left(d \omega^{k}, \omega^{i} \wedge \omega^{j}\right) g\left(d \omega^{k}, \omega^{j} \omega^{i}\right),
\end{aligned}
$$

which is $-\varepsilon_{k^{\prime}} \varepsilon_{i} \varepsilon_{j} \times(\# 1)$. Observe too that

$$
\varepsilon_{k} \varepsilon_{i} \varepsilon_{j} \times(\# 4)=\varepsilon_{k} \varepsilon_{i} \varepsilon_{j} \times(\# 5)
$$

It remains to discuss

$$
\varepsilon_{k} \varepsilon_{i} \varepsilon_{j} \times(\# 4+\# 5+\# 6)
$$

To this end, note that

$$
\begin{aligned}
& -\frac{1}{2} \varepsilon_{i} \varepsilon_{j} g\left(d \omega^{i} \wedge \omega^{i}, d \omega^{j}{ }_{\wedge \omega}{ }^{j}\right) \\
& =-\frac{1}{2} \varepsilon_{i} \varepsilon_{j} g\left(d \omega_{i}^{i}{ }_{\omega \omega^{i}}\left(d \omega^{j} \omega^{j}\right)\right) \\
& =-\frac{1}{2} \varepsilon_{i} \varepsilon_{j} g\left(d \omega^{i}, \iota_{\omega^{i}} d \omega^{j} \omega^{j}+\left(\varepsilon_{\omega}{ }^{j} \omega^{j}\right) d \omega^{j}\right) \\
& =-\frac{1}{2} \varepsilon_{i} \varepsilon_{j} g\left(d \omega^{i}, \iota_{\omega^{i}} d \omega^{j} \wedge \omega^{j}\right)-\frac{1}{2} \varepsilon_{i} g\left(d \omega^{i}, d \omega^{i}\right) \\
& =-\frac{1}{2} \varepsilon_{i} \varepsilon_{j} g\left(d \omega^{i}, g\left(\omega^{k}, \ell_{\omega} d \omega^{\dot{j}}\right) \varepsilon_{k} \omega^{k} \wedge \omega^{j}\right) \\
& -\frac{1}{2} \varepsilon_{i} g\left(d \omega^{i}, d \omega^{i}\right)
\end{aligned}
$$

$$
\begin{aligned}
&=-\frac{1}{2} \varepsilon_{k} \varepsilon_{i} \varepsilon_{j} g\left(\omega^{k},{ }_{\omega}{ }_{i} d \omega^{j}\right) g\left(d \omega^{i}, \omega^{k} \wedge \omega^{j}\right) \\
&-\frac{1}{2} \varepsilon_{i} g\left(d \omega^{i}, d \omega^{i}\right) \\
&=-\frac{1}{2} \varepsilon_{k^{\prime}} \varepsilon_{i} \varepsilon_{j} g\left(\omega^{i} \wedge \omega^{k}, d \omega^{j}\right) g\left(d \omega^{i}, \omega^{k} \wedge \omega^{j}\right) \\
&-\frac{1}{2} \varepsilon_{i} g\left(d \omega^{i}, d \omega^{i}\right) \\
&=\frac{1}{2} \varepsilon_{k^{\prime}} \varepsilon_{i} \varepsilon_{j} g\left(\omega^{k} \wedge \omega^{i}, d \omega^{j}\right) g\left(d \omega^{i}, \omega^{k} \wedge \omega^{j}\right) \\
& \quad-\frac{1}{2} \varepsilon_{i} g\left(d \omega^{i}, d \omega^{i}\right) \\
&= \varepsilon_{k^{i} \varepsilon_{i} \varepsilon_{j} \times(\# 4+\# 5)-\frac{1}{2} \varepsilon_{i} g\left(d \omega^{i}, d \omega^{i}\right) .}
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& \varepsilon_{k} g\left(\omega_{k i}, \omega^{j}\right) g\left(\omega_{k j}, \omega^{i}\right) \\
& =\varepsilon_{k} \varepsilon_{i} \varepsilon_{j} \times(\# 4+\# 5)+\varepsilon_{k} \varepsilon_{i} \varepsilon_{j} \times(\# 6) \\
& =-\frac{1}{2} \varepsilon_{i} \varepsilon_{j} g\left(d \omega^{i} \wedge \omega^{i}, d \omega^{j} \wedge \omega^{j}\right)+\frac{1}{2} \varepsilon_{i} g\left(d \omega^{i}, d \omega^{i}\right) \\
& \quad+\varepsilon_{k} \varepsilon_{i} \varepsilon_{j} \times(\# 6) .
\end{aligned}
$$

The last step is to study \#6. In terms of the objects of anholonomity, there is an expansion

$$
d \omega^{i}=\frac{1}{2} c_{a b^{i} \omega^{a} \wedge \omega^{b} \quad\left(C_{a b}^{i}=-c_{b a}^{i}\right) . ~ . ~}^{i}
$$

So

$$
g\left(d \omega^{i}, \omega^{k} \wedge \omega^{j}\right)=\frac{1}{2} c_{a b^{i}}^{g}\left(\omega^{a} \wedge \omega^{b}, \omega^{k} \wedge \omega^{j}\right)
$$

15. 

$$
\begin{gathered}
=\frac{1}{2} C^{C_{b b}}\left(g\left(\omega^{a}, \omega^{k}\right) g\left(\omega^{b}, \omega^{j}\right)-g\left(\omega^{a}, \omega^{j}\right) g\left(\omega^{b}, \omega^{k}\right)\right) \\
=\frac{1}{2} C^{i}{ }_{k j} \varepsilon_{k} \varepsilon_{j}-\frac{1}{2} C^{i}{ }_{j k^{\varepsilon}}{ }_{j} \varepsilon_{k} \\
=\varepsilon_{k} \varepsilon_{j} C^{i}{ }_{k j} .
\end{gathered}
$$

On the other hand,

$$
g\left(d \omega^{i}, d \omega^{i}\right)=\frac{1}{2} \varepsilon_{k} \varepsilon_{j}\left(C_{k j}^{i}\right)^{2} .
$$

Combining these facts then gives

$$
\begin{gathered}
\varepsilon_{k} \varepsilon_{i} \varepsilon_{j} \times(\# 6)=\frac{1}{4} \varepsilon_{k} \varepsilon_{i} \varepsilon_{j}\left(C_{k j}^{i}\right)^{2} \\
=\left(\frac{1}{2} \varepsilon_{i}\right)\left(\frac{1}{2} \varepsilon_{k} \varepsilon_{j}\left(C_{k j}^{i}\right)^{2}\right) \\
\quad=\frac{1}{2} \varepsilon_{i} g\left(d \omega^{i}, d \omega^{i}\right),
\end{gathered}
$$

from which we conclude that

$$
\begin{gathered}
\varepsilon_{k} g\left(\omega_{k i}, \omega^{j}\right) g\left(\omega_{k j}, \omega^{i}\right) \\
=-\frac{1}{2} \varepsilon_{i} \varepsilon_{j} g\left(d \omega^{i} \wedge \omega^{i}, d \omega^{j}{ }_{\wedge} \omega^{j}\right)+\varepsilon_{i} g\left(d \omega^{i}, d \omega^{i}\right)
\end{gathered}
$$

In summary:

$$
\begin{aligned}
& \varepsilon_{k}\left[g\left(\omega_{k i}, \omega^{i}\right) g\left(\omega_{k j}, \omega^{j}\right)-g\left(\omega_{k i}, \omega^{j}\right) g\left(\omega_{k j}, \omega^{i}\right)\right] v o l \\
& g \\
&= {\left[\varepsilon_{i} g\left(d \omega^{i}, d \omega^{i}\right)-\varepsilon_{i} \varepsilon_{j} g\left(\omega^{i} \wedge d \omega^{j}, \omega^{j} \wedge d \omega^{i}\right)\right.}
\end{aligned}
$$

$$
\begin{aligned}
& \left.+\frac{1}{2} \varepsilon_{i} \varepsilon_{j} g\left(d \omega^{i} \wedge \omega^{i}, d \omega^{j} \omega^{j}\right)-\varepsilon_{i} g\left(d \omega^{i}, d \omega^{i}\right)\right] v o l_{g} \\
& =\left[-\varepsilon_{i} \varepsilon_{j} g\left(\omega^{i} \wedge d \omega^{j}, \omega^{j} \wedge d \omega^{i}\right)+\frac{1}{2} \varepsilon_{i} \varepsilon_{j} g\left(d \omega^{i} \wedge \omega^{i}, d \omega^{j} \wedge \omega^{j}\right)\right] v o l_{g} \\
& =-\varepsilon_{i} \varepsilon_{j}\left(d \omega^{i} \wedge \omega^{j}\right) \wedge *\left(d \omega^{j} \wedge \omega^{i}\right)+\frac{1}{2} \varepsilon_{i} \varepsilon_{j}\left(d \omega^{i} \wedge \omega^{i}\right) \wedge *\left(d \omega^{j} \omega^{j}\right) \\
& =-\left(d \omega^{i} \wedge \omega^{j}\right) \wedge *\left(d \omega_{j} \wedge \omega_{i}\right)+\frac{1}{2}\left(d \omega^{i} \wedge \omega_{i}\right) \wedge *\left(d \omega^{j} \wedge \omega_{j}\right) .
\end{aligned}
$$

All the terms appearing in the statement of the lemma are now accounted for.]

Put

$$
L_{0}=\operatorname{vol}_{g}
$$

Given $p \geq 1$, put

$$
L_{p}=\Omega^{i_{1} j_{1}} \wedge \ldots \wedge \Omega^{i_{p} j^{p}}{ }_{\wedge \theta^{i_{1}} j_{1}} \cdots i_{p} j_{p}(2 p \leq n)
$$

Then

$$
L_{p} \in \Lambda^{n} M
$$

[Note: These definitions are independent of the choice of E.]
Examples:

$$
\text { - } L_{l}=S V o l_{g}
$$

$$
\cdot L_{2}=\left(S^{2}-4 R^{a b} R_{a b}+R^{a b c d_{R}}{ }_{a b c d}\right) v o l_{g}
$$

LEMMA We have

$$
L_{p}=\frac{1}{2^{p}}\left(\delta^{\ell_{1} \cdots \ell_{2 p}}{ }_{k_{1}} \cdots k_{2 p} R^{k_{1} k_{2}} \ell_{1} \ell_{2} \cdots R^{k_{2 p-1} k_{2 p}} \ell_{2 p-1} \ell_{2 p}\right) v o l_{g}
$$

[In fact,

$$
\begin{aligned}
& \Omega^{i_{1} j_{1}} \wedge \ldots \wedge \Omega^{i_{p} j^{j}} p_{\wedge \theta_{i_{1}} j_{1} \cdots i_{p} j_{p}}
\end{aligned}
$$

$$
\begin{aligned}
& \times \frac{1}{(n-2 p)!} \varepsilon_{i_{1} j_{1}} \cdots i_{p} j_{p} a_{2 p+1} \cdots a_{n} \omega^{a_{2 p+1}} \wedge \ldots \wedge \omega^{a_{n}} \\
& =\frac{1}{2^{p}}\left(R^{i_{1} j_{1}}{ }_{k_{1} \ell_{1}} \ldots R^{\left.i_{p}{ }_{p} p_{k_{p} \ell_{p}}\right)}\right. \\
& \times \frac{1}{(n-2 p)!} \varepsilon_{i_{1} j_{1}} \cdots i_{p} j_{p} a_{2 p+1} \cdots a_{n} \\
& \times \omega^{k_{1}}{ }_{\wedge \omega}{ }^{\ell}{ }_{1} \wedge \ldots \wedge \omega^{k^{p}}{ }_{\wedge \omega} \ell_{p^{\ell}}{ }_{\wedge \omega}{ }_{2 p+1} \wedge \ldots \wedge \omega^{a_{n}} \\
& =\frac{1}{2^{p}}\left(R^{i_{1} j_{1}}{ }_{k_{1} \ell_{1}} \ldots \mathrm{R}^{\mathrm{i}_{\mathrm{p}} \mathrm{j}_{\mathrm{p}}}{ }_{k_{\mathrm{p}} \ell_{\mathrm{p}}}\right) \\
& \times \frac{1}{(n-2 p)!} \varepsilon^{k_{1} \ell_{1} \cdots k_{p} \ell_{p} a_{2 p+1} \cdots a_{n}} \varepsilon_{i_{1} j_{1} \cdots i_{p} j_{p} a_{2 p+1} \cdots a_{n}} \\
& \times\left(\omega^{1} \wedge \ldots \wedge \omega^{n}\right) \\
& =\frac{1}{2^{p}}\left(R^{i_{1} j_{1}}{ }_{k_{1} \ell_{1}} \ldots R^{i_{p} j_{p}}{ }_{k_{p} \ell_{p}}\right) \\
& \times \delta^{k_{1} \ell_{1} \cdots k_{p} \ell_{p}}{ }_{i_{1} j_{1} \cdots i_{p} j_{p}{ }^{\text {vol }}{ }^{\prime},}
\end{aligned}
$$

which, upon relabling, is equivalent to the assertion.]

Remark: If $M$ is compact and riemannian and if $n=2 p$, then by the Gauss-Bonnet theorem,

$$
x(M)=\frac{1}{(4 \pi)^{P_{p}!}} \int_{M} L_{p^{\prime}}
$$

the LHS being the Euler characteristic of M.
[Note: Take $\mathrm{n}=2$-- then $\mathrm{p}=1$ and $\mathrm{L}_{1}=\mathrm{Svol}_{\mathrm{g}}$. Moreover, the scalar curvature $S$ is twice the sectional curvature $K$ and the Gauss-Bonnet theorem in this case says that

$$
\left.x(M)=\frac{1}{2 \pi} \int_{M} \mathrm{Kvol}_{g} \cdot\right]
$$

FACT Suppose that $n=2$ p. Fix $i \in\{1, \ldots, n\}$ and let

$$
\Pi_{\mathrm{p}}=\sum_{\mathrm{k}=0}^{\mathrm{p}-1} \mathrm{a}_{\mathrm{k}, \mathrm{p}^{\Phi_{k, p^{\prime}}},}
$$

where

$$
a_{k, p}=-\frac{\varepsilon_{i}^{p-k}}{2^{k+p_{\pi} p_{k!}[1 \cdot 3 \cdots(2 p-2 k-1)]}}
$$

and

$$
\Phi_{k, p}=\varepsilon_{i_{1}} \ldots i_{2 p} \delta^{i_{1}}{ }_{i^{\Omega}} i_{2}^{i_{3}} \wedge \ldots \wedge \Omega^{i_{2 k}} i_{2 k+1}{ }_{\wedge \omega}^{i_{2 k+2}}{ }_{i} \wedge \ldots \wedge \omega^{i_{2 p}}
$$

Then

$$
d!{ }_{p}=\frac{1}{(4 \pi)^{p_{p!}}} L_{p}
$$

[Note: Therefore $L_{p}(n=2 p)$ is exact if the orthonormal frame bundle $\mathrm{IM}(\mathrm{g})$ is trivial, hence is locally exact in general.]
19.

Reality Check Take $\mathrm{n}=2$ and $\mathrm{i}=1$-- then $\mathrm{p}=1$ and

$$
\begin{aligned}
\Pi_{1} & =a_{0,1} \Phi_{0,1} \\
& =-\frac{\varepsilon_{1}}{2 \pi} \varepsilon_{i_{1} i_{2}} \delta^{i_{1}}{ }_{1} \omega^{i_{2}}{ }_{1} \\
& =-\frac{\varepsilon_{1}}{2 \pi}\left(\varepsilon_{12}{ }^{\delta^{1}}{ }_{1} \omega^{2}{ }_{1}+\varepsilon_{21} \delta^{2}{ }_{1} \omega^{1}{ }_{1}\right) \\
& =-\frac{\varepsilon_{1}}{2 \pi} \omega^{2}{ }_{1} \\
& =-\frac{1}{2 \pi} \omega^{21} \\
& =\frac{1}{2 \pi} \omega^{12} .
\end{aligned}
$$

On the other hand,

$$
\begin{aligned}
\frac{1}{4 \pi} L_{1} & =\frac{1}{4 \pi} \varepsilon_{i j} \Omega^{i j} \\
& =\frac{1}{4 \pi}\left(\varepsilon_{12^{\Omega^{12}}}+\varepsilon_{21^{\Omega}}^{21}\right) \\
& =\frac{1}{4 \pi}\left(\Omega^{12}-\Omega^{21}\right) \\
& =\frac{1}{2 \pi} \Omega^{12} .
\end{aligned}
$$

And

$$
\begin{aligned}
\Omega_{2}^{1} & =d \omega_{2}^{1}+\omega_{1}^{1} 1_{2}^{l}+\omega_{2}^{l} \omega_{2}^{2} \\
& =d \omega_{2}^{1}
\end{aligned}
$$

$$
\Omega^{12}=d \omega^{12}
$$

$$
\Rightarrow
$$

$$
\mathrm{d} \Pi_{1}=\frac{1}{4 \pi} \mathrm{~L}_{1} .
$$

Put

$$
\left(G_{0}\right)_{j}^{i}=-\frac{1}{2} \delta_{j}^{i}
$$

Given $\mathrm{p} \geq 1$, put

$$
\left(G_{p}\right)_{j}^{i}=-\frac{1}{2^{p+1}} \delta^{i \ell_{1} \cdots \ell_{2 p}}{ }_{j k_{1} \cdots k_{2 p} R^{k_{1} k_{2}} \ell_{1} \ell_{2} \cdots R^{k_{2 p-1} k_{2 p}} \ell_{2 p-1} \ell_{2 p}}
$$

Then

$$
\left(G_{p}\right)_{j}^{i}=\left(G_{p}\right)_{i}^{j}
$$

and

$$
\nabla_{j}\left(G_{p}\right)^{i j}=0
$$

Examples:

- $\left(G_{1}\right)^{i j}=R^{i j}-\frac{1}{2} S g^{i j}$.
- $\left(G_{2}\right)^{i j}=\left[2 S R^{i j}-4 R^{i k j \ell} R_{k \ell}\right.$

$$
+2 R_{a b c}^{i} R^{j a b c}-4 R^{i a_{R}}{ }_{a}^{j}
$$

$$
-\frac{1}{2}\left[S^{2}-4 R^{a b} R_{a b}+R^{\left.a b c d_{R_{a b c d}}\right] g^{i j} .}\right.
$$

SUBLEMMA The wedge product

$$
\omega^{i} \wedge \theta_{i_{1}} \cdots i_{p}
$$

can be written as

$$
(-1)^{p}{\underset{\Sigma}{p=1}}_{p}(-1)^{r} \delta^{i}{ }_{i_{r}}{ }^{\theta} i_{1} \cdots i_{r-1}{ }^{i_{r+1}} \cdots i_{p}
$$

[Recall that

$$
g^{b} E_{i} \wedge *\left(\omega^{i}{ }^{i} \wedge \ldots \wedge \omega^{i_{p}}\right)=(-1)^{p+1} * E_{E_{i}}\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i^{p}}\right)
$$

where

$$
g^{b} E_{i}=\omega_{i}=\varepsilon_{i} \omega^{i}
$$

Therefore

$$
\begin{aligned}
& \omega_{i} \wedge *\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i_{p}},\right. \\
& =(-1)^{p+1} \sum_{r=1}^{p}(-1)^{r+1}\left(\varepsilon_{E_{i}} \omega^{i_{r}}\right) *\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i_{r-1}}{ }_{\wedge \omega}^{i_{r+1}} \wedge \ldots \wedge \omega^{i_{p}}\right) \\
& \left.=(-1)^{p} \sum_{\sum_{r=1}^{p}}^{p}(-1)^{r}{ }_{g\left(\omega_{i}, \omega^{i} r\right.}\right) *\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i_{r-1}}{ }_{\wedge \omega}{ }^{i_{r+1}} \wedge \ldots \wedge \omega^{i_{p}}\right) \\
& =(-1)^{p}{\underset{\sum r=1}{p}(-1)^{r^{r}} \varepsilon_{i} g\left(\omega^{i}, \omega^{i_{r}}\right) *\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i_{r-1}}{ }_{\wedge \omega}{ }^{i_{r+1}} \wedge \ldots \wedge \omega^{i_{p}}\right)} \\
& =(-1)^{p} \sum_{r=1}^{p}(-1)^{r^{\prime} \delta^{i}}{ }_{i_{r}} *\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i_{r-1}}{ }_{\wedge \omega}{ }^{i_{r+1}} \wedge \ldots \wedge \omega^{i_{p}}\right) \\
& \Rightarrow \\
& \varepsilon_{i} \omega^{i^{1}} \varepsilon_{i_{1}} \cdots \varepsilon_{i_{p}} \theta_{1} \cdots i_{p} \\
& =(-1)^{p}{\underset{r=1}{p}(-1)^{r} \delta^{i} i_{r} \varepsilon_{i_{1}} \cdots \varepsilon_{i_{r-1}} \varepsilon_{i_{r+1}} \cdots \varepsilon_{i_{p}} \theta_{i_{1}} \cdots i_{r-1} i_{r+1} \cdots i_{p},}
\end{aligned}
$$

$$
\begin{aligned}
& \omega^{i} \wedge \theta_{i_{l}} \cdots i_{p} \\
& =(-1)^{p} \sum_{r=l}^{p}(-1)^{r} \delta^{i} i_{i_{r}} \varepsilon_{i_{r}} \varepsilon_{i} \theta_{i_{l}} \cdots i_{r-1} i_{r+1} \cdots i_{p}
\end{aligned}
$$

But $\delta^{i}{ }_{i_{r}} \varepsilon_{i_{r}} \varepsilon_{i}=0$ if $i_{r} \neq i$ while $\delta^{i} i_{r} \varepsilon_{i_{r}} \varepsilon_{i}=\varepsilon_{i} \varepsilon_{i}=1$ if $i_{r}=i$. Therefore

$$
\begin{aligned}
& \omega^{i} \wedge \theta_{i_{1}} \cdots i_{p} \\
& \left.=(-1)^{p} \sum_{r=1}^{p}(-1)^{r} \delta^{i} i_{r} \theta_{i_{l}} \cdots i_{r-1} i_{r+1} \cdots i_{p} \cdot\right]
\end{aligned}
$$

Example: Suppose that $\mathrm{p}=1$ - then

$$
\begin{aligned}
& \omega_{i} \wedge \star \omega^{j}=(-1)^{1+1} * \iota E_{i} \omega^{j} \\
& =* g\left(\omega_{i}, \omega^{j}\right) \\
& =\star \varepsilon_{i} g\left(\omega^{i}, \omega^{j}\right) \\
& =\star \delta^{i}{ }_{j}=\delta^{i}{ }_{j}{ }^{\mathrm{vol}}{ }_{g} \\
& \Rightarrow \\
& \varepsilon_{i}{ }^{\omega}{ }^{\mathbf{i}} \varepsilon_{j}{ }_{j}{ }_{j}=\delta^{i}{ }_{j}{ }^{\operatorname{vol}}{ }_{g}
\end{aligned}
$$

$$
\begin{aligned}
\omega^{i} \wedge \theta_{j} & =\varepsilon_{i} \varepsilon_{j} \delta^{i}{ }_{j} \operatorname{vol}{ }_{g} \\
& =\delta^{i}{ }_{j} v o l_{g} .
\end{aligned}
$$

Now define the Lovelock ( $\mathrm{n}-1$ )-forms by

$$
\Xi(p)_{a}=\Omega^{i_{1} j_{1}} \wedge \ldots \wedge \Omega^{i_{p} j_{p}}{ }_{\wedge \theta_{i_{1}} j_{1}} \ldots i_{p} j_{p} a(a=1, \ldots, n)
$$

Example: Take $p=0$-- then

$$
\begin{aligned}
\Xi(0) & =\theta_{a} \\
& =\delta^{i} a_{i} \\
& =-2\left(G_{0}\right)^{i} a^{\theta_{i}} \\
& =-2\left(G_{0}\right)^{i} a^{\varepsilon_{i}} \varepsilon_{i}{ }_{i} \\
& =-2\left(G_{0}\right) a i^{* \omega} .
\end{aligned}
$$

Example: Take $\mathrm{p}=1$-- then

$$
\begin{aligned}
& \Xi(1)=\Omega^{i j} \wedge \theta_{i j a} \\
&=\frac{1}{2} R^{i j}{ }_{k \ell \ell^{\omega}}{ }^{k} \wedge \omega^{\ell} \wedge \theta_{a i j} \\
&=\frac{1}{2} R^{i j}{ }_{k \ell \ell^{\omega}}{ }^{k} \wedge(-1)^{3}\left[-\delta^{\ell} a_{i j}+\delta^{\ell}{ }_{i} \theta_{a j}-\delta^{\ell}{ }_{j}{ }_{a i}\right] \\
&=\frac{1}{2} R^{i j} k \ell^{\omega} \wedge\left[\delta^{\ell} a_{i j}-\delta^{\ell}{ }_{i}{ }_{a j}+\delta^{\ell}{ }_{j} \theta_{a i}\right] .
\end{aligned}
$$

- $\frac{1}{2} \mathrm{R}^{\mathrm{ij}}{ }_{k} \ell^{\delta}{ }^{\ell}{ }_{\mathrm{a}} \omega^{\mathrm{k}}{ }^{\wedge} \theta_{i j}$

$$
=\frac{1}{2} R^{i j}{ }_{k \ell} \ell^{\ell}{ }_{a}\left[-\delta^{k}{ }_{i} \theta_{j}+\delta^{k}{ }_{j} \theta_{i}\right] .
$$

- $-\frac{1}{2} R^{i j}{ }_{k} \ell^{\delta}{ }^{\ell}{ }_{i} \omega^{k}{ }^{\prime} \theta_{a j}$

$$
=-\frac{1}{2} R^{i j}{ }_{k \ell^{\delta}{ }_{i}^{l}}{ }_{i}\left[-\delta^{k}{ }_{a} \theta_{j}+\delta^{k}{ }_{j}{ }_{a}\right] .
$$

- $\frac{1}{2} R^{i j}{ }_{k} \ell^{\delta}{ }_{j}^{\ell} \omega^{k} \wedge \theta_{a i}$

$$
=\frac{1}{2} R^{i j}{ }_{k \ell} \ell^{\ell}{ }_{j}\left[-\delta_{a}^{k} \theta_{i}+\delta_{i}^{k} \theta_{a}\right] .
$$

Collect the coefficients of $\theta_{a}$ :

$$
\begin{aligned}
& \left(\frac{1}{2} R^{i j}{ }_{k \ell} \delta^{\ell}{ }_{j} \delta^{k}{ }_{i}-\frac{1}{2} R^{i j}{ }_{k \ell} \ell^{\ell}{ }_{i} \delta^{k}{ }_{j}\right) \theta_{a} \\
& =\left(\frac{1}{2} R^{i j}{ }_{i j}-\frac{1}{2} R^{i j}{ }_{j i}\right)^{\prime}{ }_{a} \\
& =\frac{1}{2}\left(R_{i j}^{i j}+R_{i j}^{i j}\right) \theta_{a} \\
& =s \theta_{a} .
\end{aligned}
$$

Collect the coefficients of $\theta_{i}$ :

$$
\begin{array}{r}
\left(\frac{1}{2} R^{i j}{ }_{k \ell} \delta^{\ell}{ }_{a} \delta_{j}^{k}-\frac{1}{2} R^{i j}{ }_{k \ell} \delta^{\ell}{ }_{j} \delta^{k}{ }_{a}\right) \theta_{i} \\
\quad=\left(\frac{1}{2} R^{i j}{ }_{j a}-\frac{1}{2} R^{i j}{ }_{a j}\right) \theta_{i}
\end{array}
$$

$$
\begin{aligned}
& =\frac{1}{2}\left(-R_{j a}^{j i}-R_{j a}^{j i}\right) \theta_{i} \\
& =-R_{a}^{i} \theta_{i}
\end{aligned}
$$

Collect the coefficients of $\theta_{j}$ :

$$
\begin{aligned}
&\left(\frac{1}{2} R^{i j}{ }_{k \ell} \ell^{\ell}{ }_{i} \delta^{k}{ }_{a}-\frac{1}{2} R^{i j}{ }_{k} \ell^{\ell}{ }^{\ell}{ }_{a} \delta^{k}{ }_{i}\right) \theta_{j} \\
&=\left(\frac{1}{2} R^{i j}{ }_{a i}-\frac{1}{2} R^{i j}{ }_{i a}{ }^{\prime} \theta_{j}\right. \\
&=\frac{1}{2}\left(-R^{i j}{ }_{i a}-R^{i j}{ }_{i a}{ }^{1}\right) \theta_{j} \\
&=-R^{j}{ }^{0} \theta_{j} .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
\Xi(1)_{a} & =S \theta_{a}-R^{i} a_{i}-R^{j}{ }_{a} \theta_{j} \\
& =S \delta_{a}^{i} \theta_{i}-2 R^{i} a \theta_{i} \\
& =\left(S \delta_{a}^{i}-2 R_{a}^{i}\right) \theta_{i} \\
& =-2\left(G_{1}\right)^{i} a^{\theta} \dot{i} \\
& =-2\left(G_{1}\right)^{i} a^{\varepsilon_{i}} \varepsilon_{i} \theta_{i} \\
& =-2\left(G_{1}\right) a_{i}^{* \omega}{ }^{i} .
\end{aligned}
$$

LEMMA We have

$$
E(p)_{a}=-2\left(G_{p}\right)_{a i^{*}} \omega^{i} .
$$

Suppose that $n=4 p(p=1,2, \ldots)$. Given $\left(a_{1}, \ldots, a_{2 k}\right)$, put

$$
\underline{\Omega}_{2 k}=\Omega^{a_{1}} a_{2} \wedge \ldots \wedge \Omega^{a_{2 k}}{ }_{a_{1}}
$$

and set

$$
\underline{\Pi}_{\underline{K}}=\underline{\Omega}_{2 \mathrm{k}_{1}} \wedge \ldots \wedge \underline{\Omega}_{2 \mathrm{k}_{r}}\left(\underline{K}=\left(2 \mathrm{k}_{1}, \ldots, 2 \mathrm{k}_{\mathrm{r}}\right)\right),
$$

where

$$
2\left(2 \mathrm{k}_{1}+\cdots+2 \mathrm{k}_{r}\right)=\mathrm{n} .
$$

Then

$$
\underline{\Pi}_{\underline{K}} \in \Lambda^{n_{M}}
$$

[Note: The $\underline{\underline{n}}_{\underline{K}}$ are called Pontryagin forms. In view of the definition, their number is precisely $P(n / 4)$ ( $P$ the partition function).]

Examples:

- $\mathrm{n}=4$ :

$$
\underline{\Pi}_{(2)}=\Omega_{b^{a} \Omega_{c}^{b}}^{a}
$$

- $\mathrm{n}=8$ :

$$
\left[\begin{array}{l}
\underline{\Pi}(4)=\Omega^{a} b^{\wedge} \Omega^{b} c^{\wedge} \Omega^{c} d^{\wedge \Omega}{ }^{d} a \\
\underline{\Pi}_{(2,2)}=\left(\Omega^{a}{ }_{b}{ }^{\wedge} \Omega^{b}{ }_{a}\right) \wedge\left(\Omega^{c}{ }_{d} \wedge \Omega^{d}{ }_{c}\right)
\end{array}\right.
$$

Observation: $\underline{\Omega}_{2 k}$ is closed, i.e.,

$$
\underline{d \Omega}_{2 \mathrm{k}}=0 .
$$

[This follows from the fact that

$$
d \Omega_{j}^{i}+\omega_{k^{\wedge \Omega}}^{i}{ }_{j}-\Omega_{k^{i}}^{i} \omega_{j}^{k}=0.1
$$

Example: Consider $\Omega^{a}{ }_{b}{ }^{\wedge} \Omega^{b}$ a . Thus

$$
\begin{aligned}
& =d \omega_{b}{ }_{b}{ }^{\wedge \Omega}{ }^{b}{ }_{a}+\omega^{a}{ }_{c}{ }^{\wedge \omega^{c}}{ }_{b}{ }^{\wedge \Omega}{ }^{\mathrm{b}}{ }_{a} \\
& =d\left(\omega_{b}^{a}{ }^{\wedge} \Omega_{a}^{b}\right)+\omega_{b}{ }_{b} \wedge d \Omega_{a}^{b}+\omega^{a} c^{\wedge \omega^{c}}{ }_{b}{ }^{\wedge \Omega}{ }^{b} a \\
& =d\left(\omega_{b}^{a}{ }^{a} \varepsilon_{a}^{b}{ }_{a}\right) \\
& \left.+\omega^{a}{ }_{b} \wedge^{\wedge}-\omega^{b} c^{\wedge} \Omega^{c}{ }_{a}+\Omega^{b} c^{\wedge \omega^{c}}{ }_{a}\right) \\
& +\omega^{a}{ }^{a} \omega^{c}{ }_{b}{ }^{\wedge \Omega}{ }^{b} a \\
& =d\left(\omega_{b}^{a}{ }^{\wedge \Omega}{ }_{a}^{b}\right)-\omega_{b}^{a}{ }^{\wedge} \omega^{b} c^{\wedge \Omega^{c}} a \\
& +\omega^{\mathrm{a}} \mathrm{~b}^{\wedge \omega^{c}} \mathrm{a}^{\wedge \Omega}{ }^{\mathrm{b}} \mathrm{c}^{\mathrm{c}}+\omega^{\mathrm{a}} \mathrm{c}^{\wedge \omega^{\mathrm{c}}{ }_{\mathrm{b}}{ }^{\wedge \Omega}{ }^{\mathrm{b}}{ }_{a} .}
\end{aligned}
$$

But

$$
\begin{aligned}
& \omega^{a}{ }_{c} \wedge^{c}{ }^{c} b^{\wedge \Omega}{ }^{n} a \\
&=\omega^{c}{ }_{a}{ }^{\wedge} \omega^{a}{ }_{b} \wedge \Omega^{b} \\
& c
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& \Omega_{b^{\wedge \Omega}}^{a}{ }_{a}=d\left(\omega^{a} b^{\wedge \Omega}{ }_{a}^{b}\right)-\omega_{b}^{a}{ }^{\wedge \omega^{b}} c^{\wedge \Omega^{c}} a \\
& =d\left(\omega_{b}^{a}{ }_{b}\left(d \omega^{b} a+\omega^{b} c^{\wedge \omega^{2}}\right)\right)-\omega^{a}{ }_{b}{ }^{\wedge \omega}{ }^{b} c^{\wedge \Omega \Omega}{ }^{c} a \\
& =d\left[\omega_{b}^{a}{ }^{\wedge \alpha \omega}{ }_{a}^{b}+\omega^{a} b^{\wedge \omega}{ }^{b} c^{\wedge \omega}{ }^{c}{ }_{a}\right] \\
& -\omega^{a} b^{\wedge \omega^{b}} c^{\wedge \Omega \varepsilon^{c}} a \\
& =d\left[\omega_{b}{ }_{b} \wedge d \omega^{b}{ }_{a}+\omega^{a}{ }_{b} \wedge \omega^{b}{ }_{c}{ }^{\wedge \omega}{ }^{c}{ }_{a}\right] \\
& -\omega_{b}^{a}{ }^{\wedge \omega^{b}}{ }_{c} \wedge\left(d \omega^{c}{ }_{a}+\omega^{c} d^{\wedge \omega}{ }_{a}^{d}\right) \\
& =d\left[\omega_{b}^{a}{ }_{b} \alpha^{b}{ }_{a}+\omega^{a}{ }_{b}{ }^{\wedge \omega^{b}}{ }_{c}{ }^{\wedge \omega^{c}}{ }_{a}\right] \\
& -d \omega^{c}{ }_{a}{ }^{\wedge \omega^{a}}{ }_{b} \wedge \omega^{b}{ }_{c}-\omega^{a}{ }_{b}{ }^{\wedge \omega^{b}}{ }_{c} \wedge \omega^{c}{ }_{d}{ }^{\wedge \omega}{ }^{d}{ }_{a} \\
& =d\left[\omega_{b}^{a}{ }_{b}{ }^{\alpha} \omega^{b}{ }_{a}+\omega^{a}{ }_{b}{ }^{\wedge \omega^{b}}{ }_{c} \wedge \omega^{c}{ }_{a}\right] \\
& -d \omega^{a}{ }_{c}{ }^{\wedge}{ }^{c}{ }_{b}{ }^{\wedge \omega^{b}} a-\omega^{a}{ }_{b}{ }^{\wedge \omega}{ }^{b}{ }_{c}{ }^{\wedge \omega^{c}}{ }_{d}{ }^{\wedge \omega}{ }^{d}{ }_{a} \\
& =d\left[\omega_{b}^{a}{ }_{b} \alpha^{b}{ }_{a}+\omega_{b}^{a}{ }^{\wedge \omega^{b}} c^{\wedge \omega}{ }^{c}{ }_{a}\right] \\
& -d \omega^{a}{ }_{b}{ }^{\wedge \omega^{b}} c^{\wedge \omega^{c}}{ }_{a}-\omega^{a}{ }_{b} \wedge \omega^{b} c^{\wedge \omega}{ }^{c} d^{\wedge \omega}{ }^{d} a . \\
& \bullet \frac{1}{3} d\left(\omega^{a} b^{\wedge \omega}{ }^{b} c^{\wedge \omega}{ }^{c}{ }_{a}\right)
\end{aligned}
$$

$$
\begin{aligned}
& =\frac{1}{3}\left[d \omega^{a}{ }_{b}{ }^{\wedge \omega}{ }^{b}{ }^{\wedge \omega}{ }^{c}{ }_{a}-\omega^{a} b^{\wedge d \omega}{ }^{b} c^{\wedge \omega}{ }^{c}{ }_{a}+\omega^{a}{ }_{b}{ }^{\wedge \omega}{ }^{b} c^{\wedge d \omega}{ }^{c}{ }_{a}\right] \\
& =\frac{1}{3}\left[d \omega^{a}{ }_{b} \omega^{b}{ }_{c}{ }^{\wedge \omega}{ }^{c}{ }_{a}-d \omega^{b}{ }_{c} \wedge \omega^{a}{ }_{b}{ }^{\wedge \omega}{ }^{c}{ }_{a}+d \omega^{c}{ }_{a} \wedge \omega^{a}{ }_{b}{ }^{\wedge \omega}{ }_{c}{ }_{c}\right] \\
& =\frac{1}{3}\left[d \omega^{a}{ }_{b} \omega^{b}{ }_{c}{ }^{\wedge \omega}{ }^{c}{ }_{a}-d \omega^{a}{ }_{c}{ }^{\wedge \omega}{ }^{b} a^{\wedge \omega}{ }^{c}{ }_{b}+d \omega^{a}{ }_{c} \wedge \omega^{c}{ }_{b}{ }^{\wedge \omega}{ }_{a}^{b}\right] \\
& =\frac{1}{3}\left[d \omega^{a}{ }_{b}{ }^{\wedge \omega}{ }_{c}{ }_{c}{ }^{\wedge \omega}{ }^{c}{ }_{a}-d \omega^{a}{ }_{b}{ }^{\wedge \omega^{c}}{ }_{a}{ }^{\wedge \omega^{b}}{ }_{c}+d \omega^{a}{ }_{b}{ }^{\wedge \omega^{b}}{ }_{c}{ }^{\wedge \omega^{c}}{ }_{a}\right] \\
& =\frac{1}{3}\left[a \omega^{a}{ }_{b} \omega^{b}{ }_{c}{ }^{\wedge \omega^{c}}{ }_{a}+d \omega^{a}{ }_{b}{ }^{\wedge \omega}{ }^{b} c^{\wedge \omega}{ }^{c}{ }_{a}+d \omega_{b}{ }_{b}{ }^{\wedge \omega}{ }_{c}{ }^{\wedge \omega}{ }^{c}{ }_{a}\right] \\
& =d \omega^{a}{ }^{\wedge \omega}{ }^{b}{ }_{c}{ }^{\wedge \omega}{ }^{c}{ }_{a} .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& \Omega^{a} b^{\wedge} \Omega^{b}{ }_{a}=d\left(\omega^{a}{ }_{b} \wedge d \omega_{a}^{b}\right) \\
& +d\left(\omega^{a}{ }_{b}{ }^{\wedge \omega}{ }^{b} c^{\Lambda \omega}{ }^{c}{ }_{a}\right)-\frac{1}{3} d\left(\omega^{a}{ }_{b}{ }^{\wedge \omega}{ }^{b}{ }^{\wedge \omega}{ }^{c}{ }_{a}\right) \\
& -\omega^{a} b^{\wedge \omega}{ }^{b}{ }^{\wedge \omega}{ }^{c} d^{\wedge \omega}{ }^{d}{ }_{a} \\
& =d\left[\omega^{a}{ }_{b} \wedge d \omega_{a}{ }_{a}+\frac{2}{3}\left(\omega_{b}^{a}{ }_{b}{ }^{b \omega}{ }^{b}{ }^{\wedge \omega}{ }^{c}{ }_{a}\right)\right] \\
& -\omega^{a} b^{\wedge \omega}{ }^{b}{ }^{\wedge \omega}{ }^{c}{ }^{\wedge}{ }^{\wedge \omega}{ }^{d}{ }_{a} .
\end{aligned}
$$

However the last term vanishes, so

$$
\Omega_{b^{\wedge}}^{a}{ }_{a}^{b}=d\left[\omega_{b}^{a}{ }_{b} \wedge \omega^{b}{ }_{a}+\frac{2}{3}\left(\omega_{b}^{a}{ }_{b} \omega^{b}{ }_{c} \wedge \omega^{c}{ }_{a}\right)\right]
$$

30. 

[Note: To check that

$$
\omega_{b}^{a}{ }^{\wedge \omega}{ }_{c}{ }^{\wedge \omega}{ }^{c} d^{\wedge \omega}{ }_{a}^{d}=0,
$$

write

$$
\begin{aligned}
& \omega^{a} b^{\wedge \omega}{ }^{b} c^{\wedge \omega}{ }^{c} d^{\wedge \omega}{ }^{d} a \\
& =-\omega_{a}{ }_{a} \wedge \omega^{a} b^{\wedge \omega}{ }^{b}{ }_{c} \wedge \omega^{c}{ }_{d} \\
& =-\omega^{a} d^{\wedge \omega}{ }^{d} b^{\wedge \omega}{ }^{b} c^{\wedge \omega}{ }^{c}{ }_{a} \\
& =-\omega^{a} b^{\wedge \omega}{ }^{b} d^{\wedge \omega}{ }^{d} c^{\wedge \omega}{ }^{c} a \\
& \left.=-\omega^{a}{ }_{b}{ }^{\wedge \omega}{ }^{b} c^{\wedge \omega}{ }^{c}{ }_{d}{ }^{\wedge \omega}{ }^{d}{ }_{a} \cdot\right]
\end{aligned}
$$

FACT We have

$$
\underline{\Omega}_{2 k}=d C_{2 k}
$$

where

$$
C_{2 k}=2 k \cdot \sum_{i=0}^{2 k-1}\left({ }^{2 k-1}\right) \frac{1}{2 k+i} \operatorname{tr}\left(\left(\omega_{\nabla}\right)^{2 i+1} \wedge\left(d \omega_{\nabla}\right)^{2 k-1-i}\right)
$$

[Note: To explain the notation, recall that

$$
\omega_{\nabla}=\left[\omega_{j}^{i}\right]
$$

is an element of $\Lambda^{1}(M ; \underline{\underline{\ell}}(\mathrm{n}, \underline{\mathrm{R}}))$ (here, of course, $\nabla$ is the metric connection). Accordingly,

$$
\left(\omega_{\nabla}\right)^{2 i+1}=\frac{2 i+1}{\omega_{\nabla} \wedge \cdots \wedge \omega_{\nabla}}
$$

31. 

Similar comments apply to

$$
\left.d \omega_{\nabla}=\left[d \omega_{j}^{i}\right] .\right]
$$

Reality Check Take $k=1$-- then

$$
\underline{\Omega}_{2}=\Omega_{\Omega^{a}}{ }^{\wedge}{ }^{b}{ }_{a}^{b}
$$

And

$$
\begin{aligned}
C_{2} & =2\left[\frac{1}{2} \operatorname{tr}\left(\omega_{\nabla} \wedge d \omega_{\nabla}\right)+\frac{1}{3} \operatorname{tr}\left(\omega_{\nabla} \wedge \omega_{\nabla} \wedge \omega_{\nabla}\right)\right] \\
& =\operatorname{tr}\left(\omega_{\nabla} \wedge d \omega_{\nabla}\right)+\frac{2}{3} \operatorname{tr}\left(\omega_{\nabla} \wedge \omega_{\nabla} \wedge \omega_{\nabla}\right) \\
& =\omega_{b}^{a} \wedge d \omega_{a}^{b}+\frac{2}{3}\left(\omega_{b}^{a} \wedge \omega_{c}^{b} \wedge \omega_{a}^{c}\right)
\end{aligned}
$$

which agrees with what was said above.
Remark: The $\mathcal{C}_{2 k}$ are called Chern-Simons forms.
[Note: One can represent $C_{2 k}$ as an integral:

$$
C_{2 k}=2 k \cdot \int_{0}^{1} \operatorname{tr}\left(\omega_{\nabla} \wedge\left(t^{2}\left(\omega_{\nabla}\right)^{2}+t d \omega_{\nabla}\right)^{2 k-1}\right) d t
$$

To see this, use the binomial theorem and expand the RHS to get

$$
\begin{aligned}
& 2 k \cdot \int_{0}^{1} \operatorname{tr}\left(\omega_{\nabla} \wedge\right. \\
& \sum_{i=0}^{2 k-1}(2 k-1) \\
&=\left.2 k \cdot t_{i=0}^{2 i}\left(\omega_{\nabla}\right)^{2 i} \wedge t^{2 k-1-i}\left(d \omega_{\nabla}\right)^{2 k-1-i}\right) d t \\
&\left.\sum_{i}^{2 k-1}\right) \operatorname{tr}\left(\left(\omega_{\nabla}\right)^{2 i+1} \wedge\left(d \omega_{\nabla}\right)^{2 k-1-i}\right) \cdot \int_{0}^{1} t^{2 k-1+i} d t \\
&= 2 k \cdot \sum_{i=0}^{2 k-1}(2 k-1) \frac{1}{2 k+i} \operatorname{tr}\left(\left(\omega_{\nabla}\right)^{2 i+1} \wedge\left(d \omega_{\nabla}\right)^{2 k-1-i}\right) .
\end{aligned}
$$

E.g.: Take $k=1$ and put

$$
\Omega_{\nabla}(t)=t d \omega_{\nabla}+t^{2}\left(\omega_{\nabla} \wedge \omega_{\nabla}\right)
$$

Then

$$
\begin{aligned}
& \underline{\Omega}_{2}=\int_{0}^{l} \frac{d}{d t} \operatorname{tr}\left(\Omega_{\nabla}(t) \wedge \Omega_{\nabla}(t)\right) d t \\
& =2 \int_{0}^{1} \operatorname{tr}\left(\frac{d \Omega_{\nabla}(t)}{d t} \wedge \Omega_{\nabla}(t)\right) d t \\
& =2 d \int_{0}^{1} \operatorname{tr}\left(\omega_{\nabla} \wedge \Omega_{\nabla}(t)\right) d t \\
& =2 d \int_{0}^{1} \operatorname{tr}\left(t \omega_{\nabla} \wedge d \omega_{\nabla}+t^{2} \omega_{\nabla} \wedge \omega_{\nabla} \wedge \omega_{\nabla}\right) d t \\
& \left.=\operatorname{dtr}\left(\omega_{\nabla} \wedge d \omega_{\nabla}+\frac{2}{3}\left(\omega_{\nabla} \wedge \omega_{\nabla} \wedge \omega_{\nabla}\right)\right) .\right] \\
& \text { Since }{ }^{d} \underline{\Omega}_{2 k}=0 \text {, it follows that } \\
& \left.\underline{\Pi}_{\underline{K}}=\underline{\Pi}_{\left(2 k_{1}\right.}, \ldots, 2 \mathrm{k}_{r}\right) \\
& =d\left(C_{2 k_{1}}{ }^{\wedge} \underline{\underline{\Omega}}_{2 k_{2}} \wedge \ldots \wedge \underline{\Omega}_{2 k_{r}}\right) \\
& =\mathrm{d}\left(\underline{\Omega}_{2 k_{1}}{ }^{\wedge} \mathrm{C}_{2 \mathrm{k}_{2}} \wedge \ldots \wedge \underline{\Omega}_{2 \mathrm{k}}^{\mathrm{r}}{ }^{\prime}\right) \\
& \begin{array}{l}
\cdot \\
= \\
= \\
\left(\underline{\Omega}_{2 k_{1}} \wedge \ldots \wedge \underline{\Omega}_{2 k_{r-1}} \wedge C_{2 k_{r}}\right) .
\end{array}
\end{aligned}
$$

[Note: Suppose that $i<j$ - then the difference
33.

$$
\underline{\Omega}_{2 \mathrm{k}_{1}} \wedge \ldots \wedge \mathrm{C}_{2 \mathrm{k}_{\mathrm{i}}} \wedge \ldots \wedge \underline{\Omega}_{2 \mathrm{k}_{r}}-\underline{\Omega}_{2 \mathrm{k}_{1}} \wedge \ldots \wedge \mathcal{C}_{2 \mathrm{k}_{j}} \wedge \ldots \wedge \underline{\Omega}_{2 k_{r}}
$$

equals

$$
\left.\mathrm{d} \underline{\Omega}_{2 \mathrm{k}_{1}} \wedge \ldots \wedge \mathcal{C}_{2 \mathrm{k}_{\mathrm{i}}} \wedge \ldots \wedge \mathcal{C}_{2 \mathrm{k}_{\mathrm{j}}} \wedge \ldots \wedge \underline{\Omega}_{2 k_{r}}\right)
$$

thus is exact.]

Section 28: Functional Derivatives Let $U$ and $V$ be linear spaces equipped with a bilinear functional < , >:U $\times \mathrm{V} \rightarrow$ R.
Definition: < , > is nondegenerate if

$$
\left[\begin{array}{l}
<u, v>=0 \forall \mathrm{v} \in \mathrm{~V} \Rightarrow \mathrm{u}=0 \\
<\mathrm{u}, \mathrm{v}>=0 \quad \forall \mathrm{u} \in \mathrm{U} \Rightarrow \mathrm{v}=0
\end{array}\right.
$$

Suppose that < , > is nondegenerate -- then the arrows

$$
\left[\begin{array}{ll}
\mathrm{U} \rightarrow \mathrm{~V}^{*} & (\mathrm{u} \rightarrow<\mathrm{u},>) \\
\mathrm{V} \rightarrow \mathrm{U}^{*} & (\mathrm{~V} \rightarrow<, \mathrm{V}>)
\end{array}\right.
$$

are one-to-one (but, in general, are not onto).
( $\phi$ ) Let $\phi: U \rightarrow \underline{R}-$ then the functional derivative $\frac{\delta \phi}{\delta \dot{u}}$ of $\phi$ w.r.t. $u \in U$ is the unique element of $V$ (if it exists) such that $\forall u^{\prime} \in U$,

$$
\left.\frac{\mathrm{d}}{\mathrm{~d} \varepsilon} \phi\left(u+\varepsilon u^{\prime}\right)\right|_{\varepsilon=0}=\left\langle u^{\prime}, \frac{\delta \phi}{\delta u}\right\rangle .
$$

$(\psi)$ Let $\psi: V \rightarrow \underline{R}-$ then the functional derivative $\frac{\delta \psi}{\delta v}$ of $\psi$ w.r.t. $v \in V$ is the unique element of $U$ (if it exists) such that $\forall v^{\prime} \in V$,

$$
\left.\frac{d}{d \varepsilon} \psi\left(v+\varepsilon v^{\prime}\right)\right|_{\varepsilon=0}=\left\langle\frac{\delta \psi}{\delta v}, v^{\prime}\right\rangle
$$

Remark: Functional derivatives give rise to maps

$$
\left[\begin{array}{rl}
\mathrm{D} \phi: U \rightarrow V & \left(\mathrm{D} \phi(\mathrm{u})=\frac{\delta \phi}{\delta u}\right) \\
\mathrm{D} \psi: V \rightarrow \mathrm{U} & \left(\mathrm{D} \mathrm{\psi}(\mathrm{v})=\frac{\delta \psi}{\delta v}\right) .
\end{array}\right.
$$

Example: Take $U=V=\underline{R}^{n}$ and let $<,>\underline{R}^{n} \times \underline{R}^{n} \rightarrow \underline{R}$ be the usual inner product: $<x, y>=x \cdot y$. Suppose that $f: \underline{R}^{n} \rightarrow \underline{R}$ is a $C^{\infty}$ function -- then $\forall x, y \in \underline{R}^{n}$,

$$
\left.\frac{d}{d \varepsilon} f(x+\varepsilon y)\right|_{\varepsilon=0}=\left.\nabla f\right|_{x} \cdot y
$$

$\Rightarrow$

$$
\frac{\delta f}{\delta x}=\left.\nabla f\right|_{x}
$$

Example: Let $U=V=C_{C}^{\infty}\left(R^{n}\right)$ and put

$$
<f, g>=\int_{\underline{R}^{n}} f(x) g(x) d x
$$

Define

$$
I_{k}: C_{C}^{\infty}\left(\underline{R}^{n}\right) \rightarrow \underline{R}
$$

by the rule

$$
I_{k}(f)=\int_{\underline{R}^{n}}(f(x)){ }^{k} d x \quad(k=1,2, \ldots)
$$

Then $\forall g$,

$$
\begin{aligned}
& \begin{aligned}
& \frac{d}{d \varepsilon} I_{k}(f+\varepsilon g)\left.\right|_{\varepsilon=0}=\left.\int_{R^{n}} \frac{d}{d \varepsilon}(f(x)+\varepsilon g(x))^{k}\right|_{\varepsilon=0} d x \\
&=\int_{R^{n}} k(f(x))^{k-1} g(x) d x \\
&=<k f^{k-1}, g> \\
& \Rightarrow \quad
\end{aligned} \\
& \quad \frac{\delta I_{k}}{\delta f}=k f^{k-1} .
\end{aligned}
$$

Let $M$ be a connected $C^{\infty}$ manifold of dimension $n$, which we shall assume is orientable.

Example: Take

$$
\begin{aligned}
& U=\Lambda_{C}^{P_{M}} \\
& \mathrm{~V}=\Lambda_{\mathrm{C}}^{\mathrm{n}-\mathrm{p}_{\mathrm{M}}}
\end{aligned}
$$

and let

$$
<\alpha, \beta>=\int_{M} \alpha \wedge \beta .
$$

$$
\Lambda_{C}^{p}: \quad \text { Suppose that } \phi: \Lambda_{C}^{P_{M}} \rightarrow \underline{R}-\text { then }
$$

$$
\frac{\delta \phi}{\delta \alpha} \in \Lambda_{c}^{n-p_{M}}
$$

is characterized by the relation

$$
\left.\frac{d}{d \varepsilon} \phi\left(\alpha+\varepsilon \alpha^{\prime}\right)\right|_{\varepsilon=0}=\int_{M} a^{\prime} \wedge \frac{\delta \phi}{\delta a}
$$

$\Lambda_{C}^{n-p}$ : Suppose that $\psi: \Lambda_{C}^{n-p_{M}} \rightarrow \underline{R}-$ then

$$
\frac{\delta \psi}{\delta \beta} \in \Lambda_{C} P_{M}
$$

is characterized by the relation

$$
\left.\frac{d}{d \varepsilon} \psi\left(\beta+\varepsilon \beta^{\prime}\right)\right|_{\varepsilon=0}=\int_{M} \frac{\delta \psi}{\delta \beta} \wedge \beta^{\prime} .
$$

In practice, the following situation can arise:

1. There are linear spaces $U$ and $V$ but no assumption is made regarding a bilinear functional < , >: U $\times \mathrm{V} \rightarrow$ R.
2. There is a linear subspace $U_{C} c U$ and a nondegenerate bilinear functional $<,>: U_{C} \times V \rightarrow \underline{R}$.
3. There is a subset $U_{0} \subset U$ such that $\forall u_{0} \in U_{0} \& \forall u_{c} \in U_{c}, u_{0}+\varepsilon u_{c} \in U_{0}$ provided $\varepsilon$ is sufficiently small.

Under these conditions, if $\phi: \mathrm{U}_{0} \rightarrow \underline{R}$, then it makes sense to oonsider $\frac{\delta \phi}{\delta u_{0}} \in \mathrm{~V}:$

$$
\left.\frac{\mathrm{d}}{\mathrm{~d} \varepsilon} \phi\left(u_{0}+\varepsilon u_{C}\right)\right|_{\varepsilon=0}=\left\langle u_{C^{\prime}} \frac{\delta \phi}{\delta u_{0}}\right\rangle
$$

We shall now consider a realization of this setup. Write $C_{d}^{\infty}(M)$ for $\sec \left(L_{d e n}\right)$, a module over $C^{\infty}(M)-$ then for any vector bundle $E \rightarrow M$, there is an arrow of evaluation

$$
\mathrm{ev}: \sec (E) \times \sec \left(E^{*} \otimes L_{\mathrm{den}}\right) \rightarrow C_{d}^{\infty}(M)
$$

Let

$$
\left[\begin{array}{c}
S^{2}(M)=\sec \left(S y m^{2} T M\right) \\
S_{2}(M)=\sec \left(S y m^{2} T * M\right)
\end{array}\right.
$$

Put

$$
S_{\mathrm{d}}^{2}(\mathrm{M})=\sec \left(\operatorname{Sym}^{2} T M \otimes \mathrm{~L}_{\mathrm{den}}\right)
$$

Denote by $S_{2, c}(M)$ the set of compactly supported elements of $S_{2}(M)-$ then there
is a nondegenerate bilinear functional

$$
<,>: S_{2, c}(M) \times S_{d}^{2}(M) \rightarrow \underline{R}
$$

viz.

$$
<s, \lambda \otimes \varphi>=\int_{M} \lambda(s) d m_{\varphi}
$$

Scholium: The preceding considerations are realized by taking

$$
\left[\begin{array}{l}
U=S_{2}(\mathrm{M}), V=S_{d}^{2}(\mathrm{M}) \\
U_{C}=S_{2, C}(\mathrm{M}), U_{0}=M
\end{array}\right.
$$

Example: Let

$$
L \in M C_{n}(0,0,1,2)
$$

be a lagrangian of the form

$$
L(g)=|g|^{1 / 2} F(g)
$$

where $F \in M C_{n}(0,0,0,2)$ (e.g. $|g|^{1 / 2} S$ ). Then, by definition,

$$
\operatorname{PL}(g, h)=\left.\frac{d}{d \varepsilon} L(g+\varepsilon h)\right|_{\varepsilon=0}\left(h \in S_{2, c}(M)\right)
$$

and we have

$$
\operatorname{PL}(g, h)=-\operatorname{ev}(h, E(L))+\operatorname{div} X(g, h)
$$

Here

$$
X(g, h) \in \sec \left(T M \otimes L_{\text {den }}\right)
$$

is compactly supported. If $M$ is compact, then

$$
L(g)=\int_{M} L(g)
$$

exists and

$$
\begin{aligned}
& \left.\frac{d}{d \varepsilon} L(g+\varepsilon h)\right|_{\varepsilon=0} \\
& =\int_{M} \operatorname{PL}(g, h) \\
& =\int_{M}-\operatorname{ev}(h, E(L))=<h,-E(L)> \\
& \frac{\delta L}{\delta g}=-E(L) .
\end{aligned}
$$

On the other hand, if $M$ is not compact, then the integral $\int_{M} L(g)$ need not exist but for any open, relatively compact subset KCM,

$$
L_{K}(g)=\int_{K} L(g)
$$

does exist and

$$
\left.\frac{\delta L_{K}}{\delta g}=-E(L) \right\rvert\, K .
$$

Notation: Put

$$
\Lambda_{\mathrm{d}}^{1}(M)=\sec \left(T^{\star} \mathrm{M} \otimes L_{d e n}\right)
$$

Let $D_{C}^{1}(M)$ stand for the set of compactly supported elements of $D^{1}(M)$-then there is a nondegenerate bilinear functional

$$
<,>: D_{C}^{1}(M) \times \Lambda_{d}^{1}(M) \rightarrow \underline{R},
$$

viz.

$$
<\mathrm{X}, a \otimes \varphi>=\int_{\mathrm{M}} a(\mathrm{X}) d \mathrm{~m}_{\varphi} .
$$

Observation: Fix $g \in \mathbb{M}$-- then $\forall X \in \mathcal{D}^{I}(M), L_{X} g \in S_{2}(M)$. Indeed,
7.

$$
\left(L_{X} g\right)(Y, Z)=\nabla g^{b} X(Y, Z)+\nabla g^{b} X(Z, Y)
$$

where $\nabla$ is the metric connection attached to $g$ (bear in mind that $\nabla g^{b} X \in 0_{2}^{0}(M)$ ). [Note: Locally,

$$
\left.L_{x} g_{i j}=x_{i ; j}+x_{j ; i}=\nabla_{j} x_{i}+\nabla_{i} x_{j} \cdot\right]
$$

LEMMA Fix $g \in \mathbb{M}$-- then $\forall X \in D_{C}^{1}(M) \& \forall s \in S_{2}(M)$,

$$
<L_{X} g, s^{\#} \otimes|g|^{1 / 2}>=-2<x, \operatorname{div}_{g} s \otimes|g|^{1 / 2}>
$$

[Start with the LHS, thus

$$
\begin{aligned}
& <L_{x} g, s^{\#} \otimes|g|^{1 / 2}> \\
& \quad=\int_{M} s^{\#}\left(L_{x} g\right) v_{g o l}^{g} \\
& \quad=\int_{M}\left(x_{i ; j}+x_{j ; i}\right) s^{i j_{v o l}^{g}} \\
& \quad=-2 \int_{M} x_{i} \nabla_{j} s^{i j_{v o l}}{ }_{g} .
\end{aligned}
$$

By definition, $\operatorname{div}_{g} s$ is a l-form:

$$
\left(\operatorname{div}_{g} s\right)_{i}=g^{k j} \nabla_{j} s_{k i}=g^{j k} \nabla_{j} s_{i k}=\nabla_{j} s_{i}^{j}
$$

Therefore

$$
\begin{aligned}
x_{i} \nabla_{j} s^{i j} & =g_{i k} X^{k} \nabla_{j} s^{i j} \\
& =x^{k} g_{i k} \nabla_{j} s^{i j}
\end{aligned}
$$

$$
\begin{aligned}
& =x^{k} g_{k i} \nabla_{j} s^{i j} \\
& =x^{k} \nabla_{j} s_{k}^{j} \\
& =x^{i} \nabla_{j} s_{i}^{j} \\
& =x^{i}\left(d_{i v}{ }^{s}\right)_{i}
\end{aligned}
$$

[Note: There is an integration by parts implicit in the passage from

$$
\int_{M}\left(X_{i ; j}+X_{j ; i}\right) s^{i j} v_{v o l}
$$

to

$$
-2 \int_{M} x_{i} \nabla_{j} s^{i j_{v o l}}{ }_{g} .
$$

In fact,

$$
\Rightarrow
$$

$$
\begin{aligned}
& \nabla_{j}\left(X_{i} s^{i j}\right)=X_{i ;} s^{i j}+X_{i} \nabla_{j} s^{i j}
\end{aligned}
$$

$$
\begin{aligned}
& =\int_{\mathrm{M}}\left(\operatorname{div}_{\mathrm{g}} \mathrm{~s}\right)(\mathrm{X}) \mathrm{vol}_{\mathrm{g}} \\
& \left.=<x, \operatorname{div}_{g} s \otimes|g|^{1 / 2}>.\right]
\end{aligned}
$$

9. 

Claim: $\exists \mathrm{Y} \in \mathcal{D}_{C}^{1}(M)$ such that

$$
Y^{j}=X_{i} s^{i j}
$$

To see this, observe that

$$
s^{\#} \otimes g^{b} x \in D_{l}^{2}(M)
$$

has components

$$
\left(s^{\#} \otimes g^{b} x\right)^{i j}{ }_{k}=s^{i j} x_{k} .
$$

Now apply the contraction

$$
C_{1}^{1}: D_{1}^{2}(\mathrm{M}) \rightarrow D_{0}^{1}(\mathrm{M}) \quad\left(=D^{1}(\mathrm{M})\right)
$$

Then

$$
\mathrm{Y}=\mathrm{C}_{\mathrm{l}}^{1}\left(\mathrm{~s}^{\#} \otimes \mathrm{~g}^{b} \mathrm{X}\right) \in \mathcal{D}^{l}(\mathrm{M})
$$

has components

$$
s^{i j} x_{i}
$$

and is compactly supported. Consequently,

$$
\begin{gathered}
\nabla_{j}\left(X_{i} s^{i j}\right)=Y_{; j}^{j} \\
\int_{M} \nabla_{j}\left(X_{i} s^{i j}\right) v o l_{g}=\int_{M}\left(\operatorname{div}_{g} Y\right) \operatorname{vol}_{g}=0.1
\end{gathered}
$$

Each $\mathrm{g} \in \mathrm{M}$ determines a map

$$
\left[\begin{array}{rl}
s_{d}^{2}(M) & \rightarrow \Lambda_{d}^{1}(M) \\
\Lambda & \rightarrow \operatorname{div}_{g} \Lambda
\end{array}\right.
$$

Thus write $\Lambda=s^{\#} \otimes|g|^{1 / 2}\left(s \in S_{2}(M)\right)$ and set

$$
\operatorname{div}_{g} \Lambda=\operatorname{div}_{g} s \otimes|g|^{1 / 2}
$$

The lerma then implies that $\forall X \in D_{C}^{l}(M)$,

$$
\begin{aligned}
-2 \int_{M} & \operatorname{div}_{g} \Lambda(X) \\
& =-2 \int_{M}\left(\operatorname{div}_{g} s\right)(X) v_{g o l}^{g} \\
& =\int_{M} s^{\#}\left(L_{X} g\right) v_{g o l}^{g} \\
& =\int_{M} \Lambda\left(L_{X} g\right)
\end{aligned}
$$

Example: Suppose that $X \in \mathcal{D}_{C}^{1}(M)$. Fix $g \in \underline{M}$ and define

$$
I_{X, g}: S_{d}^{2}(M) \rightarrow \underline{R}
$$

by

$$
I_{X, g}(\Lambda)=\int_{M} \Lambda\left(L_{X} g\right)
$$

Then

$$
\begin{aligned}
& \left.\frac{d}{d \varepsilon} I_{X, g}\left(\Lambda+\varepsilon \Lambda^{\prime}\right)\right|_{\varepsilon=0} \\
& \quad=\left.\int_{M} \frac{d}{d \varepsilon}\left(\Lambda+\varepsilon \Lambda^{\prime}\right)\left(L_{X} g\right)\right|_{\varepsilon=0} \\
& \quad=\int_{M} \Lambda^{\prime}\left(L_{X} g\right) \\
& \left.\quad=<L_{X} g r \Lambda^{\prime}\right\rangle
\end{aligned}
$$

11. 

$$
\frac{\delta I_{X, g}}{\delta \Lambda}=L_{X} g
$$

Example: Suppose that $X \in D_{C}^{1}(M)$. Fix $\Lambda \in S_{d}^{2}(M)$ and define

$$
\mathrm{I}_{\mathrm{X}, \mathrm{\Lambda}}: \underline{M} \rightarrow \underline{R}
$$

by

$$
I_{X, \Lambda}(g)=\int_{M} \Lambda\left(L_{X} g\right)
$$

Then

$$
\begin{aligned}
& \left.\frac{d}{d \varepsilon} I_{X, \Lambda}(g+\varepsilon h)\right|_{\varepsilon=0} \\
& \quad=\left.\int_{M} \frac{d}{d \varepsilon} \Lambda\left(L_{X} g+\varepsilon L_{X} h\right)\right|_{\varepsilon=0} \\
& \quad=\int_{M} \Lambda\left(L_{X} h\right) \\
& \quad=\int_{M} s^{\#}\left(L_{X} h\right) v^{2} l_{g}
\end{aligned}
$$

or still (cf. infra),

$$
\begin{aligned}
& =\int_{M}-\left[\left(L_{X} s^{\#}\right)(h)+s^{\#}(h) \operatorname{div}_{g} X\right] \operatorname{vol}_{g} \\
& \left.=<h,-L_{X} \Lambda\right\rangle \\
& \Rightarrow \quad \frac{\delta I_{X, \Lambda}}{\delta g}=-L_{X} \Lambda .
\end{aligned}
$$

Here

$$
L_{X} \Lambda=L_{X} s^{\#} \otimes|g|^{1 / 2}+s^{\#} \otimes\left(\operatorname{div}_{g} X\right)|g|^{1 / 2}
$$

[Note: To justify the not so obvious step in the manipulation, recall that $L_{X}$ commutes with contractions, hence

$$
\begin{aligned}
& L_{X}\left(s^{\#}(h)\right)=L_{X}\left(C_{1}^{I} C_{2}^{2}\left(s^{\#} \otimes h\right)\right) \\
= & C_{1}^{l} C_{2}^{2} L_{X}\left(s^{\#} \otimes h\right) \\
= & C_{1}^{1} C_{2}^{2}\left(\left(L_{X} s^{\#}\right) \otimes h+s^{\#} \otimes\left(L_{X} h\right)\right) \\
= & \left(L_{X} s^{\#}\right)(h)+s^{\#}\left(L_{X} h\right) .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
\int_{M} & s^{\#}\left(L_{X} h\right) \mathrm{vol}_{g} \\
& =\int_{M} L_{X}\left(s^{\#}(h)\right) \operatorname{vol}_{g}-\int_{M}\left(L_{X} s^{\#}\right)(h) \mathrm{vol}_{g} \\
& =-\int_{M}\left(L_{X} s^{\#}\right)(h) \operatorname{vol}_{g}-\int_{M} s^{\#}(h)\left(\operatorname{div}_{g} X\right) \mathrm{vol}_{g} \\
& \left.=\int_{M}-\left[\left(L_{X} s^{\#}\right)(h)+s^{\#}(h) \operatorname{div}_{g} X\right] v o l_{g} .\right]
\end{aligned}
$$

Remark: Let $T \in \mathcal{D}_{2}^{0}(M)$. Suppose that $T$ is symmetric -- then $\forall X \in \mathcal{D}^{I}$ (M), $L_{X} T$ is symmetric.
[Recall that $\forall Y, Z \in \mathcal{D}^{\perp}(M)$,

$$
\begin{aligned}
& \left(L_{X} T\right)(Y, Z)=X T(Y, Z) \\
& -T([X, Y], Z)-T(Y,[X, Z]) .]
\end{aligned}
$$

Notation: Let $g \in M$.
-Given $s \in S_{2}(M)$, put

$$
\operatorname{tr}_{g}(s)=g\left[\begin{array}{l}
0 \\
2
\end{array}\right](g, s)=g^{i j_{s}}{ }_{i j}
$$

- Given $u, v \in S_{2}(M)$, put

$$
[u, v]_{g}=g\left[0_{2}^{0}\right](u, v)=u^{i j} v_{i j} \quad\left(=u_{i j} v^{i j}\right)
$$

- Given $s \in S_{2}(M)$, put

$$
(s * s)_{i j}=s_{i k} s_{j}^{k}
$$

[Note:
(1) $s * s \in S_{2}(M)$. Proof:

$$
\begin{aligned}
s_{i k} s_{j}^{k} & =s_{i k} g^{k \ell} s_{\ell j} \\
& =s_{j \ell} g^{\ell k} s_{k i} \\
& =s_{j \ell^{s}}{ }^{\ell}{ }_{i}
\end{aligned}
$$

(2) $\operatorname{tr}_{g}(s * s)=[s, s]_{g}$. Proof:

$$
\begin{aligned}
\operatorname{tr}_{g}(s * s) & =g^{i j}(s * s){ }_{i j} \\
& =g^{i j} s_{i k} s_{j}^{k} \\
& =s_{k i} g^{i j} s_{j}^{k} \\
& \left.=s_{k i} s^{k i} \cdot\right]
\end{aligned}
$$

Suppose given a function

$$
\Phi: \underline{M} \rightarrow C_{d}^{\infty}(M)
$$

Then $\forall g \in \mathbb{M}$, the prescription

$$
\mathrm{D}_{\mathrm{g}} \Phi(\mathrm{~h})=\left.\frac{\mathrm{d}}{\mathrm{~d} \varepsilon} \Phi(\mathrm{~g}+\varepsilon \mathrm{h})\right|_{\varepsilon=0}
$$

defines a function

$$
\mathrm{D}_{\mathrm{g}} \Phi: S_{2, c}(\mathrm{M}) \rightarrow C_{d}^{\infty}(\mathrm{M})
$$

[Note: If $M$ is compact and if

$$
\phi(g)=\int_{M} \Phi(g)
$$

then in the applications, $\frac{\delta \phi}{\delta g} \in S_{d}^{2}(M)$ exists, so

$$
\left.\left.\frac{d}{d \varepsilon} \phi(g+\varepsilon h)\right|_{\varepsilon=0}=\int_{M} D_{g} \Phi(h)=<h, \frac{\delta \phi}{\delta g}>.\right]
$$

Examples:
(1) Put $\Phi(g)=|g|^{1 / 2}$ - then

$$
D_{g} \Phi(h)=\frac{1}{2} \operatorname{tr}_{g}(h)|g|^{1 / 2} .
$$

Therefore

$$
\frac{\delta \phi}{\delta g}=\frac{1}{2} g^{\#} \otimes|g|^{1 / 2}
$$

provided M is compact.
[We have

$$
\left.\frac{d}{d \varepsilon} \operatorname{det}\left(\left(g_{i j}\right)+\varepsilon\left(h_{i j}\right)\right)\right|_{\varepsilon=0}
$$

$$
\begin{aligned}
& =\left.\frac{d}{d \varepsilon} \operatorname{det}\left(g_{i j}\right) \operatorname{det}\left(l+\varepsilon\left(g^{i j}\right)\left(h_{i j}\right)\right)\right|_{\varepsilon=0} \\
& =\operatorname{det}\left(g_{i j}\right) \operatorname{tr}\left(\left(g^{i j}\right)\left(h_{i j}\right)\right) \\
& =\operatorname{tr}_{g}(h) \operatorname{det}\left(g_{i j}\right)
\end{aligned}
$$

Consequently,

$$
\begin{aligned}
& \left.\frac{d}{d \varepsilon}|g+\varepsilon h|^{1 / 2}\right|_{\varepsilon=0}=\frac{1}{2} \frac{1}{|g|^{1 / 2}} \times \frac{d}{d \varepsilon} \pm\left.\operatorname{det}\left(\left(g_{i j}\right)+\varepsilon\left(h_{i j}\right)\right)\right|_{\varepsilon=0} \\
& \quad=\frac{1}{2} \operatorname{tr}_{g}(h) \frac{1}{|g|^{1 / 2}} \times \pm \operatorname{det}\left(g_{i j}\right) \\
& \left.\quad=\frac{1}{2} \operatorname{tr}_{g}(h)|g|^{1 / 2} .\right]
\end{aligned}
$$

(2) Put $\Phi(g)=\frac{1}{|g|^{1 / 2}} \cdots$ then

$$
D_{g} \Phi(h)=-\frac{1}{2} \operatorname{tr}_{g}(h)|g|^{-1 / 2}
$$

Therefore

$$
\frac{\delta \phi}{\delta g}=-\frac{1}{2} g^{\#} \otimes|g|^{-1 / 2}
$$

provided $M$ is compact.
[In fact,

$$
\begin{aligned}
& \left.\frac{d}{d \varepsilon} \frac{1}{|g+\varepsilon h|^{1 / 2}}\right|_{\varepsilon=0} \\
= & \left.\frac{d}{d \varepsilon}\left(|g+\varepsilon h|^{1 / 2}\right)^{-1}\right|_{\varepsilon=0} \\
= & -\left.\left.\left(|g+\varepsilon h|^{1 / 2}\right)^{-2}\right|_{\varepsilon=0} \frac{d}{d \varepsilon}|g+\varepsilon h|^{1 / 2}\right|_{\varepsilon=0}
\end{aligned}
$$

$$
\begin{aligned}
& =-\left(|g|^{1 / 2}\right)^{-2} \frac{1}{2} \operatorname{tr}_{g}(\mathrm{~h})|g|^{1 / 2} \\
& \left.=-\frac{1}{2} \operatorname{tr}_{g}(\mathrm{~h})|g|^{-1 / 2} .\right]
\end{aligned}
$$

(3) Fix $s \in S_{2}$ (M) and put

$$
\Phi_{s}(g)=[s, s]_{g}|g|^{1 / 2}
$$

Then

$$
D_{g} \Phi_{s}(h)=-2[h, S * s]_{g}|g|^{1 / 2}+\frac{1}{2}[s, s]_{g} \operatorname{tr}_{g}(h)|g|^{1 / 2} .
$$

Therefore

$$
\frac{\delta \phi_{s}}{\delta g}=-2(s * s)^{\#} \otimes|g|^{1 / 2}+\frac{1}{2}[s, s] g^{g^{\#}} \otimes|g|^{1 / 2}
$$

provided $M$ is compact.
[To begin with,

$$
D_{g} \Phi_{s}(h)=\frac{d}{d \varepsilon}[s, s]_{g}+\left.\varepsilon h\right|_{\varepsilon=0}|g|^{1 / 2}+\left.[s, s]_{g} \frac{d}{d \varepsilon}|g+\varepsilon h|^{l / 2}\right|_{\varepsilon=0}
$$

But

$$
\left.\frac{d}{d \varepsilon}(g+\varepsilon h)^{i j}\right|_{\varepsilon=0}=-g^{i k_{i} j \ell_{h_{k \ell}}}
$$

Accordingly,

$$
\begin{aligned}
& \frac{d}{d \varepsilon}[s, s] g+\left.\varepsilon h\right|_{\varepsilon=0} \\
& \quad=\left.\frac{d}{d \varepsilon}(g+\varepsilon h)^{i a}(g+\varepsilon h)^{j b}\right|_{\varepsilon=0^{3} \mathbf{s b} \mathbf{s}_{i j}}
\end{aligned}
$$

$$
\begin{aligned}
& =-h^{i a} g^{j b}{ }_{s_{a b}} s_{i j}-h^{j b}{ }_{g}^{i a} s_{a b} s_{i j} \\
& =-h^{a i_{s}}{ }_{a b} g^{b j}{ }_{s_{j i}}-h^{b j}{ }_{s_{b a}} g^{a i_{s}}{ }_{i j} \\
& =-h^{a i_{s}}{ }_{a b} s_{i}^{b}-h^{b j} s_{b a} s^{a}{ }_{j} \\
& =-h^{a i}(s * s)_{a i}-h^{b j}(s * s)_{b j} \\
& =-[h, s * s]_{g}-[h, s * s]_{g} \\
& =-2[h, S * S] g .]
\end{aligned}
$$

(4) Fix $s \in S_{2}$ (M) and put

$$
\Phi_{\mathrm{s}}(\mathrm{~g})=\operatorname{tr}_{\mathrm{g}}(\mathrm{~s})|\mathrm{g}|^{1 / 2}
$$

Then

$$
D_{g} \Phi_{s}(h)=-[h, s]_{g}|g|^{1 / 2}+\frac{1}{2} \operatorname{tr}_{g}(s) \operatorname{tr}_{g}(h)|g|^{1 / 2} .
$$

Therefore

$$
\frac{\delta \phi_{g}}{\delta g}=-s^{\#} \otimes|g|^{1 / 2}+\frac{1}{2} \operatorname{tr}_{g}(s) g^{\#} \otimes|g|^{1 / 2}
$$

provided $M$ is compact.
[Simply note that

$$
\left.\frac{d}{d \varepsilon} \operatorname{tr}_{g+\varepsilon h^{(s)}}\right|_{\varepsilon=0}
$$

18. 

$$
\begin{aligned}
& =\frac{\mathrm{d}}{\mathrm{~d} \varepsilon}(g+\varepsilon h)^{\left.i j_{s_{i j}}\right|_{\varepsilon=0}} \\
& =-g^{i k} g^{j} l_{h_{k} \ell^{s}}{ }_{i j} \\
& =-h^{i j} s_{i j} \\
& \left.=-[h, s]_{g} .\right]
\end{aligned}
$$

Section 29: Variational Principles Let $M$ be a connected $C^{\infty}$ manifold of dimension $n$, which we shall assume is orientable.

Let

$$
\nabla: \underline{M} \rightarrow \text { con } T M
$$

be the map that assigns to each $g \in \mathbb{M}$ its metric connection $\nabla^{g}$ - then

$$
D_{g} \nabla(h)=\left.\frac{d}{d \varepsilon} \nabla^{g+\varepsilon h}\right|_{\varepsilon=0}
$$

is an element of $D_{2}^{l}(M)$. Viewing $D_{g} \nabla(\mathrm{~h})$ as a map $D^{l}(M) \times D^{l}(M) \rightarrow D^{l}(M)$, we have

$$
\begin{aligned}
& g\left(D_{g} \nabla(h)(X, Y), Z\right) \\
= & \frac{1}{2}\left[\nabla_{X} h(Y, Z)+\nabla_{Y} h(X, Z)-\nabla_{Z} h(X, Y)\right] .
\end{aligned}
$$

Locally,

$$
\left(D_{g} \nabla(h)\right)_{i j}^{k}=\frac{1}{2} g^{k \ell}\left(\nabla_{i} h_{\ell j}+\nabla_{j} h_{i \ell}-\nabla_{\ell} h_{i j}\right),
$$

which shows that $D_{g} \nabla(h)$ is symmetric in its covariant indices.
[Note: Let $\Gamma_{i j}^{k}(g+\varepsilon h)$ be the connection coefficients of $\nabla^{g+\varepsilon h}$-- then

$$
\left.\left.\frac{d}{d \varepsilon} \Gamma_{i j}^{k}(g+\varepsilon h)\right|_{\varepsilon=0}=\left(D_{g} \nabla(h)\right)_{i j}^{k} \cdot\right]
$$

FACT Take $h=L_{X} g\left(X \in D_{C}^{l}(M)\right)$-- then

$$
D_{g} \nabla\left(L_{X} g\right)=L_{X} \nabla^{g}
$$

Example: Consider the interior derivative

$$
\delta_{g}: \Lambda^{1} M \rightarrow C^{\infty}(M),
$$

so locally

$$
\delta_{g}^{\alpha}=-\nabla^{i} \alpha_{i}=-g^{i j^{\nabla_{j}}} \alpha_{i}
$$

2. 

Then

$$
\begin{aligned}
& \delta_{g, h}^{\prime}(a)=\frac{d}{d \varepsilon} \delta_{g}+\left.\varepsilon h^{a}\right|_{\varepsilon=0} \\
& \quad=\left.\frac{d}{d \varepsilon}\left(-(g+\varepsilon h)^{i j_{\nabla} g}+\varepsilon h_{a_{i}}\right)\right|_{\varepsilon=0} \\
& \quad=h^{i j} \nabla_{j} \alpha_{i}-\left.g^{i j} \frac{d}{d \varepsilon}\left(\nabla_{j}^{g}+\varepsilon h_{a_{i}}\right)\right|_{\varepsilon=0} \\
& \quad=h^{i j}(\nabla a)_{i j}-\left.g^{i j} \frac{d}{d \varepsilon}\left(a_{i, j}-\Gamma_{i j}^{k}(g+\varepsilon h) a_{k}\right)\right|_{\varepsilon=0} \\
& =h^{i j}(\nabla a) \\
& i j \\
& +\left.g^{i j} \frac{d}{d \varepsilon} \Gamma_{i j}^{k}(g+\varepsilon h)\right|_{\varepsilon=0} \alpha_{k} .
\end{aligned}
$$

But

$$
\begin{aligned}
& \left.g^{i j} \frac{d}{d \varepsilon} \Gamma_{i j}^{k}(g+\varepsilon h)\right|_{\varepsilon=0} \alpha_{k} \\
& \quad=g^{i j} \frac{1}{2} g^{k \ell}\left(\nabla_{i} h_{\ell j}+\nabla_{j} h_{i \ell}-\nabla_{\ell} h_{i j}\right) \alpha_{k} .
\end{aligned}
$$

And

$$
\begin{aligned}
& g^{i j} \frac{1}{2} g^{k \ell}\left(\nabla_{i} h_{\ell j}+\nabla_{j} h_{i \ell}\right) \alpha_{k} \\
& \quad=g^{l k} \alpha_{k} \frac{1}{2} g^{i j}\left(\nabla_{i} h_{\ell j}+\nabla_{j} h_{i \ell}\right) \\
& \quad=a^{\ell}\left(d_{g}{ }^{h}\right)_{\ell} .
\end{aligned}
$$

In addition,

$$
\begin{array}{r}
\nabla_{\ell}\left(g^{i j} h_{i j}\right)=g^{i j} \nabla_{\ell} h_{i j} \\
g^{i j} \frac{1}{2} g^{k \ell}\left(-\nabla_{\ell} h_{i j}\right) a_{k} \\
=-\frac{1}{2} a^{\ell} \nabla_{\ell}\left(g^{i j_{h}}{ }_{i j}\right) \\
=-\frac{1}{2} a^{l} \partial_{\ell}\left(g^{i j_{h}} h_{i j}\right)
\end{array}
$$

Therefore

$$
\begin{aligned}
& \delta_{g, h}^{\prime}(\alpha)=g\left[\frac{0}{2}\right](h, \nabla \alpha) \\
& +g\left(a, \operatorname{div}{ }_{g} h\right)-\frac{1}{2} g\left(\alpha, d\left(\operatorname{tr}_{g}(h)\right)\right) .
\end{aligned}
$$

[Note: on $C^{\infty}(M)$,

$$
\Delta_{g}=-\delta_{g} \circ d
$$

Consequently,

$$
\left.\frac{d}{d \varepsilon} \Delta_{g}+\left.\varepsilon h^{f}\right|_{\varepsilon=0}=-\frac{d}{d \varepsilon} \delta_{g}+\left.\varepsilon h^{d f}\right|_{\varepsilon=0 .}\right]
$$

Let $R^{i}{ }_{j k \ell}(g+\varepsilon h)$ be the curvature components of $\nabla^{g+\varepsilon h}$.

LEMMA We have

$$
\left.\frac{d}{d \varepsilon} R_{j k \ell}^{i}(g+\varepsilon h)\right|_{\varepsilon=0}=\nabla_{k}\left(D_{g} \nabla(h)\right)_{j \ell}^{i}-\nabla_{\ell}\left(D_{g} \nabla(h)\right)_{j k}^{i} .
$$

[Put

$$
\left\{\begin{aligned}
T_{j \ell}^{i} & =\left(D_{g} \nabla(h)\right)_{j \ell}^{i}=\left.\frac{d}{d \varepsilon} \Gamma_{j \ell}^{i}(g+\varepsilon h)\right|_{\varepsilon=0} \\
T_{j k}^{i} & =\left(D_{g} \nabla(h)\right)_{j k}^{i}=\left.\frac{d}{d \varepsilon} \Gamma_{j k}^{i}(g+\varepsilon h)\right|_{\varepsilon=0^{*}}
\end{aligned}\right.
$$

Then

$$
\begin{gathered}
\left.\quad \frac{d}{d \varepsilon} R_{j k \ell}^{i}(g+\varepsilon h)\right|_{\varepsilon=0} \\
=\partial_{k} T^{T^{i}}{ }_{\ell j}-\partial_{\ell} T^{T^{i}} \\
+T_{\ell j}^{a}{ }_{\ell j} \Gamma_{k a}^{i}+\Gamma_{\ell j}^{a} T_{k a}^{i}-T_{k j}^{a} \Gamma_{l a}^{i}-\Gamma_{k j}^{a} T_{l a}^{i} \cdot
\end{gathered}
$$

On the other hand,

$$
\begin{aligned}
& -\Gamma_{k j}^{a} T^{T^{i}} a l-\Gamma_{k l^{T^{i}}}^{j a} . \\
& -\nabla_{\ell} T^{i}{ }_{j k}=-\partial_{\ell} T^{T^{i}}{ }_{j k}-\Gamma^{i}{ }_{l a} T^{a}{ }_{j k} \\
& +\Gamma_{\ell j^{\prime}} \mathrm{T}^{\mathrm{i}}{ }_{a k}+\Gamma_{\ell k}^{\mathrm{a}} \mathrm{~T}^{\mathrm{i}}{ }_{j a} .
\end{aligned}
$$

But

$$
\left\lvert\, \begin{gathered}
\Gamma_{s t}^{r}=r_{t s}^{r} \\
{ }_{-}^{r}{ }_{s t}=T_{t s}{ }^{r}
\end{gathered}\right.
$$

so the equality of the two expressions is obvious.]

Therefore

$$
\begin{aligned}
& \left.\frac{d}{d \varepsilon} R_{j k \ell}^{i}(g+\varepsilon h)\right|_{\varepsilon=0} \\
& =\frac{1}{2} g^{i a}\left(h_{a \ell ; j ; k}+h_{j a ; \ell ; k}-h_{j \ell ; a ; k}\right) \\
& -\frac{1}{2} g^{i a}\left(h_{a k ; j ; \ell}+h_{j a ; k ; \ell}-h_{j k ; a ; \ell}\right) \\
& \text { or still, } \\
& \left.\frac{\mathrm{d}}{\mathrm{~d} \varepsilon} \mathrm{R}^{\mathrm{i}}{ }_{j k \ell}(\mathrm{~g}+\varepsilon \mathrm{h})\right|_{\varepsilon=0} \\
& =\frac{1}{2} g^{i a}\left(h_{a j ; \ell ; k}-h_{a j ; k ; \ell}\right. \\
& +h_{a l ; j ; k}-h_{j \ell ; a ; k}+h_{j k ; a ; \ell}-h_{a k ; j ; \ell} \\
& \text { or still, } \\
& \left.\frac{d}{d \varepsilon} R^{i}{ }_{j k \ell}(g+\varepsilon h)\right|_{\varepsilon=0} \\
& =\frac{1}{2} g^{i a}\left(-R_{j k \ell}^{b} h_{a b}-R_{a k \ell^{h}}{ }_{j b}\right. \\
& \left.+h_{a \ell ; j ; k}-h_{j \ell ; a ; k}+h_{j k ; a ; \ell}-h_{a k ; j ; \ell}\right) .
\end{aligned}
$$

Application: We have

$$
\begin{aligned}
\frac{d}{d \varepsilon} & \left.\operatorname{Ric}(g+\varepsilon h) j \ell\right|_{\varepsilon=0} \\
& =\left.\frac{d}{d \varepsilon} R_{j i \ell}^{i}(g+\varepsilon h)\right|_{\varepsilon=0}
\end{aligned}
$$

$$
\begin{aligned}
& =\frac{1}{2} g^{i a}\left(-R_{j i}^{b} \ell_{a b}-R^{b} a i \ell^{h} j b\right. \\
& \left.+h_{a \ell ; j ; i}-h_{j \ell ; a ; i}+h_{j i ; a ; \ell}-h_{a i ; j ; \ell}\right) .
\end{aligned}
$$

Hidden within this formula (itself perfectly respectable) are certain conceptual features that are not immediately apparent.

Notation:

- Given $s \in S_{2}(M)$, define

$$
R(s) \in S_{2}(M)
$$

by

$$
R(s)_{i j}=R_{i j}^{a b_{a b}}
$$

- Given $u, v \in S_{2}(M)$, define

$$
u * v \in D_{2}^{0}(M)
$$

by

$$
(\mathrm{u} * \mathrm{v})_{i j}=u_{i} \mathrm{k}_{\mathrm{kjj}}
$$

Then

$$
\mathrm{u} * \mathrm{v}+\mathrm{v} * \mathrm{u} \in \mathrm{~S}_{2}(\mathrm{M})
$$

Definition: The Lichnerowicz laplacian is the map

$$
\Delta_{L}: S_{2}(M) \rightarrow S_{2}(M)
$$

defined by the prescription

$$
\Delta_{L} s=-\Delta_{c o n} s+R i c * s+s * R i c-2 R(s)
$$

[Note: Locally,

$$
\left.\left(\Delta_{L} s\right)_{i j}=-g^{a b} s_{i j ; a ; b}+R_{i}^{k} s_{k j}+R_{j}{ }^{k} s_{k i}-2 R_{i j}^{a b} s_{a b} \cdot\right]
$$

FACT Suppose that $g \in \mathbb{M}$ is an Einstein metric:

$$
\operatorname{Ric}(g)=\frac{S(g)}{n} g
$$

Then

$$
\operatorname{div}_{g} \circ \Delta_{L}=-\Delta_{c o n} \circ \operatorname{div}_{g}+\frac{S(g)}{n} \operatorname{div}_{g}
$$

Given $a \in \Lambda^{1} \mathrm{M}$, put

$$
\Gamma_{g^{\alpha}}=L_{\alpha^{\#}} g \in S_{2}^{(M)},
$$

thus locally,

$$
\left(\Gamma_{g}^{\alpha}\right)_{i j}=\alpha_{i ; j}+\alpha_{j ; i}
$$

LEMMA View Ric as a map

$$
\text { Ric: } \underline{M} \rightarrow S_{2}(M)
$$

Then

$$
\begin{aligned}
& \left(D_{g} R i c\right)(h)=\left.\frac{d}{d \varepsilon} \operatorname{Ric}(g+\varepsilon h)\right|_{\varepsilon=0} \\
& =\frac{1}{2}\left[\Delta_{L} h+\Gamma_{d i v_{g}} h-H_{t r_{g}}(h)\right]
\end{aligned}
$$

[It is a question of comparing components. For this purpose, start with

$$
\frac{1}{2} g^{i a}\left(h_{a \ell ; j ; i}-h_{j \ell ; a ; i}+h_{j i ; a ; \ell}-h_{a i ; j ; \ell}\right) .
$$

First

$$
g^{i a_{h}}{ }_{a \ell ; j ; i}=g^{i a_{h}} a l ; i ; j
$$

$$
+g^{i a}\left(-R_{\ell i j}^{b}{ }_{a b}-R_{a i j}^{b} h_{\ell b}\right) .
$$

But

$$
\begin{aligned}
& \left(\Gamma_{\operatorname{div}_{g}}{ }^{h}\right)_{j \ell} \\
& \quad=\left(\operatorname{div}_{g} h\right)_{j ; \ell}+\left(\operatorname{div}_{g}^{h}\right)_{\ell ; j} \\
& \quad=h_{j ; a ; \ell}^{a}+h_{\ell}^{a} a_{i j}
\end{aligned}
$$

And

$$
\begin{aligned}
& g^{i a_{h_{a l ; i ; j}}+g^{i a_{h}} j_{j ; a ; \ell}} \\
& =g^{i a_{h}} l_{l ; i ; j}+g^{a i_{h}}{ }_{j i ; a ; \ell} \\
& =h_{\ell ; i ; j}^{i}+h_{j ; a ; \ell}^{a} \\
& =h_{\ell}^{a} a ; \ell+h_{j ; a ; \ell}^{a}
\end{aligned}
$$

So $\Gamma_{\operatorname{div}_{g}} h$ is accounted for. Next

$$
\begin{aligned}
-\left(\Delta_{c o n} h\right)_{j \ell} & =-g^{a b_{j}} h_{j \ell ; ; b} \\
& =-g^{a i} h_{j \ell ; a ; i} \\
& =-g^{i a_{h}} h_{j \ell ; a ; i}
\end{aligned}
$$

which takes care of one of the terms in $\left(\Delta_{L} h\right) j \ell$. Finally

$$
\begin{aligned}
-g^{i a_{h i}}{ }_{a i ; \ell} & =-g^{a i_{h}}{ }_{a i ; j ; \ell} \\
& =-\operatorname{tr}_{g}(h) ; j ; \ell
\end{aligned}
$$

9. 

$$
=\left(-H_{\operatorname{tr}_{g}}(\mathrm{~h})^{\prime}\right) \ell^{\prime}
$$

thereby dispatching the hessian. What remains from $\left(\Delta_{\mathrm{L}} \mathrm{h}\right)_{j \ell}$ is

$$
R_{j}^{k} h_{k \ell}+R_{\ell}^{k} h_{k j}-2 R_{j \ell^{\prime}}^{a b} h^{\prime}
$$

the claim being that this must equal

$$
\begin{aligned}
& g^{i a}\left(-R_{j i \ell}{ }^{\mathrm{h}}{ }_{a b}-R_{a i \ell}^{b}{ }_{j b}\right) \\
& +g^{i a}\left(-R_{l i j}^{b}{ }_{a b}-R_{a i j}^{b} h_{l b}\right) . \\
& \text { - }-g^{i a_{R}}{ }_{j i \ell^{h}} a b \\
& =-g^{a i_{R}}{ }_{j i \ell^{h}}{ }_{a b} \\
& =-R_{j}^{b}{ }^{a} h_{a b} \\
& =-R_{j}^{a b}{ }^{\mathrm{h}}{ }_{a b} . \\
& \text { - }-g^{i a_{R}}{ }_{\ell i j}{ }^{h} a b \\
& =-g^{a i_{R}}{ }_{\ell i j}{ }^{h} a b \\
& =-R_{\ell}{ }_{\ell}{ }_{j}{ }^{h^{a b}} \\
& =-R_{j}^{a b}{ }^{\mathrm{h}}{ }_{a b} .
\end{aligned}
$$

10. 

$$
\begin{aligned}
& \text { - }-g^{i a_{R} b} a i \ell_{j b}^{h_{j}} \\
& =-R^{b i}{ }_{i} \ell^{h} b j \\
& =R^{i b}{ }_{i} \ell^{h} b j \\
& =R^{\mathrm{b}} \ell^{\mathrm{h}} \mathrm{~b}_{j} \\
& =R_{\ell}{ }^{h_{b j}} . \\
& \text { - }-g^{i a_{R}}{ }_{a i j}{ }^{h_{l b}} \\
& =-R^{b i}{ }_{i j}{ }^{h} b l \\
& =R_{i j}^{i b}{ }_{i j}{ }^{h} l \\
& =R_{j}^{b}{ }_{j} b l \\
& =R_{j}{ }^{b_{b l}}{ }^{\text {b }}
\end{aligned}
$$

The bookkeeping is therefore complete.]

FACT Take $\mathrm{h}=\mathrm{L}_{\mathrm{X}} \mathrm{g}\left(\mathrm{X} \in \mathcal{D}_{\mathrm{C}}^{\mathrm{I}}(\mathrm{M})\right)$-- then

$$
\left(D_{g} \operatorname{Ric}\right)\left(L_{X} g\right)=L_{X}(\operatorname{Ric}(g))
$$

Identities We have

$$
\left\lvert\, \begin{aligned}
& \operatorname{tr}_{g}\left(\Delta_{\mathrm{L}} \mathrm{~h}\right)=-\Delta_{\mathrm{g}} \operatorname{tr}_{g}(\mathrm{~h}) \\
& \operatorname{tr}_{\mathrm{g}}\left(\mathrm{H}_{\operatorname{tr}_{g}(\mathrm{~h})}\right)=\Delta_{g} \operatorname{tr}_{\mathrm{g}}(\mathrm{~h}) \\
& \operatorname{tr}_{\mathrm{g}}\left(\mathrm{C}_{\operatorname{div}_{g} h}\right)=-2 \delta_{g} \operatorname{div}_{g} h .
\end{aligned}\right.
$$

$$
\left.\frac{\mathrm{d}}{\mathrm{~d} \varepsilon} \mathrm{R}_{\mathrm{k} \ell}^{\mathrm{ij}}(\mathrm{~g}+\varepsilon \mathrm{h})\right|_{\varepsilon=0^{\prime}}
$$

i.e.,

$$
\begin{aligned}
& \left.\frac{d}{d \varepsilon}\left[(g+\varepsilon h)^{j r_{R}}{ }_{r k \ell}(g+\varepsilon h)\right]\right|_{\varepsilon=0} \\
= & \left.\frac{d}{d \varepsilon}(g+\varepsilon h)^{j r}\right|_{\varepsilon=0} R_{r k \ell}^{i}+\left.g^{j r} \frac{d}{d \varepsilon} R_{r k \ell}^{i}(g+\varepsilon h)\right|_{\varepsilon=0^{\circ}}
\end{aligned}
$$

- $\left.\frac{d}{d \varepsilon}(g+\varepsilon h)^{j r}\right|_{\varepsilon=0} R_{r k \ell}^{i}$

$$
\begin{aligned}
& =-g^{j s_{g} r t_{h_{s t}} R_{r k \ell}^{i}} \\
& =-g^{t r_{R}{ }_{r k}{ }_{r l} g^{j s_{h_{s t}}}} \begin{array}{l}
=-R_{k \ell^{i t}}^{h^{j}} \\
=-R_{k}^{i a} \ell^{h^{j}} \\
\end{array} .
\end{aligned}
$$

- $\left.g^{j r} \frac{\mathrm{~d}}{\mathrm{~d} \varepsilon} \mathrm{R}_{\mathrm{rk} \ell}^{\mathrm{i}}(\mathrm{g}+\varepsilon \mathrm{h})\right|_{\varepsilon=0}$

$$
=g^{j r} \frac{1}{2} g^{i a}\left(-R_{r k \ell^{h}}^{\mathrm{h}} \mathrm{ab}^{-R_{a k} \ell_{r b}}\right.
$$

$$
+h_{a \ell ; r ; k}-h_{r \ell ; a ; k}+h_{r k ; a ; \ell}-h_{a k ; r ; \ell}
$$

$$
=\frac{1}{2}\left(-\mathrm{R}_{\mathrm{bj}}^{\mathrm{k}} \ell^{\mathrm{h}_{\mathrm{b}}^{\mathrm{i}}}-\mathrm{R}_{\mathrm{b}}^{\mathrm{i}} \ell^{\mathrm{h}_{\mathrm{b}}^{j}}\right)
$$

$$
+\frac{1}{2} g^{j r} g^{i a}\left((\nabla \nabla \mathrm{~h})_{a l r k}-(\nabla \nabla \mathrm{h})_{r l a k}+(\nabla \nabla \mathrm{h})_{r k a \ell}-(\nabla \nabla \mathrm{h})_{a k r \ell}\right)
$$

$$
\begin{aligned}
& =\frac{1}{2}\left(R_{k}^{i a} \ell^{h^{j}}-R^{a j} k \ell^{h^{i}}\right) \\
& +\frac{1}{2}\left((\nabla \nabla h)^{i} \ell_{k}^{j}-(\nabla \nabla h)^{j} \ell_{k}^{i}\right. \\
& \left.\quad+(\nabla \nabla h)_{k \ell}^{j i}-(\nabla \nabla h)_{k}^{i}{ }_{k}^{j}\right)
\end{aligned}
$$

$$
\begin{array}{r}
\Rightarrow \\
\left.\frac{d}{d \varepsilon} R^{i j}{ }_{k \ell}(g+\varepsilon h)\right|_{\varepsilon=0} \\
= \\
\frac{1}{2}\left(-R_{\left.k \ell^{i a} h_{a}^{j}-R_{k}^{a j} \ell^{h^{i}}\right)}^{+} \begin{array}{r}
\frac{1}{2}\left((\nabla \nabla h)_{\ell}^{i}{ }_{k}^{j}-(\nabla \nabla h)^{j} \ell_{k}^{i}\right. \\
\\
+(\nabla \nabla h)_{k}^{j} \ell^{i}-(\nabla \nabla h)_{k}^{i} \ell^{\prime}
\end{array}\right.
\end{array}
$$

Special Case

$$
\begin{gathered}
\left.\frac{d}{d \varepsilon} \operatorname{Ric}(g+\varepsilon h)^{j}\right|_{\varepsilon=0} \\
=\left.\frac{d}{d \varepsilon} R^{i j}{ }_{i \ell}(g+\varepsilon h)\right|_{\varepsilon=0} \\
=\frac{1}{2}\left(-R_{i \ell^{h}}^{i a}-R_{i \ell^{a j}}^{h^{i}}\right) \\
+\frac{1}{2}\left((\nabla \nabla h)^{i} \ell_{i}^{j}-(\nabla \nabla h)_{\ell}^{j}{ }_{l}^{i}\right. \\
\left.+(\nabla \nabla h)_{i}^{j} i_{i}-(\nabla \nabla h)_{i}^{i} \ell^{j}\right)
\end{gathered}
$$

So, as a corollary,

$$
\begin{aligned}
& \left.\frac{d}{d \varepsilon} S(g+\varepsilon h)\right|_{\varepsilon=0}=\left.\frac{d}{d \varepsilon} \operatorname{Ric}(g+\varepsilon h)_{j}^{j}\right|_{\varepsilon=0} \\
& =\frac{1}{2}\left(-R^{i a}{ }_{i j} h^{j}{ }_{a}-R^{a j}{ }_{i j} h^{i}{ }_{a}\right) \\
& +\frac{1}{2}\left((\nabla \nabla h)^{i}{ }_{j}{ }_{i}-(\nabla \nabla h)_{j}^{j}{ }_{j}{ }_{i}\right. \\
& \left.+(\nabla \nabla h){ }_{i}{ }_{i}{ }^{i}-(\nabla \nabla h)_{i}^{i}{ }_{j}\right) .
\end{aligned}
$$

[Note: Each of the terms involving $\nabla \nabla h$ is a divergence. For example,

$$
(\nabla \nabla h)^{i}{ }_{j}^{j}=\nabla_{i} x^{i}=x_{; i}^{i}
$$

where

$$
\left.x^{i}=(\nabla \nabla h)^{i}{ }_{j}^{j} .\right]
$$

Example: Given an open, relatively compact subset $K \subset M$, put

$$
L_{K}(g)=\int_{K} S(g) \mathrm{vol}_{g}
$$

Then an element $g \in \mathbb{M}$ is said to be critical if $\forall K \& \forall h \in S_{2, c}$ (M) (spt hсK),

$$
\left.\frac{d}{d \varepsilon} L_{K}(g+\varepsilon h)\right|_{\varepsilon=0}=0
$$

or still,

$$
\left.\int_{K} \frac{d}{d \varepsilon} S(g+\varepsilon h)\right|_{\varepsilon=0}{ }^{v o l} l_{g}+\int_{K} S(g) \frac{d}{d \varepsilon} \mathrm{vol}_{g}+\left.\varepsilon h\right|_{\varepsilon=0}=0
$$

But

$$
\int_{K} S(g) \frac{d}{d \varepsilon} \operatorname{vol}_{g}+\left.\varepsilon h\right|_{\varepsilon=0}=\frac{1}{2} \int_{K} S(g) \operatorname{tr}_{g}(h) \operatorname{vol}_{g}
$$

$$
\begin{aligned}
& =\frac{1}{2} \int_{\mathrm{K}} \operatorname{tr}_{\mathrm{g}}(\mathrm{~S}(\mathrm{~g}) \mathrm{h}) \mathrm{vol}_{\mathrm{g}} \\
& =\frac{1}{2} \int_{\mathrm{K}} \mathrm{~g}\left[\left[_{2}^{0}\right](\mathrm{S}(\mathrm{~g}) \mathrm{g}, \mathrm{~h}) \mathrm{vol}_{\mathrm{g}}\right.
\end{aligned}
$$

On the other hand,

$$
\begin{aligned}
& \left.\frac{d}{d \varepsilon} S(g+\varepsilon h)\right|_{\varepsilon=0} \\
& \quad=\frac{1}{2}\left(-R_{i j}^{i a} h_{a}^{j}-R_{i j}^{a j} h_{a}^{i}+\ldots\right),
\end{aligned}
$$

where each of the omitted terms is the divergence of a vector field whose support is compact and contained in K . But

Therefore

$$
\begin{aligned}
& \left.\int_{\mathrm{K}} \frac{\mathrm{~d}}{\mathrm{~d} \varepsilon} \mathrm{~S}(\mathrm{~g}+\varepsilon \mathrm{h})\right|_{\varepsilon=0} \mathrm{vol}_{\mathrm{g}} \\
& \quad=\int_{\mathrm{K}} \mathrm{~g}\left[\frac{0}{2}\right](-\operatorname{Ric}(\mathrm{g}), \mathrm{h}) \mathrm{vol}_{\mathrm{g}}
\end{aligned}
$$

Since $K$ is arbitrary, it follows that $g$ is critical iff

$$
g\left[\begin{array}{l}
0 \\
2
\end{array}\right]\left(-\operatorname{Ric}(g)+\frac{l}{2} S(g) g, h\right)=0
$$

for all $h \in S_{2, c}{ }^{(M)}$, i.e., $g$ is critical iff

$$
\operatorname{Ric}(g)-\frac{1}{2} S(g) g=0
$$

the vacuum field equation of general relativity.

LEMMA View $S$ as a map

$$
\mathrm{S}: \underline{M} \rightarrow C^{\infty}(\mathrm{M}) .
$$

Then

$$
\begin{aligned}
& \left(D_{g} S\right)(h)=\left.\frac{d}{d \varepsilon} S(g+\varepsilon h)\right|_{\varepsilon=0} \\
= & -\Delta_{g} t r_{g}(h)-\delta_{g} \operatorname{div}_{g} h-g\left[\begin{array}{l}
0
\end{array}\right](\operatorname{Ric}(g), h)
\end{aligned}
$$

[The third term has been identified above, so it is a question of explicating the other two.

$$
\text { Ad }-\Delta_{g} \operatorname{tr}_{g}(h): \text { We have }
$$

$$
\begin{aligned}
&-\Delta_{g} \operatorname{tr}_{g}(h)=-g^{i j}\left(H_{\operatorname{tr}_{g}(h)}\right){ }_{i j} \\
&=-g^{i j_{t r}}(h) ; i ; j \\
&=-g^{i j}\left(g^{\left.a b_{h_{a b}}\right)} ; i ; j\right. \\
&=g^{i j_{\nabla_{j}} \nabla_{i}\left(g^{a b_{h}}{ }_{a b}\right)} \\
&=-g^{i j} g^{a b_{h}} a b ; i ; j \\
&=-g^{i j} g^{a b}(\nabla \nabla h) \\
& a b i j
\end{aligned}
$$

Compare this with

$$
\frac{1}{2}\left(-(\nabla \nabla h)_{j}^{j} i_{i}^{i}-(\nabla \nabla h)_{i}^{i}{ }_{j}\right)
$$

Thus

$$
\begin{aligned}
& -(\nabla \nabla h)_{j}^{j}{ }_{i}^{i} \\
& \quad=-g^{j a_{g}}{ }^{i b}(\nabla \nabla h) a j b i
\end{aligned}
$$

$$
\begin{aligned}
& =-g^{j i_{g} a b}(\nabla \nabla h)_{i j b a} \\
& =-g^{i j_{g} a b}(\nabla \nabla h)_{i j a b} \\
& =-g^{i j} g^{a b}(\nabla \nabla h)_{a b i j}
\end{aligned}
$$

and

$$
\begin{aligned}
& -(\nabla \nabla \mathrm{h})^{i}{ }_{i}{ }_{j}{ }_{j} \\
& =-g^{i a}{ }^{j b}(\nabla \nabla h) \text { aibj } \\
& =-g^{i j} g^{a b}(\nabla \nabla h) j i b a \\
& =-g^{i j} g^{a b}(\nabla \nabla h)_{i j a b} \\
& =-g^{i j} g^{a b}(\nabla \nabla h)_{a b i j} . \\
& \underline{\underline{A d}-\delta_{g}{ }^{\text {div }}{ }_{g} h: ~ W e ~ h a v e ~} \\
& -\delta_{g} \operatorname{div}_{g} h=\nabla^{i}\left(\operatorname{div}_{g} h\right)_{i} \\
& =\nabla^{i} g^{j k_{V_{k}}}{ }_{j i} \\
& =\nabla^{i} \nabla^{j_{h}}{ }_{j i} \\
& =\nabla^{i} \nabla^{j} h_{i j} .
\end{aligned}
$$

Compare this with

$$
\frac{1}{2}\left((\nabla \nabla h)_{j}^{i}{ }_{j}+(\nabla \nabla h)_{i}^{j}{ }_{j}\right)
$$

Thus

$$
\begin{aligned}
& (\nabla \nabla h)_{j}^{i}{ }_{j} \\
& =g^{i a} g^{j b}(\nabla \nabla h) a j b i \\
& =g^{i a} g^{j b} \nabla_{i} \nabla_{b}{ }_{a j} \\
& =\nabla^{a_{\nabla}{ }^{j} h_{a j}} \\
& =\nabla^{i} \nabla^{j_{h}}{ }_{i j}
\end{aligned}
$$

and

$$
\begin{aligned}
& (\nabla \nabla h)_{i}^{j}{ }_{i}^{i} \\
& =g^{j a_{g}}{ }^{i b}(\nabla \nabla h) \\
& =g^{j a_{g}}{ }^{i b_{\nabla_{j}} \nabla_{b} h_{a i}} \\
& =\nabla^{a} \nabla^{i} h_{a i} \\
& \left.=\nabla^{i} \nabla^{j_{h}}{ }_{i j} .\right]
\end{aligned}
$$

Example: Take $M$ compact and let $h=\operatorname{Ric}(g)-$ then $\operatorname{tr}_{g}(\operatorname{Ric}(g))=S(g)$ and

$$
\begin{aligned}
& \operatorname{div}_{g} \operatorname{Ric}(g)=\frac{1}{2} d S(g) \\
& \Rightarrow \quad \\
&-\delta_{g} \operatorname{div}_{g} \operatorname{Ric}(g)=\frac{1}{2}\left(-\delta_{g} d S(g)\right) \\
&=\frac{1}{2} \Delta_{g} S(g) .
\end{aligned}
$$

18. 

Therefore

$$
\left(D_{g} S\right)(\operatorname{Ric}(g))=-\frac{1}{2} \Delta_{g} S(g)-g\left[\begin{array}{l}
0 \\
2
\end{array}\right](\operatorname{Ric}(g), \operatorname{Ric}(g)) .
$$

FACT Take $h=L_{X} g\left(X \in D_{C}^{l}(M)\right)$-- then

$$
\left(D_{g} S\right)\left(L_{X} g\right)=L_{X}(S(g)) .
$$

Remark: For later use, note that the preceding considerations imply that

$$
\int_{M}\left(\Delta_{g} \operatorname{tr}_{g}(h)+\delta_{g} \operatorname{div}_{g} h\right) \operatorname{vol}_{g}=0
$$

Define

$$
\gamma_{g}: S_{2, \mathrm{C}}(\mathrm{M}) \rightarrow C_{C}^{\infty}(\mathrm{M})
$$

by

$$
\gamma_{g}(h)=-\Delta_{g} t r_{g}(h)-\delta_{g} \operatorname{div}_{g} h-g\left[\begin{array}{l}
0 \\
2
\end{array}\right](\operatorname{Ric}(g), h)
$$

and define

$$
Y_{g}^{*}: C_{C}^{\infty}(M) \rightarrow S_{2, C}(M)
$$

by

$$
r_{g}^{*}(f)=-\left(\Delta_{g} f\right) g+H_{f}-f \operatorname{Ric}(g) .
$$

Then

$$
\left.<r_{g}(h), f\right\rangle=<h, r_{g}^{*}(f)>.
$$

I.e.:

$$
\int_{M} \Upsilon_{g}(h) \text { fvol }_{g}=\int_{M} g\left[{ }_{2}^{0}\right]\left(h, \gamma_{g}^{*}(f)\right) \mathrm{vol}_{g}
$$

Notation: Given $f \in C^{\infty}(M)$, put

$$
(\mathrm{df} \cdot \operatorname{Ric}(\mathrm{~g}))_{\mathrm{i}}=(\mathrm{df})_{j} \mathrm{R}_{\mathrm{i}}{ }^{\mathrm{j}}
$$

SUBIEMMA Let $f \in C^{\infty}(M)$-- then

$$
\operatorname{div}_{g} H_{f}-d \Delta_{g} f-d f \cdot \operatorname{Ric}(g)=0
$$

[By definition,

$$
\begin{aligned}
\left(\operatorname{div}_{g} H_{f}\right)_{i} & =\nabla^{j}\left(H_{f}\right)_{i j} \\
& =\nabla^{j} \nabla_{j}(d f)_{i} \\
& =\Delta_{c o n}(d f)_{i}
\end{aligned}
$$

But, in view of the Weitzenboeck formula,

$$
\Delta_{\text {con }}{ }^{(d f)_{i}}=\left(\Delta_{g} d f\right)_{i}+(d f)_{j} R_{i}^{j}
$$

And

$$
\begin{aligned}
\left(\Delta_{g} d f\right)_{i} & =\left(-\left(d \circ \delta_{g}+\delta_{g} \circ d\right) d f\right)_{i} \\
& =\left(d \circ-\left(\delta_{g} \circ d\right) f\right)_{i} \\
& \left.=\left(d \Delta_{g} f\right)_{i} \cdot\right]
\end{aligned}
$$

Suppose that $r_{g}^{*}(f)=0$, thus

$$
-\left(\Delta_{g} f\right) g+H_{f}-\operatorname{fRic}(g)=0
$$

and so, upon application of $\operatorname{div}_{g}$,

$$
-d \Delta_{g} f+d i v_{g} H_{f}-d f \cdot \operatorname{Ric}(g)-\operatorname{fdiv}_{g} \operatorname{Ric}(g)=0 .
$$

Therefore

$$
\operatorname{fdiv}_{g} \operatorname{Ric}(g)=0
$$

or still,

$$
\frac{1}{2} \mathrm{fdS}(\mathrm{~g})=0
$$

Consequently, if $f$ is never zero, then $d S(g)=0$, which implies that $S(g)$ is a constant, say $S(g)=\lambda$.

Example: Take $M$ compact and $n>1$. Fix $\varphi \in C_{d}^{\infty}(M): \varphi>0$. Given $g \in M_{0, n}$ (the set of riemannian structures on M), put

$$
L_{\varphi}(g)=\int_{M} S(g) \varphi
$$

Then $g$ is stationary for $L_{\varphi}$, i.e.,

$$
\left.\frac{d}{d \varepsilon} L_{\varphi}(g+\varepsilon h)\right|_{\varepsilon=0}=0
$$

for all $\mathrm{h} \in \mathrm{S}_{2}(\mathrm{M})$ iff $\operatorname{Ric}(\mathrm{g})=0$ and $\varphi=\mathrm{C}|\mathrm{g}|^{1 / 2}$ (C a positive constant).

$$
\left[F i x f>0 \text { in } C^{\infty}(M): \varphi=f|g|^{1 / 2}\right. \text {. then }
$$

$$
\begin{aligned}
\frac{d}{d \varepsilon} L_{\varphi}(g & +\varepsilon h)\left.\right|_{\varepsilon=0}=\left.\int_{M} \frac{d}{d \varepsilon} S(g+\varepsilon h)\right|_{\varepsilon=0} f|g|^{1 / 2} \\
& =\int_{M} \Upsilon_{g}(h) f v o l_{g} \\
& =\int_{M} g\left[\frac{0}{2}\right]\left(h, \gamma_{g}^{*}(f)\right) \operatorname{vol}_{g} .
\end{aligned}
$$

Accordingly, $g$ is stationary for $L_{\varphi}$ iff $\gamma_{g}^{\star}(f)=0$. Since

$$
r_{g}^{\star}(f)=-\left(\Delta_{g} f\right) g+H_{f}-f R i c(g)
$$

21. 

the conditions

$$
\left.\right|_{-\quad} \quad \begin{aligned}
& \mathrm{Ric}(g)=0
\end{aligned}
$$

are obviously sufficient. To see that they are also necessary, note that

$$
\begin{aligned}
& 0=\gamma_{g}^{*}(f) \\
& \Rightarrow=\operatorname{tr}_{g}\left(\gamma_{g}^{*}(h)\right) \\
&=-\left(\Delta_{g} f\right) t_{g}(g)+\operatorname{tr}_{g}\left(H_{f}\right)-f t_{g}(\operatorname{Ric}(g)) \\
&=(1-n) \Delta_{g} f-f \lambda \\
& \Rightarrow \quad \lambda f=(1-n) \Delta_{g} f \\
& \Rightarrow \quad f v o l_{g}=(1-n) \int_{M} \Delta_{g} f v o l_{g} \\
& \lambda \int_{M} \\
&=(1-n) \int_{M} f\left(\Delta_{g} 1\right) v_{g o l}^{g} \\
&=0 .
\end{aligned}
$$

But

$$
\begin{aligned}
& \Delta_{g} f=\frac{\lambda}{1-n} f \\
& \Rightarrow \quad \frac{\lambda}{1-n} \leq 0 \Rightarrow \lambda \geq 0 .
\end{aligned}
$$

If $\lambda>0$, then $\int_{M}$ fvol $_{g}=0$, contradicting $\mathrm{f}>0$. Therefore $\lambda=0$, hence f is harmonic:

$$
\Delta_{g} f=0 \Rightarrow f=C>0
$$

And

$$
\begin{gathered}
0=\gamma_{g}^{\star}(\mathrm{C})=-\operatorname{CRic}(\mathrm{g}) \\
\Rightarrow \operatorname{Ric}(\mathrm{g})=0 .]
\end{gathered}
$$

[Note: There may be no $g$ at which $L_{\varphi}$ is stationary.]

LEMMA View Ein as a map

$$
\operatorname{Ein}: \underline{M} \rightarrow S_{2}(M)
$$

Then

$$
\begin{aligned}
& \left(D_{g} \operatorname{Ein}\right)(h)=\left.\frac{d}{d \varepsilon} \operatorname{Ein}(g+\varepsilon h)\right|_{\varepsilon=0} \\
& =\frac{1}{2}\left[\Delta_{L} \bar{h}+\Gamma_{\operatorname{div}_{g} \bar{h}}+\left(\delta_{g} \operatorname{div}_{g} \bar{h}\right) g\right] \\
& +\frac{1}{2}\left[g\left[\frac{0}{2}\right](\operatorname{Ric}(g), \bar{h}) g-S(g) \bar{h}\right] .
\end{aligned}
$$

[Note: Here

$$
\bar{h}=h-\frac{1}{2} t r_{g}(h) g
$$

thus locally,

$$
\left.\bar{h}_{i j}=h_{i j}-\frac{1}{2} h_{a}^{a} g_{i j} \cdot\right]
$$

FACT Take $h=L_{X} g\left(X \in D_{C}^{l}(M)\right)$-- then

$$
\left(D_{g} \operatorname{Ein}\right)\left(L_{X} g\right)=L_{X}(\operatorname{Ein}(g))
$$

It is sometimes necessary to consider second order issues, the downside being that the computations can be involved.

Example: Put

$$
\left\{\begin{array}{l}
\quad \operatorname{div}_{g, h}^{\prime}=\frac{d}{d \varepsilon} \operatorname{div}_{g}+\left.\varepsilon h\right|_{\varepsilon=0} \\
\quad \operatorname{div}_{g, h}^{\prime}=\frac{d^{2}}{d \varepsilon^{2}} \operatorname{div}_{g}+\left.\varepsilon h\right|_{\varepsilon=0}
\end{array}\right.
$$

- Differentiate the identity

$$
\operatorname{div}_{g}+\varepsilon h^{\operatorname{Ein}(g+\varepsilon h)}=0
$$

once w.r.t. $\varepsilon$ and then set $\varepsilon=0$ to get

$$
\operatorname{div}_{g, h}^{\prime} \operatorname{Ein}(g)+\operatorname{div}_{g}\left(D_{g} \operatorname{Ein}\right)(h)=0 .
$$

Therefore

$$
\operatorname{div}_{g}\left(D_{g} \operatorname{Ein}\right)(h)=0
$$

if $\operatorname{Ein}(g)=0$.

- Differentiate the identity

$$
\operatorname{div}_{g+\varepsilon h^{\operatorname{Ein}}(g+\varepsilon h)}=0
$$

twice w.r.t. $\varepsilon$ and then set $\varepsilon=0$ to get

$$
\operatorname{div}_{g, h}^{\prime \prime} \operatorname{Ein}(g)+2 \operatorname{div}_{g, h}^{\prime}\left(D_{g} \operatorname{Ein}\right)(h)+\operatorname{div}_{g}\left(D_{g}^{2} E i n\right)(h, h)=0 .
$$

Therefore

$$
\operatorname{div}_{g}\left(D_{g}^{2} \operatorname{Ein}\right)(h, h)=0
$$

if

$$
\operatorname{Ein}(g)=0 \&\left(D_{g} \operatorname{Ein}\right)(h)=0
$$

[Note: Strictly speaking, div ${ }_{g, h}^{\prime \prime}$ should be denoted by div" $g_{g}(h, h)^{.]}$

Observation: Let $X$ be an infinitesimal isometry per $g$ and suppose that $s \in S_{2}(M)$ is divergence free (i.e., $\operatorname{div}_{g} s=0$ ). Define X.s by

$$
(x \cdot s)_{i}=x^{j} s_{i j}
$$

Then

$$
\delta_{g} X \cdot s=0
$$

[In fact,

$$
\begin{aligned}
\delta_{g} X \cdot s & =-\nabla^{i}(X \cdot s) \\
& =-\nabla^{i}\left(X^{j} s_{i j}\right) \\
& =-\left(\nabla^{i} X^{j}\right) s_{i j}-x^{j} \nabla^{i} s_{i j} \\
& =-\left(\nabla^{i} X^{j}\right) s_{i j}
\end{aligned}
$$

But

$$
\begin{aligned}
& \nabla_{i} X_{j}+\nabla_{j} X_{i}=0 \\
\Rightarrow & \\
& \nabla^{i} X^{j}+\nabla^{j} X^{i}=0 \\
\Rightarrow & \\
& \left.-\left(\nabla^{i} X^{j}\right) s_{i j}=\left(\nabla^{j} X^{i}\right) s_{i j}=\left(\nabla^{i} X^{j}\right) s_{i j} \cdot\right]
\end{aligned}
$$

Application: Suppose that

$$
\operatorname{Ein}(g)=0 \&\left(D_{g} \operatorname{Ein}\right)(h)=0
$$

Then for any infinitesimal isometry $X$ per $g$,

$$
\delta_{g} X \cdot\left(D_{g}^{2} E i n\right)(h, h)=0 .
$$

LEMMA Suppose that $\operatorname{Ric}(\mathrm{g})=0-$ then $\forall \mathrm{h} \in \mathrm{S}_{2, \mathrm{c}}(\mathrm{M})$,

$$
\begin{aligned}
& \int_{\mathrm{M}}\left(\mathrm{D}_{\mathrm{g}}^{2} \mathrm{~S}\right)(\mathrm{h}, \mathrm{~h}) \mathrm{vol}_{\mathrm{g}} \\
& =-\frac{1}{2} \int_{M} g\left[{ }_{2}^{0}\right](h, \Delta, h) \text { vol }_{g} \\
& \left.-\frac{1}{2} \int_{M} g l_{1}^{0}\right]\left(\operatorname{dtr}_{g}(\mathrm{~h}), \mathrm{atr}_{\mathrm{g}}(\mathrm{~h})\right) \mathrm{vol}_{\mathrm{g}} \\
& +\int_{M} g\left[{ }_{1}^{0}\right]\left(\operatorname{div}_{g} h, \operatorname{div}_{g} h\right) \text { vol }_{g} .
\end{aligned}
$$

[We have

$$
\begin{aligned}
& \int_{M}\left(D_{g}^{2} S\right)(h, h) \mathrm{vol}_{g} \\
& \quad=\left.\int_{M} \frac{d}{d \varepsilon}\left(D_{g}+\varepsilon h^{S}\right)(h)\right|_{\varepsilon=0} \mathrm{vol}_{g} .
\end{aligned}
$$

But

$$
\begin{aligned}
& \left.\frac{d}{d \varepsilon}\left[\left(D_{g}+\varepsilon h^{S}\right)(h) \operatorname{vol}_{g}+\varepsilon h\right]\right|_{\varepsilon=0} \\
= & \left.\frac{d}{d \varepsilon}\left(D_{g}+\varepsilon h^{S}\right)(h)\right|_{\varepsilon=0} \operatorname{vol}_{g}+\left(D_{g} S\right)(h) \frac{d}{d \varepsilon} \mathrm{vol}_{g}+\left.\varepsilon h\right|_{\varepsilon=0} .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& \int_{M}\left(D_{g}^{2} S\right\rangle(h, h) \operatorname{vol}_{g} \\
= & D_{g}\left[\int_{M}\left(D_{g} S\right)(h) \operatorname{vol}_{g}\right](h)-\int_{M}\left(D_{g} S\right)(h)\left(D_{g} v o l\right)(h) \\
= & D_{g}\left[\int_{M}\left(-\Delta_{g} t r_{g}(h)-\delta_{g} \operatorname{div}_{g} h-g\left[\left[_{2}^{0}\right](\operatorname{Ric}(g), h)\right) \operatorname{vol}_{g}\right](h)\right. \\
& \quad-\int_{M}\left(D_{g} S\right)(h)\left(D_{g} \operatorname{vol}\right)(h)
\end{aligned}
$$

$$
\begin{aligned}
& =-D_{g}\left[\int_{M} g\left[\begin{array}{l}
0 \\
2
\end{array}\right](\operatorname{Ric}(g), h) \operatorname{vol}_{g}\right](h) \\
& -\int_{\mathrm{M}}\left(\mathrm{D}_{\mathrm{g}} \mathrm{~S}\right)(\mathrm{h})\left(\mathrm{D}_{\mathrm{g}} \mathrm{vol}\right)(\mathrm{h}) \\
& =-\int_{M} g\left[\begin{array}{l}
0 \\
2
\end{array}\right]\left(h _ { , } \left(D_{g} \text { Ric) (h) ) Vol } g\right.\right. \\
& -\int_{M}\left(-\Delta_{g} t r_{g}(h)-\delta_{g} \operatorname{div}_{g} h\right) \frac{1}{2} \operatorname{tr}_{g}(h) \operatorname{vol}_{g} \\
& =-\frac{1}{2} \int_{M} g\left[{ }_{2}^{0}\right]\left(h, \Delta_{L} h+\Gamma_{\operatorname{div}_{g}} h-H_{\operatorname{tr}_{g}(h)}\right) \operatorname{vol}_{g} \\
& +\frac{1}{2} \int_{M}\left(\Delta_{g} \operatorname{tr}_{g}(h)+\delta_{g} \operatorname{div}_{g} h\right) \operatorname{tr}_{g}(h) \operatorname{vol}_{g} .
\end{aligned}
$$

The term

$$
-\frac{1}{2} \int_{M} g\left[{ }_{2}^{0}\right]\left(h, \Delta_{L} h\right) \mathrm{Vol}_{g}
$$

requires no further attention, hence can be set aside. Next

$$
\begin{aligned}
& \quad g\left[\begin{array}{l}
0 \\
2
\end{array}\right]\left(h, \Gamma_{\operatorname{div}_{g}}\right)^{\prime} \\
& \quad=h^{i j}\left(\Gamma_{\operatorname{div}_{g}} h_{i j}\right. \\
& \quad=h^{i j}\left(\left(\operatorname{div}_{g} h\right)_{i ; j}+\left(\operatorname{div}_{g} h\right)_{j ; i}\right) \\
& \Rightarrow \quad-\frac{1}{2} \int_{M} g\left[_{2}^{0}\right]\left(h, \Gamma_{\operatorname{div}_{g}}\right)^{v o l_{g}} \\
& \quad=-\frac{1}{2}(-2) \int_{M}\left(\operatorname{div}_{g} h\right)_{i} \nabla_{j} h^{i j}{ }_{v o l}^{g}
\end{aligned}
$$

$$
\begin{aligned}
& =\int_{M}\left(\operatorname{div}_{g} h\right)_{i}\left(\operatorname{div}_{g} h\right)^{i} \operatorname{vol}_{g} \\
& =\int_{M} g\left[{ }_{l}^{0}\right]\left(\operatorname{div}_{g} h_{f} \operatorname{div}_{g} h\right) \operatorname{vol}_{g} .
\end{aligned}
$$

And

$$
\begin{aligned}
& g\left[\begin{array}{l}
0 \\
2
\end{array}\right]\left(h, H_{\operatorname{tr}_{g}}(h)\right. \\
& =h^{i j}\left(H_{\operatorname{tr}_{g}}(h)^{i j}\right. \\
& =h^{i j} g^{a b} h_{a b ; i ; j} \\
& =h^{i j}\left(\nabla_{i} \operatorname{tr}_{g}(h)\right) ; j \\
& \Rightarrow \\
& \frac{1}{2} \int_{M} g\left[\begin{array}{l}
0 \\
2
\end{array}\right]\left(h, H_{t r}(h)\right)^{\mathrm{Vol}}{ }_{g} \\
& =\frac{1}{2} \int_{M} h^{i j}\left(\nabla_{i} \operatorname{tr}_{g}(h)\right) ; j \\
& =-\frac{1}{2} \int_{M}\left(\nabla_{j} h^{i j}\right) \nabla_{i} \operatorname{tr} g(h) v o l_{g}+\frac{1}{2} \int_{M} \nabla_{j}\left(h^{i j^{\prime}} \nabla_{i} \operatorname{tr}_{g}(h)\right) v o l_{g} \\
& =-\frac{1}{2} \int_{M}\left(\nabla_{j} h^{i j}\right) \nabla_{i} \operatorname{tr}_{g}(h) \operatorname{vol}_{g} \\
& =-\frac{1}{2} \int_{M} g\left[\begin{array}{l}
0 \\
l
\end{array} \text { (div }_{g} h, \operatorname{dtr}_{g}(h)\right) \mathrm{VOl}_{g} .
\end{aligned}
$$

On the other hand,

$$
\frac{1}{2} \int_{M}\left(\delta_{g} \operatorname{div}_{g} h\right) \operatorname{tr}_{g}(h) v_{g}
$$

$$
=\frac{1}{2} \int_{M} g\left[{ }_{1}^{0}\right]\left(\operatorname{div}_{g} h, d t r_{g}(h)\right) \mathrm{vol}_{g}
$$

Thus these terms cancel out, leaving

$$
\frac{1}{2} \int_{M}\left(\Delta_{g} \operatorname{tr}_{g}(h)\right) \operatorname{tr}_{g}(h) v o l_{g}
$$

or still,

$$
-\frac{1}{2} \int_{M} g\left[\frac{1}{0}\right]\left(\operatorname{grad}_{g} \operatorname{tr}_{g}(h), \operatorname{grad}_{g} \operatorname{tr}_{g}(h)\right) \mathrm{vol}_{g}
$$

or still,

$$
-\frac{1}{2} \int_{M} g\left[{ }_{l}^{0}\right]\left(d t r_{g}(h), d t r_{g}(h)\right) \mathrm{vol}_{g},
$$

as desired.]

Example: Take M compact and $\mathrm{n}>2$. Put

$$
L(g)=\int_{M} S(g) \mathrm{vol}_{\mathrm{g}} .
$$

Then

$$
\begin{aligned}
& \left(D_{g}^{2} L\right)(h, h)=\int_{M}\left(D_{g}^{2} S\right)(h, h) \mathrm{vol}_{g} \\
& \quad+2 \int_{M}\left(D_{g} S\right)(h)\left(D_{g} \mathrm{vol}\right)(h) \\
& \\
& \quad+\int_{M} S(g)\left(D_{g}^{2} \mathrm{vol}\right)(h, h)
\end{aligned}
$$

Suppose now that $g$ is a critical point: $\operatorname{Ein}(g)=0 \Rightarrow \operatorname{Ric}(g)=0 \& S(g)=0$, thus

$$
\begin{aligned}
& \quad\left(D_{g}^{2} L\right)(h, h)=-\frac{1}{2} \int_{M} g\left[\begin{array}{l}
0 \\
2
\end{array}\right]\left(h, \Delta_{L} h\right) \operatorname{vol} g \\
& - \\
& -\frac{1}{2} \int_{M} g\left[\begin{array}{l}
0
\end{array}\right]\left(d t r_{g}(h), d t r_{g}(h)\right) \operatorname{vol}_{g}+\int_{M} g\left[\begin{array}{l}
1
\end{array}\right]\left(\operatorname{div}_{g} h, \operatorname{div}_{g} h\right) \operatorname{vol} l_{g}
\end{aligned}
$$

$$
\begin{aligned}
& +2 \int_{M}\left(-\Delta_{g} \operatorname{tr}_{g}(h)-\delta_{g} \operatorname{div}_{g} h\right) \frac{l}{2} \operatorname{tr}_{g}(h) \operatorname{vol}_{g} \\
& =-\frac{1}{2} \int_{M} g\left[\begin{array}{l}
0 \\
2
\end{array}\left(h, \Delta_{L} h\right) \text { Vol }_{g}\right. \\
& +\frac{1}{2} \int_{M} g\left[\begin{array}{l}
0 \\
l
\end{array}\right]\left(\operatorname{dtr}_{g}(h), d r_{g}(h)\right) \operatorname{vol}_{g}+\int_{M} g\left[\begin{array}{l}
0 \\
l
\end{array}\right]\left(\operatorname{div}_{g} h, \operatorname{div}_{g} h\right) \operatorname{vol}_{g} \\
& -\int_{M} g\left[{ }_{l}^{0}\right]\left(\operatorname{div}_{g} h, \operatorname{dtr}_{g}(h)\right) \operatorname{vol}_{g} .
\end{aligned}
$$

LEMMA We have

$$
\begin{aligned}
& \left(D_{g}^{2} S\right)(h, h)=-\frac{1}{2} g\left[\begin{array}{l}
0 \\
3
\end{array}\right](\nabla h, \nabla h)+2 g\left[\begin{array}{l}
0 \\
2
\end{array}\right](\operatorname{Ric}(g), h * h) \\
& -\frac{1}{2} g\left[\begin{array}{l}
0 \\
1
\end{array}\right]\left(d t r_{g}(h), d t r_{g}(h)\right)+\nabla h * \nabla h \\
& +2 g\left[\frac{0}{2}\right]\left(h, H_{t r_{g}}(h)\right)+2 g\left[\frac{0}{1}\right]\left(\operatorname{div}_{g} h, d t r_{g}(h)\right) \\
& +\Delta_{g} g\left[\begin{array}{l}
0 \\
2
\end{array}\right](h, h)+2 \delta_{g} \operatorname{div}_{g}(h * h)
\end{aligned}
$$

[Note: Here $\nabla \mathrm{h} * \nabla \mathrm{~h}$ stands for the combination

$$
\left.\nabla_{k} h^{i j_{\nabla_{i}}}{ }_{j}^{k} .\right]
$$

Reality Check This amounts to calculating the integral

$$
\int_{M}\left(D_{g}^{2} S\right)(h, h) \text { vol }_{g}
$$

directly from the expression for $\left(D_{g}^{2} S\right)(h, h)$ provided by the lemma and comparing the result with the formula obtained earlier (which was derived under the assumption that $\operatorname{Ric}(g)=0)$.
30.
[Note: If Ric $(g)=0$, then

$$
\Delta_{L} h=-\Delta_{\text {con }} h-2 R(s)
$$

Locally,

$$
\left(\Delta_{L} h\right)_{i j}=-g^{\left.a b_{h_{i j ; a ; b}}-2 R_{i j}^{a b} h_{a b}\right]}
$$

- By definition,

$$
\begin{gathered}
g\left[{ }_{3}^{0}\right](\nabla h, \nabla h)=(\nabla h)^{i j k}(\nabla h)_{i j k} \\
=\nabla^{k} h^{i j} \nabla_{k} h_{i j}
\end{gathered}
$$

Therefore

- Write

$$
\nabla_{k}\left(h^{i j} \nabla_{i} h_{j}{ }^{k}\right)=\nabla_{k} h^{i j} \nabla_{i} h_{j}{ }^{k}+h^{i j} \nabla_{k} \nabla_{i} h_{j}{ }^{k}
$$

- 

$$
\int_{M} \nabla h * \nabla h v o l_{g}=-\int_{M} h^{i j^{\nabla_{k}}} \nabla_{i} h_{j}^{k}{ }^{k o l}{ }_{g}
$$

$$
\begin{aligned}
& -\frac{1}{2} \int_{M} g\left[\begin{array}{l}
0 \\
3
\end{array}\right](\nabla h, \nabla h) \mathrm{VOl}_{g} \\
& =-\frac{l}{2} \int_{M} \nabla^{k} h^{i j} \nabla_{\nabla_{k}} h_{i j}{ }^{\text {vol }} g \\
& =-\frac{1}{2} \int_{M}\left[\nabla^{k}\left(h^{i j^{\prime}}{ }_{k} h_{i j}\right)-h^{\left.i j_{\nabla} \nabla_{\nabla_{k}} h_{i j}\right] \operatorname{vol} g_{g}}\right. \\
& =\frac{1}{2} \int_{M} h^{i j} \nabla^{k} \nabla_{k} h_{i j}{ }^{\text {vol }}{ }_{g} \\
& =\frac{1}{2} \int_{M} g\left[\begin{array}{l}
0 \\
2
\end{array}\right]\left(h, \Delta_{\text {con }}{ }^{h}\right) \operatorname{vol}_{g} .
\end{aligned}
$$

$$
\begin{aligned}
& =-\int_{M} h^{i j}{ }_{g}{ }^{k}{ }_{a} \nabla_{k} \nabla_{i} h_{j a}{ }^{\text {vol }} g \\
& \left.=-\int_{M} h^{i j}{ }_{g}{ }_{a}{ }_{a} \nabla_{i} \nabla_{k} h_{j a}+h_{\ell a} R_{j i k}^{\ell}+h_{j \ell} R^{\ell}{ }_{a i k}\right]{ }^{v o l}{ }_{g} \\
& =-\int_{M} h^{i j} \nabla_{i} \nabla_{k} h_{j}{ }^{k}{ }^{\mathrm{Vol}}{ }_{g} \\
& -\int_{M} h^{i j_{R}}{ }^{\ell}{ }_{j i k} h_{l}{ }^{k}{ }^{\text {Vol }}{ }_{g}-\int_{M} h^{i j_{h}}{ }_{j} \ell^{R}{ }^{\ell k}{ }_{i k}{ }^{\mathrm{Vol}}{ }_{g} \\
& =-\int_{M} h^{i j} \nabla_{i} \nabla_{k} h_{j}{ }^{k}{ }^{\mathrm{Vol}}{ }_{g} \\
& -\int_{M} h^{i j_{R}}{ }_{j}^{\ell}{ }_{k i} h_{\ell}{ }^{k}{ }^{\text {vol }}{ }_{g}-\int_{M} h^{i j_{h}}{ }_{j \ell} \ell^{k \ell}{ }_{k i} \operatorname{vol}_{g} .
\end{aligned}
$$

Both of these integrals will contribute.

$$
\begin{aligned}
& \longrightarrow-\int_{M} h^{i j} \nabla_{i} \nabla_{k} h_{j}{ }^{k}{ }^{V_{O l}}{ }_{g} \\
& =-\int_{M} h^{i j}{ }_{i}\left(\operatorname{div}_{g} h{ }_{j}{ }_{j}{ }^{\text {vol }} g\right. \\
& =-\int_{M}\left[\nabla_{i}\left(h^{i j}\left(\operatorname{div}_{g} h\right)_{j}\right)-\nabla_{i} h^{i j}\left(\operatorname{div}_{g} h\right)_{j}\right] \operatorname{vol}_{g} \\
& =\int_{M} \nabla_{i} h^{i j}\left(\operatorname{div}_{g} h\right){ }_{j}{ }^{\text {VOl }_{g}} \\
& =\int_{M}\left(\operatorname{div}_{g} h\right)^{j}\left(\operatorname{div}_{g} h\right)_{j}{ }^{\text {vol }}{ }_{g} \\
& =\int_{M} g\left[\begin{array}{l}
0 \\
l
\end{array} \operatorname{div}_{g} h, \operatorname{div}_{g} h\right) \operatorname{vol}_{g} .
\end{aligned}
$$

$$
\begin{aligned}
& \longrightarrow-\int_{M} h^{i j_{R_{j}}}{ }^{\ell}{ }_{k i} h_{l}{ }^{k}{ }^{\text {vol }}{ }_{g} \\
& =-\int_{M} h^{i j}-R_{j}^{l}{ }_{j}{ }_{i} h_{l k}{ }^{\text {VOl }}{ }_{g} \\
& =\int_{M} h^{i j}{ }_{R(h)}^{i j}{ }^{\text {vol }}{ }_{g} \\
& =\int_{M} g\left[\begin{array}{l}
0 \\
2
\end{array}\right](h, R(h)) \mathrm{vol}_{g} . \\
& \longrightarrow-\int_{M} h^{i j_{h}}{ }_{j \ell^{R}}{ }^{k \ell}{ }_{k i}{ }^{\mathrm{VOl}_{g}} \\
& =-\int_{M} R_{i}^{l}{ }_{i}{ }^{i j_{h}}{ }_{j} \ell^{\text {vol }}{ }_{g} \\
& =-\int_{M} R^{l i_{h_{j \ell}} h_{i}}{ }^{j}{ }_{\text {vol }}^{g} \\
& =-\int_{M} R^{l i_{h_{l j}}}{ }^{h^{j}}{ }_{i}{ }^{\text {vol }}{ }_{g} \\
& =-\int_{M} R^{\ell i}(h * h)_{\ell i^{V o l}}^{g} \\
& =-\int_{M} g\left[\begin{array}{l}
0 \\
2
\end{array}\right](\operatorname{Ric}(g), h * h) \operatorname{vol}_{g} .
\end{aligned}
$$

- As has been already established,

$$
\begin{array}{rl}
2 \int_{M} & g\left[\begin{array}{l}
0 \\
2
\end{array}\right]\left(h, \mathrm{H}_{\operatorname{tr}_{g}(h)}\right) \mathrm{Vol}_{g} \\
& =-2 \int_{M} g\left[\begin{array}{l}
0 \\
1
\end{array}\right]\left(\operatorname{div}_{g} h, \operatorname{dtr}_{g}(h)\right) \operatorname{vol}_{g^{\prime}}
\end{array}
$$

thereby cancelling the contribution coming from

$$
2 g\left[\frac{0}{1}\right]\left(\operatorname{div}_{g} h, \operatorname{dtr}_{g}(h)\right)
$$

33. 

- Both

$$
\Delta_{g} g\left[\left[_{2}^{0}\right](h, h)\right.
$$

and

$$
2 \delta_{g} \operatorname{div}_{g}(h * h)
$$

integrate to zero.
Summary: We have

$$
\begin{aligned}
& \int_{M}\left(D_{g}^{2} S\right)(h, h) \text { vol }_{g} \\
& =\frac{1}{2} \int_{M} g\left[\begin{array}{l}
0 \\
2
\end{array}\right]\left(h, \Delta_{\text {con }}{ }^{h}\right) \mathrm{vol}_{g} \\
& +\int_{M} g\left[{ }_{2}^{0}\right](h, R(h)) \mathrm{vol}_{g} \\
& +\int_{M} g\left[{ }_{2}^{0}\right](\operatorname{Ric}(g), h * h) \mathrm{Vol}_{g} \\
& -\frac{1}{2} \int_{M} g\left[{ }_{1}^{0}\right]\left(d t r_{g}(h), d t r_{g}(h)\right) \mathrm{Vol}_{g} \\
& +\int_{M} g\left[{ }_{l}^{0}\right]\left(\operatorname{div}_{g} h \text { div }_{g} h\right) \operatorname{vol}_{g},
\end{aligned}
$$

which reduces to the formula established previously when $\operatorname{Ric}(\mathrm{g})=0$.

Section 30: Splittings Let $M$ be a connected $C^{\infty}$ manifold of dimension $n$. Assume: $M$ is compact and orientable and $n>1$.

Equip $D_{\mathrm{q}}^{\mathrm{p}}(\mathrm{M})$ with the $C^{\infty}$ topology -- then $D_{\mathrm{q}}^{\mathrm{p}}(\mathrm{M})$ is a Fréchet space. In particular: $D_{2}^{0}(M)$ is a Fréchet space, as is $S_{2}(M)$ (being a closed subspace of $\mathrm{D}_{2}^{0}(\mathrm{M})$ ).
 manifold modeled on $S_{2}(M)$.

Given $g \in \mathcal{M}_{0}$, define

$$
a_{g}: D^{1}(\mathbb{M}) \rightarrow S_{2}(M)
$$

by

$$
a_{g}(X)=L_{x} g
$$

and define

$$
a_{g}^{\star}: S_{2}(\mathrm{M}) \rightarrow D^{l}(\mathrm{M})
$$

by

$$
a_{g}^{\star}(s)=-2 g^{\#} d i v_{g} s
$$

Then

$$
\begin{aligned}
<a_{g}(X), s> & =\int_{M} g\left[\frac{0}{2}\right]\left(L_{X}^{g}, s\right) \mathrm{vol}_{g} \\
& =-2 \int_{M} g\left[l_{1}^{0}\right]\left(g^{b} x, \operatorname{div}_{g} s\right) \mathrm{vol}_{g} \\
& =-2 \int_{M} g\left[\frac{1}{0}\right]\left(X, g^{\#} \mathrm{div}_{g} s\right) \mathrm{vol}_{g} \\
& =<X, a_{g}^{*}(s)>
\end{aligned}
$$

2. 

LEMMA $\forall x \in M \& \forall \xi \in T_{X}^{*} M-\{0\}$, the symbol

$$
\sigma_{\xi}\left(a_{g} ; x\right): T_{x} M \rightarrow \text { Sym }^{2} T_{X}^{*} M
$$

of $a_{g}$ is injective.
[Given $V \in T_{X} M$, we have

$$
\begin{aligned}
& \sigma_{\xi}\left(a_{g} ; x\right)(V)=\xi \otimes g_{x}^{b} V+g_{x}^{b V} \otimes \xi . \\
& \text { So, if } \sigma_{\xi}\left(a_{g} ; x\right)(V)=0 \text {, then } \forall i \& \forall j \text {, } \\
& \xi_{i} V_{j}+V_{i} \xi_{j}=0 \\
& \Rightarrow \\
& \xi^{i} V_{i}=g_{x}^{i j} \xi_{j} V_{i} \\
& =-g_{x}^{i j} \xi_{i} V_{j} \\
& =-g_{x}^{i j} \xi_{j} V_{i} \\
& \xi^{i} V_{i}=0 \\
& \xi^{i} \xi_{i} V_{j}+\xi^{i} V_{i} \xi_{j}=\xi^{i} \xi_{i} V_{j}=0 \\
& V_{j}=0 .
\end{aligned}
$$

I.e.: $V=0$, hence $\sigma_{\xi}\left(\alpha_{g} ; x\right)$ is injective.]

By elliptic theory, it then follows that there is an orthogonal decomposition

$$
S_{2}(M)=\operatorname{Ran} \alpha_{g} \oplus \operatorname{Ker} \alpha_{g}^{*}
$$

where both Ran $a_{g}$ and Ker $a_{g}^{*}$ are closed subspaces of $S_{2}(M)$.
Consequently, every $s \in S_{2}(M)$ can be split into two pieces:

$$
s=s_{0}+L_{X} g
$$

Here $\operatorname{div}_{g} s_{0}=0$ and $L_{X} g$ is unique in $X$ up to infinitesimal isometries.
Notation: Given $X \in \mathcal{D}^{1}(M)$, put

$$
(X \cdot \operatorname{Ric}(g))_{i}=X_{j} R_{i}^{j}
$$

SUBLEMMA Let $X \in \mathcal{D}^{1}(M)$-- then

$$
\left(\operatorname{div}_{g} f_{x} g\right)_{i}=\left(\Delta_{g} g^{b x}\right)_{i}-\left(d \delta_{g} g^{b x}\right)_{i}+2(x \cdot \operatorname{Ric}(g))_{i}
$$

[By definition,

$$
\begin{aligned}
\left(\operatorname{div}_{g} \mathcal{X}^{g}\right)_{i} & =\nabla^{j}\left(x_{i ; j}+x_{j ; i}\right) \\
& =\nabla^{j} \nabla_{j} x_{i}+\nabla^{j_{\nabla_{i}} x_{j}}
\end{aligned}
$$

And (Weitzenboeck)

$$
\nabla^{j} \nabla_{j} x_{i}=\left(\Delta_{g} g^{f(x)}{ }_{i}+x_{j} R_{i}^{j}\right.
$$

Turning to $\nabla^{j} \nabla_{i} X_{j}$, write

$$
\begin{aligned}
& \nabla^{j} \nabla_{i} X_{j}=g^{j k_{\nabla_{k}} \nabla_{i} X_{j}} \\
& =g^{j k} X_{j ; i ; k} \\
& =g^{j k}\left(X_{j ; k ; i}+X_{\ell} R_{j i k}^{\ell}\right) \\
& =g^{j k_{i}} \nabla_{i} \nabla_{k} X_{j}+X_{\ell} g^{j k_{R}}{ }_{j i k} \\
& =\nabla_{i} \nabla^{j} X_{j}+X_{\ell} R^{\ell k}{ }_{i k} \\
& =\nabla_{i}\left(-\delta_{g} g^{b} x\right)+x_{\ell} R^{k \ell}{ }_{k i} \\
& =-\left(d \delta_{g^{g}}{ }^{b}\right)_{i}+X_{\ell^{R}}{ }_{i^{\prime}}
\end{aligned}
$$

from which the result.]
[Note: This computation does not use the assumption that M is compact and is valid for any $g \in M$.]

Application: Suppose that Ric (g) $=0$-- then

$$
\Delta_{g} \operatorname{tr}_{g} L_{X} g+\delta_{g} \operatorname{div}_{g} L_{X} g=0
$$

[Consider $\Delta_{g} \operatorname{tr}_{g} L_{X} g$ :

$$
\begin{aligned}
\operatorname{tr}_{g} L_{x} g & =g^{i j}\left(x_{i ; j}+x_{j ; i}\right) \\
& =2 \nabla^{i} x_{i} \\
& =-2 \delta_{g^{b}}{ }^{b} x
\end{aligned}
$$

$$
\begin{aligned}
\Delta_{g} \operatorname{tr}_{g} L_{X} g & =-2 \Delta_{g} \delta_{g} g^{b} x \\
& =-2 \delta_{g_{g}} \Delta_{g}^{b} x \\
& =2 \nabla^{i}\left(\Delta_{g} g^{b} x\right)_{i}
\end{aligned}
$$

Consider $\delta_{g} \operatorname{div}_{g} L_{X} g:$

$$
\begin{aligned}
& \delta_{g} \operatorname{div}_{g} L_{X} \\
&=-\nabla^{i}\left(\operatorname{div}_{g} L_{X} g\right)_{i} \\
&=-\nabla^{i}\left(\Delta_{g} g^{b} x\right)_{i}+\nabla^{i}\left(d \delta_{g} g\right)_{i} .
\end{aligned}
$$

But

$$
\begin{aligned}
\nabla^{i}\left(d \delta_{g} g^{b} x\right)_{i} & =\nabla^{i} \nabla_{i} \delta_{g} g^{b} x \\
& =\Delta_{c o n} \delta_{g} g^{b} x \\
& =\Delta_{g} \delta_{g} g^{b} x \\
& =\delta_{g^{\prime}} \Delta_{g} g^{b} x \\
& \left.=-\nabla^{i}\left(\Delta_{g} g^{b} x\right)_{i} \cdot\right]
\end{aligned}
$$

Rappel: Suppose that $\operatorname{Ric}(g)=0-$ then $\forall h \in S_{2}(M)$,

$$
\begin{gathered}
\int_{M}\left(D_{g}^{2} S\right)(h, h) \operatorname{vol}_{g} \\
=-\int_{M} g\left[2_{2}^{0}\right]\left(h,\left(D_{g} \operatorname{Ric}\right)(h)\right) \operatorname{vol}_{g}
\end{gathered}
$$

$$
+\frac{1}{2} \int_{M}\left(\Delta_{g} t r_{g}(h)+\delta_{g} \operatorname{div}_{g} h\right) \operatorname{tr}_{g}(h) \operatorname{vol}_{g}
$$

Example: Suppose that $\operatorname{Ric}(g)=0$. Let $h \in S_{2}(M): h=h_{0}+L_{X} g\left(\operatorname{div}_{g} h_{0}=0\right) \quad-$ then

$$
\begin{aligned}
\left(D_{g} R i c\right)(h) & =\left(D_{g} R i c\right)\left(h_{0}+L_{X} g\right) \\
& =\left(D_{g} R i c\right)\left(h_{0}\right)+\left(D_{g} R i c\right)\left(L_{X} g\right) \\
& =\left(D_{g} R i c\right)\left(h_{0}\right)+L_{X}(\operatorname{Ric}(g)) \\
& =\left(D_{g} R i c\right)\left(h_{0}\right) \\
& =\frac{1}{2}\left[\Delta_{L} h_{0}+\Gamma_{d_{i v}} h_{0}-H_{\operatorname{tr}_{g}\left(h_{0}\right)}\right] \\
& =\frac{1}{2}\left[\Delta_{L} h_{0}-H_{\operatorname{tr}_{g}\left(h_{0}\right)}\right] .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& \int_{M}\left(D_{g}^{2} S\right)(h, h) v o l_{g} \\
&=-\frac{1}{2} \int_{M} g\left[\left[_{2}^{0}\right]\left(h_{r} \Delta_{L} h_{0}-H_{\operatorname{tr}_{g}\left(h_{0}\right)}\right) v o l_{g}\right. \\
&+\frac{1}{2} \int_{M}\left(\Delta_{g} \operatorname{tr}_{g}\left(h_{0}\right)+\Delta_{g} \operatorname{tr}_{g} L_{X} g\right. \\
&\left.+\delta_{g} \operatorname{div}_{g} h_{0}+\delta_{g} \operatorname{div}_{g} L_{X} g\right) \operatorname{tr}_{g}(h) v o l_{g} \\
&=-\frac{1}{2} \int_{M} g\left[\frac{0}{2}\right]\left(h, \Delta_{L} h_{0}-H_{\operatorname{tr}_{g}\left(h_{0}\right)}\right) v o l_{g}
\end{aligned}
$$

$$
\begin{aligned}
& +\frac{1}{2} \int_{M}\left(\Delta_{g} \operatorname{tr}_{g}\left(h_{0}\right)\right) \operatorname{tr}_{g}(h) \mathrm{vol}_{g} \\
= & -\frac{1}{2} \int_{M} g\left[\begin{array}{l}
0 \\
2
\end{array}\right]\left(h_{r} \Delta_{L} h_{0}\right) \mathrm{vol}_{g} \\
& -\frac{1}{2} \int_{M} g\left[l_{1}^{0}\right]\left(d i v_{g} h, d t r_{g}\left(h_{0}\right)\right) \mathrm{vol}_{g} \\
& -\frac{1}{2} \int_{M} g\left[{ }_{l}^{0}\right]\left(d t r_{g}(h), d t r_{g}\left(h_{0}\right)\right) v o l_{g}
\end{aligned}
$$

There are some additional simplifications that can be made. First, since ic (g) $=0$,

$$
\begin{aligned}
& \operatorname{div}_{g} \circ \Delta_{L}=-\Delta_{C o n} \circ \operatorname{div}_{g} \\
\Rightarrow & \Delta_{L} h_{0} \in \operatorname{Ker} \alpha_{g}^{*} \\
\Rightarrow & -\frac{1}{2} \delta_{M} g\left[\begin{array}{l}
0
\end{array}\right]\left(h, \Delta_{L} h_{0}\right) v o l_{g} \\
= & -\frac{1}{2} \delta_{M} g\left[\frac{0}{2}\right]\left(h_{0}, \Delta_{L} h_{0}\right) .
\end{aligned}
$$

Next

$$
\begin{aligned}
\operatorname{div}_{g} h & =\operatorname{div}_{g} L_{X} g \\
& =\Delta_{g} g^{b} x-d \delta_{g} g^{b} x \\
& =-\left(d \circ \delta_{g}+\delta_{g} \circ d\right) g^{b} x-d \delta_{g} g^{b} x \\
& =-\left(2 d \delta_{g} g^{b} x+\delta_{g} d g^{b} x\right)
\end{aligned}
$$

$$
\begin{aligned}
& \operatorname{div}_{g} h+d t r_{g}(h) \\
= & -2 d \delta_{g} g^{b} x-\delta_{g} d g^{b} x+d t r_{g}\left(h_{0}\right)+d t r_{g}\left(L_{x} g\right) \\
= & -4 d \delta_{g} g^{b} x-\delta_{g} d g^{b} x+d t r_{g}\left(h_{0}\right) .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& -\frac{1}{2} \int_{M} g\left[_{1}^{0}\right]\left(d i v_{g} h+d t r_{g}(h), d t r_{g}\left(h_{0}\right)\right) \mathrm{vol}_{g} \\
= & -\frac{1}{2} \int_{M} g\left[_{1}^{0}\right]\left(d t r_{g}\left(h_{0}\right), d t r_{g}\left(h_{0}\right)\right) \mathrm{vol}_{g} \\
& +2 \int_{M} g\left[_{1}^{0}\right]\left(d \delta_{g} g^{b} x, d t r_{g}\left(h_{0}\right)\right) \mathrm{vol}_{g} \\
& +\frac{1}{2} \int_{M} g\left[_{1}^{0}\right]\left(\delta_{g} d g{ }^{b} x, d t r_{g}\left(h_{0}\right)\right) \mathrm{vol}_{g} .
\end{aligned}
$$

Finally

$$
\begin{aligned}
& \int_{M} g\left[\left[_{1}^{0}\right]\left(\delta_{g} d g^{b} x, d t r_{g}\left(h_{0}\right)\right) v o l_{g}\right. \\
& =\int_{M} g\left[{ }_{2}^{0}\right]\left(d g^{b} x, d^{2} \operatorname{tr}_{g}\left(h_{0}\right)\right) v o l_{g} \\
& =0 .
\end{aligned}
$$

So, in conclusion,

$$
\int_{M}\left(D_{g}^{2} S\right)(h, h) \operatorname{vol}_{g}
$$

$$
\begin{aligned}
= & -\frac{1}{2} \int_{M} g\left[\frac{0}{2}\right]\left(h_{0}, \Delta_{L} h_{0}\right) v o l_{g} \\
& -\frac{1}{2} \int_{M} g\left[\begin{array}{l}
0
\end{array}\right]\left(d t r_{g}\left(h_{0}\right), d t r_{g}\left(h_{0}\right)\right) \mathrm{vol}_{g} \\
& +2 \int_{M} g\left[l_{l}^{0}\right]\left(d \delta_{g} g X_{,}, d t r_{g}\left(h_{0}\right)\right) \operatorname{vol}_{g}
\end{aligned}
$$

Example: If $g \in \mathcal{M}_{0}$ is a critical point for

$$
L(g)=\int_{M} S(g) \operatorname{vol}_{g}(n>2)
$$

then

$$
\begin{aligned}
& \left(D_{g}^{2} L\right)(h, h)=-\frac{1}{2} \int_{M} g\left[_{2}^{0}\right]\left(h_{0}, \Delta_{L} h_{0}\right) \mathrm{vol}_{g} \\
& \quad+\frac{1}{2} \int_{M} g\left[{ }_{1}^{0}\right]\left(d t r_{g}\left(h_{0}\right), d t r_{g}\left(h_{0}\right)\right) \mathrm{vol}_{g} .
\end{aligned}
$$

[Note that

$$
\begin{aligned}
\left(D_{g} S\right)(h) & =-\Delta_{g} \operatorname{tr}_{g}(h)-\delta_{g} \operatorname{div}_{g} h \\
& =-\Delta_{g} \operatorname{tr}_{g}\left(h_{0}\right)-\Delta_{g} \operatorname{tr}_{g} L_{X} g-\delta_{g} \operatorname{div}_{g} L_{X} g \\
& \left.=-\Delta_{g} t r_{g}\left(h_{0}\right) \cdot\right]
\end{aligned}
$$

FACT We have

$$
\left(D_{g}^{2} L\right)(h, h)=\left(D_{g}^{2} L\right)\left(h_{0}, h_{0}\right)
$$

10. 

Rappel:

$$
\begin{aligned}
& \quad r_{g}: S_{2}(M) \rightarrow C^{\infty}(M) \\
& \quad r_{g}(h)=-\Delta_{g} t r_{g}(h)-\delta_{g} \operatorname{div}_{g} h-g\left[\begin{array}{l}
0 \\
2
\end{array}(\operatorname{Ric}(g), h)\right.
\end{aligned}
$$

and

$$
\left\{\begin{array}{l}
r_{g}^{*}: C^{\infty}(M) \rightarrow S_{2}(M) \\
\quad r_{g}^{*}(f)=-\left(\Delta_{g} f\right) g+H_{f}-f R i c(g) .
\end{array}\right.
$$

LEMMA $\forall x \in M \& \forall \xi \in T_{\mathbf{X}}^{*} M-\{0\}$, the symbol

$$
\sigma_{\xi}\left(\Upsilon_{\mathrm{g}}^{*} ; \mathrm{x}\right): \underline{R} \rightarrow \operatorname{Sym}^{2} \mathrm{~T}_{\mathrm{X}}^{\star M}
$$

of $r_{g}^{*}$ is injective.
[Given $r \in R$, we have

$$
\sigma_{\xi}\left(r_{g}^{*} ; x\right)(r)=\left(-g_{x}\left[\begin{array}{l}
0 \\
l
\end{array}\right](\xi, \xi) g_{x}+\xi \otimes \xi\right) r
$$

But the trace of the RHS is

$$
(l-n) g_{x}\left[l_{l}^{0}\right](\xi, \xi) r
$$

Therefore

$$
\left.\sigma_{\xi}\left(r_{g}^{\star} ; x\right)(r)=0 \Rightarrow r=0(n>1) .\right]
$$

By elliptic theory, it then follows that there is an orthogonal decomposition

$$
S_{2}(M)=\operatorname{Ker} \gamma_{g} \oplus \operatorname{Ran} \gamma_{g^{\prime}}^{*}
$$

where both Ker $\gamma_{g}$ and Ran $\gamma_{g}^{*}$ are closed subspaces of $S_{2}(M)$.

Consequently, every $h \in S_{2}(M)$ can be written in the form

$$
h=\tilde{h}+\left(-\left(\Delta_{g} f\right) g+H_{f}-\operatorname{fRic}(g)\right)
$$

where

$$
\Delta_{g} \operatorname{tr}_{g}(\tilde{h})+\delta_{g} \operatorname{div}_{g} h+g\left[{ }_{2}^{0}\right](\operatorname{Ric}(g), h)=0
$$

Assume now that $\operatorname{Ric}(g)=\lambda g$, thus $M$ (or rather the pair $(M, g)$ ) is an Einstein manifold (and $\lambda=S(g) / n(n>1))$.

Rappel: $\quad \forall \mathrm{h} \in \mathrm{S}_{2}(\mathrm{M})$,

$$
r_{g}(h)=\left(D_{g} S\right)(h)
$$

Therefore

$$
\begin{aligned}
& r_{g}\left(L_{X} g\right)=\left(D_{g} S\right)\left(L_{X} g\right) \\
& =L_{X}(S(g)) \\
& =0 \\
& \Rightarrow \\
& \operatorname{Ran} \alpha_{g} \subset \text { Ker } \gamma_{g} \\
& \Rightarrow \\
& S_{2}(M)=\left(\operatorname{Ker} \gamma_{g} \text { Ker } a_{g}^{*}\right) \oplus \operatorname{Ran} \alpha_{g} \oplus \operatorname{Ran} \gamma_{g}^{*} .
\end{aligned}
$$

So, if $h \in S_{2}(M)$, then

$$
h=\tilde{h}_{0}+L_{X} g+\left(-\left(\Delta_{g} f\right) g+H_{f}-\lambda f g\right)
$$

where

$$
\operatorname{div}_{g} \tilde{h}_{0}=0 \& \Delta_{g} \operatorname{tr}_{g}\left(\widetilde{h}_{0}\right)+g\left[\begin{array}{l}
0 \\
2
\end{array}\left(\operatorname{Ric}(g), \tilde{h}_{0}\right)=0\right.
$$

LEMMA We have

$$
\left[\begin{array}{l}
\lambda \neq 0 \Rightarrow \operatorname{tr}_{g}\left(\widetilde{h}_{0}\right)=0 \\
\lambda=0 \Rightarrow \operatorname{tr}_{g}\left(\widetilde{h}_{0}\right)=c_{0}
\end{array}\right.
$$

[Consider the relation

$$
\begin{aligned}
\Delta_{g} \operatorname{tr}_{g}\left(\tilde{h}_{0}\right) & =-g\left[\frac{0}{0}\right]\left(\operatorname{Ric}(g), \tilde{h}_{0}\right) \\
& =(-\lambda) g\left[\begin{array}{l}
0 \\
2
\end{array}\right]\left(g, \widetilde{h}_{0}\right) \\
& =-\lambda \operatorname{tr} g\left(\widetilde{h}_{0}\right)
\end{aligned}
$$

If $\lambda=0$, then $\operatorname{tr}_{g}\left(\tilde{h}_{0}\right)$ is harmonic, hence equals a constant $C_{0}$. If $\lambda<0$, then $\operatorname{tr}_{g}\left(\tilde{h}_{0}\right)=0$ (since the eigenvalues of $\Delta_{g}$ are $\leq 0$ ). If $\lambda>0$ and if $\lambda_{1}<0$ is the first strictly negative eigenvalue of $\Delta_{g}$, then the Lichnerowicz inequality says that

$$
\lambda_{1} \leq \frac{n}{n-1}(-\lambda) \quad(\text { see below })
$$

But

$$
\frac{n}{n-1}(-\lambda)<-\lambda,
$$

thus $\left.\operatorname{tr}_{g}\left(\widetilde{h}_{0}\right)=0.\right]$
[Note: To explicate $C_{0}$ when $\operatorname{tr}_{\mathrm{g}}\left(\tilde{\mathrm{h}}_{0}\right)$ is harmonic, observe that

$$
\int_{M}\left[\operatorname{tr}_{g}\left(\tilde{h}_{0}\right)-\frac{1}{\operatorname{vol}_{g}(M)} \int_{M} \operatorname{tr}_{g}\left(\tilde{h}_{0}\right) \mathrm{vol}_{g}\right] \mathrm{vol}_{g}=0
$$

Therefore the difference

$$
\operatorname{tr}_{g}\left(\widetilde{\mathrm{~h}}_{0}\right)-\frac{1}{\operatorname{vol}_{g}(\mathrm{M})} \int_{\mathrm{M}} \operatorname{tr}_{g}\left(\widetilde{\mathrm{~h}}_{0}\right) \operatorname{vol}_{g}
$$

is orthogonal to the constants, in particular is orthogonal to itself. I.e.:

$$
\left.C_{0}=\frac{1}{\operatorname{vol}_{g}(M)} \int_{M} \operatorname{tr}_{g}\left(\tilde{h}_{0}\right) \operatorname{vol}_{g} \cdot\right]
$$

Scholium: Suppose that $M$ is Einstein ( $n>1$ ) -- then $\forall h \in S_{2}(M)$,

$$
\left[\begin{array}{l}
\lambda \neq 0: h=h^{T T}+L_{X} g+\left(-\left(\Delta_{g} f\right) g+H_{f}-\lambda f g\right) \\
\lambda=0: h=\left(h^{T T}+\left(C_{0} / n\right) g\right)+L_{X} g+\left(-\left(\Delta_{g} f\right) g+H_{f}\right) .
\end{array}\right.
$$

[Note: Here

$$
h^{\top T}=\left.\right|^{\widetilde{h}_{0}} \begin{array}{ll} 
& (\lambda \neq 0) \\
\widetilde{\mathrm{h}}_{0}-\left(C_{0} / n\right) g & (\lambda=0)
\end{array}
$$

has zero divergence and zero trace, a circumstance which in the literature is referred to as being transverse traceless (cf. infra).]

FACT (The Lichnerowicz inequality) Suppose that $\operatorname{Ric}(g)=\lambda g(\lambda>0)$.
Let $\lambda_{1}<0$ be the first strictly negative eigenvalue of $\Delta_{g}$ - then

$$
\lambda_{1} \leq \frac{n}{n-1}(-\lambda)
$$

[Fix $f \neq 0: \Delta_{g} f=\lambda_{1} f$ and integrate the equality

$$
\begin{gathered}
\frac{1}{2} \Delta_{g}\left(g\left(\operatorname{grad}_{g} f, g r a d_{g} f\right)\right) \\
=g\left[\left[_{2}^{0}\right]\left(H_{f}, H_{f}\right)+g\left(\operatorname{grad}_{g} f, g r a d_{g} \Delta_{g} f\right)+\operatorname{Ric}\left(\operatorname{grad}_{g} f, g r a d_{g} f\right)\right.
\end{gathered}
$$

over $M$ to get

$$
\begin{gathered}
0=\int_{M} g\left[\begin{array}{l}
0 \\
2
\end{array}\right]\left(\mathrm{H}_{f}, \mathrm{H}_{f}\right) \mathrm{vol}_{g} \\
+\lambda_{1} \int_{M} g\left[\begin{array}{l}
0 \\
1
\end{array}\right](\mathrm{df}, \mathrm{df}) \mathrm{vol}_{\mathrm{g}}+\lambda \int_{M} g\left[\begin{array}{l}
0 \\
\hline
\end{array}\right](\mathrm{df}, \mathrm{df}) \mathrm{vol}_{\mathrm{g}}
\end{gathered}
$$

or still,

$$
0=\left\|H_{f}\right\|^{2}-\lambda_{I}<\Delta_{\mathrm{g}} \mathrm{f}, \mathrm{f}>-\lambda<\Delta_{\mathrm{G}} \mathrm{f}, \mathrm{f}>
$$

or still,

$$
0=\left\|\mathrm{H}_{\mathrm{f}}\right\|^{2}-\left\|\Delta_{\mathrm{g}} \mathrm{f}\right\|^{2}-\frac{\lambda}{\lambda_{\mathrm{l}}}\left\|\Delta_{\mathrm{g}} \mathrm{f}\right\|^{2}
$$

But

$$
\left\|\Delta_{\mathrm{g}} \mathrm{f}\right\|^{2} \leq n\left\|H_{f}\right\|^{2}
$$

Therefore

$$
0 \geq\left\|\mathrm{H}_{\mathrm{f}}\right\|^{2}-\mathrm{n}\left\|\mathrm{H}_{\mathrm{f}}\right\|^{2}-\frac{\lambda}{\lambda_{1}} \mathrm{n}\left\|\mathrm{H}_{\mathrm{f}}\right\|^{2}
$$

$\Rightarrow$

$$
0 \geq 1-n-\frac{\lambda}{\lambda_{1}} n
$$

$\Rightarrow$

$$
\lambda_{1}(l-n)-\lambda n \geq 0 \quad\left(\lambda_{1}<0\right)
$$

$$
\left.\lambda_{1} \leq \frac{n}{n-1}(-\lambda) \cdot\right]
$$

Observation: Let $X \in D^{l}(M), s \in S_{2}(M)$ - then

$$
\begin{aligned}
& <-\frac{2}{n}\left(\operatorname{div}_{g} X\right) g, s>=\int_{M} g\left[\begin{array}{l}
0 \\
2
\end{array}\right]\left(-\frac{2}{n}\left(\operatorname{div}_{g} X\right) g, s\right) \operatorname{vol}_{g} \\
& =-\frac{2}{n} \int_{M}\left(\operatorname{div}_{g} X\right) g\left[\begin{array}{l}
0 \\
2
\end{array}\right](g, s) \mathrm{Vol}_{g} \\
& =-\frac{2}{n} \int_{M}\left(\operatorname{div}_{g} X\right) \operatorname{tr}_{g}(s) \operatorname{vol}_{g} \\
& =\frac{2}{n} \int_{M} \mathrm{Xtr}_{\mathrm{g}}(\mathrm{~s}) \mathrm{vol}_{\mathrm{g}} \\
& =\frac{2}{n} \int_{M} g\left[\frac{1}{0}\right]\left(X, g^{\#} \operatorname{dtr}_{g}(s)\right) \text { vol }_{g} \\
& =\frac{2}{n} \int_{M} g\left[\frac{1}{0}\right]\left(X, g r a d_{g} \operatorname{tr}_{g}(s)\right) \text { vol }_{g} \\
& =<X, \frac{2}{n} \operatorname{grad}_{g} \operatorname{tr}_{g}(s)>.
\end{aligned}
$$

Given $g \in M_{0}$, define

$$
\tau_{g}: D^{l}(M) \rightarrow S_{2}(M)
$$

by

$$
\tau_{g}(X)=L_{X} g+\frac{2}{n}\left(-d i v_{g} X\right) g
$$

and define

$$
\tau_{g}^{\star}: S_{2}(M) \rightarrow D^{I}(M)
$$

by

$$
\tau_{g}^{\star}(s)=-2 g^{\#} \operatorname{div}_{g} s+\frac{2}{n} \operatorname{grad}_{g} \operatorname{tr}_{g}(s)
$$

Then

$$
<\tau_{g}(X), s>=<X, \tau_{g}^{*}(s)>.
$$

LEMMA $\forall x \in M \& \forall \xi \in T_{\mathbf{x}}^{*} M-\{0\}$, the symbol

$$
\sigma_{\xi}\left(\tau_{g} ; \mathrm{x}\right): \mathrm{T}_{\mathrm{x}} \mathrm{M} \rightarrow \operatorname{Sym}^{2} \mathrm{~T}_{\mathrm{x}}^{*} \mathrm{M}
$$

of $\tau_{\mathrm{g}}$ is injective provided $\mathrm{n}>1$.
[Given $V \in T_{X} M$, we have

$$
\sigma_{\xi}\left(\tau_{g} ; x\right)(V)=\xi \otimes g_{x}^{b}+g_{x}^{b} V \otimes \xi-\frac{2}{n}\left(V^{a_{z}}\right) g_{x}
$$

So, if $\sigma_{\xi}\left(\tau_{g} ; x\right)(V)=0$, then $\forall i \& \forall j$,

$$
\xi_{i} v_{j}+v_{i} \xi_{j}-\frac{2}{n}\left(v^{a} \xi_{a}\right)\left(g_{x}\right)_{i j}=0
$$

$$
\begin{aligned}
& \Rightarrow \\
& \Rightarrow \quad \xi^{j} V^{i} \xi_{i} V_{j}+\xi^{j} V^{i} v_{i} \xi_{j}-\frac{2}{n}\left(v^{a} \xi_{a}\right) \xi^{j} v^{i}\left(g_{x}\right){ }_{i j}=0 \\
& \\
& \quad\left(v^{i} \xi_{i}\right)\left(v^{j} \xi_{j}\right)+\left(\xi^{j} \xi_{j}\right)\left(v^{i} v_{i}\right)-\frac{2}{n}\left(v^{a} \xi_{a}\right)\left(v^{i} \xi_{i}\right)=0 \\
& \Rightarrow \\
& \\
& \quad\left(l-\frac{2}{n}\right)\left(v^{a} \xi_{a}\right)^{2}+g_{x}\left[l_{l}^{0}\right](\xi, \xi) g_{x}\left(g^{b} V, g^{b} V\right)=0
\end{aligned}
$$

$\Rightarrow$

$$
g_{x}\left(g^{b} V, g^{b} V\right)=0
$$

$\left.\Rightarrow \quad g^{\natural} \mathrm{V}=0 \Rightarrow \mathrm{~V}=0(\mathrm{n}>1).\right]$

By elliptic theory, it then follows that there is an orthogonal decomposition

$$
S_{2}(M)=\operatorname{Ran} \tau_{g} \oplus \operatorname{Ker} \tau_{g}^{*},
$$

where both Ran $\tau_{g}$ and Ker $\tau_{g}^{*}$ are closed subspaces of $S_{2}(M)$.
Consequently, every $\mathbf{s} \in S_{2}(M)$ can be split into three parts:

$$
s=s^{0}+L_{X} g+\frac{2}{n}\left(-\operatorname{div}_{g} X\right) g
$$

Here

$$
-2 g^{\#} \operatorname{div}_{g} s^{0}+\frac{2}{n} \operatorname{grad}_{g} \operatorname{tr}_{g}\left(s^{0}\right)=0
$$

or still,

$$
-g^{\#} d i v_{g} s^{0}+\frac{1}{n} g^{\#} d t r_{g}\left(s^{0}\right)=0
$$

or still,

$$
-\operatorname{div}_{g} s^{0}+\frac{1}{n} \operatorname{dtr}_{g}\left(s^{0}\right)=0
$$

or still,

$$
-\operatorname{div}_{g} s^{0}+\frac{1}{n} \operatorname{div}_{g}\left(\operatorname{tr}_{g}\left(s^{0}\right) g\right)=0
$$

or still,

$$
\operatorname{div}_{g}\left(s^{0}-\frac{1}{n} \operatorname{tr}_{g}\left(s^{0}\right) g\right)=0
$$

Remark: A vector field X is said to be conformal if

$$
L_{X} g=\frac{2}{n}\left(\operatorname{div}_{g} x\right) g
$$

Every infinitesimal isometry is conformal, the converse being false in general.
[Note: According to Yano's formula,

$$
\int_{M}\left[\operatorname{Ric}(X, X)-\left(\operatorname{div}_{g} X\right)^{2}+\frac{1}{2} g\left[\begin{array}{l}
0 \\
2
\end{array}\right]\left(L_{X} g, L_{X} g\right)-g\left[\frac{1}{1}\right](\nabla X, \nabla X)\right] \operatorname{vol}{ }_{g}=0
$$

So, if X is conformal, then

$$
\int_{M}\left[\operatorname{Ric}(X, X)-\frac{n-2}{n}\left(\operatorname{div}_{g} X\right)^{2}-g\left[\frac{1}{1}\right](\nabla X, \nabla X)\right] \operatorname{vol}_{g}=0,
$$

a relation which places an a priori restriction on the existence of X. E.g.: There are no nonzero conformal vector fields if the Ricci curvature is negative definite.]

Put

$$
s^{T T}=s^{0}-\frac{1}{n} \operatorname{tr}{ }_{g}\left(s^{0}\right) g
$$

Then

$$
s=s^{T T}+L_{X} g+\frac{2}{n}\left(-\operatorname{div}_{g} X\right) g+\frac{1}{n} \operatorname{tr}_{g}(s) g
$$

[Note: We have used the fact that

$$
\operatorname{tr}_{g}(s)=\operatorname{tr}_{g}\left(s^{0}\right)
$$

Proof:

$$
\begin{aligned}
\operatorname{tr}_{g}(s) & =\operatorname{tr}_{g}\left(s^{0}\right)+\operatorname{tr}_{g} L_{X} g+\frac{2}{n}\left(-\operatorname{div}_{g} x\right) \operatorname{tr}_{g}(g) \\
& =\operatorname{tr}_{g}\left(s^{0}\right)-2 \delta_{g} g^{b} X-2\left(\operatorname{div}_{g} X\right) \\
& =\operatorname{tr}_{g}\left(s^{0}\right)-2 \delta_{g} g^{b} X-2\left(-\delta_{g} g^{b} X\right) \\
& \left.=\operatorname{tr}_{g}\left(s^{0}\right) .\right]
\end{aligned}
$$

Notation: $S_{2}(M)^{T T}$ stands for the subspace of $S_{2}(M)$ consisting of those s such that

$$
\operatorname{div}_{g} s=0 \& \operatorname{tr}_{g}(s)=0
$$

[Note: In other words, $S_{2}(M)^{\top \top}$ is the kernel of the map

$$
S_{2}(M) \rightarrow D_{1}(M) \times C^{\infty}(M)
$$

that sends $s$ to $\left(\operatorname{div}_{g} s, \mathrm{tr}_{g}(s)\right)$.
The preceding considerations then imply that

$$
S_{2}(M)=S_{2}(M)^{T T} \oplus \operatorname{Ran} \tau_{g} \oplus C^{\infty}(M) g
$$

Remark: It can be shown that $S_{2}(M)^{\top \top}$ is infinite dimensional provided $\mathrm{n}>2$.

Here is some terminology that can serve as a recapitulation. Nomenclature:
(1) The splitting

$$
s=s_{0}+L_{X} g
$$

is called the canonical decomposition of $s \in S_{2}(M)$.
(2) The splitting

$$
h=\tilde{h}+\left(-\left(\Delta_{g} f\right) g+H_{f}-f \operatorname{Ric}(g)\right)
$$

is called the BDBE decomposition of $h \in S_{2}(M)$.
(3) The splitting

$$
s=s^{T T}+L_{X} g+\frac{2}{n}\left(-\operatorname{di} v_{g} X\right) g+\frac{1}{n} \operatorname{tr}_{g}(s) g
$$

is called the York decomposition of $s \in S_{2}(M)$.

Section 31: Metrics on Metrics Let $M$ be a connected $C^{\infty}$ manifold of dimension $n$. Assume: $M$ is compact and orientable and $n>1$.

Rappel: $M_{0}$ (the set of riemannian structures on $M$ ) is open in $S_{2}(M)$, hence is a Fréchet manifold modeled on $S_{2}(M)$.

Put

$$
\left[\begin{array}{l}
T M_{0}=M_{0} \times S_{2}(M) \\
T^{*} M_{0}=M_{0} \times S_{d}^{2}(M)
\end{array}\right.
$$

Then $\forall g \in M_{0}$,

$$
\left[\begin{array}{r}
T_{G} M_{0}=S_{2}(M) \\
T_{g^{*}-0}^{*}=S_{d}^{2}(M)
\end{array}\right.
$$

the pairing

$$
<,>: T_{g} M_{0} \times T_{g}^{*} M_{0} \rightarrow \underline{R}
$$

being

$$
\begin{aligned}
<u, v^{\#} \otimes|g|^{1 / 2}> & =\int_{M} v^{\#}(u) v^{\#} l_{g} \\
& =\int_{M} g\left[\begin{array}{l}
0
\end{array}\right](u, v) v o l_{g}
\end{aligned}
$$

[Note: $T^{\star} \underline{M}_{0}$ is the " $L^{2}$ cotangent bundle" of ${ }_{-1}^{M}$ (the fiber $T_{g}^{*}=0$ is a proper subspace of the topological dual of $T_{g} M_{0}=S_{2}(M)$ ).]

Given $\beta \in \underline{R}$, define

$$
[,]_{\beta, g}: S_{2}(M) \times S_{2}(M) \rightarrow C^{\infty}(M)
$$

by

$$
[u, v]_{\beta, g}=\left[u-\frac{1}{n} \operatorname{tr}_{g}(u) g, v-\frac{1}{n} \operatorname{tr}_{g}(v) g\right]_{g}+\beta \operatorname{tr}_{g}(u) \operatorname{tr}_{g}(v)
$$

and set

$$
\mathrm{G}_{\beta, \mathrm{g}}(\mathrm{u}, \mathrm{v})=\int_{\mathrm{M}}[\mathrm{u}, \mathrm{v}]_{\beta, \mathrm{g}^{\mathrm{vol}}}^{\mathrm{g}} .
$$

Then

$$
G_{\beta, g}: S_{2}(M) \times S_{2}(M) \rightarrow \underline{R}
$$

is a smooth symmetric bilinear form.
[Note: Obviously,

$$
[u, v]_{\beta, g}=[u, v]_{g}+\left(\beta-\frac{1}{n}\right) \operatorname{tr}_{g}(u) \operatorname{tr}_{g}(v)
$$

Therefore

$$
[\mathrm{u}, \mathrm{v}]_{\frac{1}{\mathrm{n}}, \mathrm{~g}}=[\mathrm{u}, \mathrm{v}]_{\mathrm{g}}
$$

$$
\Rightarrow
$$

$$
\mathrm{G}_{\frac{1}{\mathrm{n}}, \mathrm{~g}}(\mathrm{u}, \mathrm{v})=\int_{\mathrm{M}} \mathrm{~g}\left[\begin{array}{l}
0 \\
2
\end{array}(\mathrm{u}, \mathrm{v}) \mathrm{vol}_{\mathrm{g}} \cdot\right]
$$

Example: Take $\beta=\frac{1}{n}-1-$ then $\frac{G_{1}}{n}-1, g\left(\equiv G_{g}\right)$ is called the DeWitt metric, thus

$$
G_{g}(u, v)=\int_{M}\left([u, v]_{g}-\operatorname{tr}_{g}(u) \operatorname{tr}_{g}(v)\right) \operatorname{vol}_{g} .
$$

LEMMA $\forall \beta \neq 0, G_{\beta, g}$ is nondegenerate.
[Fix $u \in S_{2}(M)$ and suppose that $G_{\beta, g}(u, v)=0 \forall v \in S_{2}(M)$-- then in particular

$$
G_{\beta, g}\left(u, u-\frac{\beta n-1}{\beta n^{2}} \operatorname{tr}_{g}(u) g\right)=0
$$

We have
(1) $\left[u, u-\frac{\beta n-1}{\beta n^{2}} t r_{g}(u) g\right]_{g}$

$$
=[u, u]_{g}-\frac{\beta n-1}{\beta n^{2}} \operatorname{tr}_{g}(u)[u, g]_{g}
$$

$$
=[u, u]_{g}-\frac{\beta n-1}{\beta n^{2}} t r_{g}(u)^{2}
$$

(2) $\left(\beta-\frac{1}{n}\right) \operatorname{tr}_{g}(u) \operatorname{tr}_{g}\left(u-\frac{\beta n-1}{\beta n^{2}} \operatorname{tr}_{g}(u) g\right)$

$$
\begin{aligned}
& =\left(\beta-\frac{1}{n}\right) \operatorname{tr}_{g}(u)\left[\operatorname{tr}_{g}(u)-\frac{\beta n-1}{\beta n^{2}} \operatorname{tr}_{g}(u) \operatorname{tr}_{g}(g)\right] \\
& =\left(\beta-\frac{1}{n}\right) \operatorname{tr}_{g}(u)^{2}\left[1-\frac{\beta n-1}{\beta n}\right] \\
& =\frac{\beta n-1}{\beta n^{2}} \operatorname{tr}_{g}(u)^{2}
\end{aligned}
$$

Therefore

$$
\Rightarrow
$$

$$
\begin{aligned}
0= & \int_{M}\left([u, u]_{g}-\frac{\beta n-1}{\beta n^{2}} \operatorname{tr}_{g}(u)^{2}\right. \\
& \left.+\frac{\beta n-1}{\beta n^{2}} \operatorname{tr}_{g}(u)^{2}\right) \mathrm{vol}_{g} \\
= & \int_{M}[u, u]_{g}{ }^{v o l_{g}} \\
u & =0 .]
\end{aligned}
$$

Rappel: Denote by Diff ${ }^{+} M$ the normal subgroup of Diff $M$ consisting of the orientation preserving diffeomorphisms -- then there are two possibilities.

- [Diff $\left.M: \operatorname{Diff}^{+} M\right]=1$, in which case $M$ is irreversible.
- [Diff M:Diff $\left.{ }^{+} \mathrm{M}\right]=2$, in which case $M$ is reversible.
[Note: There is then an orientation reversing diffeomorphism of $M$ and a short exact sequence

$$
1 \rightarrow \operatorname{Diff}^{+} \mathrm{M} \rightarrow \operatorname{Diff} \mathrm{M} \stackrel{\varepsilon_{\mathrm{M}}}{\rightarrow} \underline{\mathrm{Z}}_{2} \rightarrow 1
$$

where $\varepsilon_{M}(\varphi)=+1$ if $\varphi$ is orientation preserving and $\varepsilon_{M}(\varphi)=-1$ if $\varphi$ is orientation reversing.]

Remark: When equipped with the $C^{\infty}$ topology, Diff $M$ is a topological group. The normal subgroup Diff ${ }^{+} M$ is both open and closed and contains Diff ${ }_{0} M$, the identity component of Diff M.

The group Diff ${ }^{+} \mathrm{M}$ operates to the right on $\underline{M}_{0}$ via pullback: $\forall \varphi \in \operatorname{Diff}{ }^{+} \mathrm{M}$,

$$
g \cdot \varphi=\varphi^{*} g \quad\left(g \in \mathbb{M}_{0}\right)
$$

FACT View $G_{\beta}$ as a semiriemannian structure on $\underline{M}_{0}(\beta \neq 0)$ - then $\forall \varphi \in \operatorname{Diff}{ }^{+}{ }^{M}$,

$$
\left(\varphi^{*}\right) * \mathrm{G}_{\beta}=\mathrm{G}_{\beta} .
$$

[Note: In other words, $\operatorname{Diff}^{+} \mathrm{M}$ can be identified with a subgroup of the isometry group of $\left(\mathrm{M}_{0}, \mathrm{G}_{\beta}\right)$.]

In what follows, it will always be assumed that $\beta \neq 0$.
$G_{\beta, g}^{b}: S_{2}(M) \rightarrow S_{d}^{2}(M) \quad$ Here

$$
\begin{aligned}
& G_{\beta, g}^{b}(u)(v)=G_{\beta, g}(u, v) \\
& =\int_{M}\left([u, v]_{g}+\left(\beta-\frac{1}{n}\right) \operatorname{tr}_{g}(u) \operatorname{tr}_{g}(v)\right) v_{g o l_{g}}
\end{aligned}
$$

But

$$
\begin{aligned}
& \left(u+\left(\beta-\frac{1}{n}\right) \operatorname{tr}_{g}(u) g\right)^{\#}(v) \\
& =\left(u^{a b}+\left(\beta-\frac{1}{n}\right) \operatorname{tr}_{g}(u) g^{a b}\right) v_{a b} \\
& =[u, v]_{g}+\left(\beta-\frac{1}{n}\right) t r_{g}(u) t r_{g}(v)
\end{aligned}
$$

Therefore

$$
\Rightarrow
$$

$$
\begin{aligned}
& G_{\beta, g}^{b}(u)(v)=\int_{M}\left(u+\left(\beta-\frac{1}{n}\right) \operatorname{tr}_{g}(u) g\right)^{\#}(v) \mathrm{vol}_{g} \\
& =<v, \quad\left(u+\left(\beta-\frac{1}{n}\right) \operatorname{tr}_{g}(u) g\right)^{\#} \otimes|g|^{1 / 2}> \\
& G_{\beta, g}^{b}(u)=\left(u+\left(\beta-\frac{1}{n}\right) t r_{g}(u) g\right)^{\#} \otimes|g|^{1 / 2} .
\end{aligned}
$$

[Note: By construction, $G_{\beta, g}^{b}$ is injective. More is true: $G_{\beta, g}^{b}$ is bijective with inverse

$$
G_{\beta, g}^{\#}: S_{d}^{2}(M) \rightarrow S_{2}(M)
$$

given by

$$
G_{\beta, g}^{\#}\left(s^{\#} \otimes|g|^{1 / 2}\right)=s+\frac{1}{\beta n}\left(\frac{1}{n}-\beta\right) \operatorname{tr}_{g}(s) g
$$

In fact,

$$
G_{\beta, g}^{\#}\left(G_{\beta, g}^{b}(s)\right)=G_{\beta, g}^{\#}\left(\left(s+\left(\beta-\frac{1}{n}\right) \operatorname{tr}_{g}(s) g\right)^{\#} \otimes|g|^{1 / 2}\right)
$$

6. 

$$
\begin{aligned}
= & s+\left(\beta-\frac{1}{n}\right) \operatorname{tr}_{g}(s) g \\
& +\frac{1}{\beta n}\left(\frac{1}{n}-\beta\right) \operatorname{tr}_{g}\left(s+\left(\beta-\frac{1}{n}\right) \operatorname{tr}_{g}(s) g\right) g \\
= & s+\left(\beta-\frac{1}{n}\right) \operatorname{tr}_{g}(s) g \\
& +\frac{1}{\beta n}\left(\frac{1}{n}-\beta\right)\left[\operatorname{tr}_{g}(s)+\left(\beta-\frac{1}{n}\right) n t r_{g}(s)\right] g \\
= & s+\left[\left(\beta-\frac{1}{n}\right)+\frac{1}{\beta n}\left(\frac{1}{n}-\beta\right)(1+\beta n-1)\right] t r_{g}(s) g \\
= & s+\left(\beta-\frac{1}{n}\right)\left[1-\frac{\beta n}{\beta n}\right] \operatorname{tr}_{g}(s) g \\
= & s .]
\end{aligned}
$$

From the definitions,

$$
\begin{aligned}
T T \mathbb{M}_{0} & =\mathrm{TM}_{0} \times T S_{2}(M) \\
& =\left(M_{0} \times S_{2}(M)\right) \times\left(S_{2}(M) \times S_{2}(M)\right)
\end{aligned}
$$

Therefore a vector field $X$ on $T M_{0}$ can be thought of as a map

$$
\left[\begin{array}{l}
\mathrm{M}_{0} \times S_{2}(\mathrm{M}) \rightarrow S_{2}(\mathrm{M}) \times S_{2}(\mathrm{M}) \\
-\quad(\mathrm{g}, \mathrm{~s})
\end{array} \quad \longrightarrow(\mathrm{u}, \mathrm{v}) .\right.
$$

Observation: There is a commutative diagram

$$
\begin{aligned}
\left(\underline{M}_{0} \times S_{2}(M)\right) \times\left(S_{2}(M) \times S_{2}(M)\right) & \xrightarrow{T \pi} \quad \underline{M}_{0} \times S_{2}(M) \\
\Pi_{T} \downarrow & \downarrow \pi \\
\underline{M}_{0} \times S_{2}(M) \xrightarrow[\pi]{ } & \underline{M}_{0}
\end{aligned}
$$

where

$$
\left[\begin{array}{l}
\pi(g, s)=g \\
\pi_{T}((g, s),(u, v))=(g, s) \\
T \pi((g, s),(u, v))=(g, u) .
\end{array}\right.
$$

Definition: A vector field $X$ on $\mathrm{TM}_{0}$ is said to be second order if

$$
T \pi \circ X=i d_{T M} .
$$

[Note: Of course, $\pi_{T} \circ \mathrm{X}=\mathrm{id}_{\mathrm{TM}_{0}}$ is automatic.]
Let

$$
X: M_{0} \times S_{2}(M) \rightarrow S_{2}(M) \times S_{2}(M)
$$

be a vector field on $T M_{0}-$ then $X$ has two components: $X=\left(X_{1}, X_{2}\right)$, where

$$
\left[\begin{array}{l}
X_{1}: M_{0} \times S_{2}(M) \rightarrow S_{2}(M) \\
X_{2}: \underline{M}_{0} \times S_{2}(M) \rightarrow S_{2}(M)
\end{array}\right.
$$

This said, it is then clear that $X$ is second order iff

$$
X(g, s)=\left(s, X_{2}(g, s)\right) \quad\left(X_{1}(g, s)=s\right)
$$

Remark: If $X$ is second order and if $\gamma(t)=(g(t), s(t)) \in \mathcal{M}_{0} \times S_{2}(M)$ is an
8.
integral curve for X , then

$$
\begin{aligned}
\frac{d r}{d t} & =\left(\frac{d g}{d t^{\prime}}, \frac{d s}{d t}\right) \\
& =X(g(t), s(t)) \\
& =\left(s(t), x_{2}(g(t), s(t))\right),
\end{aligned}
$$

so

$$
\left[\begin{array}{l}
\frac{d g}{d t}=s(t) \\
\frac{d^{2} g}{d t^{2}}=\frac{d s}{d t}=x_{2}\left(g(t), \frac{d g}{d t}\right)
\end{array}\right.
$$

or, in brief,

$$
\left.\right|_{-} \quad \begin{aligned}
& \dot{g}=s \\
& \ddot{g}=x_{2}(g, \dot{g})
\end{aligned}
$$

[Note: The geodesics of $X$ are, by definition, the projection to $M_{0}$ of its integral curves.]

Definition: A spray is a second order vector field $X$ on $\mathrm{TM}_{0}$ which satisfies the following condition: $\forall \lambda \in \underline{R}$,

$$
x_{2}(g, \lambda s)=\lambda^{2} x_{2}(g, s)
$$

[Note: In other words, $\mathrm{X}_{2}$ is homogeneous of degree 2 in the variable s , hence

$$
\left.x_{2}(g, s)=\frac{1}{2} D_{2}^{2} x_{2}(g, 0)(s, s) .\right]
$$

THEOREM Fix $\beta \neq 0$ - then there exists a unique spray $X_{\beta}$ on $T_{-0}$ whose second component $\Gamma_{\beta}$ has the property that

$$
\begin{aligned}
& G_{\beta, g}\left(\Gamma_{\beta}(g, s), h\right) \\
= & \frac{1}{2} \frac{d}{d \varepsilon} G_{\beta, g}+\left.\varepsilon h(s, s)\right|_{\varepsilon=0}-\frac{d}{d \varepsilon} G_{\beta, g}+\left.\varepsilon s(s, h)\right|_{\varepsilon=0^{\circ}} .
\end{aligned}
$$

[Note: The significance of this result will become apparent in the next section.]

The uniqueness of $X_{\beta}$ is obvious. As for its existence, let

$$
X_{\beta}(g, s)=\left(s, \Gamma_{\beta}(g, s)\right),
$$

where

$$
\Gamma_{\beta}(g, s)=s * s-\frac{1}{2} \operatorname{tr}_{g}(s) s+\frac{1}{4 \beta n}[s, s]_{g} g+\frac{\beta n-1}{4 \beta n^{2}} \operatorname{tr}_{g}(s)^{2} g
$$

or still,

$$
\Gamma_{\beta}(s, s)=s * s-\frac{1}{2} \operatorname{tr}_{g}(s) s+\frac{1}{4 \beta n}[s, s]_{\beta, g} g .
$$

Then

$$
\Gamma_{\beta}(g, \lambda s)=\lambda^{2} \Gamma_{\beta}(g, s)
$$

[Note: Put

$$
B_{\beta}(g ; u, v)=\frac{1}{2}\left[\Gamma_{\beta}(g, u+v)-\Gamma_{\beta}(g, u)-\Gamma_{\beta}(g, v) .\right]
$$

Then $B_{\beta}$ is bilinear and

$$
\begin{aligned}
\mathrm{B}_{\beta}(\mathrm{g} ; \mathrm{u}, \mathrm{u}) & =\frac{1}{2}\left[\Gamma_{\beta}(\mathrm{g}, 2 \mathrm{u})-2 \Gamma_{\beta}(\mathrm{g}, \mathrm{u})\right] \\
& =\frac{1}{2}\left[4 \Gamma_{\beta}(\mathrm{g}, \mathrm{u})-2 \Gamma_{\beta}(\mathrm{g}, \mathrm{u})\right]
\end{aligned}
$$

$$
\left.=\Gamma_{\beta}(\mathrm{g}, \mathrm{u}) .\right]
$$

Example: Take $\beta=\frac{1}{n}-1-$ then $\Gamma_{\frac{1}{n}-1}(\equiv \Gamma)$ is called the DeWitt spray, thus

$$
\Gamma(g, s)=s * s-\frac{1}{2} \operatorname{tr}_{g}(s) s+\frac{1}{4(n-1)}\left(\operatorname{tr}_{g}(s)^{2}-[s, s]_{g}\right) g
$$

To verify the equality stated in the theorem, start with the LHS:

$$
\begin{aligned}
& G_{\beta, g}\left(\Gamma_{\beta}(g, s), h\right)=\int_{M}\left[\Gamma_{\beta}(g, s), h\right]_{\beta, g}{ }^{\text {vol }}{ }_{g} \\
& =\int_{M}\left[\Gamma_{\beta}(g, s), h\right]_{g}{ }^{\text {vol }}{ }_{g} \\
& +\left(\beta-\frac{1}{n}\right) \int_{M} \operatorname{tr}_{g}\left(\Gamma_{\beta}(g, s)\right) \operatorname{tr}_{g}(h) \operatorname{vol}_{g} \\
& =\int_{M}\left\{[s * s, h]_{g}-\frac{1}{2}[s, h]{ }_{g} \operatorname{tr}_{g}(s)\right. \\
& \left.+\frac{1}{4 \beta n}[s, s]_{g} \operatorname{tr}_{g}(h)+\frac{\beta n-1}{4 \beta n^{2}} \operatorname{tr}_{g}(s)^{2} \operatorname{tr}_{g}(h)\right\}^{v o l}{ }_{g} \\
& +\left(\beta-\frac{1}{n}\right) \int_{M}\left\{[s, s]_{g} \operatorname{tr}_{g}(h)-\frac{1}{2} \operatorname{tr}_{g}(s)^{2} \operatorname{tr}_{g}(h)\right. \\
& \left.+\frac{1}{4 \beta}[s, s]_{g} \operatorname{tr}_{g}(h)+\frac{\beta n-1}{4 \beta n} \operatorname{tr}_{g}(s)^{2} \operatorname{tr}_{g}(h)\right\} \mathrm{Vol}_{g} \\
& =\int_{M}\left\{[s * s, h]_{g}-\frac{1}{2}[s, h]_{g}{ }^{t r} r_{g}(s)\right\} v o l_{g} \\
& +\left(\beta-\frac{1}{n}+\frac{1}{4}\right) \int_{M}[s, s]{ }_{g} \operatorname{tr}_{g}(h) \text { vol }_{g} \\
& +\frac{1-\beta n}{4 n} \int_{M} \operatorname{tr}_{g}(s)^{2} \operatorname{tr}_{g}(h) \operatorname{vol}_{g} .
\end{aligned}
$$

Consider now the RHS.

$$
\begin{aligned}
& -\frac{1}{2} \frac{d}{d \varepsilon} G_{\beta, g}+\left.\varepsilon h^{(s, s)}\right|_{\varepsilon=0} \\
& =\frac{1}{2} \frac{d}{d \varepsilon} \int_{M}[s, s] g+\varepsilon h^{{ }^{\mathrm{VO}}} \mathrm{~g}+\left.\varepsilon \mathrm{h}\right|_{\varepsilon=0} \\
& +\frac{1}{2}\left(\beta-\frac{1}{n}\right) \frac{d}{d \varepsilon} \int_{M} \operatorname{tr}_{g+\varepsilon h}(s)^{2}{ }^{\operatorname{vol}}{ }_{g}+\left.\varepsilon h\right|_{\varepsilon=0} \\
& =\frac{1}{2} \int_{M}-2[s * s, h]_{g} \mathrm{vol}_{g}+\frac{1}{2} \int_{M}[\mathrm{~s}, \mathrm{~s}]_{g} \frac{1}{2} \operatorname{tr}_{g}(\mathrm{~h}) \mathrm{vol}{ }_{g} \\
& +\frac{1}{2}\left(\beta-\frac{1}{n}\right) \int_{M} 2 \operatorname{tr}_{g}(s)\left(-[s, h]_{g}\right) \mathrm{Vol}_{g} \\
& +\frac{1}{2}\left(\beta-\frac{1}{n}\right) \int_{M} \operatorname{tr}_{g}(s)^{2} \frac{1}{2} \operatorname{tr}_{g}(h) \operatorname{vol}_{g} \\
& =-\int_{M}[s * s, h]_{g} \operatorname{vol}_{g}+\frac{1}{4} \int_{M}[s, s]_{g} \operatorname{tr}_{g}(h) \operatorname{vol}_{g} \\
& -\left(\beta-\frac{1}{n}\right) \int_{M} \operatorname{tr}_{g}(s)[s, h]_{g} \operatorname{vol}_{g} \\
& +\frac{1}{4}\left(\beta-\frac{1}{n}\right) \int_{M} \operatorname{tr}_{g}(s)^{2} \operatorname{tr}_{g}(h) \operatorname{vol}_{g} . \\
& -\left.\frac{d}{d \varepsilon} G_{\beta, g+\varepsilon s}(s, h)\right|_{\varepsilon=0} \\
& =-\frac{d}{d \varepsilon} \int_{M}[s, h] g+\varepsilon S^{\operatorname{vol}} g+\left.\varepsilon S\right|_{\varepsilon=0} \\
& -\left(\beta-\frac{1}{n}\right) \frac{d}{d \varepsilon} \int_{M} \operatorname{tr}_{g+\varepsilon S}(s) \operatorname{tr}_{g}+\varepsilon s(h) \operatorname{vol}_{g}+\left.\varepsilon s\right|_{\varepsilon=0}
\end{aligned}
$$

$$
\begin{aligned}
& =-\int_{M}-2\left[s_{\star} h, s\right]_{g}{ }^{\mathrm{vol}_{g}}-\int_{M}[\mathrm{~s}, \mathrm{~h}]_{\mathrm{g}} \frac{1}{2} \operatorname{tr}_{\mathrm{g}}(\mathrm{~s}) \mathrm{vol}_{\mathrm{g}} \\
& -\left(\beta-\frac{1}{n}\right) \int_{M}\left(-[s, s]_{g}\right) \operatorname{tr}_{g}(h) \operatorname{vol}_{g} \\
& -\left(\beta-\frac{1}{n}\right) \int_{M} \operatorname{tr}_{g}(s)\left(-[s, h]_{g}\right) \operatorname{vol}_{g} \\
& -\left(\beta-\frac{1}{n}\right) \int_{M} \operatorname{tr}_{g}(s) \operatorname{tr}_{g}(h) \frac{1}{2} \operatorname{tr}_{g}(s) \operatorname{vol} g_{g} \\
& =2 \int_{M}[s * h, s]_{g} \mathrm{VOl}_{g}-\frac{1}{2} \int_{M}[s, h]_{g} \operatorname{tr}_{g}(s) \mathrm{vol}_{g} \\
& +\left(\beta-\frac{1}{n}\right) \int_{M}[s, s]_{g} \operatorname{tr}_{g}(h) \operatorname{vol}_{g} \\
& +\left(\beta-\frac{1}{n}\right) \int_{M} \operatorname{tr}_{g}(s)[s, h]{ }_{g}{ }^{v o l_{g}} \\
& -\frac{1}{2}\left(\beta-\frac{1}{n}\right) \int_{M} \operatorname{tr}_{g}(s)^{2} \operatorname{tr}_{g}(h) \operatorname{vol}_{g} .
\end{aligned}
$$

N.B. We have

$$
\begin{aligned}
& 2[s * h, s]_{g}-[s * s, h]_{g} \\
& =2 s^{i j}(s * h)_{i j}-h^{i j}(s * s)_{i j} \\
& =2 s^{i j} s_{i k} h_{j}^{k}-h^{i j} s_{i k} s_{j}^{k}
\end{aligned}
$$

And

$$
\begin{aligned}
& h^{i j} s_{i k} s_{j}^{k} \\
& \quad=g^{j \ell_{h}}{ }_{\ell}{ }^{s_{i k}} s^{k}
\end{aligned}
$$

$$
\begin{aligned}
& =h_{\ell^{s}{ }_{i k} g^{j \ell{ }_{s}^{k}}{ }_{j}}^{=h^{i}{ }_{s_{i k}}{ }^{k \ell}} \\
& =h_{\ell^{s}}^{k}{ }_{i k} s^{i \ell} \\
& =h^{k}{ }_{j}{ }_{i k} s^{i j} \\
& =s^{i j} s_{i k} h^{k}{ }_{j}
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& {[s * h, s]_{g}=[s * s, h] g } \\
\Rightarrow & \\
& 2[s * h, s]_{g}-[s * s, h]_{g}=[s * s, h]_{g} .
\end{aligned}
$$

Combining terms then gives

$$
\begin{aligned}
& \frac{1}{2} \frac{d}{d \varepsilon} G_{\beta, g}+\left.\varepsilon h(s, s)\right|_{\varepsilon=0}-\frac{d}{d \varepsilon} G_{\beta, g}+\left.\varepsilon s(s, h)\right|_{\varepsilon=0} \\
& \quad=\int_{M}\left\{[s * s, h]_{g}-\frac{1}{2}[s, h]_{g} \operatorname{tr}_{g}(s)\right\} v o l_{g} \\
& +\left(\beta-\frac{1}{n}+\frac{1}{4}\right) \int_{M}[s, s]_{g} \operatorname{tr}_{g}(h) \operatorname{vol}_{g} \\
& \quad+\frac{l-\beta n}{4 n} \int_{M} \operatorname{tr}_{g}(s)^{2} \operatorname{tr}_{g}(h) \operatorname{vol}_{g}
\end{aligned}
$$

which is precisely the expression derived above for

$$
G_{\beta, g}\left(\Gamma_{\beta}(g, s), h\right) .
$$

[Note: There is a cancellation

$$
\begin{aligned}
& -\left(\beta-\frac{1}{\mathrm{n}}\right) \int_{\mathrm{M}} \mathrm{tr}_{\mathrm{g}}(\mathrm{~s})[\mathrm{s}, \mathrm{~h}] \\
& \mathrm{g} \\
& \mathrm{vol}_{\mathrm{g}} \\
& +\left(\beta-\frac{1}{\mathrm{n}}\right) \int_{\mathrm{M}} \operatorname{tr}_{\mathrm{g}}(\mathrm{~s})[\mathrm{s}, \mathrm{~h}] \\
& \left.g \mathrm{vol}_{\mathrm{g}} \cdot\right]
\end{aligned}
$$

The governing equation for the geodesics of $X_{\beta}$ is

$$
\ddot{g}=\Gamma_{\beta}(g, \dot{g})
$$

or, written out,

$$
\ddot{g}=\dot{g} \star \dot{g}-\frac{1}{2} \operatorname{tr}_{g}(\dot{g}) \dot{g}+\frac{1}{4 \beta n}[\dot{g}, \dot{g}]_{\beta, g} g .
$$

Remark: This equation is an ODE and the evolution of a solution $g(t)$ depends only on

$$
\left[\begin{array}{l}
g(0) \\
\dot{g}(0)
\end{array}\right.
$$

To be precise: Given $\left(g_{0}, s_{0}\right)$, there exists a unique integral curve $r:]-\varepsilon, \varepsilon\left[\rightarrow \mathrm{M}_{0} \times S_{2}(M)\right.$ for $X_{\beta}$ such that $\gamma(0)=\left(g_{0}, s_{0}\right)$, i.e.,

$$
\left[\begin{array}{l}
g(0)=g_{0} \\
\dot{g}(0)=s_{0}
\end{array}\right.
$$

[Note: The geodesics can be found explicitly but the formulas are not particularly enlightening (they do show, however, that the geodesics exist for a short time only in that they eventually run out of $\underline{M}_{0}$ into $S_{2}(M)$ ).

Section 32: The Symplectic Structure Let $M$ be a connected $C^{\infty}$ manifold of dimension $n$. Assume: $M$ is compact and orientable and $n>1$.

Rappel: There is an arrow of evaluation

$$
\left[\begin{array}{rl}
S_{2}(M) \times S_{d}^{2}(M) & \rightarrow C_{d}^{\infty}(M) \\
(s, \Lambda) & \longrightarrow \Lambda(s)
\end{array}\right.
$$

and a nondegenerate bilinear functional

$$
<,>: S_{2}(M) \times S_{d}^{2}(M) \rightarrow \underline{R},
$$

viz.

$$
<s, \Lambda\rangle=\int_{\mathbb{M}} \Lambda(s) .
$$

Consider $T^{*} \underline{M}_{0}=\underline{M}_{0} \times S_{d}^{2}(M)-$ then

$$
T T^{\star \mathrm{M}_{0}}=\left(\underline{M}_{0} \times S_{\mathrm{d}}^{2}(\mathrm{M})\right) \times\left(S_{2}(\mathrm{M}) \times S_{\mathrm{d}}^{2}(\mathrm{M})\right)
$$

$\Rightarrow$

$$
T_{(g, \Lambda)} T^{* *} M_{0}=S_{2}(M) \times S_{d}^{2}(M)
$$

The Canonical 1-Form $\theta$ This is the map

$$
\Theta_{(g, \Lambda)}: T(g, \Lambda)^{T^{*} M_{-0}} \rightarrow \underline{R}
$$

defined by the prescription

$$
\left.\theta_{(g, \Lambda)}\left(s^{\prime}, \Lambda^{\prime}\right)=<s^{\prime}, \Lambda\right\rangle .
$$

The Canonical 2-Form $\Omega$ This is the map

$$
\Omega_{(g, \Lambda)}: T(g, \Lambda)^{T^{\star}{ }_{-M}^{M}} \times{ }^{T}(\mathrm{~g}, \Lambda)^{T^{\star} M_{M}} \rightarrow \underline{R}
$$

defined by the prescription

$$
\left.{ }^{\Omega}(g, \Lambda)\left(\left(s_{1}, \Lambda_{1}\right),\left(s_{2}, \Lambda_{2}\right)\right)=\left\langle s_{1}, \Lambda_{2}\right\rangle-<s_{2}, \Lambda_{1}\right\rangle
$$

or, in deteminant notation,

$$
\Omega_{(g, \Lambda)}\left(\left(s_{1}, \Lambda_{1}\right),\left(s_{2}, \Lambda_{2}\right)\right)=\left|\begin{array}{ll}
s_{1} & \Lambda_{1} \\
s_{2} & \Lambda_{2}
\end{array}\right|
$$

LEMMA We have

$$
\Omega=-d \theta .
$$

[In fact,

$$
\left.\begin{array}{c}
\left.d \theta\right|_{(g, \Lambda)}\left(\left(s_{1}, \Lambda_{1}\right),\left(s_{2}, \Lambda_{2}\right)\right) \\
\left.\left.=\frac{d}{d \varepsilon} \Theta_{\left(g+\varepsilon s_{1}, \Lambda\right.}+\varepsilon \Lambda_{1}\right)\left.\left(s_{2}, \Lambda_{2}\right)\right|_{\varepsilon=0}-\frac{d}{d \varepsilon} \Theta_{\left(g+\varepsilon s_{2}, \Lambda\right.}+\varepsilon \Lambda_{2}\right)\left.\left(s_{1}, \Lambda_{1}\right)\right|_{\varepsilon=0} \\
=\frac{d}{d \varepsilon}<s_{2}, \Lambda+\varepsilon \Lambda_{1}>\left.\right|_{\varepsilon=0}-\frac{d}{d \varepsilon}<s_{1}, \Lambda+\varepsilon \Lambda_{2}>\left.\right|_{\varepsilon=0} \\
=<s_{2}, \Lambda_{1}>-<s_{1}, \Lambda_{2}> \\
=-\Omega(g, \Lambda)
\end{array}\left(\left(s_{1}, \Lambda_{1}\right),\left(s_{2}, \Lambda_{2}\right)\right) .\right] \quad \$
$$

Therefore $\Omega$ is exact and the pair $\left(T^{*} \underline{M}_{0}, \Omega\right)$ is a symplectic manifold.
Fix $\beta \neq 0$ and define

$$
\phi_{\beta}: T M_{0}+T^{\star} M_{0}
$$

by

$$
\phi_{\beta}(g, s)=\left(g, G_{\beta, g}^{b}(s)\right) .
$$

Then $\phi_{\beta}$ is an isomorphism of vector bundles, hence

$$
\Omega_{\beta}=\phi_{\beta}^{*} \Omega
$$

is nondegenerate. On the other hand,

$$
\begin{aligned}
\phi_{\beta}^{* R} & =\phi_{\beta}^{\star}(-d \theta) \\
& =-d \phi_{\beta}^{*} \Theta
\end{aligned}
$$

which implies that $\Omega_{\beta}$ is exact. Conclusion: The pair $\left(\mathrm{TM}_{0}, \Omega_{\beta}\right)$ is a symplectic manifold.
[Given $\beta_{i} \neq 0(i=1,2)$, the bijection

$$
\phi_{\beta_{2}}^{-1} \circ \phi_{\beta_{1}}: \mathrm{TM}_{-0} \rightarrow \mathrm{TM}_{-0}
$$

is a canonical transformation:

$$
\left(\phi_{\beta_{2}}^{-1} \circ \phi_{\beta_{1}}\right) * \Omega_{\beta_{2}}=\Omega_{\beta_{1}} .
$$

For the LHS equals

$$
\left.\phi_{\beta_{1}}^{\star} \circ\left(\phi_{\beta_{2}}^{\star}\right)^{-1} \circ \phi_{\beta_{2}^{*}}^{\star} \Omega=\phi_{\beta_{1}}^{\star} \Omega=\Omega_{\beta_{1}} \cdot\right]
$$

SUBLEMMA The tangent map

$$
T \phi_{\beta}: \mathrm{TTM}_{0} \rightarrow \mathrm{TT}^{\star} \mathrm{M}_{0}
$$

is given by

$$
T \phi_{\beta}(g, s, u, v)=\left(g, G_{\beta, g}^{b}(s), u, D G_{\beta, g}^{b}(u)(s)+G_{\beta, g}^{b}(v)\right) .
$$

[Note: Since

$$
G_{\beta}^{b}: M_{0} \rightarrow \operatorname{Hom}\left(S_{2}(M), S_{d}^{2}(M)\right),
$$

it follows that

$$
D G_{\beta}^{b}: M_{0} \rightarrow \operatorname{Hom}\left(S_{2}(M), \operatorname{Hom}\left(S_{2}(M), S_{d}^{2}(M)\right)\right),
$$

where

$$
D G_{\beta, g}^{b}(u)=\frac{d}{d \varepsilon} G_{\beta, g}^{b}+\left.\varepsilon u\right|_{\varepsilon=0^{\circ}}
$$

Explicated:

$$
\begin{aligned}
& <w, D G_{\beta, g}^{b}(u)(v)> \\
& \left.\quad=\frac{d}{d \varepsilon} G_{\beta, g+\left.\varepsilon u^{b}(v)(w)\right|_{\varepsilon=0}} \quad=\left.\frac{d}{d \varepsilon} G_{\left.\beta, g+\varepsilon u^{(v, w}\right)}\right|_{\varepsilon=0^{\cdot}}\right]
\end{aligned}
$$

LEMMA We have

$$
\begin{aligned}
& \quad\left(\Omega_{\beta}\right)(g, s)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right)\right) \\
& \quad=G_{\beta, g}\left(u_{1}, v_{2}\right)-G_{\beta, g}\left(u_{2}, v_{1}\right) \\
& +<u_{1}, D G_{\beta, g}^{b}\left(u_{2}\right)(s)>-<u_{2}, D G_{\beta, g}^{b}\left(u_{1}\right)(s)>.
\end{aligned}
$$

[Thanks to the sublemma,

$$
\begin{aligned}
& \left(\phi_{\beta}^{* \Omega)}(g, s)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right)\right)\right. \\
& =\Omega_{\left(g, G_{\beta, g}^{b}(s)\right)}\left(\left(u_{1}, D G_{\beta, g}^{b}\left(u_{1}\right)(s)+G_{\beta, g}^{b}\left(v_{1}\right)\right),\left(u_{2}, D G_{\beta, g}^{b}\left(u_{2}\right)(s)+G_{\beta, g}^{b}\left(v_{2}\right)\right)\right) \\
& = \\
& <u_{1}, D G_{\beta, g}^{b}\left(u_{2}\right)(s)>+<u_{1}, G_{\beta, g}^{b}\left(v_{2}\right)> \\
& \\
& =G_{\beta, g}\left(u_{1}, v_{2}\right)-u_{2}, \mathrm{DG}_{\beta, g}^{b}\left(u_{2}, v_{1}\right) \\
& \\
& \left.\quad+<u_{1}\right)(s)>-<u_{2}, G_{\beta, g}^{b}\left(v_{1}\right)> \\
&
\end{aligned}
$$

Maintaining the assumption that $\beta \neq 0$, define $K_{\beta}: T_{-0} \rightarrow \underline{R}$ by

$$
K_{\beta}(g, s)=\frac{1}{2} G_{\beta, g}(s, s)
$$

N.B. Consider $\mathrm{dK}_{\beta}$, thus

$$
\left.d K_{\beta}\right|_{(g, s)}: T(g, s) \stackrel{T M_{0}}{=} \rightarrow \underline{R}
$$

with

$$
\begin{aligned}
& \left.\quad d K_{\beta}\right|_{(g, s)}(u, v)=\left.\frac{d}{d \varepsilon} K_{\beta}(g+\varepsilon u, s+\varepsilon v)\right|_{\varepsilon=0} \\
& =\left.\frac{d}{d \varepsilon} K_{\beta}(g+\varepsilon u, s)\right|_{\varepsilon=0}+\left.\frac{d}{d \varepsilon} K_{\beta}(g, s+\varepsilon v)\right|_{\varepsilon=0^{\circ}}
\end{aligned}
$$

And

- $\left.\frac{d}{d \dot{\varepsilon}} K_{\beta}(g+\varepsilon u, s)\right|_{\varepsilon=0}$

$$
=\frac{d}{d \varepsilon} \frac{1}{2} G_{\beta, g}+\left.\varepsilon u^{(s, s)}\right|_{\varepsilon=0}
$$

$$
\begin{gathered}
=\frac{1}{2}<s, D G_{\beta, g}^{b}(u)(s)> \\
\left.0 \frac{d}{d \varepsilon} K_{\beta}(g, s+\varepsilon v)\right|_{\varepsilon=0} \\
=\left.\frac{d}{d \varepsilon} \frac{1}{2} G_{\beta, g}(s+\varepsilon v, s+\varepsilon v)\right|_{\varepsilon=0} \\
=G_{\beta, g}(s, v) .
\end{gathered}
$$

THEOREM For all vector fields X on $\mathrm{TM}_{0}$,

$$
\begin{aligned}
& \Omega_{\beta}\left(X_{\beta}, X\right)=d K_{\beta}(X) . \\
& \text { [Suppose that } X(g, s)=(u, v)-\text { then } \\
& \left(\Omega_{\beta}\right)(g, s)\left(X_{\beta}(g, s), X(g, s)\right) \\
& =\left(\Omega_{\beta}\right)_{(g, s)}\left(\left(s, \Gamma_{\beta}(g, s)\right),(u, v)\right) \\
& =G_{\beta, g}(s, v)-G_{\beta, g}\left(u, \Gamma_{\beta}(g, s)\right) \\
& +<s, \mathrm{DG}_{\beta, \mathrm{g}}^{\mathrm{b}}(\mathrm{u})(\mathrm{s})>-<\mathrm{u}, \mathrm{DG}_{\beta, \mathrm{g}}^{\mathrm{b}}(\mathrm{~s})(\mathrm{s})> \\
& =G_{\beta, g}(s, v) \\
& -\frac{1}{2} \frac{d}{d \varepsilon} G_{\beta, g}+\left.\varepsilon u(s, s)\right|_{\varepsilon=0}+\frac{d}{d \varepsilon} G_{\beta, g}+\left.\varepsilon s(s, u)\right|_{\varepsilon=0} \\
& +\left.\frac{d}{d \varepsilon} G_{\beta, g+\varepsilon u}(s, s)\right|_{\varepsilon=0}-\left.\frac{d}{d \varepsilon} G_{\beta, g+\varepsilon s}(s, u)\right|_{\varepsilon=0}
\end{aligned}
$$

$$
\begin{gathered}
=G_{\beta, g}(s, v)+\frac{l}{2} \frac{d}{d \varepsilon} G_{\beta, g}+\left.\varepsilon u(s, s)\right|_{\varepsilon=0} \\
=G_{\beta, g}(s, v)+\frac{l}{2}<s, D G_{\beta, g}^{b}(u)(s)> \\
\left.=\left.d K_{\beta}\right|_{(g, s)}(u, v) .\right]
\end{gathered}
$$

Interpretation: Per $\Omega_{\beta}, X_{\beta}$ is a hamiltonian vector field on ${ }^{T M}$ with energy $K_{\beta}$.

FACT (Conservation of Energy) Let $\gamma(t)$ be an integral curve for $X_{\beta}$ then the function $t \rightarrow K_{\beta}(\gamma(t))$ is constant in $t$.
[Simply note that

$$
\begin{aligned}
\frac{d}{d t} K_{\beta}(\gamma(t)) & =\left.d K_{\beta}\right|_{\gamma(t)}(\dot{\gamma}(t)) \\
& =\left(\Omega_{\beta}\right)_{\gamma(t)}\left(X_{\beta}(\gamma(t)), \dot{\gamma}(t)\right) \\
& =\left(\Omega_{\beta}\right)_{\gamma(t)}\left(X_{\beta}(\gamma(t)), x_{\beta}(\gamma(t))\right) \\
& =0 .]
\end{aligned}
$$

Construction Let $X \in \mathcal{D}^{I}(M)$-- then $X$ induces a vector field $\bar{X}: M_{0} \rightarrow S_{2}(M)$ on $\underline{M}_{0}$ via the prescription

$$
\bar{x}(g)=L_{x} g
$$

Put $\Phi_{t}=\phi_{t}^{*}$, where $\phi_{t}$ is the flow of X -- then there is a commatative diagram

$$
\begin{array}{ccc}
\mathrm{TM}_{0} & \mathrm{TI}_{\mathrm{t}} & \mathrm{TM}_{0} \\
\pi \downarrow & & \downarrow \pi \\
\mathrm{M}_{0} & \vec{\Phi}_{\mathrm{t}} & \underline{\mathrm{M}}_{0} .
\end{array}
$$

Here

$$
T \Phi_{t}(g, s)=\left(\Phi_{t}(g), D \Phi_{t}(s)\right)
$$

and

$$
\frac{d}{d t}\left(\left.D \Phi_{t}\right|_{g}(s)\right)=\left.D \bar{X}\right|_{\Phi_{t}(g)}\left(\left.D \Phi_{t}\right|_{g}(s)\right)
$$

SUBLEMMA We have

$$
K_{\beta}=K_{\beta} \circ T \Phi_{t} .
$$

Application: At any point $(g, s) \in \mathcal{T M}_{0}$,

$$
\begin{aligned}
& 0=\left.\frac{d}{d t} K_{\beta}\left(\Phi_{t}(g),\left.D \Phi_{t}\right|_{g}(s)\right)\right|_{t=0} \\
= & \frac{1}{2} \frac{d}{d \varepsilon} G_{\beta, g}+\left.\varepsilon L_{X} g(s, s)\right|_{\varepsilon=0}+G_{\beta, g}\left(s,\left.D \bar{X}\right|_{g}(s)\right) .
\end{aligned}
$$

Rappel: A first integral for a vector field on $\mathbb{T M}_{0}$ is a function $\mathrm{f}: \mathrm{TM}_{-0} \rightarrow \underline{R}$ which is constant on integral curves.

So, e.g., $K_{\beta}$ is a first integral for $X_{\beta}$.

LEMMA $\forall X \in D^{1}(M)$, the function

$$
(g, s) \rightarrow G_{\beta, g}\left(s, L_{X} g\right)
$$

is a first integral for $X_{\beta}$.
[Let $\gamma(t)=(g(t), s(t))$ be an integral curve for $X_{\beta}$ - then $\dot{g}=s$ and

$$
\begin{gathered}
G_{\beta, g}(\ddot{g}, h)=G_{\beta, g}\left(\Gamma_{\beta}(g, \dot{g}), h\right) \\
=\frac{1}{2} \frac{d}{d \varepsilon} G_{\beta, g}+\left.\varepsilon h(\dot{g}, \dot{g})\right|_{\varepsilon=0}-\frac{d}{d \varepsilon} G_{\beta, g}+\left.\varepsilon \dot{g}(\dot{g}, h)\right|_{\varepsilon=0} \\
G_{\beta, g}(\ddot{g}, h)+\frac{d}{d \varepsilon} G_{\beta, g}+\left.\varepsilon \dot{g}(\dot{g}, h)\right|_{\varepsilon=0} \\
=\frac{1}{2} \frac{d}{d \varepsilon} G_{\beta, g}+\left.\varepsilon h(\dot{g}, \dot{g})\right|_{\varepsilon=0}
\end{gathered}
$$

or, restoring the dependence on $t$,

$$
\frac{\mathrm{d}}{\mathrm{dt}} G_{\beta, g(t)}(s(t), h)=\frac{1}{2} \frac{d}{d \varepsilon} G_{\beta, g(t)}+\left.\varepsilon h(s(t), s(t))\right|_{\varepsilon=0^{\circ}}
$$

Now replace $h$ by $L_{X} g(t)$-- then

$$
\begin{aligned}
& \frac{d}{d t} G_{\beta, g(t)}\left(s(t), L_{X} g(t)\right) \\
& =\frac{1}{2} \frac{d}{d \varepsilon} G_{\beta, g(t)}+\left.\varepsilon L_{X} g(t)(s(t), s(t))\right|_{\varepsilon=0} \\
& \quad \quad+G_{\beta, g(t)}\left(s(t), \frac{d}{d t} L_{X} g(t)\right) .
\end{aligned}
$$

But

$$
\begin{aligned}
\frac{d}{d t} L_{X} g(t) & =\frac{d}{d t} \bar{X}(g(t)) \\
& =\left.D \bar{X}\right|_{g(t)}(\dot{g}(t)) \\
& =\left.D \bar{X}\right|_{g(t)}(s(t))
\end{aligned}
$$

10. 

Therefore

$$
\left.\frac{d}{d t} G_{\beta, g(t)}\left(s(t), L_{X} g(t)\right)=0 .\right]
$$

[Note: We have

- $g(t) g(t)^{-1}=I$
$\Rightarrow$

$$
\frac{d g^{-1}}{d t}=-g^{-1} \cdot{ }_{g}-1
$$

- $(g(t)+\varepsilon S(t))(g(t)+\varepsilon S(t))^{-1}=I$

$$
\begin{aligned}
\left.\frac{d}{d \varepsilon}(g+\varepsilon s)^{-1}\right|_{\varepsilon=0} & =-\left.\left.\left.(g+\varepsilon s)^{-1}\right|_{\varepsilon=0} \frac{d}{d \varepsilon}(g+\varepsilon s)\right|_{\varepsilon=0}(g+\varepsilon s)^{-1}\right|_{\varepsilon=0} \\
& \left.=-g^{-1} \dot{g} g^{-1} .\right]
\end{aligned}
$$

Write

$$
\begin{aligned}
& G_{\beta, g}\left(s, L_{X} g\right)=G_{\beta, g}\left(L_{X} g, s\right) \\
& =\int_{M}\left[L_{X} g, s\right]_{\beta, g}{ }^{v o l_{g}} \\
& =\int_{M}\left(\left[L_{X} g, s\right]_{g}+\left(\beta-\frac{1}{n}\right) t_{g}\left(L_{X} g\right) \operatorname{tr}_{g}(s)\right) v o l_{g} \\
& =\int_{M}\left(\left[L_{X} g, s\right]_{g}+\left(\beta-\frac{1}{n}\right)\left[L_{X} g, g\right]_{g} t r_{g}(s)\right) \mathrm{vol}_{g} \\
& =\int_{M}\left[L_{X} g, s+\left(\beta-\frac{1}{n}\right) t_{g}(s) g\right]_{g}{ }^{v o l_{g}}
\end{aligned}
$$

$$
\begin{aligned}
& \left.=\left.\left\langle L_{X} g_{f}\left(s+\left(\beta-\frac{1}{n}\right) \operatorname{tr}_{g}(s) g\right)^{\#} \otimes\right| g\right|^{l / 2}\right\rangle \\
& \left.=-2<X, \operatorname{div}_{g}\left(s+\left(\beta-\frac{1}{n}\right) \operatorname{tr}_{g}(s) g\right) \otimes|g|^{1 / 2}\right\rangle \\
& =-2 \int_{M} \operatorname{div}_{g}\left(s+\left(\beta-\frac{1}{n}\right) \operatorname{tr}_{g}(s) g\right)(X) \operatorname{vol}_{g} .
\end{aligned}
$$

Let

$$
\pi_{\beta, g}(s)=s+\left(\beta-\frac{1}{n}\right) t r_{g}(s) g .
$$

Then it follows that the function

$$
(g, s) \rightarrow \int_{M} \operatorname{div}_{g}\left(\pi_{\beta, g}(s)\right)(X) \operatorname{vol}_{g}
$$

is a first integral for $X_{\beta}$.
Conservation Principle Suppose that $\gamma(t)=(g(t), s(t))$ is an integral
curve for $X_{\beta}$. Abbreviating $\pi_{\beta, g(t)}(s(t))$ to $\pi_{\beta}(t), \forall X \in D^{l}(M)$,

$$
\int_{M} \operatorname{div}_{g(t)} \pi_{\beta}(t)(X) \operatorname{vol}_{g(t)}
$$

is a constant function of $t$, which implies that

$$
\operatorname{div}_{g(t)} \pi_{\beta}(t) \otimes|g(t)|^{1 / 2} \in \Lambda_{d}^{l}(M)
$$

is a constant function of $t$. Consequently, if

$$
\operatorname{div}_{g(0)} \pi_{\beta}(0)=0,
$$

then $\forall t$,

$$
\operatorname{div}_{g(t)} \pi_{\beta}(t)=0 .
$$

Section 33: Motion in a Potential Let $M$ be a connected $C^{\infty}$ manifold of dimension $n$. Assume: $M$ is compact and orientable and $n>1$.

Given $N \in C^{\infty}(M)$, put

$$
V_{N}(g)=\int_{M} N S(g) \operatorname{vol}_{g}\left(g \in 1_{0}\right)
$$

Then $V_{N}: M_{0} \rightarrow \underline{R}$ and

$$
\begin{aligned}
&\left.d v_{N}\right|_{g}(h)=\left.\frac{d}{d \varepsilon} V_{N}(g+\varepsilon h)\right|_{\varepsilon=0} \\
&=\left.\int_{M} N \frac{d}{d \varepsilon} S(g+\varepsilon h)\right|_{\varepsilon=0} v o l_{g}+\int_{M} N S(g) \frac{d}{d \varepsilon} v o l_{g}+\left.\varepsilon h\right|_{\varepsilon=0} \\
&=\int_{M} N\left[-\Delta_{g} \operatorname{tr}_{g}(h)-\delta_{g} \operatorname{div}_{g} h-g\left[\begin{array}{l}
0 \\
2
\end{array}(\text { Ric }(g), h)\right] v o l_{g}\right. \\
&+\int_{N} N S(g) \frac{1}{2} \operatorname{tr}_{g}(h) \operatorname{vol}_{g} .
\end{aligned}
$$

- $\int_{M} N\left(-\Delta_{g} \operatorname{tr}_{g}(\mathrm{~h})\right) \operatorname{Vol}_{g}$

$$
\begin{aligned}
& =\int_{M}\left(-\Delta_{g} N\right) \operatorname{tr}_{g}(h) \operatorname{vol}_{g} \\
& \left.=\int_{M}\left[\left(-\Delta_{g} N\right) g, h\right]\right]_{g} \operatorname{vol}_{g} .
\end{aligned}
$$

- $\int_{M} N\left(-\delta_{g} \operatorname{div}_{g} h\right) \operatorname{vol}_{g}$

$$
\begin{aligned}
& =-\int_{M} g\left[\begin{array}{l}
0 \\
l
\end{array}\right]\left(d N, \operatorname{div}_{g} h\right) \mathrm{vol}_{g} \\
& =\int_{M} g\left[\left[_{2}^{0}\right]\left(H_{N} r h\right) \operatorname{vol}_{g}\right. \\
& =\int_{\mathrm{M}}\left[\mathrm{H}_{\mathrm{N}}, \mathrm{~h}\right] \mathrm{g}^{\mathrm{vol}} \mathrm{~g}_{\mathrm{g}} .
\end{aligned}
$$

- $\int_{\mathrm{M}}\left[-\operatorname{Ng}\left[{ }_{2}^{0}\right](\operatorname{Ric}(g), h)+N S(g) \frac{1}{2} \operatorname{tr}_{g}(h)\right] \operatorname{vol}_{g}$

$$
\begin{aligned}
& =\int_{M}-N\left([\operatorname{Ric}(g), h]_{g}-\frac{1}{2} S(g)[g, h]_{g}\right) \mathrm{Vol}_{g} \\
& =\int_{N}\left[-N\left(\operatorname{Ric}(g)-\frac{1}{2} S(g) g\right), h\right]_{g} \mathrm{Vol}_{g}
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& \left.d V_{N}\right|_{g}(h) \\
= & \int_{M}\left[\left(-\Delta_{g} N\right) g+H_{N}-N\left(\operatorname{Ric}(g)-\frac{1}{2} S(g) g\right), h\right] \\
= & \int_{M}\left(\left(-\Delta_{g} N\right) g+H_{N}-N\left(\operatorname{Ric}(g)-\frac{1}{2} S(g) g\right)\right)^{\#}(h) V^{v o l} g \\
= & <h,\left(\left(-\Delta_{g} N\right) g+H_{N}-N\left(\operatorname{Ric}(g)-\frac{1}{2} S(g) g\right)\right)^{\#} \otimes|g|^{1 / 2}> \\
\Rightarrow & \\
& \left.d V_{N}\right|_{g}=\left(\left(-\Delta_{g} N\right) g+H_{N}-N\left(\operatorname{Ric}(g)-\frac{1}{2} S(g) g\right)\right)^{\#} \otimes|g|^{1 / 2} .
\end{aligned}
$$

Now fix $\beta \neq 0$ and let

$$
\operatorname{grad}_{\beta, g} V_{N}=G_{\beta, g}^{\#}\left(d v_{N} \mid g\right)
$$

1. We have

$$
\begin{aligned}
& G_{\beta, g}^{\#}\left(\left(\left(-\Delta_{g} N\right) g+H_{N}\right)^{\#} \otimes|g|^{1 / 2}\right) \\
& =\left(-\Delta_{g} N\right) g+H_{N}+\frac{1}{\beta n}\left(\frac{1}{n}-\beta\right) \operatorname{tr}_{g}\left(\left(-\Delta_{g} N\right) g+H_{N}\right) g \\
& =\left(-\Delta_{g} N\right) g+H_{N}
\end{aligned}
$$

$$
\begin{aligned}
& +\frac{1}{\beta}\left(\frac{1}{n}-\beta\right)\left(-\Delta_{g} N\right) g+\frac{1}{\beta n}\left(\frac{1}{n}-\beta\right)\left(\Delta_{g} N\right) g \\
& =H_{N}+\frac{1-n-\beta n}{\beta n^{2}}\left(\Delta_{g} N\right) g
\end{aligned}
$$

2. We have

$$
\begin{aligned}
& G_{\beta, g}^{\#}\left(-N\left(\operatorname{Ric}(g)-\frac{1}{2} S(g) g\right)^{\#} \otimes|g|^{1 / 2}\right) \\
& =-N\left(\operatorname{Ric}(g)-\frac{1}{2} S(g) g\right)+\frac{1}{\beta n}\left(\frac{1}{n}-\beta\right) \operatorname{tr}_{g}\left(-N\left(\operatorname{Ric}(g)-\frac{1}{2} S(g) g\right)\right) g \\
& =-N\left(\operatorname{Ric}(g)-\frac{1}{2} S(g) g\right)+\frac{1}{\beta n}\left(\frac{1}{n}-\beta\right)\left(-N S(g)+\frac{1}{2} N n S(g)\right) g \\
& =-N R i c(g)-N\left(\frac{2-n-2 \beta n}{2 \beta n^{2}}\right) S(g) g .
\end{aligned}
$$

Combining 1 and 2 then gives

$$
\begin{aligned}
& \operatorname{grad}_{\beta, g} V_{N}=H_{N}+\frac{1-n-\beta n}{\beta n^{2}}\left(\Delta_{g} N\right) g \\
& -N R i c(g)-N\left(\frac{2-n-2 \beta n}{2 \beta n^{2}}\right) S(g) g
\end{aligned}
$$

Example: Take $\beta=\frac{1}{n}-1-$ then

$$
\int_{-}^{1-n-\left(\frac{1}{n}-1\right) n=0} \begin{aligned}
& 2-n-2\left(\frac{1}{n}-1\right) n=n \\
& 2\left(\frac{1}{n}-1\right) n^{2}=2 n(1-n)
\end{aligned}
$$

thus in this case the gradient of $V_{N}$ at $g$ (denoted by grad ${ }_{g} V_{N}$ ) equals

$$
\mathrm{H}_{\mathrm{N}}-\operatorname{NRic}(\mathrm{g})+\frac{\mathrm{l}}{2(\mathrm{n}-\mathrm{l})} \mathrm{NS}(\mathrm{~g}) \mathrm{g} .
$$

[Note: When $N=1$, the hessian drops out and there remains

$$
\left.-\operatorname{Ric}(g)+\frac{1}{2(n-1)} S(g) g .\right]
$$

Define a vector field

$$
Y_{\beta, N}: M_{0} \times S_{2}(M) \rightarrow S_{2}(M) \times S_{2}(M)
$$

on $\mathrm{TM}_{-0}$ by

$$
\begin{aligned}
Y_{\beta, N}(g, s) & =\left(s, \Gamma_{\beta}(g, s)\right)+\left(0,-\operatorname{grad}_{\beta, g} V_{N}\right) \\
& =\left(s, \Gamma_{\beta}(g, s)-\operatorname{grad}_{\beta, g} V_{N}\right)
\end{aligned}
$$

Then $Y_{\beta, N}$ is second order and the equation determining its geodesics reads

$$
\ddot{g}=Y_{\beta, N}(g, \dot{g})=\Gamma_{\beta}(g, \dot{g})-\operatorname{grad}_{\beta, g} V_{N}
$$

Example: Take $\beta=\frac{1}{n}-1$ and $N=1$ - then

$$
\begin{aligned}
\ddot{g}=\dot{g} * \dot{g} & -\frac{1}{2} \operatorname{tr}_{g}(\dot{g}) \dot{g}+\frac{1}{4(n-1)}\left(\operatorname{tr}_{g}(\dot{g})^{2}-[\dot{g}, \dot{g}]_{g}\right) g \\
& +\operatorname{Ric}(g)-\frac{1}{2(n-1)} S(g) g
\end{aligned}
$$

THEOREM For all vector fields $Y$ on $\mathrm{TM}_{0}$,

$$
\Omega_{\beta}\left(Y_{\beta, N^{\prime}}, Y\right)=d E_{\beta, N}(Y)
$$

where

$$
E_{\beta, N}=K_{\beta}+V_{N} .
$$

[Suppose that $Y(g, s)=(u, v)-$ then

$$
\begin{aligned}
& \left(\Omega_{\beta}\right)_{(g, s)}\left(Y_{\beta, N}(g, s), Y(g, s)\right) \\
& =\left(\Omega_{\beta}\right)_{(g, s)}\left(\left(s, \Gamma_{\beta}(g, s)\right)+\left(0, \operatorname{-grad}_{\beta, g} V_{N}\right),(u, v)\right) \\
& =\left(\Omega_{\beta}\right)_{(g, s)}\left(\left(s, \Gamma_{\beta}(g, s)\right),(u, v)\right) \\
& +\left(\Omega_{\beta}\right){ }_{(g, s)}\left(\left(0,-\operatorname{grad}_{\beta, g} V_{N}\right),(u, v)\right) \\
& =\left.d K_{\beta}\right|_{(g, s)}(u, v) \\
& +\left(\Omega_{\beta}\right)_{(g, s)}\left(\left(0,-\operatorname{grad}_{\beta, g} V_{N}\right),(u, v)\right) \\
& =\left.d K_{\beta}\right|_{(g, s)}(u, v)-G_{\beta, g}\left(u,-\operatorname{grad}_{\beta, g} V_{N}\right) .
\end{aligned}
$$

And

$$
\begin{aligned}
& G_{\beta, g}\left(u, \operatorname{grad}_{\beta, g} V_{N}\right) \\
& =G_{\beta, g}\left(u, G_{\beta, g}^{\#}\left(d v_{N} \mid g^{\prime}\right)\right) \\
& =G_{\beta, g}\left(G_{\beta, g}^{\#}\left(\left.d v_{N}\right|_{g}\right), u\right) \\
& =G_{\beta, g}^{b}\left(G_{\beta, g}^{\#}\left(\left.d v_{N}\right|_{g}\right)\right)(u) \\
& =d v_{N} \mid g^{(u) \cdot]}
\end{aligned}
$$

Bearing in mind that the pair ( $\mathrm{TM}_{-0}, \Omega_{\beta}$ ) is a symplectic manifold, it follows that $Y_{\beta, N}$ is a hamiltonian vector field on $T M_{0}$ with energy $E_{\beta, N}$.
[Note: As before, energy is conserved, i.e., on an integral curve $\gamma(t)$ for $Y_{\beta, N^{\prime}}$ the function $t \rightarrow E_{\beta, N}(\gamma(t))$ is constant in $t$.]

Take $\mathrm{N}=1$ and write V in place of $\mathrm{V}_{1}$, hence

$$
V(g)=\int_{M} S(g) \operatorname{vol}_{g}\left(g \in M_{0}\right)
$$

and

$$
\mathrm{V}=\mathrm{V} \circ \Phi_{\mathrm{t}}
$$

$\Rightarrow$

$$
\begin{aligned}
0 & =\left.\frac{d}{d t} V\left(\Phi_{t}(g)\right)\right|_{t=0} \\
& =d V_{g}\left(L_{x} g\right)
\end{aligned}
$$

LENMA $\forall X \in D^{l}(M)$, the function

$$
(g, s) \rightarrow G_{\beta, g}\left(s, L_{X} g\right)
$$

is a first integral for $Y_{\beta} \quad\left(\equiv Y_{\beta, 1}\right)$.
[The only new point is that

$$
\begin{aligned}
& G_{\beta, g(t)}\left(g r a d_{\beta, g(t)} V, L_{X} g(t)\right) \\
& =\left.d V\right|_{g(t)}\left(L_{X} g(t)\right) \\
& =0.1
\end{aligned}
$$

Therefore the function

$$
(g, s) \rightarrow \int_{M} \operatorname{div}_{g}\left(\pi_{\beta, g}(s)\right)(X) \operatorname{vol} g
$$

is a first integral for $Y_{\beta}$. But $X \in D^{l}(M)$ is arbitrary. So, along an integral curve $\gamma(t)$ for $Y_{\beta}$,

$$
\operatorname{div}_{g(t)} \pi_{\beta}(t) \otimes|g(t)|^{l / 2} \in \Lambda_{d}^{l}(M)
$$

is necessarily a constant.
Notation: Let

$$
\pi_{g}(s)=s-\operatorname{tr}_{g}(s) g .
$$

Then

$$
\pi_{g}=\pi_{\beta, g}
$$

for the choice $\beta=\frac{l}{n}-1$.

LEMMA We have

$$
-\Delta_{g} \operatorname{tr}_{g}(s)-\delta_{g} \operatorname{div}_{g} s=-\delta_{g} \operatorname{div}_{g} \pi_{g}(s)
$$

[In fact,

$$
\begin{aligned}
-\Delta_{g} \operatorname{tr}_{g}(s) & =-\operatorname{div}_{g} \operatorname{grad}_{g} \operatorname{tr}_{g}(s) \\
& =-\operatorname{div}_{g} g^{\#}(d \operatorname{tr} g(s)) \\
& =\delta_{g} g^{b} g^{\#}\left(d t r_{g}(s)\right) \\
& =\delta_{g}\left(d t r_{g}(s)\right) \\
& =\delta_{g} \operatorname{div}_{g}\left(\operatorname{tr}_{g}(s) g\right)
\end{aligned}
$$

Therefore

$$
\begin{aligned}
-\Delta_{g} t r_{g}(s) & -\delta_{g} \operatorname{div}_{g} s \\
& =\delta_{g} \operatorname{div}_{g}\left(\operatorname{tr}_{g}(s) g\right)-\delta_{g} \operatorname{div}_{g} s
\end{aligned}
$$

$$
\begin{aligned}
& =\delta_{g} \operatorname{div}_{g}\left(\operatorname{tr}_{g}(s) g-s\right) \\
& \left.=-\delta_{g} \operatorname{div}_{g} \pi_{g}(s) .\right]
\end{aligned}
$$

Define a function $\Phi_{\beta}: T \mathbb{M}_{0} \rightarrow C_{d}^{\infty}(M)$ by

$$
\Phi_{\beta}(g, s)=\left(\frac{1}{2}[s, s]_{\beta, g}+S(g)\right) \otimes|g|^{1 / 2}
$$

Then $\Phi_{\beta}$ is the energy density:

$$
\begin{aligned}
E_{\beta}(g, s) & =K_{\beta}(g, s)+V(g) \\
& =\int_{M} \Phi_{\beta}(g, s)
\end{aligned}
$$

THEOREM On the integral curves for $Y_{\beta}$,

$$
\frac{d}{d t} \Phi_{\beta}(g, \dot{g})+\delta_{g} \operatorname{div}_{g} \pi_{g}(\dot{g}) \otimes|g|^{1 / 2}=0
$$

[First

$$
\begin{aligned}
& \frac{d}{d t} \frac{1}{2}[\dot{g}, \dot{g}]_{\beta, g} \otimes|g|^{1 / 2} \\
= & \left([\dot{g}, \ddot{g}]_{g}+\left(\beta-\frac{1}{n}\right) \operatorname{tr}_{g}(\dot{g}) \operatorname{tr}_{g}(\ddot{g})\right) \otimes|g|^{1 / 2} \\
& +\left(-[\dot{g}, \dot{g} * \dot{g}]_{g}-\left(\beta-\frac{1}{n}\right) \operatorname{tr}_{g}(\dot{g})[\dot{g}, \dot{g}]_{g}\right) \otimes|g|^{1 / 2} \\
& +\left(\frac{1}{2}[\dot{g}, \dot{g}]_{\beta, g} \xrightarrow{\operatorname{tr}_{g}(\dot{g})}\right. \\
& =|g|^{1 / 2} .
\end{aligned}
$$

Now insert the explicit expression for 9 derived above.
9.

- $[\dot{g}, \ddot{g}]_{g}$ is the sum of five terms:

1. $[\dot{g}, \dot{\mathrm{~g}} \star \dot{\mathrm{~g}}]{ }_{\mathrm{g}}$.
2. $-\frac{1}{2} \operatorname{tr}_{g}(\dot{g})[\dot{g}, \dot{g}]{ }_{g}$.
3. $\frac{1}{4 \beta \mathrm{n}} \operatorname{tr}_{\mathrm{g}}(\dot{\mathrm{g}})[\dot{\mathrm{g}}, \dot{\mathrm{g}}]_{\beta, g}$.
4. $[\mathrm{g}, \operatorname{Ric}(\mathrm{g})]_{\mathrm{g}}$.
5. $\frac{2-n-2 \beta n}{2 \beta n^{2}} \operatorname{tr}_{g}(\dot{g}) S(g)$.

- $\left(\beta-\frac{1}{n}\right) \operatorname{tr}_{g}(\dot{g}) \operatorname{tr}_{g}(\ddot{g})$ is the sum of five terms:

6. $\left(\beta-\frac{1}{n}\right) \operatorname{tr}_{g}(\dot{g})[\dot{g}, \dot{g}]_{g}$.
7. $-\frac{1}{2}\left(\beta-\frac{1}{n}\right) \operatorname{tr}_{g}(\dot{g})^{3}$.
8. $\left(\beta-\frac{1}{n}\right) \operatorname{tr}_{g}(\dot{g}) \frac{1}{4 \beta}[\dot{g}, \dot{g}]_{\beta, g}$.
9. $\left(\beta-\frac{1}{n}\right) \operatorname{tr}_{g}(\dot{g}) S(g)$.
10. $\left(\beta-\frac{1}{n}\right) \frac{2-n-2 \beta n}{2 \beta n} \operatorname{tr}_{g}(\dot{g}) S(g)$.

There are two inmediate cancellations, viz. term 1 cancels with - $[\dot{g}, \dot{g} * \dot{g}]_{g}$ and term 6 cancels with $-\left(\beta-\frac{1}{n}\right) \operatorname{tr}_{g}(\dot{g})[\dot{g}, \dot{g}]_{g}$. Consider next term 3 and term 8

$$
+\frac{1}{4} \operatorname{tr}_{g}(\dot{g})[\dot{g}, \dot{g}]_{\beta, g}
$$

I.e.:

$$
\begin{aligned}
& \left(\frac{1}{4 \beta n}+\frac{1}{4 \beta}\left(\beta-\frac{1}{n}\right)+\frac{1}{4}\right) \operatorname{tr}_{g}(\dot{g})[\dot{g}, \dot{g}]_{\beta, g} \\
= & \frac{1}{2} \operatorname{tr}_{g}(\dot{g})[\dot{g}, \dot{g}]_{\beta, g}
\end{aligned}
$$

or still,

$$
\frac{1}{2} \operatorname{tr}_{g}(\dot{g})\left([\dot{g}, \dot{g}]_{g}+\left(\beta-\frac{1}{n}\right) \operatorname{tr}_{g}(\dot{g})^{2}\right),
$$

which cancels with term $2+$ term 7. There remains

$$
\begin{gathered}
{[\dot{g}, \operatorname{Ric}(g)] g} \\
+\left(\frac{2-n-2 \beta n}{2 n^{2}}+\left(\beta-\frac{1}{n}\right)+\left(\beta-\frac{1}{n}\right) \frac{2-n-2 \beta n}{2 \beta n}\right) \operatorname{tr}_{g}(\dot{g}) S(g) .
\end{gathered}
$$

But

$$
\begin{aligned}
& \frac{2-n-2 \beta n}{2 \beta n^{2}}+\left(\beta-\frac{1}{n}\right)\left(1+\frac{2-n-2 \beta n}{2 \beta n}\right) \\
= & \frac{2-n-2 \beta n}{2 \beta n^{2}}+\left(\beta-\frac{1}{n}\right)\left(\frac{2 \beta n+2-n-2 \beta n}{2 \beta n}\right) \\
= & \frac{2-n-2 \beta n}{2 \beta n^{2}}+\frac{(n \beta-1)(2-n)}{2 \beta n^{2}} \\
= & \frac{2-n-2 \beta n+2 n \beta-2-n^{2} \beta+n}{2 \beta n^{2}} \\
= & -\frac{n^{2} \beta}{2 \beta n^{2}}=-\frac{1}{2} .
\end{aligned}
$$

Thus matters reduce to

$$
[\dot{g}, \operatorname{Ric}(g)]_{g}-\frac{1}{2} \operatorname{tr}_{g}(\dot{g}) S(g)
$$

However

$$
\begin{aligned}
& \frac{d}{d t} S(g) \otimes|g|^{1 / 2} \\
& =\left(-\Delta_{g} t r_{g}(\dot{g})-\delta_{g} \operatorname{div}_{g} \dot{g}-[\operatorname{Ric}(g), \dot{g}]_{g}\right) \otimes|g|^{1 / 2} \\
& \\
& \quad+\frac{1}{2} \operatorname{tr}_{g}(\dot{g}) S(g) \otimes|g|^{1 / 2} .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
\frac{d}{d t} \Phi_{\beta}(g, \dot{g}) & =\frac{d}{d t} \frac{1}{2}[\dot{g}, \dot{g}]_{\beta, g} \otimes|g|^{1 / 2}+\frac{d}{d t} S(g) \otimes|g|^{1 / 2} \\
& =\left(-\Delta_{g} \operatorname{tr}_{g}(\dot{g})-\delta_{g} \operatorname{div}_{g} \dot{g}\right) \otimes|g|^{1 / 2} \\
& =-\delta_{g} \operatorname{div}_{g} \pi_{g}(\dot{g}) \otimes|g|^{1 / 2}
\end{aligned}
$$

which completes the proof.]

While this result is valid $\forall \beta \neq 0$, it is hybrid in character and points to the significance of the DeWitt metric: The choice $\beta=\frac{1}{n}-1$ is the parameter value per $\pi_{g}$, hence along an integral curve $\gamma(t)$ for $\frac{Y_{1}}{n}-1$,

$$
\operatorname{div}_{g(t)} \pi(t) \otimes|g(t)|^{1 / 2}
$$

is a constant. Accordingly, if at $t=0$,

$$
\operatorname{div}_{g(0)} \pi(0)=0,
$$

then $\forall t$,

$$
\operatorname{div}_{g(t)} \pi(t)=0,
$$

thus

$$
\frac{d}{d t} \Phi_{\frac{1}{n}-1}=0
$$

and so $\Phi_{\frac{1}{n}-1}$ is pointwise constant in time.
[Note: Here $\pi(t)$ stands for $\pi_{g(t)}(s(t))$, where $\left.\gamma(t)=(g(t), s(t)).\right]$
Remark: Let C be a nonzero constant. Replace V by $\mathrm{CV}\left(\mathrm{a} . \mathrm{k} . \mathrm{a} . \mathrm{V}_{\mathrm{C}}\right.$ ) and define a function $\Phi_{\beta, C}: T M_{0} \rightarrow C_{d}^{\infty}(M)$ by

$$
\Phi_{\beta, C}(g, s)=\left(\frac{1}{2}[s, s]_{\beta, g}+C S(g)\right) \otimes|g|^{1 / 2}
$$

Then, on the integral curves of $Y_{\beta, C}$,

$$
\frac{\mathrm{d}}{\mathrm{dt}} \Phi_{\beta, C}(\mathrm{~g}, \dot{\mathrm{~g}})+\mathrm{c} \delta_{\mathrm{g}} \operatorname{div}_{\mathrm{g}} \pi_{\mathrm{g}}(\dot{\mathrm{~g}}) \otimes|\mathrm{g}|^{1 / 2}=0
$$

Let

$$
H_{\beta}=\Phi_{\beta} \circ \phi_{\beta}^{-1} .
$$

Then

$$
\mathrm{H}_{\beta}: \mathrm{T}^{*} \mathrm{M}_{-0} \rightarrow \mathrm{C}_{\mathrm{d}}^{\infty}(\mathrm{M})
$$

LEMMA We have

$$
H_{\beta}(g, \Lambda)=\left(\frac{1}{2}[s, s]_{g}-\frac{1}{2 \beta n}\left(\beta-\frac{1}{n}\right) \operatorname{tr}_{g}(s)^{2}+S(g)\right) \otimes|g|^{1 / 2}
$$

if $\Lambda=s^{\#} \otimes|g|^{1 / 2}$.
[Since

$$
\phi_{\beta}(g, s)=\left(g, G_{\beta, g}^{b}(s)\right),
$$

it follows that

$$
\phi_{\beta}^{-1}(g, \Lambda)=\left(g, G_{\beta, g}^{\#}(\Lambda)\right)
$$

Therefore

$$
\begin{aligned}
& H_{\beta}\left(g, s^{\#} \otimes|g|^{1 / 2}\right) \\
& =\Phi_{\beta}\left(s, G_{\beta, g}^{\#}\left(s^{\#} \otimes|g|^{1 / 2}\right)\right) \\
& =\Phi_{\beta}\left(g, s+\frac{l}{\beta n}\left(\frac{l}{n}-\beta\right) \operatorname{tr}_{g}(s) g\right) \\
& =\left(\frac{1}{2}\left[s+\frac{1}{\beta n}\left(\frac{1}{n}-\beta\right) \operatorname{tr}_{g}(s) g, s+\frac{l}{\beta n}\left(\frac{1}{n}-\beta\right) \operatorname{tr}_{g}(s) g\right]_{\beta, g}+S(g)\right) \otimes|g|^{1 / 2} . \\
& \text { - } \frac{1}{2}\left[s+\frac{1}{\beta n}\left(\frac{1}{n}-\beta\right) \operatorname{tr}_{g}(s) g, s+\frac{1}{\beta n}\left(\frac{1}{n}-\beta\right) \operatorname{tr}_{g}(s) g\right]_{g} \\
& =\frac{1}{2}[s, s]_{g}+\frac{l}{\beta n}\left(\frac{1}{n}-\beta\right) \operatorname{tr}_{g}(s)[s, s]_{g} \\
& +\frac{1}{2} \frac{1}{\beta^{2} n^{2}}\left(\frac{1}{n}-\beta\right)^{2} \operatorname{tr}_{g}(s)^{2}[g, g]_{g} \\
& =\frac{1}{2}[s, s]_{g}+\left(\frac{1}{\beta n}\left(\frac{1}{n}-\beta\right)+\frac{1}{2} \frac{1}{\beta^{2} n}\left(\frac{1}{n}-\beta\right)^{2}\right) \operatorname{tr}_{g}(s)^{2} . \\
& \text { - } \frac{1}{2}\left(\beta-\frac{1}{n}\right)\left(\operatorname{tr}_{g}\left(s+\frac{l}{\beta n}\left(\frac{l}{n}-\beta\right) \operatorname{tr}_{g}(s) g\right)\right)^{2} \\
& =\frac{1}{2}\left(\beta-\frac{1}{n}\right)\left(\operatorname{tr}_{g}(s)+\frac{1}{\beta n}\left(\frac{1}{n}-\beta\right) \operatorname{tr}_{g}(s) \operatorname{tr}_{g}(g)\right)^{2} \\
& =\frac{1}{2}\left(\beta-\frac{l}{n}\right)\left(\operatorname{tr}_{g}(s)+\frac{l}{\beta}\left(\frac{1}{n}-\beta\right) \operatorname{tr}_{g}(s)\right)^{2}
\end{aligned}
$$

$$
\begin{aligned}
& =\frac{1}{2}\left(\beta-\frac{1}{n}\right)\left(1+\frac{1}{\beta}\left(\frac{1}{n}-\beta\right)\right)^{2} \operatorname{tr}_{g}(s)^{2} \\
& =\frac{1}{2} \frac{1}{\beta^{2} n^{2}}\left(\beta-\frac{1}{n}\right) \operatorname{tr}_{g}(s)^{2} .
\end{aligned}
$$

Thus the coefficient of $\operatorname{tr}_{g}(s)^{2}$ is

$$
\frac{1}{\beta n}\left(\frac{1}{n}-\beta\right)+\frac{1}{2} \frac{1}{\beta^{2} n}\left(\frac{1}{n}-\beta\right)^{2}+\frac{1}{2} \frac{1}{\beta^{2} n^{2}}\left(\beta-\frac{1}{n}\right)
$$

or still,

$$
\begin{gathered}
\frac{1}{\beta n}\left(\frac{1}{n}-\beta\right)\left(1+\frac{1}{2 \beta}\left(\frac{1}{n}-\beta\right)-\frac{1}{2 \beta n}\right) \\
\left.=-\frac{1}{2 \beta n}\left(\beta-\frac{1}{n}\right) \cdot\right]
\end{gathered}
$$

Example: Take $\beta=\frac{1}{n}-1$-- then

$$
-\frac{1}{2 \beta n}\left(\beta-\frac{1}{\mathrm{n}}\right)=-\frac{1}{2(\mathrm{n}-1)},
$$

so

$$
\mathrm{H}_{\frac{1}{n}-1}(\mathrm{~g}, \Lambda)=\left(\frac{1}{2}[s, s]_{g}-\frac{1}{2(n-1)} \operatorname{tr}_{g}(s)^{2}+\mathrm{S}(\mathrm{~g})\right) \otimes|g|^{1 / 2}
$$

if $\Lambda=s^{\#} \otimes|g|^{1 / 2}$, which implies that

$$
\begin{aligned}
& { }_{\frac{1}{n}-1}\left(\mathrm{~g}, \mathrm{G}_{\mathrm{g}}^{\mathrm{b}}(\mathrm{~s})\right) \\
& =H_{\frac{1}{n}-1}\left(\mathrm{~g},\left(\mathrm{~s}-\operatorname{tr}_{\mathrm{g}}(\mathrm{~s}) \mathrm{g}\right)^{\#} \otimes|g|^{1 / 2}\right) \\
& =\left(\frac{1}{2}[s, s]_{g}-\frac{1}{2} \operatorname{tr}_{g}(s)^{2}+s(g)\right) \otimes|g|^{1 / 2} .
\end{aligned}
$$

Define a function $H_{\beta}: T^{*} M_{0} \rightarrow \underline{R}$ by

$$
H_{\beta}(g, \Lambda)=\int_{M} H_{\beta}(g, \Lambda) .
$$

Then

$$
d H_{\beta} \mid(g: \Lambda): T(g, \Lambda)^{T *} \underline{M}_{0} \rightarrow \underline{R},
$$

where

$$
\begin{gathered}
\left.d H_{\beta}\right|_{(g, \Lambda)}\left(s, \Lambda^{\prime}\right)=\left.\frac{d}{d \varepsilon} H_{\beta}\left(g+\varepsilon s, \Lambda+\varepsilon \Lambda^{\prime}\right)\right|_{\varepsilon=0} \\
=\left.\frac{d}{d \varepsilon} H_{\beta}(g+\varepsilon s, \Lambda)\right|_{\varepsilon=0}+\left.\frac{d}{d \varepsilon} H_{\beta}\left(g, \Lambda+\varepsilon \Lambda^{\prime}\right)\right|_{\varepsilon=0} \\
=\left\langle s, \frac{\delta H_{\beta}}{\delta g}\right\rangle+\left\langle\frac{\delta H^{\beta}}{\delta \Lambda}, \Lambda^{\prime}\right\rangle .
\end{gathered}
$$

Definition: The hamiltonian vector field

$$
\mathrm{Z}_{\beta}: \mathrm{M}_{0} \times S_{\mathrm{d}}^{2}(\mathrm{M}) \rightarrow S_{2}(\mathrm{M}) \times S_{\mathrm{d}}^{2}(\mathrm{M})
$$

on $T * M_{0}$ corresponding to $H_{\beta}$ is given by the prescription

$$
z_{\beta}(g, \Lambda)=\left(\frac{\delta H_{\beta}}{\delta \Lambda},-\frac{\delta H_{\beta}}{\delta g}\right)
$$

To justify the terminology, let $Z$ be any vector field on $T{ }^{*} \mathbf{M}_{0}$. Suppose that $Z(g, \Lambda)=\left(s, \Lambda^{\prime}\right)$-- then

$$
\begin{aligned}
& \Omega_{(g, \Lambda)}\left(Z_{\beta}(g, \Lambda), Z(g, \Lambda)\right) \\
& \quad=\Omega_{(g, \Lambda)}\left(\left(\frac{\delta H_{\beta}}{\delta \Lambda},-\frac{\delta H_{\beta}}{\delta g}\right),\left(s, \Lambda^{\prime}\right)\right)
\end{aligned}
$$

$$
\begin{aligned}
& =\left\langle\frac{\delta H_{\beta}}{\delta \Lambda}, \Lambda^{\prime}>-<s,-\frac{\delta H_{\beta}}{\delta g}\right\rangle \\
& \left.=<s, \frac{\delta H_{\beta}}{\delta g}\right\rangle+<\frac{\delta H_{\beta}}{\delta \Lambda}, \Lambda^{\prime}> \\
& =\left.d H_{\beta}\right|_{(g, \Lambda)}\left(s, \Lambda^{\prime}\right) .
\end{aligned}
$$

Observation: The diagram

$$
\mathrm{TTM}_{0} \quad \stackrel{\mathrm{~T} \phi_{\beta}}{\rightarrow} \quad \mathrm{TT}^{*} \underline{\mathrm{M}}_{0}
$$

$$
Y_{\beta} \uparrow \quad \uparrow Z_{\beta}
$$

$$
\mathrm{TM}_{0} \quad \overrightarrow{\phi_{\beta}} \quad{ }^{\mathrm{T} * \mathrm{M}_{0}}
$$

$$
\begin{array}{rll}
E_{\beta} & \downarrow & \downarrow H_{\beta} \\
& \underline{\mathrm{R}} & \underline{\mathrm{R}}
\end{array}
$$

commutes.
Therefore

$$
\left(\phi_{\beta}\right)_{*} Y_{\beta}=Z_{\beta} .
$$

Moreover, if $\gamma(t)$ is an integral curve for $Y_{\beta}$ and $c(t)$ is an integral curve for $z_{\beta}$ and if $\phi_{\beta} \gamma(0)=c(0)$, then $\phi_{\beta} \gamma(t)=c(t)$, hence the projections of $\gamma(t)$ and $c(t)$ onto $\underline{M}_{0}$ coincide.

Remark: Hamilton's equations are, by definition, the system of differential equations defined by $Z_{\beta}$ :

$$
\frac{d c}{d t}=\left.z_{\beta}\right|_{c(t)}
$$

## 1.

Section 34: Constant Lapse, Zero Shift Let $M$ be a connected $C^{\infty}$ manifold of dimension $n>2$. Fix $\varepsilon(0<\varepsilon \leq \infty)$ and assume that

$$
M=]-\varepsilon, \varepsilon[\times \Sigma,
$$

where $\Sigma$ is compact and orientable (hence $\operatorname{dim} \Sigma=n-1$ ).
[Note: $\Sigma$ is going to play the role of the $M$ from the previous section, so when quoting results from there, one must replace $n$ by $n-1$.

Notation: $Q$ is the set of riemannian structures on $\Sigma$, thus now

$$
\left[\begin{array}{rl}
T Q & =Q \times S_{2}(\Sigma) \\
T^{*} Q & =Q \times S_{d}^{2}(\Sigma)
\end{array}\right.
$$

Fix a nonzero constant $N$ (the lapse). Suppose that $t \rightarrow q(t) \quad\left(=q_{t}\right)$ ( $t \in]-\varepsilon, \varepsilon[$ ) is a path in $Q$-- then the prescription

$$
\begin{aligned}
& g_{(t, x)}((r, X),(s, Y)) \\
& \quad=-{r s N^{2}}^{2}+q_{x}(t)(X, Y)\left(r, s \in \underline{R} \& X, Y \in T_{x} \Sigma\right)
\end{aligned}
$$

defines an element of $\underline{M}_{1, n-1}\left(g_{00}=g\left(\partial_{0}, \partial_{0}\right)=-N^{2}\right)$.
Notation: Indices $a, b, c$ run from $l$ to $n-l$.

SUBLEMMA In adapted coordinates, the connection coefficients of $g$ are given by

$$
\left[\begin{array}{l}
\Gamma_{a b}^{c}(t, x)=\left(\Gamma_{t}\right)^{c}{ }_{a b}(x) \\
\Gamma_{a b}^{0}(t, x)=\frac{1}{2 N^{2}}\left(\dot{q}_{t}\right)_{a b}(x) \\
\Gamma_{0 b}^{c}(t, x)=\frac{1}{2}\left(\dot{q}_{t}\right)_{b}^{c}(x)
\end{array}\right.
$$

and

$$
\Gamma_{00}^{0}(t, x)=\Gamma_{0 b}^{0}(t, x)=\Gamma_{00}^{c}(t, x)=0
$$

LEMMA In adapted coordinates, the components of Rich (g) are given by

$$
\text { - } R_{a 0}(t, x)=-\frac{1}{2}\left[d t r_{q_{t}}\left(\dot{q}_{t}\right)_{a}(x)-\left(\operatorname{div}_{q_{t}} \dot{q}_{t}\right)_{a}(x)\right]
$$

- $R_{00}(t, x)=-\frac{1}{2} \operatorname{tr}_{q_{t}}\left(\ddot{q}_{t}\right)(x)+\frac{1}{4}\left[\dot{q}_{t}, \dot{q}_{t}\right]_{q_{t}}(x)$
- $R_{a b}(t, x)=\frac{1}{2 N^{2}}\left(\ddot{q}_{t}\right)_{a b}(x)$

$$
\begin{gathered}
-\frac{1}{2 N^{2}}\left(\dot{q}_{t} * \dot{q}_{t}\right)_{a b}(x)+\frac{1}{4 N^{2}} \operatorname{tr}_{q_{t}}\left(\dot{q}_{t}\right)(x)\left(\dot{q}_{t}\right)_{a b}(x) \\
+\operatorname{Ric}\left(q_{t}\right)_{a b}(x) .
\end{gathered}
$$

THEOREM Rich $(g)=0$ iff $q_{t}$ satisfies the differential equation

$$
\ddot{q}_{t}=\Gamma\left(q_{t}, \dot{q}_{t}\right)+2 N^{2} \operatorname{grad}_{q_{t}} v
$$

and the constraints

$$
\left[\begin{array}{l}
\operatorname{div}_{q_{t}}\left(\dot{q}_{t}-\operatorname{tr}_{q_{t}}\left(\dot{q}_{t}\right) q_{t}\right)=0 \\
\frac{1}{2}\left(\left[\dot{q}_{t}, \dot{q}_{t}\right]_{q_{t}}-\operatorname{tr}{q_{t}}\left(\dot{q}_{t}\right)^{2}\right)-2 N^{2} S\left(q_{t}\right)=0
\end{array}\right.
$$

We shall start with the assumption that $\operatorname{Ric}(g)=0$.

Rappel:

$$
\begin{aligned}
& \Gamma\left(q_{t}, \dot{q}_{t}\right)=\dot{q}_{t} * \dot{q}_{t}-\frac{1}{2} \operatorname{tr}_{q_{t}}\left(\dot{q}_{t}\right) \dot{q}_{t} \\
& +\frac{1}{4(n-2)}\left(\operatorname{tr}_{q_{t}}\left(\dot{q}_{t}\right)^{2}-\left[\dot{q}_{t}, \dot{q}_{t}\right] q_{t}\right) q_{t}
\end{aligned}
$$

and

$$
\operatorname{grad}_{q_{t}} V=-\operatorname{Ric}\left(q_{t}\right)+\frac{1}{2(n-2)} S\left(q_{t}\right) q_{t}
$$

[Note: Recall that grad $_{q_{t}} V$ stands for the gradient of $V$ in the DeWitt metric (which here amounts to choosing $\beta=\frac{1}{n-1}-1$ ).]

$$
\begin{aligned}
& \bullet R_{a b}=0 \\
& = \\
& -\frac{1}{2 N^{2}}\left(\ddot{q}_{t}\right)_{a b} \\
& =-\frac{1}{2 N^{2}}\left(\dot{q}_{t} * \dot{q}_{t}\right)_{a b}+\frac{1}{4 N^{2}} t_{q_{t}}\left(\dot{q}_{t}\right)\left(\dot{q}_{t}\right)_{a b} \\
& \\
& \quad+\operatorname{Ric}\left(q_{t}\right)_{a b} \\
& \Rightarrow \quad \ddot{q}_{t}=\dot{q}_{t} * \dot{q}_{t}-\frac{1}{2} t r_{q_{t}}\left(\dot{q}_{t}\right) \dot{q}_{t}-2 N^{2} \operatorname{Ric}\left(q_{t}\right) . \\
& \qquad R_{00}=0 \\
& \Rightarrow \quad\left(\dot{q}_{t}\right)=\frac{1}{2}\left[\dot{q}_{t}, \dot{q}_{t}\right]_{q_{t}}
\end{aligned}
$$

$$
\begin{aligned}
& \Rightarrow \\
& \quad \operatorname{tr}_{q_{t}}\left(\dot{q}_{t} * \dot{q}_{t}\right)-\frac{1}{2} \operatorname{tr}_{q_{t}}\left(\dot{q}_{t}\right)^{2}-2 N^{2} \operatorname{tr}_{q_{t}} \operatorname{Ric}\left(q_{t}\right)=\frac{1}{2}\left[\dot{q}_{t}, \dot{q}_{t}\right]_{q_{t}} \\
& \Rightarrow \\
& \quad\left[\dot{q}_{t}, \dot{q}_{t}\right]_{q_{t}}-\frac{1}{2} \operatorname{tr}_{q_{t}}\left(\dot{q}_{t}\right)^{2}-2 N^{2} s\left(q_{t}\right)=\frac{1}{2}\left[\dot{q}_{t}, \dot{q}_{t}\right]_{q_{t}} \\
& \Rightarrow \\
& \quad \frac{1}{2}\left(\left[\dot{q}_{t}, \dot{q}_{t}\right]_{q_{t}}-\operatorname{tr}_{q_{t}}\left(\dot{q}_{t}\right)^{2}\right)-2 N^{2} s\left(q_{t}\right)=0
\end{aligned}
$$

Therefore

$$
\begin{gathered}
\frac{1}{4(n-2)}\left(\operatorname{tr}_{q_{t}}\left(\dot{q}_{t}\right)^{2}-\left[\dot{q}_{t}, \dot{q}_{t}\right]_{q_{t}}\right) q_{t}+\frac{1}{n-2} N^{2} S\left(q_{t}\right) q_{t} \\
=\frac{1}{n-2}\left(\frac{1}{4}\left(\operatorname{tr}_{q_{t}}\left(\dot{q}_{t}\right)^{2}-\left[\dot{q}_{t}, \dot{q}_{t}\right]_{q_{t}}\right)+N^{2} S\left(q_{t}\right)\right) q_{t} \\
=0 .
\end{gathered}
$$

But then

$$
\ddot{q}_{t}=\Gamma\left(q_{t}, \dot{q}_{t}\right)+2 N^{2} \operatorname{grad}_{q_{t}} v
$$

as claimed.
[Note: Since

$$
\begin{aligned}
2 N^{2} \operatorname{grad}_{q_{t}} & =-\left(-2 N^{2} \operatorname{grad}_{q_{t}} v\right) \\
& =-\operatorname{grad}_{q_{t}} v-2 N^{\prime}
\end{aligned}
$$

it follows that the curve $t \rightarrow q(t)(t \in]-\varepsilon, \varepsilon[)$ is a geodesic per

$$
\left.\frac{\mathrm{Y}}{\mathrm{n}-1}-1,-2 \mathrm{~N}^{2} \cdot\right]
$$

Finally

$$
\begin{aligned}
& \mathrm{R}_{\mathrm{a} 0}=0 \\
\Rightarrow & \left.\operatorname{div}_{q_{t}} \dot{q}_{t}\right)_{a}=\operatorname{dtr}_{q_{t}}\left(\dot{q}_{t}\right)_{a} \\
\Rightarrow & \\
\Rightarrow \quad & \left(\operatorname{div}_{q_{t}} \dot{q}_{t}\right)_{a}=\left(\operatorname{div}_{q_{t}}\left(t r_{q_{t}}\left(\dot{q}_{t}\right) q_{t}\right)\right)_{a} \\
\Rightarrow & \operatorname{div}_{q_{t}}\left(\dot{q}_{t}-\operatorname{tr}_{q_{t}}\left(\dot{q}_{t}\right) q_{t}\right)=0
\end{aligned}
$$

Thus, in summary, the stated conditions on $q_{t}$ are necessary. That they are also sufficient can be established by running the argument in reverse.

Remark: By definition,

$$
\pi(t)=\dot{q}_{t}-t r_{q_{t}}\left(\dot{q}_{t}\right) q_{t}
$$

Therefore

$$
\operatorname{div}_{q_{t}}\left(\dot{q}_{t}-\operatorname{tr}_{q_{t}}\left(\dot{q}_{t}\right) q_{t}\right)=\operatorname{div}_{q_{t}}^{\pi(t)}
$$

On the other hand,

$$
\frac{E^{1}}{n-1}-1,-2 N^{2}\left(q_{t}, \dot{q}_{t}\right)=K_{\frac{1}{n-1}-1}\left(q_{t}, \dot{q}_{t}\right)+v_{-2 N^{2}}\left(q_{t}\right)
$$

$$
=\int_{\Sigma} \frac{\Phi}{\frac{1}{n-1}}-1,-2 N^{2}\left(q_{t}, \dot{q}_{t}\right),
$$

where

$$
\begin{gathered}
\frac{\Phi}{\frac{1}{n-1}}-1,-2 N^{2}\left(q_{t}, \dot{q}_{t}\right) \\
=\left(\frac{1}{2}\left(\left[\dot{q}_{t}, \dot{q}_{t}\right]_{q_{t}}-\operatorname{tr}_{q_{t}}\left(\dot{q}_{t}\right)^{2}\right)-2 N^{2} S\left(q_{t}\right)\right) \otimes\left|q_{t}\right|^{1 / 2}
\end{gathered}
$$

FACT If Ric (g) $=0$ and if

$$
\ddot{q}_{t}=\Gamma_{\beta}\left(q_{t}, \dot{q}_{t}\right)+2 N^{2} \operatorname{grad}_{\beta, q_{t}} v
$$

subject to

$$
\frac{1}{2}\left[\dot{q}_{t}, \dot{q}_{t}\right]_{\beta, q_{t}}-2 N^{2} s\left(q_{t}\right)=0
$$

for some $\beta \neq \frac{1}{n-1}-1$, then $q_{t}=q_{0}$ for all $t$ and $\operatorname{Ric}\left(q_{0}\right)=0$.
We shall now transfer the theory from $T Q$ to $T^{*} Q$. For this purpose, it will be simplest to first change the initial data, which is the path

$$
t \rightarrow\left(q_{t}, \dot{q}_{t}\right)
$$

in TQ .
Let $\underline{n}_{t}=\frac{1}{N} \partial_{t}-$ then

$$
\begin{aligned}
g\left(\underline{n}_{t}, \underline{n}_{t}\right) & =\frac{1}{N^{2}} g\left(\partial_{t}, \partial_{t}\right) \\
& =-\frac{N^{2}}{N^{2}}=-1 .
\end{aligned}
$$

Given $t \in]-\varepsilon, \varepsilon\left[\right.$, put $\Sigma_{t}=\{t\} \times \Sigma$ and let $i_{t}: \Sigma \approx \Sigma_{t} \rightarrow M$ be the embedding.

Working with the metric connection of $g$, let $x_{t} \in S_{2}(\Sigma)$ : be the extrinsic curvature, thus

$$
\begin{aligned}
x_{t}(V, W) & =q_{t}\left(-i_{t}^{*} \nabla V_{v} n_{t}, W\right) g\left(\underline{n}_{t}, \underline{n}_{t}\right) \\
& =q_{t}\left(i_{t}^{*} \nabla_{V} n_{t}, W\right)
\end{aligned}
$$

LEMMA We have

$$
\left(x_{t}\right)_{a b}=\frac{1}{2 N}\left(\dot{q}_{t}\right)_{a b}
$$

[In fact,

$$
\left.\left.\right|_{\left[\partial_{t}, \partial_{a}\right]=0} ^{\left[\partial_{t}, \partial_{b}\right]=0} \quad\right|_{-} ^{\nabla_{\partial_{t}} \partial_{a}=\nabla_{\partial_{a}} \partial_{t}} \begin{aligned}
& \partial_{b}=\nabla_{\partial_{b}} \partial_{t}
\end{aligned}
$$

$$
\partial_{t}\left(q_{t}\right)_{a b}=q_{t}\left(i_{t}^{*} \nabla_{a}\left(N \underline{n}_{t}\right), \partial_{b}\right)+q_{t}\left(\partial_{a}, i i_{t}^{* \nabla_{\partial_{b}}}\left(N \underline{n}_{t}\right)\right)
$$

$$
=N\left(\left(x_{t}\right)_{a b}+\left(x_{t}\right)_{b a}\right)
$$

$$
=2 \mathrm{~N}\left(x_{t}\right)_{\mathrm{ab}}
$$

$$
\left.\left(x_{t}\right)_{a b}=\frac{1}{2 N}\left(\dot{q}_{t}\right)_{a b} \cdot\right]
$$

So, instead of the path

$$
t \rightarrow\left(q_{t}, \dot{q}_{t}\right)
$$

we can just as well work with the path

$$
t \rightarrow\left(q_{t}, x_{t}\right)
$$

Put $K_{t}=\operatorname{tr}_{q_{t}}\left(x_{t}\right)-$ then

$$
\operatorname{tr}_{q_{t}}\left(\dot{q}_{t}\right)=2 \mathrm{NK}_{t}
$$

Definition: The momentum of the theory is the path $t \rightarrow p_{t}$ in $S_{d}^{2}(\Sigma)$ defined by the prescription

$$
p_{t}=\pi_{t} \otimes\left|q_{t}\right|^{1 / 2}
$$

where

$$
\pi_{t}=\left(x_{t}-K_{t} q_{t}\right)^{\#}
$$

LEMMA We have

$$
x_{t}=\pi_{t}^{b}-\frac{1}{n-2} \operatorname{tr}_{q_{t}}\left(\pi_{t}^{b}\right) q_{t} .
$$

[Simply observe that

$$
\pi_{t}^{b}=x_{t}-k_{t} q_{t}
$$

$\Rightarrow$

$$
x_{t}=\pi_{t}^{b}+k_{t} q_{t}
$$

$$
K_{t}=t r_{q_{t}}\left(\pi_{t}^{b}\right)+k_{t} t r_{q_{t}}\left(q_{t}\right)
$$

9. 

$$
=\operatorname{tr}_{q_{t}}\left(\pi_{t}^{b}\right)+(n-1) K_{t}
$$

$$
\Rightarrow
$$

$$
\operatorname{tr}_{q_{t}}\left(\pi_{t}^{b}\right)=(2-n) k_{t}
$$

$\Rightarrow$

$$
\left.x_{t}=\pi_{t}^{b}-\frac{1}{n-2} t r_{t}\left(\pi_{t}^{b}\right) q_{t} \cdot\right]
$$

Therefore

$$
\begin{aligned}
\dot{q}_{t} & =2 N x_{t} \\
& =2 N\left(\pi_{t}^{b}-\frac{1}{n-2} \operatorname{tr}_{q_{t}}\left(\pi_{t}^{b}\right) q_{t}\right) .
\end{aligned}
$$

Consider the relations figuring in the theorem, beginning with the constraints.

$$
-\operatorname{div}_{q_{t}}\left(\dot{q}_{t}-\operatorname{tr}_{q_{t}}\left(\dot{q}_{t}\right) q_{t}\right)=0
$$

In terms of $x_{t}$, this reads

$$
\operatorname{div}_{q_{t}}\left(2 N x_{t}-2 N K_{t} q_{t}\right)=0
$$

or still,

$$
\operatorname{div}_{q_{t}}\left(x_{t}-K_{t} q_{t}\right)=0
$$

But $\operatorname{div}_{q_{t}} p_{t}$ is, by definition,

$$
\operatorname{div}_{q_{t}}\left(x_{t}-K_{t} q_{t}\right) \otimes\left|q_{t}\right|^{1 / 2}
$$

thus our constraint becomes

$$
\begin{aligned}
& \operatorname{div}_{q_{t}} p_{t}=0 . \\
& \text { - } \frac{1}{2}\left(\left[\dot{q}_{t}, \dot{q}_{t}\right]_{q_{t}}-\operatorname{tr}{ }_{q_{t}}\left(\dot{q}_{t}\right)^{2}\right)-2 N^{2} S\left(q_{t}\right)=0 . \\
& \text { In terms of } x_{t} \text {, this reads } \\
& \frac{1}{2}\left((2 N)^{2}\left[x_{t}, x_{t}\right] q_{t}-(2 N)^{2} K_{t}^{2}\right)-2 N^{2} S\left(q_{t}\right)=0 \\
& \text { or still, } \\
& \left(\left[x_{t}, x_{t}\right]_{q_{t}}-K_{t}^{2}\right)-s\left(q_{t}\right)=0 \\
& \text { or still, } \\
& {\left[\pi_{t}^{b}-\frac{1}{n-2} t r_{q_{t}}\left(\pi_{t}^{b}\right) q_{t}, \pi_{t}^{b}-\frac{1}{n-2} t r_{q_{t}}\left(\pi_{t}^{b}\right) q_{t}\right]_{q_{t}}} \\
& -\left(\operatorname{tr}_{q_{t}}\left(\pi_{t}^{b}\right)-\frac{n-1}{n-2} \operatorname{tr}_{q_{t}}\left(\pi_{t}^{b}\right)\right)^{2}-S\left(q_{t}\right)=0
\end{aligned}
$$

or still,

$$
\left[\pi_{t}^{b}, \pi_{t}^{b}\right]_{q_{t}}+\left(-\frac{2}{n-2}+\frac{n-1}{(n-2)^{2}}-\frac{1}{(n-2)^{2}}\right) t r_{q_{t}}\left(\pi_{t}^{b}\right)^{2}-s\left(q_{t}\right)=0
$$

or still,

$$
\left[\pi_{t}^{b}, \pi_{t}^{b}\right]_{q_{t}}-\frac{1}{n-2} t r_{q_{t}}\left(\pi_{t}^{b}\right)^{2}-s\left(q_{t}\right)=0
$$

or still,

$$
\left(\left[\pi_{t}, \pi_{t}\right]_{q_{t}}-\frac{1}{n-2} \operatorname{tr}_{q_{t}}\left(\pi_{t}\right)^{2}-S\left(q_{t}\right)\right) \otimes\left|q_{t}\right|^{1 / 2}=0
$$

where we have set

$$
\left\{\begin{array}{l}
{\left[\pi_{t}, \pi_{t}\right]_{q_{t}}=q_{t}\left[\begin{array}{l}
2 \\
0
\end{array}\right]\left(\pi_{t}, \pi_{t}\right)\left(=q_{t}\left[\begin{array}{l}
0 \\
2
\end{array}\right]\left(\pi_{t}^{b}, \pi_{t}^{b}\right)\right)} \\
\quad t_{q_{t}}\left(\pi_{t}\right)=q_{t}\left[\begin{array}{l}
2 \\
0
\end{array}\right]\left(\pi_{t}, q_{t}^{\#}\right)\left(=q_{t}\left[\begin{array}{l}
0 \\
2
\end{array}\right]\left(\pi_{t}^{b}, q_{t}\right)\right)
\end{array}\right.
$$

It remains to reformulate the differential equation

$$
\begin{aligned}
& \ddot{q}_{t}=\Gamma\left(q_{t}, \dot{q}_{t}\right)+2 N^{2} \operatorname{grad}_{q_{t}} v \\
& =\dot{q}_{t} \star \dot{q}_{t}-\frac{1}{2} \operatorname{tr}_{q_{t}}\left(\dot{q}_{t}\right) \dot{q}_{t} \\
& +\frac{1}{4(n-2)}\left(\operatorname{tr}_{q_{t}}\left(\dot{q}_{t}\right)^{2}-\left[\dot{q}_{t}, \dot{q}_{t}\right]_{q_{t}}\right) q_{t} \\
& \quad+2 N^{2}\left(-\operatorname{Ric}\left(q_{t}\right)+\frac{1}{2(n-2)} S\left(q_{t}\right) q_{t}\right)
\end{aligned}
$$

in terms of $p_{t}$.
We have

$$
\dot{p}_{t}=\frac{d}{d t} \pi_{t} \otimes\left|q_{t}\right|^{1 / 2}+\pi_{t} \otimes \frac{d}{d t}\left|q_{t}\right|^{1 / 2}
$$

where

$$
\begin{aligned}
\frac{d}{d t} \pi_{t} & =\frac{d}{d t}\left(x_{t}-K_{t} q_{t}\right)^{\#} \\
& =\frac{d}{d t} x_{t}^{\#}-\frac{d}{d t}\left(K_{t} q_{t}^{\#}\right) \\
& =\frac{d}{d t} x_{t}^{\#}-\left(\frac{d}{d t} K_{t}\right) q_{t}^{\#}-K_{t}\left(\frac{d}{d t} q_{t}^{\#}\right)
\end{aligned}
$$

Formulas

- $\frac{d}{d t} x_{t}^{\#}=\left(\dot{x}_{t}\right)^{\#}-4 N\left(x_{t} \star x_{t}\right)^{\#}$.
$\cdot \frac{d}{d t} K_{t}=-2 N\left[x_{t}, x_{t}\right] q_{t}+\operatorname{tr}_{q_{t}}\left(\dot{x}_{t}\right)$.
- $\frac{d}{d t} q_{t}^{\#}=-2 N x_{t}^{\#}$.
$\cdot \frac{d}{d t}\left|q_{t}\right|^{1 / 2}=N K_{t}\left|q_{t}\right|^{1 / 2}$.

To isolate $\dot{x}_{t}$, one need only divide $\ddot{q}_{t}$ by $2 N$.

1. $\frac{1}{2 N} \dot{q}_{t} * \dot{q}_{t}$

$$
\begin{aligned}
& =\frac{1}{2 N}(2 N)^{2} x_{t} * x_{t} \\
& =2 N\left(x_{t} * x_{t}\right)
\end{aligned}
$$

2. $\frac{1}{2 N}\left(-\frac{1}{2} \operatorname{tr}_{q_{t}}\left(\dot{q}_{t}\right) \dot{q}_{t}\right)$

$$
\begin{aligned}
& =\frac{1}{2 N}\left(-\frac{1}{2} t r_{q_{t}}\left(2 N x_{t}\right) 2 N x_{t}\right) \\
& =-N K_{t} x_{t}
\end{aligned}
$$

3. $\frac{1}{2 N} \frac{1}{4(n-2)}\left(\operatorname{tr}_{q_{t}}\left(\dot{q}_{t}\right)^{2}-\left[\dot{q}_{t}, \dot{q}_{t}\right]_{q_{t}}\right) q_{t}$

$$
=\frac{1}{2 N} \frac{1}{4(n-2)}\left(\operatorname{tr}_{q_{t}}\left(2 N x_{t}\right)^{2}-\left[2 N x_{t}, 2 N x_{t}\right]_{q_{t}}\right) q_{t}
$$

$$
=\frac{N}{2(n-2)}\left(K_{t}^{2}-\left[x_{t}, x_{t}\right]_{q_{t}}\right) q_{t}
$$

4. $\frac{1}{2 N}\left(2 N^{2}\left(-\operatorname{Ric}\left(q_{t}\right)+\frac{1}{2(n-2)} S\left(q_{t}\right) q_{t}\right)\right)$

$$
=-\operatorname{NRic}\left(q_{t}\right)+\frac{N}{2(n-2)} s\left(q_{t}\right) q_{t}
$$

Therefore

$$
\dot{x}_{t}=1+2+3+4 .
$$

And then

$$
\begin{aligned}
& \quad \operatorname{tr}_{q_{t}}\left(\dot{x}_{t}\right)=\operatorname{tr}_{q_{t}}(1)+\operatorname{tr}_{q_{t}}(2)+\operatorname{tr}_{q_{t}}(3)+\operatorname{tr}_{q_{t}}(4) \\
& =2 N\left[x_{t}, x_{t}\right]_{q_{t}}-N K_{t}^{2} \\
& \quad+\frac{N}{2} \frac{(n-1)}{(n-2)}\left(K_{t}^{2}-\left[x_{t}, x_{t}\right]_{q_{t}}\right) \\
& -
\end{aligned}
$$

From the above,

$$
\begin{aligned}
& \dot{p}_{t}=\left(\dot{x}_{t}\right)^{\#} \otimes\left|q_{t}\right|^{1 / 2}-4 N\left(x_{t} * x_{t}\right)^{\#} \otimes\left|q_{t}\right|^{1 / 2} \\
& +2 N\left[x_{t}, x_{t}\right] q_{t} q_{t}^{\#} \otimes\left|q_{t}\right|^{1 / 2}-t r_{q_{t}}\left(\dot{x}_{t}\right) q_{t}^{\#} \otimes\left|q_{t}\right|^{1 / 2} \\
& \quad+2 N K_{t} t_{t}^{\#} \otimes\left|q_{t}\right|^{1 / 2}+N K_{t} \pi_{t} \otimes\left|q_{t}\right|^{1 / 2} .
\end{aligned}
$$

To assemble the terms involving Ric $\left(q_{t}\right)$ and $S\left(q_{t}\right)$, note that

$$
4^{\#}=-\operatorname{NRic}\left(q_{t}\right)^{\#}+\frac{N}{2(n-2)} S\left(q_{t}\right) q_{t}^{\#}
$$

However, there is also a contribution from $-\operatorname{tr}_{q_{t}}\left(\dot{x}_{t}\right) q_{t}^{\#}$, viz.

$$
\left(N S\left(q_{t}\right)-\frac{N}{2} \frac{(n-1)}{(n-2)} S\left(q_{t}\right)\right) q_{t}^{\#}
$$

But

$$
\begin{aligned}
& \frac{N}{2(n-2)}+N-\frac{N}{2} \frac{(n-1)}{(n-2)} \\
& \quad=N\left(\frac{1}{2(n-2)}(1-n+1)+1\right) \\
& \quad=N\left(\frac{2-n}{2(n-2)}+1\right)=\frac{N}{2} .
\end{aligned}
$$

Thus we are left with

$$
\begin{aligned}
-N\left(\operatorname{Ric}\left(q_{t}\right)\right. & \left.-\frac{1}{2} s\left(q_{t}\right) q_{t}\right)^{\#} \\
= & -\operatorname{NEin}\left(q_{t}\right)^{\#}
\end{aligned}
$$

Next

$$
1^{\#}-4 N\left(x_{t} * x_{t}\right)^{\#}=-2 N\left(x_{t} * x_{t}\right)^{\#}
$$

which leaves

$$
\begin{aligned}
& -N K_{t} x_{t}^{\#}+\frac{N}{2(n-2)}\left(k_{t}^{2}-\left[x_{t}, x_{t}\right]_{q_{t}}\right) q_{t}^{\#} \\
& +2 N\left[x_{t}, x_{t}\right]_{q_{t}} q_{t}^{\#}-2 N\left[x_{t}, x_{t}\right] q_{t} q_{t}^{\#}+N K_{t}^{2} q_{t}^{\#} \\
& -\frac{N}{2} \frac{(n-1)}{(n-2)}\left(K_{t}^{2}-\left[x_{t}, x_{t}\right] q_{t}\right) q_{t}^{\#}+2 N K_{t} x_{t}^{\#}+N K_{t}\left(x_{t}^{\#}-K_{t} q_{t}^{\#}\right)
\end{aligned}
$$

Now collate the data and collect terms.

- The coefficient of $k_{t} t_{t}^{\#}$ is

$$
-N+2 N+N=2 N
$$

- The coefficent of $k_{t}^{2} q_{t}^{\#}$ is

$$
\begin{aligned}
\frac{N}{2(n-2)} & +N-\frac{N}{2} \frac{(n-1)}{(n-2)}-N \\
& =\frac{N}{2(n-2)}(1-n+1)=-\frac{N}{2}
\end{aligned}
$$

- The coefficent of $\left[x_{t}, x_{t}\right] q_{t} q_{t}^{\#}$ is

$$
\begin{aligned}
& -\frac{N}{2(n-2)}+2 N-2 N+\frac{N}{2} \frac{(n-1)}{(n-2)} \\
& \quad=\frac{N}{2(n-2)}(-1+n-1)=\frac{N}{2}
\end{aligned}
$$

To recapitulate:

$$
\begin{aligned}
\dot{p}_{t}= & -2 N\left(x_{t} x_{t}\right)^{\#} \otimes\left|q_{t}\right|^{1 / 2}+2 N K_{t} x_{t}^{\#} \otimes\left|q_{t}\right|^{1 / 2} \\
& -\frac{N}{2} K_{t}^{2} q_{t}^{\#} \otimes\left|q_{t}\right|^{1 / 2}+\frac{N}{2}\left[x_{t}, x_{t}\right] q_{t} q_{t}^{\#} \otimes\left|q_{t}\right|^{1 / 2} \\
& -\operatorname{NEin}\left(q_{t}\right)^{\#} \otimes\left|q_{t}\right|^{1 / 2}
\end{aligned}
$$

But we are not done yet: It is best to replace $x_{t}$ by $\pi_{t}$. Observation: Since

$$
\begin{aligned}
x_{t} & =\pi_{t}^{b}-\frac{1}{n-2} t r_{q_{t}}\left(\pi_{t}^{b}\right) q_{t} \\
& =\pi_{t}^{b}-\frac{1}{n-2}(2-n) k_{t} q_{t} \\
& =\pi_{t}^{b}+k_{t} q_{t^{\prime}}
\end{aligned}
$$

it follows that

$$
\begin{aligned}
& =\left(\pi_{t}^{b}+K_{t} q_{t}\right) a c\left(\pi_{t}^{b}+K_{t} q_{t}\right)_{b}^{c} \\
& =\left(\pi_{t}^{b}\right) a{ }^{\left(\pi_{t}^{b}\right)^{c}}{ }_{b} \\
& +\left(K_{t} q_{t}\right)_{a c}\left(\pi_{t}^{b}\right)_{b}^{c}+\left(\pi_{t}^{b}\right) a c\left(K_{t} q_{t}\right)_{b}^{c} \\
& +\left(K_{t}\right)^{2}\left(q_{t}\right){ }_{a c}\left(q_{t}\right)_{b}^{c} \\
& =\left(\pi_{t}^{b} * \pi_{t}^{b}\right)_{a b}+2 K_{t}\left(\pi_{t}^{b}\right)_{a b}+\left(K_{t}\right)^{2}\left(q_{t}\right)_{a b} .
\end{aligned}
$$

Accordingly,

$$
\begin{aligned}
& -2 N\left(x_{t} * x_{t}\right)^{\#} \\
& \quad=-2 N\left(\pi_{t} * \pi_{t}+2 K_{t} \pi_{t}+\left(K_{t}\right) q_{t}^{\#}\right),
\end{aligned}
$$

where, by definition,

$$
\pi_{t}^{* \pi} t=\left(\pi_{t}^{b} \pi_{t}^{b}\right)^{\#}
$$

Therefore

$$
\begin{gathered}
-2 N\left(x_{t} * x_{t}\right)^{\#}+2 N K_{t} t_{t}^{\#} \\
=-2 N\left(\pi_{t} t^{* \pi} t^{\prime}-4 N K_{t} \pi_{t}-2 N\left(K_{t}\right)^{2} q_{t}^{\#}\right. \\
+2 N K_{t} \pi_{t}+2 N\left(K_{t}\right)^{2} q_{t}^{\#}
\end{gathered}
$$

$$
\begin{aligned}
& =-2 N\left(\pi_{t} * \pi_{t}\right)-2 N K_{t} \pi_{t} \\
& =-2 N\left(\pi_{t} * \pi_{t}-\frac{1}{n-2} t r_{q_{t}}\left(\pi_{t}\right) \pi_{t}\right) .
\end{aligned}
$$

The last item of detail is

$$
-\frac{N}{2} K_{t}^{2} q_{t}^{\#}+\frac{N}{2}\left[x_{t}, x_{t}\right] q_{t} q_{t}^{\#}
$$

Write

$$
\begin{aligned}
& {\left[x_{t}, x_{t}\right]_{q_{t}}=\left[\pi_{t}^{b}+k_{t} q_{t}, \pi_{t}^{b}+k_{t} q_{t}\right]_{q_{t}} } \\
= & {\left[\pi_{t}, \pi_{t}^{b}\right]_{q_{t}}+2 k_{t}\left[\pi_{t}^{b}, q_{t}\right]_{q_{t}}+\left(k_{t}\right)^{2}\left[q_{t}, q_{t}\right]_{q_{t}} } \\
= & {\left[\pi_{t}, \pi_{t}\right]_{q_{t}}+2 k_{t} t r_{q_{t}}\left(\pi_{t}\right)+(n-1)\left(k_{t}\right)^{2} } \\
= & {\left[\pi_{t}, \pi_{t}\right]_{q_{t}}+2 k_{t}(2-n){K_{t}}+(n-1)\left(k_{t}\right)^{2} } \\
= & {\left[\pi_{t}, \prime \pi_{t}\right]_{q_{t}}+(3-n) k_{t}^{2} . }
\end{aligned}
$$

Then

$$
\begin{aligned}
& -\frac{N}{2} K_{t}^{2} q_{t}^{\#}+\frac{N}{2}\left[\kappa_{t}, \kappa_{t}\right]_{q_{t}} q_{t}^{\#} \\
& =\frac{N}{2}\left(\left[\pi_{t}, \pi_{t}\right]_{q_{t}}+(3-n) k_{t}^{2}-k_{t}^{2}\right) q_{t}^{\#} \\
& =\frac{N}{2}\left(\left[\pi_{t}, \pi_{t}\right]_{q_{t}}+(2-n) K_{t}^{2}\right) q_{t}^{\#} \\
& =\frac{N}{2}\left(\left[\pi_{t}, \pi_{t}\right]_{q_{t}}+\frac{2-n}{(2-n)^{2}} t r_{q_{t}}\left(\pi_{t}\right)^{2}\right) q_{t}^{\#}
\end{aligned}
$$

$$
=\frac{N}{2}\left(\left[\pi_{t}, \pi_{t}\right]_{q_{t}}-\frac{1}{n-2} \operatorname{tr}_{q_{t}}\left(\pi_{t}\right)^{2}\right) q_{t}^{\#}
$$

Summary: We have

$$
\begin{aligned}
\dot{p}_{t}= & -2 N\left(\pi_{t} * \pi r_{t}-\frac{1}{n-2} \operatorname{tr}_{q_{t}}\left(\pi_{t}\right) \pi_{t}\right) \otimes\left|q_{t}\right|^{1 / 2} \\
& +\frac{N}{2}\left(\left[\pi_{t}, \pi_{t}\right]_{q_{t}}-\frac{1}{n-2} t r_{q_{t}}\left(\pi_{t}\right)^{2}\right) q_{t}^{\#} \otimes\left|q_{t}\right|^{1 / 2} \\
& -\operatorname{NEin}\left(q_{t}\right)^{\#} \otimes\left|q_{t}\right|^{1 / 2}
\end{aligned}
$$

Section 35: Variable Lapse, Zero Shift Let $M$ be a connected $C^{\infty}$ manifold of dimension $n>2$. Fix $\varepsilon(0<\varepsilon \leq \infty)$ and assume that

$$
M=]-\varepsilon, \varepsilon[\times \Sigma,
$$

where $\Sigma$ is compact and orientable (hence $\operatorname{dim} \Sigma=n-1$ ).
Let $N \in C^{\infty}(M)$ be strictly positive (or strictly negative) (the lapse). Put

$$
N_{t}(x)=N(t, x) \quad(x \in \Sigma)
$$

Suppose that $t \rightarrow q(t)\left(=q_{t}\right)(t \in]-\varepsilon, \varepsilon[)$ is a path in $Q-$ then the prescription

$$
\begin{aligned}
& g_{(t, x)}((r, X),(s, Y)) \\
& =-\operatorname{rsN}_{t}^{2}(x)+q_{x}(t)(X, Y) \quad\left(r, s \in \mathbb{R} \& X, Y \in T_{x} \Sigma\right)
\end{aligned}
$$

defines an element of $M_{1, n-1}\left(g_{00}=g\left(\partial_{0}, \partial_{0}\right)=-N^{2}\right)$.

Let $\underline{n}_{t}=\frac{1}{N_{t}} \partial_{t}-$ then

$$
\begin{aligned}
g\left(\underline{n}_{t}, \underline{n}_{t}\right) & =\frac{1}{N_{t}^{2}} g\left(\partial_{t}, \partial_{t}\right) \\
& =-\frac{N_{t}^{2}}{N_{t}^{2}}=-1 .
\end{aligned}
$$

Working with the metric connection of $g$, let $x_{t} \in S_{2}(\Sigma)$ be the extrinsic curvature, thus

$$
\begin{aligned}
x_{t}(V, W) & =q_{t}\left(-i_{t}^{*} \nabla_{V} \underline{n}_{t}, W\right) g\left(\underline{n}_{t}, \underline{n}_{t}\right) \\
& =q_{t}\left(i_{t}^{*} \nabla_{V} n_{t}, W\right)
\end{aligned}
$$

And, as in the case of constant $N$,

$$
x_{t}=\frac{1}{2 N_{t}} \dot{q}_{t}
$$

Remark: The focus below will be on the computation of $\dot{x}_{t}$ rather than $\ddot{q}_{t}$.
At each $t$, submanifold theory is applicable to the pair ( $M, \Sigma$ ) (per $\bar{g}=i_{t}^{*} g=\left(q_{t}\right)$. To help keep things straight, overbars are sometimes used to distinguish objects on $\Sigma$ from the corresponding objects on $M$.

IFMMA In adapted coordinates (and abbreviated notation), the connection coefficients of $g$ are given by

$$
\left[\begin{array} { l } 
{ \Gamma _ { a b } ^ { c } = \overline { \Gamma } _ { a b } ^ { c } } \\
{ \Gamma _ { a b } ^ { 0 } = \frac { 1 } { 2 N ^ { 2 } } q _ { a b , 0 } } \\
{ \Gamma _ { 0 b } ^ { c } = \frac { 1 } { 2 } q ^ { c d } q _ { d b , 0 } }
\end{array} \quad \text { and } \quad \left[\begin{array}{r}
\Gamma_{00}^{0}=\frac{N, 0}{N} \\
\Gamma_{0 b}^{0}=\frac{N, b}{N} \\
\Gamma_{0}^{c}{ }_{00}=N q^{c d_{N}}, d^{0}
\end{array}\right.\right.
$$

[The computation is carried out using

$$
\begin{gathered}
\Gamma_{i j}^{k}=\frac{1}{2} g^{k \ell}\left(g_{\ell i, j}+g_{\ell j, i}-g_{i j, \ell}\right) \\
\cdot \Gamma_{a b}^{c}=\frac{1}{2} g^{c \ell}{ }_{\left(g_{\ell a, b}+g_{\ell b, a}-g_{a b, \ell}\right)}^{=} \begin{array}{c}
\frac{1}{2} g^{c 0}\left(g_{0 a, b}+g_{0 b, a}-g_{a b, 0}\right) \\
+\frac{1}{2} g^{c d}\left(g_{d a, b}+g_{d b, a}-g_{a b, d}\right)
\end{array} .
\end{gathered}
$$

$$
\begin{aligned}
& =\frac{1}{2} q^{c d}\left(q_{d a, b}+q_{d b, a}-q_{a b, d}\right) \\
& =\bar{\Gamma}^{c}{ }_{a b} .
\end{aligned}
$$

$$
\begin{aligned}
-\Gamma_{a b}^{0}= & \frac{1}{2} g^{0 l}\left(g_{l a, b}+g_{l b, a}-g_{a b, \ell}\right) \\
& =\frac{1}{2} g^{00}\left(g_{0 a, b}+g_{0 b, a}-g_{a b, 0}\right) \\
& =\frac{1}{2} g^{00}\left(-g_{a b, 0}\right) \\
& =\frac{1}{2 N^{2}} q_{a b, 0}
\end{aligned}
$$

$$
\text { - } \begin{aligned}
\Gamma_{0 b}^{c}= & \frac{1}{2} g^{c \ell}\left(g_{\ell 0, b}+g_{l b, 0}-g_{0 b, \ell}\right) \\
& =\frac{1}{2} g^{c \ell}\left(g_{\ell 0, b}+g_{\ell b, 0}\right) \\
& =\frac{1}{2} g^{c d}\left(g_{d 0, b}+g_{d b, 0}\right) \\
& =\frac{1}{2} q^{c d} q_{d b, 0}
\end{aligned}
$$

- $\Gamma_{00}^{0}=\frac{1}{2} g^{0 \ell}\left(g_{\ell 0,0}+g_{\ell 0,0}-g_{00, \ell}\right)$

$$
=\frac{1}{2} g^{00}\left(g_{00,0}+g_{00,0}-g_{00,0}\right)
$$

$$
=\frac{1}{2} g^{00}\left(g_{00,0}\right)
$$

$$
\begin{aligned}
& =\frac{1}{2}\left(-\frac{1}{N^{2}}\right) \partial_{0}\left(-N^{2}\right) \\
& =\frac{\mathrm{N}, \mathrm{O}}{\mathrm{~N}} . \\
& \text { - } \Gamma_{0 b}^{0}=\frac{1}{2} g^{0 \ell}\left(g_{\ell 0, b}+g_{l b, 0}-g_{0 b, \ell}\right) \\
& =\frac{1}{2} g^{00}\left(g_{00, b}+g_{0 b, 0}-g_{0 b, 0}\right) \\
& =\frac{1}{2} g^{00}\left(g_{00, b}\right) \\
& =\frac{1}{2}\left(-\frac{1}{N^{2}}\right) \partial_{b}\left(-N^{2}\right) \\
& =\frac{\mathrm{N}, \mathrm{~b}}{\mathrm{~N}} . \\
& \text { - } \Gamma_{00}^{c}=\frac{1}{2} g^{c \ell}\left(g_{\ell 0,0}+g_{\ell 0,0}-g_{00, \ell}\right) \\
& =\frac{1}{2} g^{c d}\left(g_{d 0,0}+g_{d 0,0}-g_{00, d}\right) \\
& =\frac{1}{2} g^{c d}\left(-g_{00, d}\right) \\
& =\frac{1}{2} g^{c d}\left(-\partial_{d}\left(-N^{2}\right)\right) \\
& =\mathrm{Ng}^{\mathrm{Cd}} \mathrm{~N}, \mathrm{~d} \\
& =\mathrm{Nq}^{\mathrm{Cd}}{ }_{\mathrm{N}}{ }_{\mathrm{d}} .
\end{aligned}
$$

Example: We have

$$
x_{a b}=\nabla_{b} \underline{n}_{a}=\underline{n}_{a, b}-\Gamma_{a b}^{i} \underline{n}_{i}
$$

$$
=-\Gamma_{a b}^{i} \underline{n}_{i}=-\Gamma_{a b}^{0}(-N)=\frac{1}{2 N} q_{a b, 0}
$$

Recall now our indexing conventions for the curvature tensor:

$$
R_{i j k l}=g\left(\partial_{i^{\prime}}, R\left(\partial_{k}, \partial_{\ell}\right) \partial_{j}\right) .
$$

Rappel: We have

$$
\begin{aligned}
& g\left(W_{1}, R\left(V_{1}, V_{2}\right) W_{2}\right) \\
& =\bar{g}\left(W_{1}, \vec{R}\left(V_{1}, V_{2}\right) W_{2}\right) \\
& +g\left(\Pi_{\nabla}\left(V_{1}, W_{2}\right), \Pi_{\nabla}\left(V_{2}, W_{1}\right)\right)-g\left(\Pi_{\nabla}\left(V_{1}, W_{1}\right), \Pi_{\nabla}\left(V_{2}, W_{2}\right)\right) .
\end{aligned}
$$

[Note: Here it is understood that $\nabla$ is the metric connection of $g$. Moreover, the dependence on $t$ is implicit:

$$
\begin{aligned}
\Pi_{\nabla}(V, W) & =x_{\nabla}(V, W) \underline{n} \\
& \left.=x(V, W) \underline{n} \equiv x_{t}(V, W) \underline{n}_{t} \cdot\right]
\end{aligned}
$$

Specialize and take

$$
W_{1}=\partial_{a}, v_{1}=\partial_{c}, v_{2}=\partial_{d}, W_{2}=\partial_{b}
$$

Then

$$
\begin{gathered}
R_{a b c d}=\bar{R}_{a b c d} \\
+g\left(x\left(\partial_{c}, \partial_{b}\right) \underline{n}, x\left(\partial_{d^{\prime}}, \partial_{a}\right) \underline{n}\right)-g\left(x\left(\partial_{c}, \partial_{a}\right) \underline{n}, x\left(\partial_{d}, \partial_{b}\right) \underline{n}\right) \\
=\bar{R}_{a b c d}+x_{a c} x_{b d}-x_{a d} x_{b c} .
\end{gathered}
$$

Rappel: We have

$$
\begin{aligned}
& g\left(\underline{n}, R\left(V_{1}, V_{2}\right) W\right) \\
= & g\left(\underline{n},\left(\nabla_{V_{1}}^{\perp} \Pi_{\nabla}\right)\left(V_{2}, W\right)\right)-g\left(\underline{n},\left(\nabla_{V_{2}}^{\perp} \Pi_{\nabla}\right)\left(V_{1}, W\right)\right)
\end{aligned}
$$

or still,

$$
\begin{aligned}
& g\left(\underline{n}, R\left(V_{1}, V_{2}\right) W\right) \\
= & \left(\bar{\nabla}_{V_{2}} x\right)\left(V_{1}, W\right)-\left(\bar{\nabla}_{V_{1}} x\right)\left(V_{2}, W\right) .
\end{aligned}
$$

[Note: $\bar{\nabla}$ is the metric connection of $\bar{g}$, hence is torsion free. Therefore

$$
\left.\overline{\mathrm{g}}\left(\mathrm{~S}_{\underline{\mathrm{n}}} \overline{\mathrm{~T}}\left(\mathrm{~V}_{1}, \mathrm{~V}_{2}\right), \mathrm{W}\right)=0 .\right]
$$

Details It is a question of supplying the omitted steps in the preceding manipulation. To begin with,

$$
\left(\bar{\nabla}_{\mathrm{V}_{1}} x\right)\left(\mathrm{V}_{2}, \mathrm{~W}\right)=\mathrm{V}_{1}\left(x\left(\mathrm{~V}_{2}, \mathrm{~W}\right)\right)-x\left(\bar{\nabla}_{\mathrm{V}_{1}} \mathrm{~V}_{2}, \mathrm{~W}\right)-x\left(\mathrm{~V}_{2}, \overline{\mathrm{~V}}_{\mathrm{V}_{1}} \mathrm{~W}\right) .
$$

On the other hand,

$$
\begin{aligned}
& g\left(\underline{n},\left(\nabla_{V_{1}}^{\perp} \Pi_{\nabla}\right)\left(V_{2}, W\right)\right) \\
& =g\left(\underline{n}, \nabla_{V_{1}}^{\perp} \Pi_{\nabla}\left(V_{2}, W\right)\right) \\
& -g\left(\underline{n}, \Pi_{\nabla}\left(\bar{\nabla}_{V_{1}} V_{2}, W\right)\right)-g\left(\underline{n}, \Pi_{\nabla}\left(V_{2}, \bar{\nabla}_{V_{1}}, W\right)\right) .
\end{aligned}
$$

- $g\left(\underline{n}, \nabla_{V_{1}}^{\perp} \Pi_{\nabla}\left(V_{2}, W\right)\right)$

$$
\begin{aligned}
& =g\left(\underline{n}, \operatorname{nor} i^{*} \nabla_{V_{1}} \Pi_{V}\left(V_{2}, W\right)\right) \\
& =g\left(\underline{n}, \operatorname{nor} i^{*} \nabla_{V_{1}}\left(x\left(V_{2}, W\right) \underline{n}\right)\right) \\
& =g\left(\underline{n}, \operatorname{nor}\left(V_{1}\left(x\left(V_{2}, W\right)\right) \underline{n}+x\left(V_{2}, W\right) i^{*} \nabla_{V_{1}} \underline{n}\right)\right) \\
& =V_{1}\left(x\left(V_{2}, W\right)\right) g(\underline{n}, \underline{n})+x\left(V_{2}, W\right) g\left(\underline{n}, i^{*} \nabla_{V_{1}} \underline{n}\right) \\
& =-V_{1}\left(x\left(V_{2}, W\right)\right)+x\left(V_{2}, W\right) g\left(\underline{n},-S_{\underline{n}} V_{1}\right) \\
& =-V_{1}\left(x\left(V_{2}, W\right)\right) .
\end{aligned}
$$

$$
\left[\begin{array}{rl}
g\left(\underline{n}, \Pi_{\nabla}\left(\bar{\nabla}_{V_{1}} V_{2}, W\right)\right) & =g\left(\underline{n}, x\left(\bar{\nabla}_{V_{1}} V_{2}, W\right) \underline{n}\right)=-x\left(\bar{\nabla}_{V_{1}} V_{2}, W\right) \\
g\left(\underline{n}, \Pi_{\nabla}\left(V_{2}, \bar{\nabla}_{V_{1}} W\right)\right) & =g\left(\underline{n}, x\left(V_{2}, \bar{\nabla}_{V_{1}} W\right) \underline{n}\right)=-x\left(V_{2}, \bar{\nabla}_{V_{1}} W\right) .
\end{array}\right.
$$

Therefore

$$
\begin{aligned}
g\left(\underline{n},\left(\nabla_{V_{1}}^{\perp} \Pi_{\nabla}\right)\left(V_{2}, W\right)\right) & =-v_{1}\left(x\left(V_{2}, W\right)\right)-x\left(\bar{\nabla}_{V_{1}} V_{2}, W\right)-x\left(V_{2}, \bar{\nabla}_{V_{1}} W\right) \\
& =-\left(\bar{\nabla}_{V_{1}} x\right)\left(V_{2}, W\right)
\end{aligned}
$$

Specialize and take

$$
v_{1}=\partial_{b}, v_{2}=\partial_{c}, w=\partial_{a} .
$$

Then

$$
\mathrm{R}_{0 a b c}=\mathrm{N}\left(\bar{\nabla}_{c} x_{a b}-\bar{\nabla}_{b} x_{a c}\right)
$$

It will also be necessary to compute $\mathrm{R}_{0 \mathrm{aOb}}$ which, by definition, is
8.

$$
g\left(\partial_{0}, R\left(\partial_{0}, \partial_{b}\right) \partial_{a}\right) .
$$

But $\partial_{0}=N \underline{n}$, thus

$$
\begin{aligned}
\frac{R_{0 a 0 b}}{N^{2}} & =g\left(\underline{n}, R\left(\underline{n}, \partial_{b}\right) \partial_{a}\right) \\
& =g\left(R\left(\underline{n}, \partial_{b}\right) \partial_{a}, \underline{n}\right) \\
& =g\left(R\left(\partial_{a}, \underline{n}\right) \underline{n}, \partial_{b}\right) \\
& =-g\left(R\left(\underline{n}, \partial_{a}\right) \underline{n}, \partial_{b}\right)
\end{aligned}
$$

Write

$$
R\left(\underline{n}, \partial_{a}\right) \underline{n}=\nabla_{\underline{n}} \nabla_{a} \underline{n}-\nabla_{a} \nabla_{\underline{n}} \underline{n}-\nabla_{\left[\underline{n}, \partial_{a}\right]} \underline{n} .
$$

Then the calculation divides into three parts, viz.

$$
\left[\begin{array}{rl}
1 . & g\left(\nabla_{\underline{n}} \nabla_{a} \underline{n}, \partial_{b}\right) \\
\text { 2. } & g\left(\nabla_{a} \nabla_{\underline{n}} \underline{n}, \partial_{b}\right) \\
3 . & g\left(\nabla_{\left[\underline{n}, \partial_{a}\right]} \underline{n}, \partial_{b}\right) .
\end{array}\right.
$$

Ad 1: First,

$$
\left(\nabla_{\mathrm{a}} \mathrm{n}\right)^{\mathrm{b}}=x_{\mathrm{a}}^{\mathrm{b}} .
$$

Second,

$$
\left(\nabla_{a}\right)^{0}=\left(\nabla_{a}\left(\frac{1}{N} \partial_{0}\right)\right)^{0}
$$

$$
\begin{aligned}
& =\left(\frac{1}{N} \nabla_{a} a_{0}+a_{a}\left(\frac{1}{N}\right) \partial_{0}\right)^{0} \\
& =\left(\frac{1}{N} \Gamma^{k}{ }_{a 0} \partial_{k}-\frac{N, a}{N^{2}} a_{0}\right)^{0} \\
& =\frac{1}{N} \Gamma^{0} a 0-\frac{N, a}{N^{2}} \\
& =\frac{1}{N}\left(\frac{N, a}{N}\right)-\frac{N, a}{N^{2}} \\
& =0 .
\end{aligned}
$$

Third, $\forall X \in D^{l}(M)$,

$$
\begin{aligned}
& \left(\nabla_{\underline{n}} \mathrm{X}\right)^{\mathrm{C}}=\frac{1}{\mathrm{~N}}\left(\nabla_{0} \mathrm{X}\right)^{\mathrm{C}} \\
& =\frac{1}{\mathrm{~N}}\left[\mathrm{X}_{, 0}^{\mathrm{c}}+\Gamma_{0 \mathrm{j}^{\mathrm{c}}} \mathrm{X}^{\mathrm{j}}\right] \\
& =\frac{1}{N}\left[X^{\mathrm{C}}, 0 \text { }+\Gamma_{00}^{\mathrm{C}}{ }_{00} \mathrm{X}^{0}+\Gamma^{\mathrm{C}}{ }_{0 \mathrm{~d}} \mathrm{X}^{\mathrm{d}}\right] \\
& =\frac{1}{N}\left[X_{, 0}^{C}+N{ }^{c d}{ }_{N}{ }_{, d^{\prime}} X^{0}+\frac{1}{2} g^{c b} g_{b d, 0} X^{d}\right] \\
& =\frac{X^{C}, 0}{N}+g^{C d}{ }_{N}, d^{X^{0}}+\frac{1}{2 N} g^{C b} 2 N x_{b d} x^{d} \\
& =\frac{x^{c}, 0}{N}+g^{c d_{N}}, d^{X^{0}}+x_{d}^{C} x^{d} .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& g\left(\nabla_{\underline{n}} \nabla_{a} \underline{\underline{n}}, \partial_{b}\right) \\
& \quad=\left(\nabla_{\underline{\mathbf{n}}} \nabla_{a} \underline{\underline{n}}\right)^{i}\left(\partial_{b}\right)_{i}
\end{aligned}
$$

$$
\begin{aligned}
& =g_{i j}\left(\partial_{b}\right)^{j}\left(\nabla_{\underline{n}} \nabla_{a} \underline{n}\right)^{i} \\
& =g_{i b}\left(\nabla_{\underline{\eta}} \nabla_{a} \underline{n}\right)^{i} \\
& =g_{0 b}\left(\nabla_{\underline{n}} \nabla_{a} \underline{n}^{0}+g_{c b}\left(\nabla_{\underline{n}} \nabla_{a} \underline{n}\right)^{c}\right. \\
& =g_{b c}\left(\nabla_{\underline{n}} \nabla_{a} \underline{n}\right)^{c} \\
& =g_{b c}\left[\frac{1}{N}\left(\nabla_{a} \underline{n}\right)_{, 0}^{c}+g^{o d_{N}}{ }_{, d}\left(\nabla_{a n} \underline{n}\right)^{0}+x_{d}^{c}\left(\nabla_{a} \underline{n}\right)^{d_{1}}\right] \\
& =g_{b c}\left[\frac{1}{N} x_{a, 0}^{c}+x_{d}^{c} x_{a}^{d}\right] \\
& =\frac{1}{N}\left[\frac{\partial}{\partial t} x_{a b}-x_{a}^{c} \frac{\partial}{\partial t} g_{b c}\right]+(x * x) a b \\
& =\frac{1}{N} \frac{\partial}{\partial t} x_{a b}-x_{a}^{c} \frac{1}{N}\left(2 N x_{b c}\right)+(x * x)_{a b} \\
& =\frac{1}{N} \frac{\partial}{\partial t} x_{a b}-(x * x) a b .
\end{aligned}
$$

Ad 2: Analogously,

$$
g\left(\nabla_{a} \nabla_{n} \underline{n}, \partial_{b}\right)=\frac{N_{; b ; a}}{N}-\frac{N_{, b^{N}, a}}{N^{2}} .
$$

Ad 3: On the one hand,

$$
\left[\underline{n}, \partial_{a}\right]^{c}=0
$$

while on the other,

$$
\begin{aligned}
{\left[\underline{n}, a_{a}\right]^{0} } & =\underline{n}^{i}\left(a_{a}\right)^{0}, i \\
& =-\left(a_{a}\right)^{i}(\underline{n})^{0}, i \\
& =-(\underline{n})^{i}, a \\
& =-a_{a}\left(\frac{1}{\bar{N}}\right)=\frac{N}{N^{2}} \\
&
\end{aligned}
$$

So

$$
\begin{aligned}
& \left.\nabla_{\left[\underline{n}, \partial_{a}\right]} \underline{\underline{n}}=\left[\underline{n}, \partial_{a}\right]\right]_{i} \nabla_{i} \underline{n} \\
& =\frac{\mathrm{N}, \mathrm{a}}{\mathrm{~N}^{2}} \nabla_{0} \underline{n} \\
& =\frac{\mathrm{N}, \mathrm{a}}{\mathrm{~N}^{2}} \nabla_{0}\left(\frac{1}{\mathrm{~N}} \mathrm{a}_{0}\right) \\
& =\frac{N}{N^{2}}\left[\frac{1}{N} \nabla_{0} \partial_{0}+\partial_{0}\left(\frac{1}{\mathrm{~N}}\right) \partial_{0}\right] \\
& =\frac{\mathrm{N}, \mathrm{a}}{\mathrm{~N}^{2}}\left[\frac{1}{\mathrm{~N}} \Gamma_{00}^{\mathrm{k}} \mathrm{\partial}_{\mathrm{k}}+\partial_{0}\left(\frac{1}{\mathrm{~N}}\right) \partial_{0}\right] \\
& \Rightarrow \\
& { }^{\left.g\left(\nabla_{\left[\underline{n}, \partial_{a}\right.}\right] \underline{n}, \partial_{b}\right)} \\
& =\frac{N}{N^{2}}{ }^{2}\left(\frac{1}{\mathrm{~N}} \Gamma^{c}{ }_{00} g\left(\partial_{c}, \partial_{b}\right)\right) \\
& =\frac{\mathrm{N}, \mathrm{a}}{\mathrm{~N}^{2}} \frac{1}{\mathrm{~N}}\left(\mathrm{Ng}^{\mathrm{Cd}}{ }_{\mathrm{N}}, \mathrm{~d}\right) \mathrm{g}_{\mathrm{Cb}}
\end{aligned}
$$

$$
\begin{aligned}
& =\frac{N}{N^{2}} g^{c d} g_{C b}, d \\
& =\frac{N}{N^{2}}, \delta^{d} b^{N}, d \\
& =\frac{N_{r} a^{N}, b}{N^{2}} .
\end{aligned}
$$

Now combine terms:

$$
\begin{aligned}
\frac{R_{0 a 0 b}}{N^{2}}= & -g\left(R\left(\underline{n}, \partial_{a}\right) \underline{n}, \partial_{b}\right) \\
= & -\left[\frac{1}{N} \frac{\partial}{\partial t} x_{a b}-(x \star x) a b\right. \\
& \left.+\frac{N, a^{N}, b}{N^{2}}-\frac{N_{; b ; a}}{N}-\frac{N, a^{N}, b}{N^{2}}\right] \\
= & -\left[\frac{1}{N} \frac{\partial}{\partial t} x_{a b}-(x * x) a b-\frac{1}{N}\left(H_{N}\right)_{a b}\right]
\end{aligned}
$$

THEOREM Rich $(g)=0$ iff $x_{t}$ satisfies the differential equation

$$
\dot{x}_{t}=2 N_{t}\left(x_{t} * x_{t}\right)-N_{t} K_{t} x_{t}-N_{t} \operatorname{Ric}\left(q_{t}\right)+H_{N_{t}}
$$

and the constraints

$$
\left[\begin{array}{l}
\operatorname{div}_{q_{t}}\left(x_{t}-K_{t} q_{t}\right)=0 \\
\left(\left[x_{t}, x_{t}\right]_{q_{t}}-k_{t}^{2}\right)-s\left(q_{t}\right)=0
\end{array}\right.
$$

It will be enough to establish the necessity of the stated conditions (sufficiency follows by retracement). So suppose that $\operatorname{Ric}(g)=0$.

- $R_{a b}=0$

$$
0=R_{a i b}^{i}=g^{i j} R_{j a i b}
$$

$\Rightarrow$

$$
0=g^{00} R_{0 a 0 b}+g^{c d_{R_{d a c b}}}
$$

$$
=-\frac{1}{N^{2}} \mathrm{R}_{0 \mathrm{aOb}}+\mathrm{g}^{\mathrm{cd}} \mathrm{R}_{\mathrm{dacb}}
$$

$$
=\frac{1}{N} \frac{\partial}{\partial t} x_{a b}-(x * x)_{a b}-\frac{1}{N}\left(H_{N}\right)_{a b}
$$

$$
+g^{c d}\left(\bar{R}_{d a c b}+x_{d c} x_{a b}-x_{d b} x_{a c}\right)
$$

$$
=\frac{1}{N} \frac{\partial}{\partial t} x_{a b}-(x \star x)_{a b}-\frac{1}{N}\left(H_{N}\right)_{a b}
$$

$$
+\bar{R}_{a b}+K x_{a b}-(x * x)_{a b}
$$

$$
\Rightarrow
$$

$$
\frac{1}{N} \frac{\partial}{\partial t} x_{a b}=2(x \star x)_{a b}-K x_{a b}-\bar{R}_{a b}+\frac{1}{N}\left(H_{N}\right)_{a b}
$$

$=$

$$
\frac{\partial}{\partial t} x_{a b}=2 N(x * x)_{a b}-N K x_{a b}-N \bar{R}_{a b}+\left(H_{N}\right)_{a b}
$$

I.e.:

$$
\dot{x}_{t}=2 N_{t}\left(x_{t}^{* x_{t}}\right)-N_{t} K_{t} x_{t}-N_{t} R i c\left(q_{t}\right)+H_{N_{t}} \cdot
$$

$$
\text { - } \mathrm{R}_{0 \mathrm{a}}=0
$$

$$
0=R_{0 i a}^{i}=g^{i j_{R_{j 0 i a}}}
$$

$$
=g^{b c_{R_{c 0 b a}}}
$$

$$
=-g^{b c_{R_{0 c b a}}}
$$

$$
\Rightarrow
$$

$$
\left.0=g^{b C_{N}\left(\bar{\nabla}_{a} x_{c b}\right.}-\bar{\nabla}_{b}{ }_{c a}\right)
$$

$$
=N\left(\bar{\nabla}_{a} x_{b}^{b}-\bar{\nabla}_{b} x_{a}^{b}\right)
$$

=

$$
\bar{\nabla}_{b} x_{a}^{b}-\bar{\nabla}_{a}^{x^{b}}{ }_{b}=0
$$

But

$$
\left[\begin{array}{l}
\quad\left(\operatorname{div}_{q} x\right)_{a}=\bar{\nabla}_{b} x^{b} a \\
\quad\left(\operatorname{div}_{q}(K q)\right)_{a}=\bar{\nabla}_{a} x_{b}^{b}
\end{array}\right.
$$

Therefore

$$
\operatorname{div}_{q}(x-K q)=0
$$

I.e.:

$$
\operatorname{div}_{q_{t}}\left(x_{t}-K_{t} q_{t}\right)=0
$$

- $\mathrm{R}_{00}=0$
=

$$
\begin{aligned}
0=R_{0 i 0}^{i} & =g^{i j_{R_{j 0 i 0}}} \\
& =g^{a b} R_{b 0 a 0} \\
& =-g^{a b} R_{0 b a 0} \\
& =g^{a b} R_{0 b 0 a} \\
& =g^{a b} R_{0 a 0 b} \\
& =g^{a b}\left(-N^{2}\right)\left[\frac{1}{N} \frac{\partial}{\partial t} x_{a b}-(x * x) a b-\frac{1}{N}\left(H_{N}\right) a b\right]
\end{aligned}
$$

=

$$
\begin{aligned}
0 & =g^{a b}\left[\frac{1}{N} \frac{\partial}{\partial t} x_{a b}-(x \star x)_{a b}-\frac{1}{N}\left(H_{N}\right) a b\right] \\
& =g^{a b}\left[2(x \star x)_{a b}-K x_{a b}-\bar{R}_{a b}+\frac{1}{N}\left(H_{N}\right)_{a b}\right.
\end{aligned}
$$

$$
\begin{aligned}
& \left.-(x * x)_{a b}-\frac{1}{N}\left(H_{N}\right)_{a b}\right] \\
= & g^{a b}\left[(x * x)_{a b}-K x_{a b}-\bar{R}_{a b}\right] \\
= & \left([x, x]_{q}-K^{2}\right)-S(q) .
\end{aligned}
$$

I.e.:

$$
\left(\left[x_{t}, x_{t}\right]_{q_{t}}-k_{t}^{2}\right)-s\left(q_{t}\right)=0 .
$$

The necessity of the stated conditions is thereby established. Observation:

$$
\left[x_{t}, x_{t}\right]_{q_{t}}-k_{t}^{2}=s\left(q_{t}\right)
$$

$\Rightarrow$

$$
\begin{aligned}
& \dot{x}_{t}=2 N_{t}\left(x_{t} * x_{t}\right)-N_{t} K_{t} x_{t}-N_{t} \operatorname{Ric}\left(q_{t}\right)+H_{N_{t}} \\
& =2 N_{t}\left(x_{t} * x_{t}\right)-N_{t} K_{t} x_{t}+\frac{N_{t}}{2(n-2)}\left(K_{t}^{2}-\left[x_{t}, x_{t}\right] q_{t}\right) q_{t} \\
& -N_{t} \operatorname{Ric}\left(q_{t}\right)+H_{N_{t}}+\frac{N_{t}}{2(n-2)} S\left(q_{t}\right) q_{t} \\
& =\frac{1}{2 N_{t}} \Gamma\left(q_{t}, 2 N_{t} x_{t}\right)+\operatorname{grad}_{q_{t}} V_{N_{t}} .
\end{aligned}
$$

Definition: The momentum of the theory is the path $t \rightarrow p_{t}$ in $s_{d}^{2}(\Sigma)$ defined by the prescription

$$
p_{t}=\pi_{t} \otimes\left|q_{t}\right|^{1 / 2}
$$

where

$$
\pi_{t}=\left(x_{t}-K_{t} q_{t}\right)^{\#}
$$

The discussion in the previous section can now be repeated virtually verbatim.

Constraint Equations These are the relations

$$
\left[\begin{array}{c}
\left(\left[\pi_{t}, \pi_{t}\right]_{q_{t}}-\frac{1}{n-2} t r_{q_{t}}\left(\pi_{t}\right)^{2}-s\left(q_{t}\right)\right) \otimes\left|q_{t}\right|^{1 / 2}=0 \\
\operatorname{div}_{q_{t}} p_{t}=0
\end{array}\right.
$$

Evolution Equations These are the relations

$$
\dot{q}_{t}=2 N_{t}\left(\pi_{t}^{b}-\frac{1}{n-2} \operatorname{tr}_{q_{t}}\left(\pi_{t}^{b}\right) q_{t}\right)
$$

and

$$
\begin{aligned}
\dot{p}_{t}= & -2 N_{t}\left(\pi_{t} * \pi_{t}-\frac{1}{n-2} \operatorname{tr}_{q_{t}}\left(\pi_{t}\right) \pi_{t}\right) \otimes\left|q_{t}\right|^{1 / 2} \\
& +\frac{N_{t}}{2}\left(\left[\pi_{t}, \pi_{t}\right]_{q_{t}}-\frac{1}{n-2} \operatorname{tr}{q_{t}}\left(\pi_{t}\right)^{2}\right) q_{t}^{\#} \otimes\left|q_{t}\right|^{1 / 2} \\
& -N_{t} \operatorname{Ein}\left(q_{t}\right)^{\#} \otimes\left|q_{t}\right|^{1 / 2} \\
& +\left(H_{N_{t}}-\left(\Delta_{q_{t}} N_{t}\right) q_{t}\right)^{\#} \otimes\left|q_{t}\right|^{1 / 2}
\end{aligned}
$$

[Note: The explanation for the appearance of the laplacian $\Delta_{q_{t}} N_{t}$ is the fact that $\operatorname{tr}_{q_{t}}\left(\dot{x}_{t}\right)$ figures in the formula for $\left.\dot{p}_{t}.\right]$

Section 36: Incorporation of the Shift Let $M$ be a connected $C^{\infty}$ manifold of dimension $n>2$. Fix $\varepsilon(0<\varepsilon \leq \infty)$ and assume that

$$
M=]-\varepsilon, \varepsilon[\times \Sigma,
$$

where $\Sigma$ is compact and orientable (hence $\operatorname{dim} \Sigma=n-1$ ).
Definition: A shift is a time dependent vector vield $\vec{N}$ on $\Sigma$ (thus
$\vec{N}:]-\varepsilon, \varepsilon\left[\rightarrow T \Sigma\right.$ has the property that $\left.\vec{N}_{t}(x)=\vec{N}(t, x) \in T{ }_{x} \Sigma \forall x \in \Sigma\right)$.
Fix a lapse $N$ and a shift $\vec{N}$. Suppose that $t \rightarrow q(t)\left(=q_{t}\right)(t \in]-\varepsilon, \varepsilon[)$ is a path in $Q$. Then the prescription

$$
\begin{aligned}
& g_{(t, x)}((r, X),(s, Y)) \\
& =-r s\left(N_{t}^{2}(x)-q_{X}(t)\left(\left.\left.\vec{N}_{t}\right|_{x^{\prime}} \vec{N}_{t}\right|_{x}\right)\right) \\
& +\operatorname{sq}_{x}(t)\left(X,\left.\vec{N}_{t}\right|_{x}\right)+r q_{x}(t)\left(Y,\left.\vec{N}_{t}\right|_{x}\right) \\
& +q_{x}(t)(X, Y) \quad\left(r, s \in R \in X, Y \in T T_{x} \Sigma\right)
\end{aligned}
$$

defines an element of $M_{1, n-1}$.
[Note: In adapted coordinates (with $\vec{N}=N^{a} \partial_{a}$ ),

$$
\left[g_{i j}\right]=\left|\begin{array}{cc}
-N^{2}+N^{N_{N}} N_{a} & N_{b} \\
N_{a} & q_{a b}
\end{array}\right|
$$

and

$$
\left.\left[g^{i j}\right]=\frac{1}{N^{2}}\left[\begin{array}{cc}
-1 & N^{b} \\
N^{a} & N^{2} q^{a b}-N^{a} N^{b}
\end{array}\right] .\right]
$$

Remark: We can write

$$
g=-\left(N^{2}-q(\vec{N}, \vec{N})\right) d t \otimes d t+\vec{N}^{b} \otimes d t+d t \otimes \vec{N}^{b}+q
$$

modulo, of course, the obvious agreements.

$$
\begin{aligned}
& \text { Let } \underline{n}_{t}=\frac{1}{N_{t}}\left(\frac{\partial}{\partial t}-\vec{N}_{t}\right)-\text { then } \\
& \qquad \begin{aligned}
& g\left(\underline{n}_{t}, \partial_{a}\right) \\
&=\frac{1}{N_{t}} g\left(\frac{\partial}{\partial t}-\vec{N}_{t}, \partial_{a}\right) \\
&=\frac{1}{N_{t}}\left(g\left(\partial_{0}, \partial_{a}\right)-N^{b} g\left(\partial_{b}, \partial_{a}\right)\right) \\
&=\frac{1}{N_{t}}\left(N_{a}-N^{b} q_{a b}\right) \\
&=\frac{1}{N_{t}}\left(N_{a}-N_{a}\right)=0 .
\end{aligned}
\end{aligned}
$$

On the other hand,

$$
\begin{aligned}
& g\left(\underline{n}_{t}, \underline{n}_{t}\right) \\
& \quad=\frac{1}{N_{t}^{2}} g\left(\frac{\partial}{\partial t}-\vec{N}_{t}, \frac{\partial}{\partial t}-\vec{N}_{t}\right)
\end{aligned}
$$

$$
\begin{aligned}
& =\frac{1}{N_{t}^{2}}\left(g\left(\partial_{0}, \partial_{0}\right)-2 g\left(a_{0}, \vec{N}_{t}\right)+g\left(\vec{N}_{t}, \vec{N}_{t}\right)\right) \\
& =\frac{1}{N_{t}^{2}}\left(g_{00}-2 N^{a} g_{0 a}+N^{a} N^{b} q_{a b}\right) \\
& =\frac{1}{N_{t}^{2}}\left(-N_{t}^{2}+N^{a} N_{a}-2 N^{a} N_{a}+N_{a} N_{a}\right) \\
& \quad=-\frac{N_{t}^{2}}{N_{t}^{2}}=-1 .
\end{aligned}
$$

Remark: Obviously,

$$
\underline{\mathrm{n}}^{0}=\frac{\mathrm{l}}{\mathrm{~N}}, \underline{\mathrm{n}}^{\mathrm{a}}=-\frac{\mathrm{N}^{\mathrm{a}}}{\mathrm{~N}}
$$

In addition,

$$
\underline{n}^{b}=-N d t
$$

FACT We have

$$
\left[\begin{array}{l}
\nabla_{0} \partial_{a}=\left(\partial_{a} N+x_{a b} N^{b}\right) \underline{n}+\left(N x_{a}^{b}+\bar{\nabla}_{a} N^{b}\right) \partial_{b} \\
\nabla_{a \underline{n}}=x_{a}^{b} \partial_{b} \\
\quad \nabla_{0 \underline{n}}=\left(\partial_{b} N+x_{b c} N^{C}\right) q^{b a} \partial_{a} .
\end{array}\right.
$$

LEMMA Let $x_{t} \in S_{2}(\Sigma)$ be the extrinsic curvature (per the metric connection
of g) -- then

$$
\dot{q}_{t}=2 N_{t} x_{t}+L_{\overrightarrow{N_{t}}} q_{t}
$$

[For

$$
\begin{aligned}
& \partial_{t}\left(q_{t}\right)_{a b}= q_{t}\left(i_{t}^{*} \nabla_{a}\left(N_{t} n_{t}+\vec{N}_{t}\right), \partial_{b}\right) \\
&+q_{t}\left(\partial_{a}, i i_{t}^{*} \nabla_{\partial_{b}}\left(N_{t} \underline{n}_{t}+\vec{N}_{t}\right)\right) \\
&= 2 N_{t}\left(x_{t}\right)_{a b}+q_{t}\left(\bar{\nabla}_{\partial_{a}} \vec{N}_{t}, \partial_{b}\right)+q_{t}\left(\partial_{a}, \bar{\nabla}_{\partial_{b}} \vec{N}_{t}\right) \\
&= 2 N_{t}\left(x_{t}\right)_{a b}+\left(L_{\vec{N}}^{t}\right. \\
&\left.\left.q_{t}\right)\left(\partial_{a}, \partial_{b}\right) \cdot\right]
\end{aligned}
$$

Application:

$$
\frac{d}{d t}\left|q_{t}\right|^{1 / 2}=\left(\operatorname{div}_{q_{t}} \vec{N}_{t}+N_{t} K_{t}\right)\left|q_{t}\right|^{1 / 2}
$$

The presence of the shift is not a problem: It adds one more term to the equation of motion.

THEOREM Ric $(g)=0$ iff $x_{t}$ satisfies the differential equation

$$
\dot{x}_{t}=2 N_{t}\left(x_{t} * x_{t}\right)-N_{t} K_{t} x_{t}-N_{t} \operatorname{Ric}\left(q_{t}\right)+H_{N_{t}}+L_{N_{t}} x_{t}
$$

and the constraints

$$
\left.\right|_{-} \quad \operatorname{div}_{q_{t}}\left(x_{t}-k_{t} q_{t}\right)=0 .
$$

Apart from a few additional wrinkles, the argument runs along the by now familiar lines.

$$
\begin{aligned}
& -R_{a 0 b}^{0} \\
& =\frac{1}{N}\left[\dot{x}_{a b}-N x_{a}^{c} x_{c b}-x_{b c} \bar{\nabla}_{a} N^{c}-\bar{\nabla}_{b}\left(\bar{\nabla}_{a} N+x_{a c} N^{c}\right)\right]
\end{aligned}
$$

[In fact,

$$
\begin{aligned}
R_{a 0 b}^{0} & =d t\left(\nabla_{0} \nabla_{b} \partial_{a}-\nabla_{b} \nabla_{0} \partial_{a}\right) \\
& =d t\left(\nabla_{0}\left(x_{a b} \underline{\underline{n}}+\bar{\Gamma}_{b a}^{c} \partial_{c}\right)-\nabla_{b} \nabla_{0} \partial_{a}\right) \\
& =\frac{1}{N} \dot{x}_{a b}+d t\left(\bar{\Gamma}_{a b}^{C} \nabla_{0} \partial_{c}-\nabla_{b}\left(\left(\partial_{a} N+x_{a c^{N}} N^{c}\right) \underline{n}+\left(N x_{a}^{c}+\bar{\nabla}_{a} N^{c}\right) \partial_{c}\right)\right) \\
& =\frac{1}{N}\left[\dot{x}_{a b}+\bar{\Gamma}_{b a}^{c}\left(\partial_{c} N+x_{c d} N^{d}\right)-\partial_{b}\left(\partial_{a} N+x_{a c} N^{C}\right)-\left(N x_{a}^{c}+\bar{\nabla}_{a} N^{C}\right) x_{b c}\right] \\
& \left.=\frac{1}{N}\left[\dot{x}_{a b}-N x_{a}^{c} x_{c b}-x_{b c} \bar{\nabla}_{a} N^{c}-\bar{\nabla}_{b}\left(\bar{\nabla}_{a} N+x_{a c} N^{C}\right)\right] .\right]
\end{aligned}
$$

- $\mathrm{R}^{\mathrm{C}} \mathrm{acb}$

$$
=\bar{R}_{a b}+K x_{a b}-x_{a c} x_{b}^{c}+\frac{N^{c}}{N}\left(\bar{\nabla}_{b} x_{a c}-\bar{\nabla}_{c} x_{a b}\right) .
$$

[In fact,

$$
\begin{aligned}
R_{a c b}^{C} & =g^{c i_{R_{i a c b}}} \\
& =g^{c d} R_{d a c b}+g^{c 0} R_{0 a c b}
\end{aligned}
$$

$$
\begin{aligned}
& =q^{c d}\left(\bar{R}_{d a c b}+x_{d c} x_{a b}-x_{d b} x_{a c}\right)-\frac{N^{c} N^{d}}{N^{2}} R_{d a c b} \\
& +\frac{N^{c}}{N^{2}}\left[g\left(N n_{-} R\left(\partial_{c^{\prime}}, \partial_{b}\right) \partial_{a}\right)+g\left(\vec{N}^{\prime} R\left(\partial_{c}, \partial_{b}\right) \partial_{a}\right)\right] \\
& =\bar{R}_{a b}+K x_{a b}-x_{a c} x_{b}^{c}-\frac{N^{c} N^{d}}{N^{2}} R_{d a c b} \\
& +\frac{N^{c}}{N^{2}}\left[N\left(\bar{\nabla}_{b} x_{a c}-\bar{\nabla}_{c} x_{a b}\right)+N^{d} R_{d a c b}\right] \\
& \left.=\bar{R}_{a b}+K x_{a b}-x_{a c} x_{b}^{c}+\frac{N^{c}}{N}\left(\bar{\nabla}_{b} x_{a c}-\bar{\nabla}_{c} x_{a b}\right) .\right]
\end{aligned}
$$

Therefore

$$
\begin{aligned}
R_{a b} & =R_{a 0 b}^{0}+R_{a c b}^{c} \\
& =\bar{R}_{a b}+K x_{a b}-2 x_{a c} x_{b}^{c} \\
& +\frac{1}{N}\left[\dot{x}_{a b}-\bar{\nabla}_{a} \bar{\nabla}_{b} N-N N_{c}^{c} \bar{\nabla}_{c} x_{a b}-x_{b c} \bar{\nabla}_{a} N^{c}-x_{a c} \bar{\nabla}_{b} N^{c}\right] \\
& =\bar{R}_{a b}+K x_{a b}-2(x * x)_{a b}+\frac{1}{N}\left[\dot{x}_{a b}-\left(H_{N}\right)_{a b}-L_{\vec{N}} x_{a b}\right] .
\end{aligned}
$$

But then $R_{a b}=0$ iff

$$
\dot{x}_{a b}=2 N(x * x)_{a b}-N K x_{a b}-N \bar{R}_{a b}+\left(H_{N}\right)_{a b}+L_{\vec{N}}^{x} x_{a b} .
$$

N.B. Since there is no torsion,

$$
\begin{aligned}
L_{\vec{N}}^{L_{\mathrm{N}}} x_{a b} & =\vec{\nabla}_{\overrightarrow{\mathrm{N}}} x_{a b}+x\left(\bar{\nabla}_{\mathrm{a}} \overrightarrow{\mathrm{~N}}, \partial_{\mathrm{b}}\right)+x\left(\partial_{\mathrm{a}}, \bar{\nabla}_{\mathrm{b}} \overrightarrow{\mathrm{~N}}\right) \\
& =\vec{\nabla}_{\overrightarrow{\mathrm{N}}} x_{a b}+x\left(\left[\partial_{a}, \vec{N}\right], \partial_{b}\right)+x\left(\partial_{a},\left[\partial_{b}, \overrightarrow{\mathrm{~N}}\right]\right)
\end{aligned}
$$

$$
\begin{aligned}
& =N^{C} \bar{\nabla}_{c} x_{a b}+x\left(\left(\bar{\nabla}_{a} N^{c}\right) a_{c^{\prime}} a_{b}\right)+x\left(a_{a^{\prime}}\left(\bar{\nabla}_{b} N^{c}\right) a_{c}\right) \\
& =N^{c} \bar{\nabla}_{c} x_{a b}+x_{b c} \bar{\nabla}_{a} N^{c}+x_{a c} \bar{\nabla}_{b} N^{c} .
\end{aligned}
$$

FACT We have

$$
\operatorname{tr}_{q}\left(L_{\vec{N}} x\right)=\underset{\vec{N}}{L_{\vec{N}}} \operatorname{tr}_{q}(x)+\underset{\vec{N}}{\left[x, L_{q} q\right]}
$$

Remark: The evolution of $k_{t}$ follows from the evolution of $x_{t}$. Indeed,

$$
\begin{aligned}
\dot{K}_{t} & =-\left[\dot{q}_{t}, x_{t}\right]_{q_{t}}+\operatorname{tr}_{q_{t}}\left(\dot{x}_{t}\right) \\
& =-\left[2 N_{t} x_{t}+L_{\vec{N}_{t}} q_{t}, x_{t}\right]_{q_{t}}+\operatorname{tr}_{q_{t}}\left(\dot{x}_{t}\right) \\
& =-\left[x_{t}, L_{\vec{N}_{t}} q_{t}\right]_{q_{t}}-2 N_{t}\left[x_{t}, x_{t}\right]_{q_{t}}+\operatorname{tr}_{q_{t}}\left(\dot{x}_{t}\right) \\
& =L_{\vec{N}_{t}} \operatorname{tr}_{q_{t}}\left(x_{t}\right)-\operatorname{tr}{ }_{q_{t}}\left(L_{\vec{N}_{t}} x_{t}\right)-2 N_{t}\left[x_{t}, x_{t}\right]_{q_{t}}+t r_{q_{t}}\left(\dot{x}_{t}\right)
\end{aligned}
$$

Notation: Let

$$
\mathrm{h}=\mathrm{g}+\underline{\mathrm{n}}^{b} \otimes \underline{\mathrm{n}}^{b} .
$$

Then

$$
\left.\left[h_{i j}\right]=\left\lvert\, \begin{array}{ccc}
N^{2} N_{a} & N_{b} \\
N_{a} & q_{a b}
\end{array}\right.\right]
$$

and
8.

$$
\left[h^{i j}\right]=\left|\begin{array}{cc}
0 & 0 \\
0 & q^{a b}
\end{array}\right|
$$

To discuss the first constraint, write

$$
\begin{aligned}
& \operatorname{Ric}\left(\underline{n}, \partial_{a}\right)=\underline{n}^{i}{ }^{\mathbf{j}}{ }_{i j a} \\
& =g^{i k} \underline{n}_{k} R_{i j a}^{j} \\
& =g^{k i} \underline{n}_{i} R^{j}{ }_{k j a} \\
& =\underline{n}_{\mathbf{i}} g^{i k_{R}^{j}}{ }_{k j a} \\
& =\underline{n}_{\mathrm{n}} \mathrm{R}^{\mathrm{ji}}{ }_{\mathrm{j}} \mathrm{a} \\
& =-\underline{n}_{i} R^{i j}{ }_{j a} \\
& =-\underline{n}_{i} g^{j \ell_{R}{ }_{\ell j a}} \\
& =-\underline{n}_{\mathrm{i}} \mathrm{R}_{\ell j a^{\mathrm{i}}} \mathrm{~g}^{\mathrm{j} \ell} \\
& =-\underline{n}_{i} R_{\ell j a}^{i}\left(h^{j \ell}-\underline{n}^{\dot{j}} \underline{n}^{\ell}\right)
\end{aligned}
$$

$$
\begin{aligned}
& =-\underline{n}_{i} g^{i k_{R_{k c b a}} q^{c b}} \\
& =-g^{k i} \underline{n}_{i} R_{k c b a} q^{c b} \\
& =-\underline{n}^{k} R_{k c b a} q^{c b} \\
& =-g\left(\underline{n}_{r} R\left(a_{b}, \partial_{a}\right) \partial_{c}\right) q^{c b} \\
& =-\left(\bar{\nabla}_{a} x_{b c}-\bar{\nabla}_{b}^{x_{a c}}\right) q^{c b} \\
& =\bar{\nabla}^{c} x_{a c}-\bar{\nabla}_{a} x_{c}^{c} \\
& =\bar{\nabla}^{b} x_{a b}-\bar{\nabla}_{a} x_{b}^{b} \\
& =\bar{\nabla}_{b} x_{a}^{b}-\bar{\nabla}_{a} x_{b}^{b}
\end{aligned}
$$

Accordingly, if $\operatorname{Ric}(g)=0$, then

$$
\bar{\nabla}_{b} x_{a}^{b}-\bar{\nabla}_{a} x_{b}^{b}=0
$$

Therefore

$$
\operatorname{div}_{q}(x-\operatorname{Kq})=0
$$

I.e.:

$$
\operatorname{div}_{q_{t}}\left(x_{t}-k_{t} q_{t}\right)=0
$$

Conversely, under the stated conditions,

$$
\begin{array}{ll} 
& \operatorname{Ric}\left(\underline{n}, \partial_{a}\right)=0 \\
\Rightarrow \quad & \operatorname{Ric}\left(N \underline{n}, \partial_{a}\right)=0 \\
\Rightarrow \quad & \operatorname{Ric}^{\prime}\left(a_{0}-N^{b} \partial_{b}, \partial_{a}\right)=0 \\
\Rightarrow \quad & R_{0 a}-N^{b} R_{b a}=0 \\
\Rightarrow \quad & R_{0 a}=0 .
\end{array}
$$

Details We claim that

$$
\underline{n}_{\mathrm{i}} \mathrm{R}^{\mathrm{i}} \ell j \mathrm{n}^{\mathrm{n}^{\mathrm{n}}} \underline{l}^{\ell}=0,
$$

a not completely obvious point. Thus

$$
\begin{aligned}
\underline{n}_{i} R_{\ell j a}^{i} \underline{n}^{j} \underline{n}^{\ell} & =\underline{n}_{0} R_{\ell j a}^{0} \underline{n}^{j} \underline{n}^{\ell} \\
& =-N R_{\ell j a}^{0} \underline{n}^{j} \underline{n}^{\ell}
\end{aligned}
$$

And

$$
\begin{gathered}
R_{\ell j a}^{0} \underline{n}_{\underline{j}}^{\underline{n}}=g^{0 k_{R_{k \ell j a}} \underline{n}_{\underline{n}} \underline{j}^{j}} \\
=g^{00} R_{0 \ell j a^{n}} \underline{n}^{j}+g^{0 b_{R_{l j a}} \underline{n}^{\ell} \underline{n}^{j}}
\end{gathered}
$$

$$
\begin{aligned}
& =g^{00} R_{000 a} \underline{n}^{0} \underline{n}^{0}+g^{00} R_{00 d a} \underline{n}^{0} \underline{n}^{d} \\
& +g^{00} R_{0 c 0 a} \underline{n}^{C} \underline{n}^{0}+g^{00} R_{0 c d a} \underline{n}^{C} \underline{n}^{d} \\
& +g^{0 b} R_{b 00 a} \underline{n}^{0} \underline{n}^{0}+g^{0 b} R_{b 0 d a} \underline{n}^{0} \underline{n}^{d} \\
& +g^{0 b} R_{b c 0 a} \underline{n}^{c} \underline{n}^{0}+g^{0 b} R_{b c d a} \underline{n}^{c} \underline{n}^{d} \\
& \text { - } R_{000 a}=0 \& R_{00 d a}=0 \text {. } \\
& \text { - } g^{00} R_{0 c 0 a} \underline{n}^{C} \underline{n}^{0} \\
& =g^{00} \underline{n}^{c} \underline{n}^{0} R_{0 c 0 a} \\
& =-\frac{1}{N^{2}} \cdot-\frac{N^{C}}{N} \cdot \frac{1}{N} R_{0 c 0 a} \\
& =\frac{N^{C}}{N^{4}} R_{0 c 0 a} \\
& =-\frac{N^{b}}{N^{4}} R_{b 00 a} .
\end{aligned}
$$

But

$$
\begin{aligned}
& g^{0 b b_{b 00 a}} \underline{n}^{0} \underline{n} \\
= & g^{0 b} \underline{n}^{0} \underline{n}^{0} R_{b 00 a} \\
= & \frac{N^{b}}{N^{2}} \cdot \frac{1}{N} \cdot \frac{1}{N} R_{b 00 a} \\
= & \frac{N^{b}}{N^{4}} R_{b 00 a} .
\end{aligned}
$$

$$
\begin{aligned}
& \text { - } g^{00} R_{0 \propto d a} \underline{n}^{\mathrm{C}^{\mathrm{n}}}{ }^{\mathrm{d}} \\
& =g^{00} \underline{n}^{c} \underline{n}^{d} R_{0 c d a} \\
& =-\frac{1}{N^{2}} \cdot-\frac{\mathrm{N}^{\mathrm{C}}}{\mathrm{~N}} \cdot-\frac{\mathrm{N}^{\mathrm{d}}}{\mathrm{~N}} \mathrm{R}_{0 \text { cda }} \\
& =-\frac{N^{C} N^{d}}{N^{4}} R_{0 c d a} \\
& =\frac{N^{C} N^{\mathrm{d}}}{\mathrm{~N}^{4}} \mathrm{R}_{\mathrm{c} 0 \mathrm{da}} \\
& =\frac{N^{b} N^{d}}{N^{4}} R_{b 0 d a} .
\end{aligned}
$$

But

$$
\begin{aligned}
& g^{0 b_{R_{b 0 d a}} \underline{n}^{0} \underline{n}^{d}} \\
& \quad=g^{0 b} \underline{n}^{0} \underline{n}^{d} R_{b 0 d a} \\
& \quad=\frac{N^{b}}{N^{2}} \cdot \frac{1}{N} \cdot-\frac{N^{d}}{N} R_{b 0 d a} \\
& \quad=-\frac{N^{b} N^{d}}{N^{4}} R_{b 0 d a} .
\end{aligned}
$$

This leaves

$$
g^{0 b} R_{b c 0 a} \underline{n}^{c} \underline{n}^{0}+g^{0 b} R_{b c d a} \underline{n}^{c} \underline{n}^{d}
$$

- $R_{b c 0 a}=R_{0 a b c}=-R_{a 0 b c}$.

13. 

And

$$
R_{a 0 b c}+R_{a b c 0}+R_{a c 0 b}=0
$$

But

$$
\begin{aligned}
& g^{0 b} \underline{n}^{c} \underline{n}^{0} R_{a c 0 b} \\
& =-g^{0 b} \underline{n}^{c} \underline{n}^{0} R_{a c b 0} \\
& =-g^{0 c} \underline{n}^{b} \underline{n}^{0} R_{a b c 0} \\
& =\frac{N^{c} N^{b}}{N^{4}} R_{a b c 0^{0}}
\end{aligned}
$$

On the other hand,

$$
g^{0 b_{n} \underline{n}^{0}} \underline{n}^{0}=-\frac{N^{b_{N} c}}{N^{4}}
$$

Consequently,

$$
g^{0 b_{n} \underline{n}^{c} \underline{n}^{0} R_{b c 0 a}=0 .}
$$

$$
\text { - } R_{b c d a}=R_{d a b c}=-R_{a d b c}
$$

And

$$
\mathrm{R}_{\mathrm{adbc}}+\mathrm{R}_{\mathrm{abcd}}+\mathrm{R}_{\mathrm{acdb}}=0
$$

But

$$
\begin{aligned}
& g^{0 b_{n} \underline{n}_{n}} \underline{R}_{a c d b} \\
& =-g^{0 b} \underline{n}^{c} \underline{n}^{d} R_{a c b d} \\
& =-g^{0 c} \underline{n}_{n} \underline{n}^{d} R_{a b c d}
\end{aligned}
$$

$$
=-\frac{N^{c^{C} N^{b} N^{d}}}{N^{4}} R_{a b c d} .
$$

On the other hand,

$$
g^{0 b_{n} \underline{n}^{n}} \underline{n}^{d}=\frac{N^{b} N^{c} N^{d}}{N^{4}}
$$

Consequently,

$$
g^{0 b_{n} \underline{n}_{\underline{n}} R_{b c d a}}=0
$$

Turning now to the second constraint, write

$$
\begin{aligned}
& S(g)=R_{i k j \ell} g^{i j} g^{k \ell} \\
& =R_{i k j \ell}\left(h^{i j}-\underline{n}^{i} \underline{n}^{j}\right)\left(h^{k \ell}-\underline{n}^{k} \underline{n}^{\ell}\right)
\end{aligned}
$$

$$
\begin{aligned}
& =R_{a c b d} q^{a b q} q^{c d}-2 \operatorname{Ric}(\underline{n}, \underline{n}) \\
& =\left(\bar{R}_{a c b d}+x_{a b} x_{c d}-x_{a d} x_{c b}\right) q^{a b} q^{c d}-2 \operatorname{Ric}(\underline{n}, \underline{n}) \\
& =S(q)+K^{2}-[x, x]_{q}-2 \operatorname{Ric}(\underline{n}, \underline{n}) .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& \operatorname{Ein}(\underline{n}, \underline{n})=\operatorname{Ric}(\underline{n}, \underline{n})+\frac{1}{2} S(g) \\
& =\operatorname{Ric}(\underline{n}, \underline{n})+\frac{1}{2}\left(S(q)+K^{2}-[x, x]_{q}-2 \operatorname{Ric}(\underline{n}, \underline{n})\right) \\
& =
\end{aligned}
$$

So, if $\operatorname{Ric}(g)=0$, then $\operatorname{Ein}(g)=0$, hence

$$
S(q)+K^{2}-[x, x]_{q}=0
$$

or still,

$$
\left([x, x]_{q}-K^{2}\right)-S(q)=0
$$

I.e.:

$$
\left(\left[x_{t}, x_{t}\right]_{q_{t}}-k_{t}^{2}\right)-s\left(q_{t}\right)=0
$$

Conversely, under the stated conditions,

$$
\begin{aligned}
& \operatorname{Ein}(\underline{n}, \underline{n})=0 \\
\Rightarrow & \quad \operatorname{Ric}(\underline{n}, \underline{n})+\frac{1}{2} S(g)=0 \\
\Rightarrow & \frac{1}{N^{2}} \operatorname{Ric}\left(\partial_{0}-N^{a} \partial_{a}, \partial_{0}-N^{b} \partial_{b}\right)+\frac{1}{2} g^{i j_{R_{i j}}}=0 \\
\Rightarrow \quad & \frac{1}{N^{2}} R_{00}+\frac{1}{2} g^{00} R_{00}=0 \\
\Rightarrow \quad & \frac{1}{N^{2}} R_{00}-\frac{1}{2} \frac{1}{N^{2}} R_{00}=0 \\
\Rightarrow \quad & \frac{1}{2} R_{00}=0 \Rightarrow R_{00}=0 .
\end{aligned}
$$

16. 

Details The claim is that

$$
-R_{i k j} \ell^{h^{i j} \underline{n}^{k} \underline{n}^{\ell}-R_{i k j} \ell^{h^{k} \ell_{\underline{n}}^{i} \underline{n}} \underline{n}^{j}-R_{i k j \ell^{\underline{n}}} \underline{n}_{\underline{n}} \underline{n}_{\underline{n}}^{k} \ell}
$$

equals

$$
-2 R_{i k j}^{k} \underline{n}^{i} \underline{n}^{j}
$$

- $-R_{i k j} \ell^{\mathrm{h}^{\mathrm{j}} \underline{n}^{k} \underline{n} \ell}$

$$
=-R_{k i \ell j} h^{k \ell \underline{n}^{i} \underline{n}} \underline{j}^{j}
$$

$$
=-R_{\ell i k j} h^{k \ell \underline{n}^{i} \underline{n}} \underline{j}^{j}
$$

- $-R_{i k j} \ell^{h^{k} \ell_{\underline{n}} \underline{n}^{j}}$

$$
\begin{aligned}
& =-R_{k i \ell j} h^{k \ell \underline{n}^{i} \underline{n}}{ }^{j} \\
& =-R_{\ell i k j} h^{k \ell} \underline{n}^{i} \underline{n} j
\end{aligned}
$$

- $-R_{i k j \ell} \underline{n}^{i} \underline{n}^{j_{n}} \underline{n}^{\ell} \ell$

$$
\begin{aligned}
& =-R_{k i \ell j} \underline{n}^{i} \underline{n}^{j_{n}} \underline{n}^{\ell} \\
& =-R_{\ell i k j} \underline{n}^{i} \underline{n}^{j} \underline{n}^{k} \underline{n}^{\ell} .
\end{aligned}
$$

-     - $2 R_{i k j}^{k} \underline{n}^{i} \underline{n}^{j}$

$$
\begin{aligned}
& =-2 g^{k l_{R_{l i k j}} \underline{n}^{i} \underline{n}^{j}} \\
& =-2\left(h^{k \ell}-\underline{n}^{k} \underline{n}^{\ell}\right)_{R_{l i k j} \underline{n}^{i} \underline{n}^{j}}
\end{aligned}
$$

$$
=2 R_{\ell i k j} \underline{n}^{i} \underline{n}^{j} \underline{n}_{\underline{n}} \underline{n}^{\ell}-2 R_{\ell i k j} h^{k \ell} \underline{n}^{i} \underline{\underline{n}} .
$$

Matters thus reduce to showing that

$$
R_{\ell i k j} \underline{n}^{i} \underline{n}^{j} \underline{n}^{k} \underline{\underline{n}} \ell=0
$$

To this end, we shall use the fact that

$$
R_{\ell i k j}+R_{\ell k j i}+R_{\ell j i k}=0
$$

- $R_{\ell k j i} \underline{n}^{i} \underline{n}^{j} \underline{n}^{k} \underline{n}^{\ell}$

$$
\begin{aligned}
& =-R_{\ell k i j} \underline{n}^{i} \underline{n}^{j} \underline{n}^{k} \underline{n}^{\ell} \\
& =-R_{\ell i k j} \underline{n}^{i} \underline{n}^{j} \underline{n}^{k} \underline{n}^{\ell} .
\end{aligned}
$$

- $R_{\ell j i k} \underline{n}^{i} \underline{n}^{j} \underline{n}^{k} \underline{n}^{\ell}$

$$
\begin{aligned}
& =-R_{\ell j k i} \underline{n}^{i} \underline{n}^{j} \underline{n}^{k} \underline{n}^{\ell} \\
& =-R_{\ell k j i} \underline{n}^{i} \underline{n}^{j} \underline{n}^{k} \underline{n} \ell .
\end{aligned}
$$

Therefore

$$
\mathrm{R}_{\ell \mathrm{ikj}} \underline{n}^{i} \underline{n}^{j} \underline{n}^{k} \underline{\underline{n}}^{\ell}=0
$$

LEMMA We have

$$
\begin{aligned}
s(g) & =s(q)+[x, x] q-k^{2} \\
& -2 \nabla_{i}\left(\underline{n}^{j} \nabla_{j} \underline{n}^{i}-\underline{n}^{i} \nabla_{j} \underline{n}^{j}\right) .
\end{aligned}
$$

18. 

[As was noted above,

$$
S(g)=S(q)+K^{2}-[x, x]_{q}-2 \operatorname{Ric}(\underline{n}, \underline{n})
$$

But

$$
\operatorname{Ric}(\underline{n}, \underline{n})=\left(\nabla_{i} \nabla_{j} \underline{n}^{i}-\nabla_{j} \nabla_{i} \underline{n}^{i}\right) \underline{n}^{j}
$$

$-2 \operatorname{Ric}(\underline{n}, \underline{n})$

$$
\begin{aligned}
& =2\left[\left(\nabla_{i} \underline{n}^{j}\right)\left(\nabla_{j} \underline{n}^{i}\right)-\left(\nabla_{j} \underline{n}^{j}\right)\left(\nabla_{i} \underline{n}^{i}\right)\right] \\
& -2\left[\nabla_{i}\left(\underline{n}^{j} \nabla_{j} \underline{n}^{i}\right)-\nabla_{j}\left(\underline{n}^{j} \nabla_{i} \underline{n}^{i}\right)\right] .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
S(g)= & S(q)+K^{2}-[x, x]_{q}+2\left([x, x]_{q}-k^{2}\right) \\
& -2 \nabla_{i}\left(\underline{n}^{j} \nabla_{j} \underline{n}^{i}-\underline{n}^{i} \nabla_{j} \underline{n}^{j}\right) \\
= & S(q)+[x, x]_{q}-k^{2} \\
& \left.-2 \nabla_{i}\left(\underline{n}^{j} \nabla_{j} \underline{n}^{i}-\underline{n}^{i} \nabla_{j} \underline{n}^{j}\right) .\right]
\end{aligned}
$$

Formulas

$$
\begin{aligned}
& \infty \nabla_{i}\left(\underline{n}^{i} \nabla_{j} \underline{n}^{j}\right) \\
&=d x^{i}\left(\nabla_{i}(K \underline{n})\right) \\
&=d t\left(\nabla_{0}(K \underline{n})\right)+d x^{a}\left(\nabla_{a}(K \underline{n})\right)
\end{aligned}
$$

$$
\begin{aligned}
& =\frac{1}{N}\left(q^{a b} x_{a b}\right)^{\cdot}+\kappa^{2}-\frac{N^{a}}{N} \nabla_{a} K \\
& =\frac{1}{N}\left(q^{a b}\right) \cdot x_{a b}+\frac{1}{N} q^{a b} \dot{x}_{a b}+k^{2}-\frac{1}{N} L_{\vec{N}}\left(q^{c d} x_{c d}\right) \\
& =-\frac{1}{N} q^{a c} \dot{q}_{c d} q^{d b_{n}}{ }_{a b}+\frac{1}{N} \operatorname{tr}_{q}(\dot{x})+K^{2} \\
& -\frac{1}{N}\left(L_{\vec{N}} q^{\mathrm{cd}}\right)_{c d}-\frac{1}{\mathrm{~N}} q^{\mathrm{cd}}{\underset{\vec{N}}{ }}^{\mathrm{N}} \mathrm{~cd} \\
& \left.=-\frac{1}{N} q^{a c}\left(2 N x_{c d}+L_{\vec{N}} q_{c d}\right) q^{d b}\right) x_{a b}+\frac{1}{N} t r_{q}(\dot{x})+K^{2} \\
& \left.-\frac{1}{\mathrm{~N}}\left(\underset{\overrightarrow{\mathrm{~N}}}{ } \mathrm{~L}^{\mathrm{cd}}\right) x_{\mathrm{cd}}-\frac{1}{\mathrm{~N}} \operatorname{tr}_{\mathrm{q}}{ }_{\overrightarrow{\mathrm{N}}} \mathrm{~L}^{x}\right) \\
& =-2[x, x]_{q}+\frac{1}{N}\left(L_{\vec{N}} q^{a b}\right) x_{a b}+\frac{1}{N} \operatorname{tr}_{q}(\dot{x})+K^{2} \\
& -\frac{1}{\mathrm{~N}}\left(\underset{\overrightarrow{\mathrm{~N}}}{ } \mathrm{~L}^{\mathrm{Cd}}\right) x_{c d}-\frac{1}{\mathrm{~N}} \operatorname{tr}_{q}\left(\underset{\vec{N}}{\left(L_{\mathrm{N}}\right)}\right. \\
& =-2[x, x]_{q}+\frac{1}{N} \operatorname{tr}_{q}(\dot{x})+K^{2}-\frac{1}{N} \operatorname{tr}_{q}\left(L_{\vec{N}} x\right) . \\
& \text { - } \nabla_{i}\left(\underline{n}^{j} \nabla_{j} \underline{n}^{i}\right) \\
& =d x^{i}\left(\nabla_{i}\left(\underline{n}^{\mathbf{j}_{j} \underline{n}}\right)\right) \\
& =d x^{i}\left(\nabla_{i}\left[\frac{1}{N}\left(\partial_{c} N+x_{b c} N^{N^{b}}\right) q^{c d} \partial_{d}-\frac{N^{b}}{N} x_{b}{ }^{d} \partial_{d}\right]\right)
\end{aligned}
$$

20. 

$$
\begin{aligned}
& =d x^{i}\left(\nabla_{i}\left[\frac{\partial_{C}^{N}}{N} q^{c d} \partial_{d}\right]\right) \\
& =\operatorname{dt}\left(\frac{\partial_{C}^{N}}{N} q^{C d} \nabla_{0} \partial_{d}\right)+d x^{a}\left(\nabla_{a}\left[\frac{\partial_{C} N}{N} q^{c d_{\partial}}\right]\right) \\
& =\frac{\partial_{c} N}{N^{2}} q^{c d}\left(\partial_{d} N+N^{b} x_{b d}\right)+\bar{\nabla}_{a}\left(\frac{l}{N} \bar{\nabla}^{a} N\right)-\frac{\partial_{c} N}{N^{2}} x^{c} a^{a} \\
& =\frac{1}{\mathrm{~N}} \bar{\nabla}^{\mathrm{a}} \overline{\mathrm{~V}}_{\mathrm{a}} \mathrm{~N} \\
& =\frac{1}{\mathrm{~N}} \Delta_{\mathrm{q}} \mathrm{~N} .
\end{aligned}
$$

Substituting these relations into the lemma then gives

$$
\begin{aligned}
S(g)= & S(q)-3[x, x]_{q}+K^{2} \\
& +\frac{2}{N}\left(\operatorname{tr}_{q}(\dot{x})-\operatorname{tr}_{q}\left(L_{\vec{N}} x\right)-\Delta_{q} N\right) .
\end{aligned}
$$

Scholium: We have

$$
\begin{aligned}
G_{a b}= & R_{a b}-\frac{1}{2} S(g) g_{a b} \\
= & \bar{G}_{a b}+K x_{a b}-2(x * x)_{a b}+\frac{3}{2}[x, x]_{q} q_{a b}-\frac{1}{2} K^{2} q_{a b} \\
& +\frac{1}{N}\left(\dot{x}_{a b}-\operatorname{tr}_{q}(\dot{x}) q_{a b}\right) \\
+ & \frac{1}{N}\left[\left(\Delta_{q} N\right) q_{a b}-\left(H_{N}\right)_{a b}+\operatorname{tr}_{q} \underset{\vec{N}}{\left(L_{\sim} x\right) q_{a b}-L L_{\vec{N}} x a b}\right]
\end{aligned}
$$

Therefore

$$
\mathrm{G}_{\mathrm{ab}}=0
$$

iff

$$
\begin{aligned}
& \dot{x}_{a b}-\operatorname{tr}_{q}(\dot{x}) q_{a b}=L_{\vec{N}} x_{a b}-\operatorname{tr}_{q}\left(L_{\vec{N}}^{x} x\right) q_{a b} \\
& +2 N(x * x)_{a b}-N K x_{a b}-\frac{3}{2} N[x, x]_{q} q_{a b}+\frac{1}{2} N K^{2} q_{a b} \\
& \quad-N \bar{G}_{a b}+\left(H_{N}\right)_{a b}-\left(\Delta_{q} N\right) q_{a b} .
\end{aligned}
$$

Remark: Locally,

$$
G=G(\underline{n}, \underline{n}) \underline{n}^{b} \otimes \underline{n}^{b}+G\left(\underline{n}, \partial_{a}\right)\left(\underline{n}^{b} \otimes d x^{a}+d x^{a} \otimes \underline{n}^{b}\right)+G\left(\partial_{a}, \partial_{b}\right) d x^{a} \otimes d x^{b} .
$$

The preceding result admits an interpretation in the language of lagrangian mechanics. For this purpose, we shall use the following notation.

- q will stand for an arbitrary element of $Q$ and $v$ will stand for an arbitrary element of $S_{2}(\Sigma)$.
- $N$ will stand for an arbitrary element of $C_{>0}^{\infty}(\Sigma) \cup C_{<0}^{\infty}(\Sigma)$.
[Note: Earlier $N$ was a time dependent element of $\left.C_{>0}^{\infty}(\Sigma) \cup C_{<0}^{\infty}(\Sigma).\right]$
- $\overrightarrow{\mathrm{N}}$ will stand for an arbitrary element of $\mathcal{D}^{1}(\Sigma)$.
[Note: Earlier $\vec{N}$ was a time dependent element of $\left.D^{l}(\Sigma).\right]$
Given ( $\mathrm{q}, \mathrm{v} ; \mathrm{N}, \overrightarrow{\mathrm{N}}$ ), put

$$
x=\frac{v-L_{\vec{N}} q}{2 N} .
$$

[Note: It is clear that $x \in S_{2}(\Sigma)$, thus it makes sense to form $[x, x]_{q}$
and $\left.K=\operatorname{tr}_{q}(x).\right]$
Definition: The lagrangian of the theory is the function

$$
L: \mathbb{T Q} \rightarrow C_{d}^{\infty}(\Sigma)
$$

defined by the rule

$$
L(q, v ; N, \vec{N})=N\left(S(q)+[x, x] q-K^{2}\right) \otimes|q|^{1 / 2}
$$

[Note: Accordingly, N and $\overrightarrow{\mathrm{N}}$ are merely external variables.]
Heuristics Here is the motivation for this seemingly off the wall definition. Returning to the original setup, let

$$
f=-2 \nabla_{i}\left(\underline{n}_{\nabla_{j}} \underline{n}^{i}-\underline{n}^{i} \nabla_{j} \underline{n}^{j}\right)
$$

Then $f$ is a divergence (on M). So, ignoring boundary terms and all issues of convergence,

$$
\begin{aligned}
& \int_{M} S(g) v o l_{g}=\int_{-\varepsilon}^{\varepsilon} d t \int_{\Sigma}\left(S(g) \circ i_{t}\right) i_{t}^{*}\left(\iota_{\partial / \partial t}{ }^{v o l} g_{g}\right) \\
& =\int_{-\varepsilon}^{\varepsilon} d t \int_{\Sigma}\left(S(g) \circ i_{t}\right) g\left(\underline{n}_{t} \prime \underline{n}_{t}\right) g\left(\partial / \partial t, \underline{n}_{t}\right) v o l_{q_{t}} \\
& =\int_{-\varepsilon}^{\varepsilon} d t \int_{\Sigma}\left(S\left(g_{t}\right) \circ i_{t}\right)(-1) g\left(N_{t} \underline{n}_{t}, n_{t}\right) v^{v o l_{q_{t}}} \\
& =\int_{-\varepsilon}^{\varepsilon} d t \int_{\Sigma} N_{t}\left(S(g) \circ i_{t}\right) v o l_{q_{t}} \\
& =\int_{-\varepsilon}^{\varepsilon} d t \int_{\Sigma} N_{t}\left(S\left(q_{t}\right)+\left[x_{t}, x_{t}\right]_{q_{t}}-K_{t}^{2}+f \circ i_{t}\right) v o l_{q_{t}}
\end{aligned}
$$

$$
\begin{aligned}
= & \int_{-\varepsilon}^{\varepsilon} d t \int_{\Sigma} N_{t}\left(S\left(q_{t}\right)+\left[x_{t}, x_{t}\right]_{q_{t}}-k_{t}^{2}\right) v o l_{q_{t}} \\
& +\int_{M} \text { vol }_{g} \\
= & \int_{-\varepsilon}^{\varepsilon} d t \int_{\Sigma} N_{t}\left(S\left(q_{t}\right)+\left[x_{t}, x_{t}\right]_{q_{t}}-K_{t}^{2}\right) v o l_{q_{t}} \\
= & \int_{-\varepsilon}^{\varepsilon} d t \int_{\Sigma} L\left(q_{t}, \dot{q}_{t} ; N_{t}, \vec{N}_{t}\right) .
\end{aligned}
$$

[Note: Working in adapted coordinates,

$$
\operatorname{vol}_{g}=|g|^{1 / 2} d t \wedge d x^{1} \wedge \ldots \wedge d x^{n-1}
$$

thus

$$
\begin{aligned}
& d t \wedge \iota_{\partial / \partial t^{v o l} g} \\
& =|g|^{1 / 2} d t \wedge \iota_{\partial / \partial t} d t \wedge\left(d x^{1} \wedge \ldots \wedge d x^{n-1}\right) \\
& \quad-|g|^{1 / 2} d t \wedge d t \wedge \varepsilon_{\partial / \partial t}\left(d x^{1} \wedge \ldots \wedge d x^{n-1}\right) \\
& \left.=v o l_{g .}\right]
\end{aligned}
$$

Let

$$
L(q, v ; N, \vec{N})=\int_{\Sigma} L(q, v ; N, \vec{N})
$$

Example: Consider the simplest case: $N=1, \vec{N}=\overrightarrow{0}-$ then

$$
\begin{aligned}
& L(q, v ; 1, \overrightarrow{0})=\int_{\Sigma} L(q, v ; 1, \overrightarrow{0}) \\
& =\int_{\Sigma}\left(S(q)+\left[\frac{v}{2}, \frac{v_{2}}{2}\right]_{q}-\operatorname{tr}_{q}\left(\frac{v}{2}\right)^{2}\right) \mathrm{vol}_{q} \\
& =\frac{1}{4} \int_{\Sigma}\left([\mathrm{v}, \mathrm{v}]_{q}-\operatorname{tr}_{q}(\mathrm{v})^{2}\right) \mathrm{vol}_{\mathrm{q}}-\int_{\Sigma}-\mathrm{S}(\mathrm{q}) \mathrm{vol}_{\mathrm{q}}
\end{aligned}
$$

$$
\begin{aligned}
& =\frac{1}{4} G_{q}(v, v)-V_{-1}(q) \\
& =\frac{1}{2} K_{\frac{1}{n}-1}(q, v)-v_{-1}(q) .
\end{aligned}
$$

Notation: Write

$$
\frac{\delta L}{\delta q_{a b}}=\left(\frac{\delta L}{\delta q}\right)^{a b} \text { and } \frac{\delta L}{\delta v_{a b}}=\left(\frac{\delta L}{\delta v}\right)^{a b} \text {. }
$$

[Note: On general grounds,

$$
\left.\frac{\delta L}{\delta q} \in S_{d}^{2}(\Sigma) \text { and } \frac{\delta L}{\delta v} \in S_{d}^{2}(\Sigma) .\right]
$$

SUBLEMMA We have

$$
\begin{aligned}
& \frac{\delta L}{\delta q_{a b}}=L_{\vec{N}}\left[\left(x^{a b}-K q^{a b}\right) \otimes|q|^{1 / 2}\right] \\
+ & {\left[-2 N\left((x * x)^{a b}-K x^{a b}\right)+\frac{N}{2}([x, x]\right.} \\
q & \left.-K^{2}\right) q^{a b} \\
- & \left.N \bar{G}^{a b}+\left(H_{N}\right)^{a b}-\left(\Delta_{q^{N}} N\right) q^{a b}\right] \otimes|q|^{1 / 2} .
\end{aligned}
$$

SUBLEMMA We have

$$
\frac{\delta L}{\delta v_{a b}}=\left(x^{a b}-K q^{a b}\right) \otimes|q|^{1 / 2}
$$

Consider now the original situation, viz. the triple $\left(q_{t}, N_{t}, \vec{N}_{t}\right)$ $(t \in]-\varepsilon, \varepsilon[)$-- then insertion of this data into the formulas for the functional
derivatives leads to two functions of $t$ :

$$
\frac{\delta L}{\delta q_{a b}}(t) \quad \& \frac{\delta L}{\delta v_{a b}}(t) .
$$

THEOREM $G^{a b}=0$ iff the equations of Lagrange are satisfied, i.e., iff

$$
\frac{\mathrm{d}}{\mathrm{dt}} \frac{\delta L}{\delta \mathrm{v}_{\mathrm{ab}}}(\mathrm{t})=\frac{\delta L}{\delta q_{a b}}(\mathrm{t})
$$

It is a question of first calculating

$$
\frac{\mathrm{d}}{\mathrm{dt}} \frac{\delta L}{\delta \mathrm{v}_{\mathrm{ab}}}(\mathrm{t})
$$

and then comparing terms.
Step 1: From the definitions,

$$
\begin{aligned}
& \frac{d}{d t} \frac{\delta L}{\delta v_{a b}}(t)=\frac{d}{d t}\left(\left(x^{a b}-K q^{a b}\right) \otimes|q|^{1 / 2}\right) \\
& \quad=\frac{d}{d t}\left(x_{c d}\left(q^{a c} q^{b d}-q^{a b} q^{a d}\right) \otimes|q|^{1 / 2}\right)
\end{aligned}
$$

- $\left(\frac{d}{d t} x_{c d}\right) q^{a c} q^{b d}$

$$
\begin{aligned}
& =q^{a c} q^{b d} \dot{x}_{c d} \\
& =\dot{x}^{a b}\left(\neq\left(x^{a b}\right) \cdot\right) .
\end{aligned}
$$

- $x_{o d}\left(\frac{d}{d t} q^{a c}\right) q^{b d}$

$$
=x_{c d}\left(-q^{a u} \dot{q}_{u v} q^{v c}\right) q^{b d}
$$

$$
\begin{aligned}
& =-x_{o d} \dot{q}^{\mathrm{ac}} \mathrm{q}^{\mathrm{bd}} . \\
& \text { - } x_{c d} q^{a c}\left(\frac{d}{d t} q^{b d}\right) \\
& =x_{c d} q^{a c}\left(-q^{b u} \dot{q}_{u v} q^{v d}\right) \\
& =-x_{c d} q^{a c \cdot b d} . \\
& \text { - - }\left(\frac{d}{d t} x_{c d}\right) q^{a b_{q}}{ }^{c d} \\
& =\left(-q^{c d} \dot{x}_{c d}\right) q^{a b} \\
& =-\operatorname{tr}_{q}(\dot{x}) q^{a b} . \\
& \text { - - } x_{c d}\left(\frac{d}{d t} q^{a b}\right) q^{c d} \\
& =-x_{c d}\left(-q^{a u} \dot{q}_{u v} q^{v b}\right) q^{c d} \\
& =x_{c d} \dot{q}^{a b} q^{c d} \text {. } \\
& \text { - }-x_{c d} q^{a b}\left(\frac{d}{d t} q^{c d}\right) \\
& =-x_{c d} q^{a b}\left(-q^{c u} \dot{q}_{u v} q^{v d}\right) \\
& =x_{c d} q^{a b} \cdot{ }_{q}^{c d} . \\
& \text { - }\left(x^{a b}-K q^{a b}\right) \otimes \frac{d}{d t}|q|^{1 / 2} \\
& =\frac{1}{2}\left(x^{a b}-K q^{a b}\right) q^{c d} \dot{q}_{c d} \otimes|q|^{1 / 2} .
\end{aligned}
$$

Summary: We have

$$
\begin{aligned}
& \frac{d}{d t}\left(\left(x^{a b}-K q^{a b}\right) \otimes|q|^{1 / 2}\right) \\
& \quad=\left(\dot{x}^{a b}-t_{q}(\dot{x}) q^{a b}\right) \otimes|q|^{1 / 2} \\
& -x_{c d}\left(\dot{q}^{a c} q^{b d}+q^{a c} \cdot \dot{q}^{b d}-\dot{q}^{a b} q^{c d}-q^{a b \cdot c d}\right) \otimes|q|^{1 / 2} \\
& \quad+\frac{1}{2}\left(x^{a b}-K^{a b}\right) q^{c d} \dot{q}_{c d} \otimes|q|^{1 / 2} .
\end{aligned}
$$

Step 2: Write

$$
\begin{aligned}
& -x_{c d}\left(\dot{q}^{a c} q^{b d}+q^{a c} \dot{q}^{b d}-\dot{q}^{a b} q^{c d}-q^{a b \cdot c d}\right) \\
& =-x_{c d}\left(2 N x^{a c}+\left(L_{\vec{N}} q\right)^{a c}\right) q^{b d} \\
& -x_{c d}\left(2 N x^{b d}+\underset{\vec{N}}{\left(L_{M}\right)}{ }^{b d}\right) q^{a c} \\
& +x_{c d}\left(2 N x^{a b}+\underset{\vec{N}}{\left.\left(L_{q}\right)^{a b}\right)} q^{c d}\right. \\
& +x_{c d}\left(2 \mathrm{Nx}\left(\underset{\vec{N}}{\mathrm{Cd}}+\underset{\left(\mathrm{L}^{\mathrm{N}}\right.}{ }{ }^{\mathrm{Cd}}\right) q^{a b} .\right.
\end{aligned}
$$

28. 

$$
\begin{aligned}
& \left(L_{\vec{N}}\right)^{b d}=q^{b u}\left(L_{\vec{N}} q_{w v}\right) q^{\text {vd }}=-\mathcal{L}_{\vec{N}} q^{b d} \\
& \underset{\vec{N}}{\left(L_{N}\right)}{ }^{a b}=q^{a u}\left(L_{\vec{N}} q_{w v}\right) q^{v b}=-L_{\vec{N}} q^{a b}
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& -x_{c d}\left(\dot{q}^{a c} q^{b d}+q^{a c} \dot{q}^{b d}-\dot{q}^{a b} q^{c d}-q^{a b} \cdot c d\right) \\
& =-2 \mathrm{~N} x_{c d} x^{x^{a c}}{ }_{q}^{b d}-2 N x_{c d} x^{b^{b d}} q^{a c} \\
& +2 N x_{c d} x^{a b} q^{c d}+2 N x_{c d} x^{c d} q^{a b} \\
& +x_{c d}\left(\left(L_{\vec{N}} q^{a c}\right) q^{b d}+\left(L_{\vec{N}} q^{b d}\right) q^{a c}-\left(\underset{\vec{N}}{\left(L^{a b}\right.}\right) q^{c d}-\left(L_{\vec{N}} q^{c d}\right) q^{a b}\right) \\
& =-4 \mathrm{~N}(x * x)^{\mathrm{ab}}+2 \mathrm{NK} x^{\mathrm{ab}}+2 \mathrm{~N}[x, x] q^{\mathrm{ab}} \\
& +x_{c d_{\vec{N}}}\left(q^{a c} q^{b d}-q^{a b} q^{c d}\right) .
\end{aligned}
$$

Next

$$
\begin{aligned}
& \frac{1}{2}\left(x^{a b}-K^{a b}\right) q^{c d} \dot{q}_{c d} \\
& =\frac{1}{2}\left(x^{a b}-K q^{a b}\right) q^{c d}\left(2 N x c_{c d}+L_{\vec{N}}^{q_{c d}}\right)
\end{aligned}
$$

$$
\begin{aligned}
&= N\left(x^{a b}-K q^{a b}\right) q^{c d} x_{c d} \\
&+\frac{1}{2}\left(x^{a b}-K q^{a b}\right) q^{c d}\left(N_{c ; d}+N_{d ; c}\right) \\
&=N\left(x^{a b}-K q^{a b}\right) K+\left(x^{a b}-K q^{a b}\right) \bar{\nabla}_{c} N^{c}
\end{aligned}
$$

Summary: We have

$$
\begin{aligned}
& \frac{d}{d t}\left(\left(x^{a b}-K q^{a b}\right) \otimes|q|^{1 / 2}\right) \\
& =\left(\dot{x}^{a b}-\operatorname{tr}_{q}(\dot{x}) q^{a b}\right) \otimes|q|^{1 / 2} \\
& -\left(4 N(x * x)^{a b}-2 N K x^{a b}-2 N[x, x] q^{q} q^{a b}\right) \otimes|q|^{1 / 2} \\
& +x_{c d_{\vec{N}}}{ }_{\vec{N}}\left(q^{a c} q_{q}^{b d}-q^{a b} q^{c d}\right) \otimes|q|^{1 / 2} \\
& +N\left(x^{a b}-K q^{a b}\right) K \otimes|q|^{1 / 2}+\left(x^{a b}-K q^{a b}\right) \bar{\nabla}_{C} N^{c} \otimes|q|^{1 / 2} \\
& =\left(\dot{x}^{a b}-\operatorname{tr}_{q}(\dot{x}) q^{a b}\right) \otimes|q|^{1 / 2} \\
& -\left(4 N(x * x)^{a b}-3 N K x^{a b}-2 N[x, x] q^{a b}+N^{2} q^{a b}\right) \otimes|q|^{1 / 2} \\
& +x_{o d}{ }_{\vec{N}}\left(q^{a c} q^{b d}-q^{a b} q^{c d}\right) \otimes|q|^{l / 2} \\
& +\left(x^{a b}-K_{q}^{a b}\right) \bar{\nabla}_{c} N^{c} \otimes|q|^{1 / 2} .
\end{aligned}
$$

The final point is to note that

$$
L_{\vec{N}}\left(x^{a b}-K q^{a b}\right)
$$

$$
\begin{aligned}
& ={\underset{\vec{N}}{ } L_{c d}\left(x_{c d}\left(q^{a c} q^{b d}-q^{a b} q^{c d}\right)\right)}_{=}^{\left(L_{\vec{N}} x_{c d}\right)\left(q^{a c_{q} b d}-q^{a b} q^{c d}\right)} \\
& \quad \\
& \quad+x_{c d_{\vec{N}}}^{L_{\vec{N}}}\left(q^{a c} q^{b d}-q^{a b_{q} c d}\right)
\end{aligned}
$$

Since $\bar{\nabla}_{C} N^{C}=\operatorname{div}_{q} \vec{N}^{\prime}$, it follows that

$$
\begin{aligned}
x_{c d} L_{\vec{N}} & \left(q^{a c_{q} b d}-q^{a b} q^{c d}\right) \otimes|q|^{1 / 2} \\
& +\left(x^{a b}-K^{a b}\right) \bar{\nabla}_{c} N^{c} \otimes|q|^{1 / 2} \\
= & L_{\vec{N}}\left[\left(x^{a b}-\left(K q^{a b}\right) \otimes|q|^{1 / 2}\right]\right. \\
& \quad-\left(L_{\vec{N}}^{x} c d\right)\left(q^{a c} q_{q}^{b d}-q^{a b} q^{c d}\right) \otimes|q|^{1 / 2} .
\end{aligned}
$$

Observation:

$$
\begin{aligned}
& \left.\int^{-\quad q^{a c} q^{b d}} \underset{\vec{N}}{\left(L_{X d} x\right.}\right)=\underset{\vec{N}}{\left(L_{1} x\right)^{a b}} \\
& \left.q^{c d} \underset{\vec{N}}{(L, x}{ }_{c d}\right) q^{a b}=\operatorname{tr}_{q^{(L)}}^{\left(L_{N}\right)} q^{a b} .
\end{aligned}
$$

Taking the preceding considerations into account, we then find that

$$
\frac{\mathrm{d}}{\mathrm{dt}} \frac{\delta L}{\delta \mathrm{v}_{\mathrm{ab}}}(\mathrm{t})=\frac{\delta L}{\delta q_{a b}}(\mathrm{t})
$$

iff

$$
\dot{x}^{a b}-\operatorname{tr}_{q}(\dot{x}) q^{a b}=\left(L_{\vec{N}} x\right)^{a b}-\operatorname{tr}_{q}\left(L_{\vec{N}} x\right) q^{a b}
$$

$$
\begin{gathered}
+2 N(x * x)^{a b}-N K x^{a b}-\frac{3}{2} N[x, x] q^{a b}+\frac{1}{2} N K^{2} q^{a b} \\
-N \bar{G}^{a b}+\left(H_{N}\right)^{a b}-\left(\Delta_{q} N\right) q^{a b}
\end{gathered}
$$

which is equivalent to the assertion of the theorem.
One can also arrive at the constraint equations by demanding that $\forall t$,

$$
\left[\begin{array}{rl}
\frac{\delta L}{\delta N} & =0 \\
\frac{\delta L}{\delta \vec{N}} & =0
\end{array}\right.
$$

relationships which should be expected to hold on purely formal grounds (due to the absence of the corresponding velocities in the definition of L ).
[Note: Here

$$
\left[\begin{array}{l}
\frac{\delta L}{\delta N} \in C_{d}^{\infty}(\Sigma) \\
\left.\frac{\delta L}{\Delta N} \in \Lambda_{d}^{1}(\Sigma) .\right]
\end{array}\right.
$$

Ad $\frac{\delta L}{\delta N}:$ we have

$$
\begin{aligned}
& \left.\frac{d}{d \varepsilon} L\left(q, v ; N+\varepsilon N^{\prime} ; \vec{N}\right)\right|_{\varepsilon=0} \\
= & \left.\int_{\Sigma} \frac{d}{d \varepsilon} L\left(q, v ; N+\varepsilon N^{\prime}, \vec{N}\right)\right|_{\varepsilon=0^{*}}
\end{aligned}
$$

- $\left.\frac{d}{d \varepsilon}\left(N+\varepsilon N^{\prime}\right) S(q)\right|_{\varepsilon=0}$

$$
=N^{\prime} S(q)
$$

- $\left.\frac{d}{d \varepsilon}\left(N+\varepsilon N^{\prime}\right)[x, x] q\right|_{\varepsilon=0}$

$$
=\left.\frac{d}{d \varepsilon}\left(N+\varepsilon N^{\prime}\right)\left[\frac{v-L_{\vec{N}} q}{2\left(N+\varepsilon N^{\prime}\right)}, \frac{v-L_{\vec{N}} q}{2\left(N+\varepsilon N^{\prime}\right)}\right]\right|_{\varepsilon=0}
$$

$$
=\left.\frac{d}{d \varepsilon} \frac{1}{4\left(N+\varepsilon N^{\prime}\right)}\left[v-L_{\vec{N}} q, v-L_{\vec{N}} q\right] q\right|_{\varepsilon=0}
$$

$$
=-\frac{1}{4} \frac{\mathrm{~N}^{\prime}}{\mathrm{N}^{2}}\left[v-{\underset{\mathrm{N}}{ }}_{L_{\vec{N}}}, v-{\underset{\mathrm{N}}{ }}_{L_{\mathrm{N}}}\right]_{q}
$$

$$
=-N^{\prime}[x, x]_{q^{*}}
$$

- $\left.\frac{\mathrm{d}}{\mathrm{d} \varepsilon}\left(\mathrm{N}+\mathrm{E}^{\prime}\right)\left(-\mathrm{K}^{2}\right)\right|_{\varepsilon=0}$

$$
=-\left.\frac{d}{d \varepsilon}\left(N+\varepsilon N^{\prime}\right) \operatorname{tr}_{q}(x)^{2}\right|_{\varepsilon=0}
$$

$$
=-\left.\frac{\mathrm{d}}{\mathrm{~d} \varepsilon}\left(\mathrm{~N}+\varepsilon \mathrm{N}^{\prime}\right)\left[\mathrm{q}, \frac{\mathrm{v}-\mathrm{L}_{\overrightarrow{\mathrm{N}}} \mathrm{q}}{2\left(\mathrm{~N}+\varepsilon \mathrm{N}^{\prime}\right)}\right]_{q}^{2}\right|_{\varepsilon=0}
$$

$$
=-\left.\frac{d}{d \varepsilon} \frac{1}{4\left(N+\varepsilon N^{\prime}\right)}\left[q, v-L_{\vec{N}} q\right]_{q}^{2}\right|_{\varepsilon=0}
$$

33. 

$$
\begin{aligned}
& =\frac{1}{4} \frac{N^{\prime}}{N^{2}}\left[q, v-L_{\vec{N}} q\right]_{q}^{2} \\
& =N^{\prime} \operatorname{tr}_{q}(x)^{2} \\
& =N^{\prime} K^{2} .
\end{aligned}
$$

Thus

$$
\frac{\delta L}{\delta N}=\left(S(q)-[x, x]{ }_{q}+K^{2}\right) \otimes|q|^{1 / 2}
$$

and so

$$
\frac{\delta L}{\delta N}(t)=0 \Leftrightarrow \cdot\left(\left[x_{t}, x_{t}\right]_{q_{t}}-k_{t}^{2}\right)-s\left(q_{t}\right)=0
$$

Ad $\frac{\delta L}{\delta \vec{N}}$ : We have

$$
\begin{aligned}
& \left.\frac{d}{d \varepsilon} L\left(q, v ; N, \vec{N}+\varepsilon \vec{N}^{\prime}\right)\right|_{\varepsilon=0} \\
& =\left.\int_{\Sigma} \frac{d}{d \varepsilon} L\left(q, v ; N, \vec{N}+\varepsilon \vec{N}^{\prime}\right)\right|_{\varepsilon=0^{*}}
\end{aligned}
$$

- $\left.N \frac{d}{d \varepsilon}\left[\frac{v-L_{\vec{N}}+\varepsilon \vec{N}^{\prime}}{2 N}, \frac{v-L_{\vec{N}}+\varepsilon \vec{N}^{q}}{2 N}\right]_{q}\right|_{\varepsilon=0}$

$$
=\mathrm{N} \frac{\mathrm{~d}}{\mathrm{~d} \varepsilon} \frac{1}{{(2 \mathrm{~N})^{2}}^{2}}\left(-\left[\mathrm{v}, \mathrm{~L}_{\varepsilon \vec{N}^{\prime}} \mathrm{q}\right]_{\mathrm{q}}+{\underset{\overrightarrow{\mathrm{N}}}{ } \mathrm{~L}_{\varepsilon \vec{N}^{\prime}} \mathrm{q}, \mathrm{~L}_{\mathrm{q}}}_{\mathrm{q}}^{\mathrm{q}}\right.
$$

$$
-\left[L_{\varepsilon \vec{N}^{\prime}} q, v\right]_{q}+\left.\left[L_{\varepsilon \vec{N}^{\prime}} q, L_{\vec{N}}^{q]} q\right)\right|_{\varepsilon=0}
$$

$$
=-\left[x, \stackrel{L}{\mathrm{~N}}^{\prime}, \mathrm{q}\right]_{\mathrm{q}}
$$

$$
\Rightarrow
$$

$$
\int_{\Sigma}-\left[x, L_{\vec{N},} q\right] q^{\otimes|q|^{1 / 2}}
$$

$$
=-<L_{\vec{N}^{\prime}} q_{n} x^{\#} \otimes|q|^{1 / 2}>
$$

$$
=2<\vec{N}^{\prime}, \operatorname{div}_{q} x \otimes|q|^{1 / 2}>
$$

$$
\cdot-\left.\mathrm{N} \frac{\mathrm{~d}}{\mathrm{~d} \varepsilon}\left[q, \frac{\mathrm{v}-L_{\vec{N}}+\varepsilon \vec{N}^{\prime}}{2 \mathrm{~N}}\right]_{q}^{q}\right|_{\varepsilon=0}
$$

$$
=-\left.2 N[q, x] q \frac{d}{d \varepsilon}\left[q,-\frac{L_{\varepsilon \vec{N}^{\prime}}}{2 N}\right]\right|_{\varepsilon=0}
$$

$$
=[q, x]_{q}\left[q_{, L_{\vec{N}}},\right]_{q}
$$

$$
=\operatorname{tr}_{q}(x)\left[q, L_{\vec{N}}, q\right] q
$$

$$
=K\left[q, L_{\vec{N}}, q\right]_{q}
$$

$$
\begin{aligned}
& =-\left.\frac{\mathrm{d}}{\mathrm{~d} \varepsilon}\left[\mathrm{x}_{\mathrm{L}}^{\mathrm{L}} \underset{\varepsilon \vec{N}^{\prime}}{ } \mathrm{q}\right]\right|_{\varepsilon=0}
\end{aligned}
$$

$$
\begin{aligned}
& \Rightarrow \\
& \int_{\Sigma} K\left[q, L_{\vec{N} \cdot}, q\right] q^{\otimes|q|^{1 / 2}} \\
& =\int_{\Sigma} K^{i j}\left(\bar{\nabla}_{j}\left(\vec{N}^{\prime}\right)_{i}+\bar{\nabla}_{i}\left(\vec{N}^{\prime}\right)_{j}\right){ }^{\mathrm{Vol}}{ }_{q} \\
& =\int_{\Sigma} K\left(\bar{\nabla}_{j}\left(\vec{N}^{\prime}\right)^{j}+\bar{\nabla}_{i}\left(\vec{N}^{\prime}\right)^{i}\right) \operatorname{vol}_{q} \\
& =2 \int_{\Sigma} \mathrm{Kdiv}_{\mathrm{q}} \overrightarrow{\mathrm{~N}}^{\prime \mathrm{VOl}_{q}} \\
& =-2 \int_{\Sigma} \vec{N}^{\prime} \mathrm{Kvol}_{q} \\
& =-2 \delta_{\Sigma} d K\left(\vec{N}^{\prime}\right){ }^{\text {vol }}{ }_{q} \\
& =-2 \int_{\Sigma}\left(\operatorname{div}_{q} \mathrm{Kq}\right)\left(\vec{N}^{\prime}\right) \mathrm{Vol}_{\mathrm{q}} \\
& \left.=-\left.2\left\langle\vec{N}^{\prime}, \operatorname{div}_{q} K q \otimes\right| q\right|^{1 / 2}\right\rangle .
\end{aligned}
$$

Thus

$$
\frac{\delta L}{\delta \vec{N}}=2\left(\operatorname{div}_{q} x-\operatorname{div}_{q} K q\right) \otimes|q|^{1 / 2}
$$

and so

$$
\frac{\delta L}{\delta \vec{N}}(t)=0 \Leftrightarrow \operatorname{div}_{q_{t}}\left(x_{t}-K_{t} q_{t}\right)=0 .
$$

Section 37: Dynamics Let $M$ be a connected $C^{\infty}$ manifold of dimension $n>2$. Fix $\varepsilon(0<\varepsilon \leq \infty)$ and assume that

$$
M=]-\varepsilon, \varepsilon[\times \Sigma,
$$

where $\Sigma$ is compact and orientable (hence $\operatorname{dim} \Sigma=n-1$ ).
Suppose given a triple $\left(q_{t}, N_{t}, \vec{N}_{t}\right)(t \in]-\varepsilon, \varepsilon[)$ (subject to the customary stipulations).

Definition: The momentum of the theory is the path $t \rightarrow p_{t}$ in $S_{d}^{2}(\Sigma)$ defined by the prescription

$$
p_{t}=\pi_{t} \otimes\left|q_{t}\right|^{1 / 2},
$$

where

$$
\pi_{t}=\left(x_{t}-k_{t} q_{t}\right)^{\#}
$$

[Note: The motivation lying behind the definition of $\pi_{t}$ is the fact that

$$
\frac{\delta L}{\delta v}=p .
$$

Here $p$ stands for $\pi^{\#} \otimes|q|^{1 / 2}$ with $\left.\pi=x-\mathrm{Kq}.\right]$
One can then reformulate the results from the last section along the following lines.

Constraint Equations These are the relations

$$
\left[\begin{array}{c}
\left(\left[\pi_{t}, \pi_{t}\right] q_{t}-\frac{1}{n-2} t r_{q_{t}}\left(\pi_{t}\right)^{2}-s\left(q_{t}\right)\right) \otimes\left|q_{t}\right|^{1 / 2}=0 \\
\operatorname{div}_{q_{t}} p_{t}=0
\end{array}\right.
$$

Evolution Equations These are the relations

$$
\dot{q}_{t}=2 N_{t}\left(\pi_{t}^{b}-\frac{1}{n-2} \operatorname{tr}_{q_{t}}\left(\pi_{t}^{b}\right) q_{t}\right)+L_{\vec{N}_{t}} q_{t}
$$

and

$$
\begin{aligned}
\dot{p}_{t}= & -2 N_{t}\left(\pi_{t} \pi_{t}-\frac{1}{n-2} \operatorname{tr}_{q_{t}}\left(\pi_{t}\right) \pi_{t}\right) \otimes\left|q_{t}\right|^{1 / 2} \\
+ & \frac{N_{t}}{2}\left(\left[\pi_{t}, \pi_{t}\right]_{q_{t}}-\frac{1}{n-2} t r_{q_{t}}\left(\pi_{t}\right)^{2}\right) q_{t}^{\#} \otimes\left|q_{t}\right|^{1 / 2} \\
& -N_{t}{ }^{\operatorname{Ein}\left(q_{t}\right)^{\#} \otimes\left|q_{t}\right|^{1 / 2}} \\
+ & \left(H_{N_{t}}-\left(\Delta_{q_{t}} N_{t}\right) q_{t}\right)^{\#} \otimes\left|q_{t}\right|^{1 / 2}+L_{\vec{N}_{t}} p_{t} .
\end{aligned}
$$

THEOREM Ein $(g)=0$ iff the constraint equations and the evolution equations are satisfied by the pair $\left(q_{t}, p_{t}\right)$.

Derivatives Given a function $F: T^{*} Q \rightarrow C_{d}^{\infty}(\Sigma)$, define

$$
{ }^{\mathrm{D}}(\mathrm{q}, \Lambda) \mathrm{F}: S_{2}(\Sigma) \times S_{d}^{2}(\Sigma) \rightarrow C_{d}^{\infty}(\Sigma)
$$

by

$$
\begin{aligned}
& \left(\mathrm{D}(\mathrm{q}, \Lambda)^{F}\right)\left(\mathrm{v}, \Lambda^{\prime}\right)=\left.\frac{d}{d \varepsilon} F\left(q+\varepsilon v, \Lambda+\varepsilon \Lambda^{\prime}\right)\right|_{\varepsilon=0} \\
= & \left.\frac{d}{d \varepsilon} F(\mathrm{q}+\varepsilon \mathrm{v}, \Lambda)\right|_{\varepsilon=0}+\left.\frac{d}{d \varepsilon} F\left(q, \Lambda+\varepsilon \Lambda^{\prime}\right)\right|_{\varepsilon=0^{\prime}}
\end{aligned}
$$

Write

$$
\left\{\begin{array}{l}
\quad D_{q^{\prime}} F(q, \Lambda) v=\left.\frac{d}{d \varepsilon} F(q+\varepsilon v, \Lambda)\right|_{\varepsilon=0} \\
\quad D_{\Lambda} F(q, \Lambda) \Lambda^{\prime}=\left.\frac{d}{d \varepsilon} F\left(q, \Lambda+\varepsilon \Lambda^{\prime}\right)\right|_{\varepsilon=0}
\end{array}\right.
$$

and put

$$
F(q, \Lambda)=\int_{\Sigma} F(q, \Lambda)
$$

Then

$$
\left[\begin{array}{l}
\left.\frac{d}{d \varepsilon} F(q+\varepsilon v, \Lambda)\right|_{\varepsilon=0}=\int_{\Sigma} D_{q} F(q, \Lambda) v=\left\langle v, \frac{\delta F}{\delta q}\right\rangle \\
\left.\quad \frac{d}{d \varepsilon} F\left(q, \Lambda+\varepsilon \Lambda^{\prime}\right)\right|_{\varepsilon=0}=\int_{\Sigma} D_{\Lambda} F(q, \Lambda) \Lambda^{\prime}=\left\langle\frac{\delta F}{\delta \Lambda^{\prime}} \Lambda^{\prime}\right\rangle
\end{array}\right.
$$

provided, of course, that the relevant functional derivatives exist.
[Note: Analogous conventions are used in other situations as well, e.g., if instead $\left.\mathrm{F}: \mathrm{T}^{*} \mathrm{Q} \rightarrow \Lambda_{\mathrm{d}}^{1}(\Sigma).\right]$

Define a function $H: T^{\star} Q \rightarrow C_{d}^{\infty}(\Sigma)$ by

$$
H(q, \Lambda)=\left([s, s]_{q}-\frac{1}{n-2} \operatorname{tr}_{q}(s)^{2}-s(q)\right) \otimes|q|^{1 / 2}
$$

if $\Lambda=s^{\#} \otimes|q|^{1 / 2}$ and for any $f \in C^{\infty}(\Sigma)$, put

$$
H_{f}(q, \Lambda)=\int_{\Sigma} f H(q, \Lambda)
$$

LEMMA We have

$$
\begin{aligned}
& D_{q} H(q, \Lambda) v=2\left([v, s * s]_{q}-\frac{1}{n-2} \operatorname{tr}_{q}(s)[v, s]_{q}\right) \otimes|q|^{1 / 2} \\
& -\frac{1}{2}\left([s, s]_{q}-\frac{1}{n-2} \operatorname{tr}_{q}(s)^{2}\right) \operatorname{tr}_{q}(v) \otimes|q|^{1 / 2} \\
& \quad+q\left[_{2}^{0}\right](v, \operatorname{Ein}(q)) \otimes|q|^{1 / 2} \\
& \quad+\left(\Delta_{q} \operatorname{tr}_{q}(v)+\delta_{q} \operatorname{div}_{q} v\right) \otimes|q|^{1 / 2}
\end{aligned}
$$

and

$$
D_{\Lambda} H(q, \Lambda) \Lambda^{\prime}=2\left(e v\left(s, \Lambda^{\prime}\right)-\frac{1}{n-2} \operatorname{tr}_{q}(s) e v\left(q, \Lambda^{\prime}\right)\right)
$$

So, as a corollary,

$$
\begin{aligned}
\frac{\delta H_{f}}{\delta q}= & 2 f\left(s \star s-\frac{1}{n-2} \operatorname{tr}_{q}(s) s\right)^{\#} \otimes|q|^{1 / 2} \\
& -\frac{f}{2}\left([s, s]_{q}-\frac{1}{n-2} \operatorname{tr}_{q}(s)^{2}\right) q^{\#} \otimes|q|^{1 / 2} \\
& +\operatorname{fEin}(q)^{\#} \otimes|q|^{1 / 2} \\
& -\left(H_{f}-\left(\Delta_{q} f\right) q\right)^{\#} \otimes|q|^{1 / 2}
\end{aligned}
$$

and

$$
\frac{\delta H_{f}}{\delta \Lambda}=2 f\left(s-\frac{1}{n-2} \operatorname{tr}_{q}(s) q\right)
$$

Define a function $I: T^{*} Q \rightarrow \Lambda_{d}^{1}(\Sigma)$ by

$$
I(q, \Lambda)=-2 \operatorname{div}_{q} \Lambda
$$

Each $X \in \mathcal{D}^{1}(\Sigma)$ thus gives rise to a map $I_{X}: T^{*} Q \rightarrow C_{d}^{\infty}(\Sigma)$, viz.

$$
I_{X}(q, \Lambda)=-2 \operatorname{div}_{q} \Lambda(X) \quad(=\operatorname{ev}(X, I(q, \Lambda)))
$$

Let

$$
I_{X}(q, \Lambda)=\int_{\Sigma} I_{X}(q, \Lambda)
$$

Then

$$
\left.\right|_{-\frac{\delta I_{X}}{\delta q}=-L_{X} \Lambda} \begin{aligned}
& \frac{\delta I_{X}}{\delta \Lambda}=L_{X} q^{\prime}
\end{aligned}
$$

[Note: Recall that

$$
\left.L_{X} \Lambda=L_{X} s^{\#} \otimes|q|^{1 / 2}+s^{\#} \otimes\left(\operatorname{div}_{q} X\right)|q|^{J / 2} .\right]
$$

Heuristics $T$ see the origin of the preceding definitions, consider the fiber derivative of $L$ :

$$
\left[\begin{array}{l}
F L: T Q \rightarrow T^{\star} Q \\
F L(q, v)=\left(q, \frac{\delta L}{\delta v}\right) .
\end{array}\right.
$$

Then

$$
\begin{aligned}
& \left\langle v, \frac{\delta L}{\delta v}\right\rangle-L(q, v ; N, \vec{N}) \\
& =\left\langle 2 N x, \frac{\delta L}{\delta v}\right\rangle+\left\langle L_{\vec{N}} q, \frac{\delta L}{\delta v}\right\rangle-L(q, v ; N, \vec{N}) .
\end{aligned}
$$

But

$$
\begin{aligned}
&\left.<2 \mathrm{~N} x, \frac{\delta L}{\delta \mathrm{v}}\right\rangle=\int_{\Sigma}[2 \mathrm{~N} x, x-\mathrm{Kq}]_{q} \mathrm{vol}_{\mathrm{q}} \\
&=2 \int_{\Sigma} N\left([x, x]_{q}-\mathrm{K}^{2}\right) \mathrm{vol}_{\mathrm{q}} \\
& \Rightarrow
\end{aligned}
$$

$$
\begin{aligned}
& =2 \int_{\Sigma} N\left([x, x]_{q}-K^{2}\right) \mathrm{vol}_{q} \\
& \quad-\int_{\Sigma} N\left(S(q)+[x, x]_{q}-\mathrm{K}^{2}\right) \mathrm{vol}_{q} \\
& =\int_{\Sigma} N\left([x, x]_{q}-K^{2}-S(q)\right) \operatorname{vol}_{q}
\end{aligned}
$$

$$
\begin{aligned}
& =\int_{\Sigma} N\left([\pi, \pi]_{q}+(3-n) K^{2}-K^{2}-S(q)\right) \mathrm{vol}_{q} \\
& =\int_{\Sigma} N\left([\pi, \pi]_{q}+(2-n) K^{2}-S(q)\right) \mathrm{vol}_{q} \\
& =\int_{\Sigma} N\left([\pi, \pi]_{q}-\frac{1}{n-2} \operatorname{tr}_{q}(\pi)^{2}-S(q)\right) \mathrm{vol}_{q} \\
& =\int_{\Sigma} N\left(\left[\pi^{b}, \pi^{b}\right]_{q}-\frac{1}{n-2} \operatorname{tr}_{q}\left(\pi^{b}\right)^{2}-S(q)\right) \mathrm{vol}_{q} \\
& =H_{N}(q, p) .
\end{aligned}
$$

As for the term involving the Lie derivative,

$$
\begin{aligned}
& \left\langle\underset{\vec{N}}{L_{\vec{N}}}, \frac{\delta L}{\delta v}>\right. \\
& \left.=\left.\left\langle{\underset{\vec{N}}{ }} q,(x-K q)^{\#} \otimes\right| q\right|^{1 / 2}\right\rangle \\
& =-2<\overrightarrow{\mathrm{N}}, \operatorname{div}_{\mathrm{q}}(x-\mathrm{Kq}) \otimes|\mathrm{q}|^{1 / 2}> \\
& =\left\langle\overrightarrow{\mathrm{N}},-2 \operatorname{div}_{\mathrm{q}} \mathrm{p}\right\rangle \\
& =\int_{\Sigma}-2 \operatorname{div}_{\mathrm{q}} \mathrm{p}(\overrightarrow{\mathrm{~N}}) \\
& =\int_{\Sigma} I_{\vec{N}}(q, p) \\
& =I_{\vec{N}}(q, p) \text {. }
\end{aligned}
$$

FACT $\forall X \in D^{1}(\Sigma)$,

$$
\left[\begin{array}{l}
\left(D_{\left.(q, \Lambda)^{H}\right)\left(L_{X} q, L_{X} \Lambda\right)=L_{X}(H(q, \Lambda))}^{\left(D_{\left.(q, \Lambda)^{I}\right)\left(L_{X} q, L_{X} \Lambda\right)}=L_{X}(I(q, \Lambda))\right.} .\right.
\end{array}\right.
$$

[Note: Keep in mind that

$$
\left[\begin{array}{l}
D_{(q, \Lambda)^{H}}^{H} S_{2}(\Sigma) \times S_{d}^{2}(\Sigma) \rightarrow C_{d}^{\infty}(\Sigma) \\
D_{\left.(q, \Lambda)^{I}: S_{2}(\Sigma) \times S_{d}^{2}(\Sigma) \rightarrow \Lambda_{d}^{1}(\Sigma) .\right]}
\end{array}\right.
$$

Let

$$
H_{f, X}(q, \Lambda)=H_{f}(q, \Lambda)+I_{X}(q, \Lambda)
$$

Then the hamiltonian vector field

$$
\mathrm{z}_{\mathrm{f}, \mathrm{X}}: Q \times s_{\mathrm{d}}^{2}(\Sigma) \rightarrow s_{2}(\Sigma) \times s_{\mathrm{d}}^{2}(\Sigma)
$$

on $T^{*} Q$ corresponding to $H_{f, X}$ is characterized by the condition

$$
\Omega\left(\mathrm{z}_{\mathrm{f}, \mathrm{X}^{\prime}}-\right)=\mathrm{dH} \mathrm{f}, \mathrm{X}
$$

and can be represented in terms of functional derivatives:

$$
\mathrm{z}_{\mathrm{f}, \mathrm{x}}(\mathrm{q}, \Lambda)=\left(\frac{\delta H_{\mathrm{f}, \mathrm{X}}}{\delta \Lambda},-\frac{\delta H_{f, x}}{\delta q}\right)
$$

Now specialize and take $f=N_{t}, X=\vec{N}_{t}$. Replacing $(q, \Lambda)$ by $\left(q_{t}, p_{t}\right)$, the evolution equations state that

$$
\left(\dot{q}_{t}, \dot{p}_{t}\right)=z_{N_{t}, \vec{N}_{t}}\left(q_{t}, p_{t}\right)
$$

Otherwise said: The curve

$$
t \rightarrow\left(q_{t}, p_{t}\right) \in T^{*} Q
$$

is an integral curve for Z

$$
N_{t}, \vec{N}_{t} \cdot
$$

Definition: Let $t \rightarrow f(t)$ be a path in $C_{>0}^{\infty}(\Sigma)$ (or $C_{<0}^{\infty}(\Sigma)$ ) and let $t \rightarrow X(t)$ be a path in $D^{1}(\Sigma)$-- then a curve $t \rightarrow(q(t), \Lambda(t))$ in $T^{*} Q$ is said to satisfy the evolution equations if

$$
\begin{aligned}
\dot{q} & =\frac{\delta H_{f, X}}{\delta \Lambda} \\
\dot{\Lambda} & =-\frac{\delta H_{f, x}}{\delta q}
\end{aligned}
$$

[Note: Here $t$ lies in some open interval centered at the origin.] Example: If $\operatorname{Ein}(g)=0$, then the curve $t \rightarrow\left(q_{t}, p_{t}\right)$ satisfies the evolution equations, where

$$
\left[\begin{array}{l}
f(t)=N_{t} \\
X(t)=\vec{N}_{t}
\end{array}\right.
$$

LEMMA Under the conditions of the preceding definition, along $(q(t), \Lambda(t))$, we have

$$
\left[\begin{array}{l}
\frac{d H}{d t}=-\frac{1}{f(t)} \delta_{q(t)}\left(f(t)^{2} I(q(t), \Lambda(t))\right)+L_{X(t)}(H(q(t), \Lambda(t))) \\
\frac{d I}{d t}=(d f(t)) \otimes H(q(t), \Lambda(t))+L_{X(t)} I(q(t), \Lambda(t))
\end{array}\right.
$$

or, in brief,
9.

$$
\left[\begin{array}{l}
\frac{d H}{d t}=-\frac{1}{E} \delta_{q}\left(f^{2} I\right)+L_{X} H \\
\frac{d I}{d t}=(d f) H+L_{X} I .
\end{array}\right.
$$

We shall first consider $\frac{d H}{d t}$ :

$$
\begin{aligned}
\frac{d H}{d t}= & \frac{d}{d t} H(q(t), \Lambda(t)) \\
= & \left(D_{\left.(q, \Lambda)^{H}\right)(\dot{q}, \dot{\Lambda})}\right. \\
= & \left(D_{\left.(q, \Lambda)^{H}\right)}\left(\frac{\delta H_{f}}{\delta \Lambda},-\frac{\delta H_{f}}{\delta q}\right)\right. \\
& +\left(D_{(q, \Lambda)}^{H)}\left(\frac{\delta I_{X}}{\delta \Lambda},-\frac{\delta I_{X}}{\delta q}\right) .\right.
\end{aligned}
$$

But

$$
\left[\begin{array}{l}
\frac{\delta I_{X}}{\delta \Lambda}=L_{x} q \\
\frac{\delta I_{x}}{\delta q}=-L_{x} \Lambda .
\end{array}\right.
$$

Therefore

$$
\begin{aligned}
& \text { (D }_{\left.(\mathrm{q}, \Lambda)^{H}\right)}\left(\frac{\delta I_{X}}{\delta \Lambda},-\frac{\delta I_{X}}{\delta q}\right) \\
& \quad=\left(D_{\left.(q, \Lambda)^{H}\right)\left(L_{X} q^{\prime} L_{X} \Lambda\right)}\right. \\
& =L_{X}(H(q, \Lambda)) .
\end{aligned}
$$

It remains to deal with

$$
\left(D_{(q, \Lambda)}^{H)}\left(\frac{\delta H_{f}}{\delta \Lambda},-\frac{\delta H_{f}}{\delta q}\right)\right.
$$

or still,

$$
D_{q} H(q, \Lambda)\left(\frac{\delta H_{f}}{\delta \Lambda}\right)-D_{\Lambda} H(q, \Lambda)\left(\frac{\delta H_{f}}{\delta q}\right)
$$

or still,

$$
\begin{aligned}
& \left(\Delta_{q} \operatorname{tr}_{q}\left(\frac{\delta H_{f}}{\delta \Lambda}\right)+\delta_{q} \operatorname{div}_{q}\left(\frac{\delta H_{f}}{\delta \Lambda}\right)\right) \otimes|q|^{1 / 2} \\
& +D_{\Lambda} H(q, \Lambda)\left(\left(H_{f}-\left(\Delta_{q} f\right) q\right)^{\#} \otimes|q|^{1 / 2}\right)
\end{aligned}
$$

or still,

$$
\begin{aligned}
& \Delta_{q} \operatorname{tr}_{q}\left(2 f\left(\operatorname{tr}_{q}(s)-\frac{1}{n-2} \operatorname{tr}_{q}(s) \operatorname{tr}_{q}(q)\right)\right) \otimes|q|^{1 / 2} \\
& +\delta_{q} \operatorname{div}_{q}\left(2 f\left(s-\frac{1}{n-2} \operatorname{tr}_{q}(s) q\right)\right) \otimes|q|^{1 / 2} \\
& +2 \operatorname{ev}\left(s_{1}\left(H_{f}-\left(\Delta_{q} f\right) q\right)^{\#} \otimes|q|^{1 / 2}\right) \\
& \quad-\frac{2}{n-2} \operatorname{tr}_{q}(s) e v\left(q,\left(H_{f}-\left(\Delta_{q} f\right) q\right)^{\#} \otimes|q|^{1 / 2}\right) \\
& = \\
& \quad-\frac{2}{n-2} \Delta_{q}\left(\operatorname{ttr}_{q}(s)\right) \otimes|q|^{1 / 2} \\
& \quad+\delta_{q} \operatorname{div}_{q}(2 f s) \otimes|q|^{1 / 2} \\
& -\frac{2}{n-2} \delta_{q} \operatorname{div}_{q}\left(f t_{q}(s) q\right) \otimes|q|^{1 / 2} \\
& +2\left[s, H_{f}\right]_{q} \otimes|q|^{l / 2}-2\left(\Delta_{q} f\right) t r_{q}(s) \otimes|q|^{1 / 2}
\end{aligned}
$$

$$
-\frac{2}{n-2} \operatorname{tr}_{q}(s) \operatorname{tr}_{q}\left(H_{f}\right) \otimes|q|^{1 / 2}+\frac{2 n-2}{n-2}\left(\Delta_{q} f\right) \operatorname{tr}_{q}(s) \otimes|q|^{1 / 2}
$$

Since

$$
\begin{aligned}
\delta_{q} \operatorname{div}_{q} & \left(f \operatorname{tr}_{q}(\mathrm{~s}) \mathrm{q}\right) \\
& \left.=\delta_{q} d^{\left(f t r_{q}\right.}(\mathrm{s})\right) \\
& =-\Delta_{q}\left(f \operatorname{tr}_{q}(\mathrm{~s})\right)
\end{aligned}
$$

and

$$
\operatorname{tr}_{q}\left(H_{f}\right)=\Delta_{q} f
$$

matters reduce to

$$
\begin{aligned}
& -\frac{2}{n-2} \Delta_{q}\left(f t r_{q}(s)\right) \otimes|q|^{1 / 2} \\
& +\delta_{q} \operatorname{div}_{q}(2 f s) \otimes|q|^{1 / 2}+2\left[s, H_{f}\right]_{q} \otimes|q|^{1 / 2} \\
& +\frac{2}{n-2} \Delta_{q}\left(f \operatorname{tr}_{q}(s)\right) \otimes|q|^{1 / 2} \\
& +\left(\Delta_{q} f\right) \operatorname{tr}_{q}(s)\left[-2-\frac{2}{n-2}+\frac{2 n-2}{n-2}\right] \otimes|q|^{1 / 2}
\end{aligned}
$$

or still,

$$
\delta_{q} \operatorname{div}_{q}(2 f s) \otimes|q|^{1 / 2}+2\left[s, H_{f}\right]_{q} \otimes|q|^{1 / 2}
$$

$$
\delta_{\mathrm{q}} \operatorname{div}_{\mathrm{q}}(\mathrm{fs})=-\left[\mathrm{s}, \mathrm{H}_{\mathrm{f}}\right]_{\mathrm{q}}+\frac{1}{\mathrm{f}} \delta_{\mathrm{q}}\left(\mathrm{f}^{2} \operatorname{div}_{\mathrm{q}} \mathrm{~s}\right)
$$

[Start by writing

$$
\begin{aligned}
-\delta_{q} \operatorname{div}_{q}(f s) & =\bar{\nabla}^{a}\left(\operatorname{div}_{q}(f s)\right)_{a} \\
& =\bar{\nabla}^{a} \bar{\nabla}^{b}(f s) \\
& =\left(f s^{a b}\right) ; a ; b \\
& =\left(f ; a^{a b}+f s_{; a}^{a b} ; b\right. \\
& =f ; a ; b^{s^{a b}}+f ; a^{s} ; b+\left(f s_{; a}^{a b}\right) ; b \\
& =\left[s, H_{f}\right] q+f ; a^{s} ; b+\left(f s_{; a b}^{a b} ; b\right.
\end{aligned}
$$

But

$$
\begin{aligned}
& f ; a^{s} ; b \\
&\left(f s_{; a}^{a b}\right) ; b \\
&=f ; a^{a b} ; b+f ; b^{s} ; a+f s_{; a ; b}^{a b} \\
&=f ; a^{a b} ; b+f ; a^{a b} ; b+f s_{; a ; b}^{a b} \\
&=2 f ; a^{a b} ; b+f s ; a ; b .
\end{aligned}
$$

On the other hand,

$$
\begin{aligned}
-\delta_{q}\left(f^{2} \operatorname{div}_{q} s\right) & =\bar{\nabla}^{\mathrm{a}}\left(\mathrm{f}^{2} \mathrm{div}_{q} s\right) a \\
& =\bar{\nabla}_{\mathrm{a}}\left(\mathrm{f}^{2} \mathrm{div}_{q} s\right)^{a}
\end{aligned}
$$

$$
\begin{gathered}
=\left(f^{2} \operatorname{div}_{q} s\right)_{; a}^{a} \\
=\left(f^{2}\right) ; a^{\left(\operatorname{div}_{q} s\right)^{a}+f^{2}\left(\operatorname{div}_{q} s\right)_{; a}^{a}} \\
=(2 f) f ; a^{s} ; b+f^{2} s_{; a ; b}^{a b} .
\end{gathered}
$$

Therefore

$$
\left.\delta_{\mathrm{q}} \operatorname{div}_{\mathrm{q}}(\mathrm{fs})=-\left[\mathrm{s}, \mathrm{H}_{\mathrm{f}}\right]_{\mathrm{q}}+\frac{1}{\mathrm{f}} \delta_{\mathrm{q}}\left(\mathrm{f}^{2} \operatorname{div}_{\mathrm{q}} \mathrm{~s}\right) .\right]
$$

Accordingly,

$$
\begin{aligned}
& \left(\delta_{q} \operatorname{div}_{q}(2 f s)+2\left[s, H_{f}\right]_{q}\right) \otimes|q|^{1 / 2} \\
& \quad=\frac{1}{f} \delta_{q}\left(2 f^{2} \operatorname{div}_{q} s\right) \otimes|q|^{1 / 2} \\
& \quad=\frac{1}{f} \delta_{q}\left(f^{2} 2 \operatorname{div}_{q} s \otimes|q|^{1 / 2}\right) \\
& \quad=-\frac{1}{f} \delta_{q}\left(f^{2}\left(-2 \operatorname{div}_{q} \Lambda\right)\right) \\
& \quad=-\frac{1}{f} \delta_{q}\left(f^{2} I(q, \Lambda)\right)
\end{aligned}
$$

This establishes the formula for $\frac{d H}{d t}$. Turning to $\frac{d I}{d t}$, fix $Y \in D^{1}(\Sigma)$-- then

$$
\begin{gathered}
\left\langle Y, \frac{d I}{d t}\right\rangle=\left\langle Y, \frac{d}{d t} I(q(t), \Lambda(t))\right\rangle \\
=\langle Y,(D(q, \Lambda) I)(\dot{q}, \dot{\Lambda})\rangle \\
=-<f_{,}\left(D(q, \Lambda)^{H}\right)\left(L_{Y} q, L_{Y} \Lambda\right)>
\end{gathered}
$$

$$
\begin{aligned}
& -<X,\left(D(q, \Lambda)^{I}\right)\left(L_{Y} q_{1} L_{Y}\right)> \\
= & -<f, L_{Y}(H(q, \Lambda))>-<X, L_{Y}(I(q, \Lambda))> \\
= & -\int_{\Sigma}\left[f L_{Y}(H(q, \Lambda))+\operatorname{ev}\left(X, L_{Y}(I(q, \Lambda))\right)\right] \\
= & \int_{\Sigma}\left[\left(L_{Y} f\right) H(q, \Lambda)+\operatorname{ev}\left(L_{Y} X, I(q, \Lambda)\right)\right] \\
= & \int_{\Sigma}\left[Y(d f) H(q, \Lambda)-\operatorname{ev}\left(L_{X} Y, I(q, \Lambda)\right)\right] \\
= & \int_{\Sigma}\left[e v(Y,(d f) H(q, \Lambda))+e v\left(Y, L_{X} I(q, \Lambda)\right)\right] \\
= & \int_{\Sigma} \operatorname{ev}\left(Y,(d f) H(q, \Lambda)+L_{X} I(q, \Lambda)\right) \\
= & <Y,(d f) H(q, \Lambda)+L_{X} I(q, \Lambda)>.
\end{aligned}
$$

The formula for $\frac{d I}{d t}$ thus follows, $Y$ being arbitrary.
[Note: Integration by parts has been used several times and can be justified in the usual way.]

Poisson Brackets Given functions $\mathrm{F}_{1}, \mathrm{~F}_{2}: T^{*} \mathrm{Q} \rightarrow \mathrm{C}_{\mathrm{d}}^{\infty}(\Sigma)$, put

$$
\left[\begin{array}{l}
F_{1}(q, \Lambda)=\int_{\Sigma} F_{1}(q, \Lambda) \\
F_{2}(q, \Lambda)=\int_{\Sigma} F_{2}(q, \Lambda)
\end{array}\right.
$$

and let

$$
\Gamma_{-} \begin{aligned}
& \mathrm{z}_{1} \\
& \mathrm{z}_{2}
\end{aligned}
$$

be the corresponding hamiltonian vector fields:

$$
\left[\begin{array}{l}
\mathrm{z}_{1}(q, \Lambda)=\left(\frac{\left.\delta F_{1},-\frac{\delta F_{1}}{\delta \Lambda}\right)}{\delta q}\right) \\
\mathrm{z}_{2}(q, \Lambda)=\left(\frac{\delta F_{2}}{\delta \Lambda},-\frac{\delta F_{2}}{\delta q}\right)
\end{array}\right.
$$

Then the Poisson bracket of $F_{1}, F_{2}$ is the function

$$
\left\{F_{1}, F_{2}\right\}: T * Q \rightarrow R
$$

defined by the rule

$$
\left\{F_{1}, F_{2}\right\}(q, \Lambda)=\Omega\left(Z_{1}(q, \Lambda), Z_{2}(q, \Lambda)\right)
$$

Therefore

$$
\begin{aligned}
\left\{F_{1}, F_{2}\right\} & =\left\langle\frac{\delta F_{1}}{\delta \Lambda},-\frac{\delta F_{2}}{\delta q}\right\rangle-\left\langle\frac{\delta F_{2}}{\delta \Lambda},-\frac{\delta F_{1}}{\delta q}\right\rangle \\
& =\left\langle\frac{\delta F_{2}}{\delta \Lambda}, \frac{\delta F_{1}}{\delta q}\right\rangle-\left\langle\frac{\delta F_{1}}{\delta \Lambda}, \frac{\delta F_{2}}{\delta q}\right\rangle
\end{aligned}
$$

[Note: Tacitly, it is assumed that the functional derivatives exist.]

LEMMA Let $F: T^{*} Q \rightarrow C_{d}^{\infty}(\Sigma)$-- then, in the presence of the evolution equations, along ( $q(t), \Lambda(t)$ ), we have

$$
\frac{d F}{d t}=\left\{F, H_{f, x}\right\}
$$

[In fact,

$$
\frac{d F}{d t}=\int_{\Sigma} \frac{d}{d t} F(q(t), \Lambda(t))
$$

$$
\begin{aligned}
& \left.=\int_{\Sigma}{ }^{(D}(q, \Lambda) F\right)(\dot{q}, \dot{\Lambda}) \\
& =\int_{\Sigma} D_{q} F(q, \Lambda) \dot{q}+\int_{\Sigma} D_{\Lambda} F(q, \Lambda) \dot{\Lambda} \\
& =\left\langle\dot{q}, \frac{\delta F}{\delta q}\right\rangle+\left\langle\frac{\delta F}{\delta \Lambda}, \dot{\Lambda}\right\rangle \\
& =\left\langle\frac{\delta H_{f, X}}{\delta \Lambda}, \frac{\delta F}{\delta q}\right\rangle+\left\langle\frac{\delta F}{\delta \Lambda^{\prime}},-\frac{\delta H_{f, X}}{\delta q}\right\rangle \\
& =\left\langle\frac{\delta H_{f, X}}{\delta \Lambda}, \frac{\delta F}{\delta q}\right\rangle-\left\langle\frac{\delta F}{\delta \Lambda}, \frac{\delta H_{f, X}}{\delta q}\right\rangle \\
& \left.=\left\{F, H_{f, x}\right\} .\right]
\end{aligned}
$$

THEOREM Suppose that $f_{1}, f_{2} \in C^{\infty}(\Sigma)$ and $X_{1}, X_{2} \in \mathcal{D}^{1}(\Sigma)$ - then

$$
\begin{aligned}
& \left\{H_{f_{1}}, X_{1}, H_{f_{2}}, X_{2}\right\}=\int_{\Sigma}\left(L_{X_{1}} f_{2}-L_{X_{2}} f_{1}\right) H \\
& +\int_{\Sigma} \operatorname{ev}\left(f_{1}\left(\operatorname{grad} f_{2}\right)-f_{2}\left(\operatorname{grad} f_{1}\right), I\right) \\
& \quad+\int_{\Sigma} \operatorname{ev}\left(\left[x_{1}, X_{2}\right], I\right) .
\end{aligned}
$$

[Fix a point $\left(q_{0}, \Lambda_{0}\right)$ and take $f_{2}$ in $C_{>0}^{\infty}(\Sigma)$. Choose paths $t \rightarrow f_{2}(t)$ in $C_{>0}^{\infty}(\Sigma)$ and $t \rightarrow X_{2}(t)$ in $D^{I}(\Sigma)$ such that $f_{2}(0)=f_{2}, X_{2}(0)=x_{2}$. Let $t \rightarrow(q(t), \Lambda(t))$ be the curve in $T^{*} Q$ satisfying the evolution equations subject to $(q(0), \Lambda(0))=$ $\left(q_{0}, \Lambda_{0}\right)$-- then along $(q(t), \Delta(t))$, we have

$$
\left\{H_{f_{1}}, x_{1}, H_{f_{2}}, x_{2}\right\}
$$

$$
\begin{aligned}
& =\frac{d}{d t} H_{f_{1}}, X_{1} \\
& =\frac{\mathrm{d}}{\mathrm{dt}} \int_{\Sigma}\left(\mathrm{f}_{1} \mathrm{H}+\mathrm{I}_{\mathrm{X}_{1}}\right) \\
& =\int_{\Sigma}\left(f_{1} \frac{d H}{d t}+\frac{d}{d t} I_{x_{1}}\right) \\
& =\int_{\Sigma} f_{1}\left(-\frac{1}{f_{2}} \delta_{q}\left(f_{2}^{2}\right)+L_{X_{2}}{ }^{H}\right) \\
& \left.\left.+\int_{\Sigma} \mathrm{ev}^{\left(\mathrm{X}_{1},(\mathrm{df}\right.} \mathrm{F}_{2}\right) \mathrm{H}+\mathrm{L}_{\mathrm{X}_{2}} \mathrm{I}\right) \\
& =\int_{\Sigma}\left(L_{X_{1}} f_{2}-L_{X_{2}} f_{1}\right) H \\
& -\delta_{\Sigma} \frac{f_{1}}{f_{2}} \delta_{q}\left(f_{2}^{2}{ }^{\mathrm{I}}\right) \\
& +\int_{\Sigma} \operatorname{ev}\left(\left[X_{1}, X_{2}\right] \text {, } \mathrm{I}\right) .
\end{aligned}
$$

And (cf. infra)

$$
\begin{aligned}
& -\int_{\Sigma} \frac{f_{1}}{f_{2}} \delta_{q}\left(f_{2}^{2}{ }^{\mathrm{I}}\right) \\
& =\int_{\Sigma} \mathrm{ev}\left(\mathrm{f}_{1}\left(\operatorname{grad}_{\mathrm{q}} \mathrm{f}_{2}\right)-\mathrm{f}_{2}\left(\operatorname{grad}_{\mathrm{q}} \mathrm{f}_{1}\right), \mathrm{I}\right) .
\end{aligned}
$$

Setting $t=0$ completes the proof when $f_{2}$ is strictly positive. Assume now that $\mathrm{f}_{2}$ is arbitrary. Fix $\mathrm{C}>0: \mathrm{f}_{2}+\mathrm{C} \in \mathrm{C}_{>0}^{\infty}(\Sigma)$-- then

$$
\left\{\mathrm{H}_{\mathrm{f}_{1}, \mathrm{x}_{1}},{ }^{\prime \mathrm{f}_{2}+\mathrm{C}, \mathrm{x}_{2}}{ }^{\}}\right.
$$

$$
=\left\{H_{f_{1}}, X_{1}, H_{f_{2}}, X_{2}\right\}+\left\{H_{f_{1}}, X_{1}, H_{C, 0}\right\}
$$

or still,

$$
\begin{aligned}
& \left\{\mathrm{H}_{\mathrm{f}_{1}}, \mathrm{X}_{1}, \mathrm{H}_{\mathrm{f}_{2}}, \mathrm{X}_{2}\right\} \\
& =\left\{\mathrm{H}_{\mathrm{F}_{1}}, \mathrm{X}_{1}, \mathrm{H}_{\mathrm{f}_{2}+\mathrm{C}, \mathrm{X}_{2}}\right\}-\left\{\mathrm{H}_{\mathrm{I}_{1}}, \mathrm{X}_{1}, \mathrm{H}_{\mathrm{C}, 0}\right\} \\
& =\int_{\Sigma}\left(L_{X_{1}}\left(f_{2}+C\right)-L_{X_{2}}{ }^{f}{ }_{1}\right) H \\
& +\int_{\Sigma} \operatorname{ev}\left(f_{1} \operatorname{grad}\left(f_{2}+C\right)-\left(f_{2}+C\right) \operatorname{grad} f_{1}, I\right) \\
& +\int_{\Sigma} \mathrm{ev}\left(\left[\mathrm{X}_{1}, \mathrm{X}_{2}\right], I\right) \\
& -\int_{\Sigma} \mathrm{ev}\left(-\operatorname{Cgrad} \mathrm{f}_{1}, I\right) \\
& =\int_{\Sigma}\left(L_{X_{1}} f_{2}-L_{X_{2}} f_{1}\right) H \\
& +\int_{\Sigma} \mathrm{ev}\left(\mathrm{f}_{1}\left(\operatorname{grad} f_{2}\right)-\mathrm{f}_{2}\left(\operatorname{grad} f_{1}\right), I\right) \\
& \left.+\int_{\Sigma} \operatorname{ev}\left(\left[X_{1}, X_{2}\right], I\right) .\right]
\end{aligned}
$$

[Note: There are results in PDE theory that guarantee existence (and uniqueness) of solutions to the evolution equations, a fact which was taken for granted in the above. This accounts for the initial restriction on $f_{2}$.]

Details At a point $(q, \Lambda)$,

$$
\begin{aligned}
& -\int_{\Sigma} \frac{f_{1}}{f_{2}} \delta_{q}\left(f_{2}^{2} I(q, \Lambda)\right) \\
& =\int_{\Sigma} \frac{f_{1}}{f_{2}} \delta_{q}\left(2 f_{2}^{2} \operatorname{div}_{q} s\right){ }^{\mathrm{vol}}{ }_{q} \\
& =2 \int_{\Sigma} q\left[l_{1}^{0}\right]\left(d\left(\frac{f}{f_{2}}\right), f_{2}^{2} \operatorname{div}_{q} s\right) \operatorname{vol}_{q} \\
& =2 \int_{\Sigma} q\left[\begin{array}{l}
0 \\
l_{1}
\end{array}\left(\frac{f_{2}\left(d f_{1}\right)-f_{1}\left(d f_{2}\right)}{f_{2}^{2}}, f_{2}^{2} \operatorname{div}_{q} s\right){ }^{v o l}{ }_{q}\right. \\
& =2 \int_{\Sigma} q\left[\begin{array}{l}
0 \\
1
\end{array}\right]\left(f_{2}\left(d f_{1}\right)-f_{1}\left(d f_{2}\right), \operatorname{div}_{q} s\right) \operatorname{vol}_{q} \\
& =2 \int_{\Sigma}\left(\operatorname{div}_{q} s\right)\left(f_{2}\left(\operatorname{grad}_{q} f_{1}\right)\right) \operatorname{vol}_{q} \\
& -2 \int_{\Sigma}\left(\operatorname{div}_{q} s\right)\left(f_{1}\left(\operatorname{grad}_{q} f_{2}\right)\right) \operatorname{vol}_{q} \\
& =2 \int_{\Sigma} \operatorname{div}_{q} \Lambda\left(f_{2}\left(\operatorname{grad}_{q} f_{1}\right)\right) \\
& -2 \int_{\Sigma} \operatorname{div}_{q} \Lambda\left(f_{1}\left(\operatorname{grad}_{q} f_{2}\right)\right) \operatorname{vol}_{q} \\
& =\int_{\Sigma} \operatorname{ev}\left(f_{1}\left(\operatorname{grad}_{q} f_{2}\right)-f_{2}\left(\operatorname{grad}_{q} f_{1}\right), I(q, \Delta)\right) .
\end{aligned}
$$

$$
\begin{aligned}
& \left\{\int_{\Sigma} f H, \int_{\Sigma} I_{X}\right\}=-\int_{\Sigma}\left(L_{X} f\right) H \\
& \left\{\int_{\Sigma} f_{1} H, \int_{\Sigma} f_{2} H\right\}=\int_{\Sigma} \operatorname{ev}\left(f_{1}\left(\operatorname{grad} f_{2}\right)-f_{2}\left(\operatorname{grad} f_{1}\right), I\right)
\end{aligned}
$$

$$
\left.\left\{\int_{\Sigma} I_{x_{1}}, \delta_{\Sigma} I_{x_{2}}\right\}=\delta_{\Sigma} I_{\left[x_{1}\right.}, \mathrm{x}_{2}\right] .
$$

These relations can also be derived directly, i.e., without an appeal to the evolution equations.

The first formula is easy to establish:

$$
\begin{aligned}
& \left\{\int_{\Sigma} \mathrm{fH}, \int_{\Sigma} \mathrm{I}_{\mathrm{X}}\right\}(\mathrm{q}, \Lambda) \\
& =\left\langle\frac{\delta I_{X}}{\delta \Lambda}, \frac{\delta H_{f}}{\delta q}\right\rangle-\left\langle\frac{\delta H_{f}}{\delta \Lambda}, \frac{\delta I_{X}}{\delta q}\right\rangle \\
& =\left\langle L_{X} q^{\delta}, \frac{\delta H_{f}}{\delta q}\right\rangle+\left\langle\frac{\delta H_{f}}{\delta \Lambda}, L_{X} \Lambda\right\rangle \\
& =\int_{\Sigma}{ }^{f D_{q}}{ }_{q}(\mathrm{q}, \Lambda)\left(L_{X} \mathrm{q}\right)+\int_{\Sigma} \mathrm{fD}_{\Lambda} \mathrm{H}(\mathrm{q}, \Lambda)\left(\mathrm{L}_{\mathrm{X}} \Lambda\right) \\
& =\int_{\Sigma} f\left(\mathrm{D}(\mathrm{q}, \Lambda)^{H}\right)\left(L_{X} \mathrm{q}^{\prime} \mathrm{L}_{\mathrm{X}}{ }^{\Lambda}\right) \\
& =\int_{\Sigma} f L_{X}(H(q, \Lambda)) \\
& =-\int_{\Sigma}\left(L_{X} f\right) H(q, \Lambda) .
\end{aligned}
$$

To discuss the second, let

$$
\left.\right|_{-} ^{H_{1}=H_{f_{1}}} \begin{aligned}
& H_{2}=H_{f_{2}}
\end{aligned}
$$

and write
21.

$$
\left[\begin{array}{l}
\frac{\delta H_{1}}{\delta q}=f_{1} A-\left(H_{f_{1}}-\left(\Delta_{q} f_{1}\right) q\right)^{\#} \otimes|q|^{1 / 2} \\
\frac{\delta H_{2}}{\delta q}=f_{2} A-\left(H_{f_{2}}-\left(\Delta_{q} f_{2}\right) q\right)^{\#} \otimes|q|^{1 / 2}
\end{array}\right.
$$

Then

$$
\begin{aligned}
& \left\{\int_{\Sigma} f_{1} H, \int_{\Sigma} f_{2} H\right\}(q, \Lambda) \\
& =\left\langle\frac{\delta H_{2}}{\delta \Lambda}, \frac{\delta H_{1}}{\delta q}\right\rangle-\left\langle\frac{\delta H_{1}}{\delta \Lambda}, \frac{\delta H_{2}}{\delta q}\right\rangle \\
& =<2 f_{2}\left(s-\frac{1}{n-2} \operatorname{tr}_{q}(s) q\right), f_{1} A-\left(H_{f_{1}}-\left(\Delta_{q_{1}} f_{1}\right) q\right)^{\#} \otimes|q|^{1 / 2}> \\
& -<2 f_{l}\left(s-\frac{l}{n-2} \operatorname{tr}_{q}(s) q\right), f_{2} A-\left(H_{f_{2}}-\left(\Delta_{q} f_{2}\right) q\right)^{\#} \otimes|q|^{1 / 2}> \\
& =<2 f_{1} f_{2}\left(s-\frac{1}{n-2} \operatorname{tr}_{q}(s) q\right), A>-<2 f_{1} f_{2}\left(s-\frac{1}{n-2} \operatorname{tr}_{q}(s) q\right), A> \\
& \left.-2 \int_{\Sigma} f_{2}\left(H_{f_{1}}-\left(\Delta_{q} f_{l}\right) q\right)^{\#}\left(s-\frac{1}{n-2} \operatorname{tr}_{q}(s) q\right)\right)_{q o l}^{q} \\
& +2 \int_{\Sigma} f_{l}\left(H_{f_{2}}-\left(\Delta_{q} f_{2}\right) q\right)^{\#}\left(s-\frac{l}{n-2} \operatorname{tr}_{q}(s) q\right) \operatorname{vol}_{q} \\
& =-2 \int_{\Sigma} f_{2}\left(\nabla^{a} \nabla^{b} f_{1}-q^{a b} \nabla^{c} \nabla_{c} f_{1}\right)\left(s_{a b}-\frac{1}{n-2} \operatorname{tr}_{q}(s) q_{a b}\right) \operatorname{vol}_{q} \\
& +2 \int_{\Sigma} f_{1}\left(\nabla^{a} b^{b} f_{2}-q^{a b} \nabla_{\nabla} \nabla_{c} f_{2}\right)\left(s_{a b}-\frac{l}{n-2} \operatorname{tr}_{q}(s) q_{a b}\right) v o l_{q} \\
& =2 \int_{\Sigma}\left[f_{1} \nabla \nabla^{a} b_{f_{2}}-f_{2} \nabla{ }^{a} \nabla^{b_{f}}{ }_{1}\right] s_{a b}{ }^{v o l}{ }_{q}
\end{aligned}
$$

$$
\begin{aligned}
& +2 \int_{\Sigma} f_{2} \nabla^{c} \nabla_{c} f_{1}\left(q^{a b} s_{a b}-\frac{1}{n-2} \operatorname{tr}_{q}(s) q^{a b} q_{a b}\right) v o l q \\
& -2 \int_{\Sigma} f_{1} \nabla^{c} \nabla_{c} f_{2}\left(q^{a b} S_{a b}-\frac{1}{n-2} \operatorname{tr}_{q}(s) q^{a b} q_{a b}\right) \text { vol }_{q} \\
& +\frac{2}{n-2} \int_{\Sigma}\left(f_{2} q_{a b} \nabla \nabla^{a^{b}} f_{1}\right) \operatorname{tr}_{q}(s) \operatorname{vol}_{q} \\
& -\frac{2}{n-2} \int_{\Sigma}\left(f_{1} q_{a b} \nabla^{a} \nabla^{b} f_{1}\right) \operatorname{tr}_{q}(s) \operatorname{vol}_{q} \\
& =2 \int_{\Sigma}\left[f_{1} \nabla^{\left.\mathrm{a} \nabla^{\mathrm{b}} \mathrm{f}_{2}-\mathrm{f}_{2} \nabla^{\mathrm{a}} \nabla^{\mathrm{b}} \mathrm{f}_{1}\right] \mathrm{s}_{a b}{ }^{\mathrm{vol}}{ }_{q}, ~}\right. \\
& -\frac{2}{n-2} \int_{\Sigma}\left(f_{2} \nabla^{C} \nabla_{C} f_{1}\right) t r_{q}(s) \operatorname{vol}_{q} \\
& +\frac{2}{n-2} \int_{\Sigma}\left(f_{1} \nabla^{c} \nabla_{c} f_{2}\right) t r_{q}(s) \operatorname{vol}_{q} \\
& +\frac{2}{n-2} \int_{\Sigma}\left(f_{2} \nabla^{a_{\nabla_{a}}} f_{1}\right) t r_{q}(s) v o l_{q} \\
& -\frac{2}{n-2} \int_{\Sigma}\left(f_{1} \nabla^{a^{\nabla_{a}} f_{2}}\right) \operatorname{tr}_{q}(s){ }^{v o l_{q}} \\
& =2 \int_{\Sigma}\left[f_{1} \nabla^{a} \nabla^{b} f_{2}-f_{2} \nabla^{\left.a_{0}{ }^{b} f_{1}\right] s_{a b}{ }^{v o l}{ }_{q}}\right. \\
& =\int_{\Sigma}\left[\nabla_{a}\left(f_{1} \nabla_{b} f_{2}-f_{2} \nabla_{b} f_{1}\right)+\nabla_{b}\left(f_{1} \nabla_{a} f_{2}-f_{2} \nabla_{a} f_{1}\right)\right] s^{a b} V_{V O} \\
& \left.=\int_{\Sigma} s^{a b} L_{\left(f_{1}\left(\operatorname{grad}_{q} f_{2}\right)\right.}-f_{2}\left(\operatorname{grad}_{q} f_{1}\right)\right) q_{a b} \operatorname{vol}_{q}
\end{aligned}
$$

$$
\begin{aligned}
& =<L_{\left(f_{1}\left(\operatorname{grad}_{q} f_{2}\right)-f_{2}\left(\operatorname{grad}_{q} f_{1}\right)\right)} q^{\prime}, s^{\#} \otimes|q|^{1 / 2}> \\
& =-2<f_{1}\left(\operatorname{grad}_{q} f_{2}\right)-f_{2}\left(\operatorname{grad}_{q} f_{1}\right), \operatorname{div}_{q} s \otimes|q|^{1 / 2}> \\
& =\int_{\Sigma} \operatorname{ev}\left(f_{1}\left(\operatorname{grad}_{q} f_{2}\right)-f_{2}\left(\operatorname{grad}_{q} f_{1}\right), I(q, \Lambda)\right) .
\end{aligned}
$$

As for the third formula, we have

$$
\begin{aligned}
& \left\{\int_{\Sigma} I_{X_{1}}, \int_{\Sigma} I_{X_{2}}\right\}(q, \Lambda) \\
& =\left\langle\frac{{ }^{\delta I_{X_{2}}}}{\delta \Lambda}, \frac{{ }^{\delta I_{X_{1}}}}{\delta q}\right\rangle-\left\langle\frac{{ }^{\delta I_{X_{1}}}}{\delta \Lambda}, \frac{{ }^{\delta I_{X_{2}}}}{\delta q}\right\rangle \\
& =<L_{X_{2}} q,-L_{X_{1}}{ }^{\Lambda>}>-<L_{X_{1}}{ }^{q},-L_{X_{2}}{ }^{\Lambda}> \\
& =-\int_{\Sigma}\left(L_{X_{1}} \Lambda\right)\left(L_{X_{2}} q\right)+\int_{\Sigma}\left(L_{X_{2}}{ }^{\Lambda}\right)\left(L_{X_{1}} q\right) \\
& =\int_{\Sigma} \Lambda\left(L_{X_{1}} L_{X_{2}}{ }^{q}\right)-\int_{\Sigma} \Lambda\left(L_{X_{2}} L_{X_{1}}{ }^{q}\right) \\
& =\int_{\Sigma} \Lambda\left(\left(L_{X_{1}} L_{X_{2}}-L_{X_{2}} L_{1}\right) q\right) \\
& =\int_{\Sigma} \Lambda\left(L_{\left[x_{1}, x_{2}\right]}^{q}\right) \\
& =-2 \int_{\Sigma} \operatorname{div}_{q} \Lambda\left(\left[\mathrm{X}_{1}, \mathrm{X}_{2}\right]\right) \\
& =\int_{\Sigma} I_{\left[X_{1}, X_{2}\right]}(\mathrm{q}, \Lambda) .
\end{aligned}
$$

Remark: The set whose elements are the $H_{f, X}$ is a vector space over $\underline{R}$ but it is not closed under the Poisson bracket operation since

$$
\left\{H_{f_{1}}, H_{f_{2}}\right\}(q, \Lambda)=\int_{\Sigma} e v\left(f_{1}\left(\operatorname{grad}_{q} f_{2}\right)-f_{2}\left(\operatorname{grad}_{q} f_{1}\right), I(q, \Lambda)\right)
$$

and the vector field

$$
f_{1}\left(\operatorname{grad}_{q} f_{2}\right)-f_{2}\left(\operatorname{grad}_{q} f_{1}\right)
$$

depends on $q$. On the other hand, the set whose elements are the $I_{X}$ is a vector space over R which is closed under the Poisson bracket operation:

$$
\left.\left\{I_{x_{1}}, I_{x_{2}}\right\}=I_{\left[x_{1}\right.}, x_{2}\right]
$$

So, in view of the Jacobi identity

$$
\left\{I_{\mathrm{x}_{1}},\left\{I_{\mathrm{x}_{2}}, I_{\mathrm{x}_{3}}\right\}\right\}+\left\{I_{\mathrm{x}_{2}},\left\{I_{\mathrm{x}_{3}}, I_{\mathrm{x}_{1}}\right\}\right\}+\left\{I_{\mathrm{x}_{3}},\left\{I_{\mathrm{x}_{1}}, I_{\mathrm{x}_{2}}\right\}\right\}=0
$$

it is a Lie algebra over R. The arrow $X \rightarrow I_{X}$ is thus a homomorphism of Lie algebras.

Let

$$
\left\{\begin{aligned}
\mathrm{Con}_{\mathrm{H}} & =\left\{(\mathrm{q}, \Lambda) \in \mathrm{T}^{*} \mathrm{Q}: \mathrm{H}(\mathrm{q}, \Lambda)=0\right\} \\
\mathrm{Con}_{\mathrm{D}} & =\left\{(\mathrm{q}, \Lambda) \in \mathrm{T}^{*} \mathrm{Q}: I(\mathrm{I}, \Lambda)=0\right\}
\end{aligned}\right.
$$

Then

$$
\mathrm{Con}_{\mathrm{Q}}=\mathrm{Con}_{\mathrm{H}} \mathrm{CCOn}_{\mathrm{D}} \mathrm{CT} \mathrm{~T}_{\mathrm{Q}}
$$

is called the physical phase space of the theory.
[Note: The constraint equations imply that $\left.\forall t,\left(q_{t}, p_{t}\right) \in C o n_{Q}.\right]$ Remark: $C o n_{Q}$ is not a submanifold of $T^{*} Q$.

A function

$$
F=\int_{\Sigma} F \quad\left(F: T^{*} Q \rightarrow C_{d}^{\infty}(\Sigma)\right)
$$

is said to be a constraint if

$$
F \mid \mathrm{Con}_{Q}=0
$$

In particular: The

$$
\left.\right|_{-} \begin{aligned}
& H_{f} \\
& \\
& I_{X}
\end{aligned}
$$

are constraints, these being termed primary.
Observation: The Poisson bracket of two primary constraints is a constraint.
[Note: In traditional terminology, this says that $G R$ is a first class system.]

Section 38: Causality In this section we shall provide a proofless summary of the relevant facts.

Let $M$ be a connected $C^{\infty}$ manifold of dimension $n>2$.
Rappel: If $M$ is noncompact or if $M$ is compact and has zero Euler characteristic, then $M_{1, n-1}$ is not empty.

Assume henceforth that $M$ is noncompact. Fix $g \in M_{1, n-1}$-- then the pair ( $M, g$ ) is said to be a spacetime if $M$ is orientable and time orientable (i.e., admits a timelike vector field).

Remark: The tangent space $T_{X} M$ at a given $x \in M$ is $\underline{R}^{1, n-1}$. Therefore a vector $X \in T_{X} M$ is timelike if $g_{x}(X, X)<0$, lightlike if $g_{x}(X, X)=0$, and spacelike if $g_{X}(X, X)>0$. The complement in $T_{X} M$ of the closure of the spacelike points has two components ("timecones") and there is no intrinsic way to distinguish them. If one of these cones is singled out and called the future cone $V_{+}(x)$, then $T_{x} M$ is said to be time oriented. A timelike or lightlike vector in or on $\mathrm{V}_{+}(\mathrm{x})$ is said to be future directed. The other cone is denoted by $\mathrm{V}_{-}(\mathrm{x})$. A timelike or lightlike vector in or on $V_{-}(x)$ is said to be past directed.
[Note: If $T$ is a timelike vector field, then $T_{X} M$ can be time oriented by specifying the time cone containing $T_{x}$.]

Assume henceforth that ( $M, g$ ) is a spacetime.
FACI Let $g_{1}, g_{2} \in M_{1, n-1}$. Suppose that $\forall x \in M \& \forall x \in T_{x} M^{\prime}$,

$$
\left(g_{1}\right)_{x}(X, X)=0 \text { iff }\left(g_{2}\right)_{x}(X, X)=0
$$

Then

$$
g_{1}=\varphi g_{2},
$$

where $\varphi \in C_{>0}^{\infty}(M)$.

A curve in $M$ is timelike, lightlike, or spacelike if its tangent vectors are timelike, lightlike, or spacelike.

A curve in $M$ is causal if its tangent vectors are timelike or lightlike. A causal curve is future directed (past directed) if its tangent vectors have this property.

A future directed causal curve $\gamma: I \rightarrow M$ is said to have a future endpoint (past endpoint) if $\gamma(t)$ converges to some point in M as $t \uparrow \sup I(t \downarrow$ inf $I$ ).

A past directed causal curve $\gamma: I \rightarrow M$ is said to have a past endpoint (future endpoint) if $\gamma(t)$ converges to some point in $M$ as $t \uparrow \sup I(t \downarrow$ inf $I)$.

A future (past) directed causal curve $\gamma$ is said to start at a point $p \in M$ provided that $p$ is the past (future) endpoint of $\gamma$.

A future (past) directed causal curve $\gamma$ is said to be future (past) inextendible if it possesses no future (past) endpoint.

Notation: $\forall \mathrm{p}, \mathrm{q}$ in M ,
$\left\lvert\, \begin{aligned} & \mathrm{p} \ll \mathrm{q}: \exists \text { a future directed timelike curve from } \mathrm{p} \text { to } \mathrm{q} . \\ & \mathrm{p}<\mathrm{q}: \exists \text { a future directed causal curve from } \mathrm{p} \text { to } \mathrm{q} .\end{aligned}\right.$
[Note: It may or may not be the case that $p \ll p$ but it's always true that $\mathrm{p}<\mathrm{p}$ (conventionally, a constant curve is lightlike and both future and past directed).]

Definition: The chronological future of $p$ is

$$
I^{+}(p)=\{q: p \ll q\}
$$

and the causal future of $p$ is

$$
J^{+}(p)=\{q: p<q\}
$$

The chronological past of $p$ is

$$
I^{-}(p)=\{q: q \ll p\}
$$

and the causal past of $p$ is

$$
J^{-}(p)=\{q: q<p\}
$$

[Note: For a nonempty subset $S \subset M$, the sets $I^{ \pm}(S), J^{ \pm}(S)$ are defined analogously. E.g.: $I^{+}(S)=\{q: p \ll q(\exists p \in S)\}$ and $J^{+}(S)=\{q: p<q(\exists p \in S)\}$. Obviously, $I^{+}(S)=\bigcup_{p \in S} I^{+}(p)$ and $J^{+}(S)=\bigcup_{p \in S} J^{+}(p)$. Furthermore, $J^{+}(S)$ OUI $(S)$.]

LEMMA If $\mathrm{x} \ll \mathrm{y}$ and $\mathrm{y}<\mathrm{z}$ or if $\mathrm{x}<\mathrm{y}$ and $\mathrm{y} \ll \mathrm{z}$, then $\mathrm{x} \ll \mathrm{z}$.

Application: We have

$$
\begin{aligned}
I^{+}(S) & =I^{+}\left(I^{+} S\right)=I^{+}\left(J^{+} S\right) \\
& =J^{+}\left(I^{+} S\right) \subset J^{+}\left(J^{+} S\right)=J^{+}(S)
\end{aligned}
$$

LEMMA If $p \ll q$, then $\exists$ neighborhoods $N_{p}$ of $p$ and $N_{q}$ of $q$ such that

$$
\int_{-}^{p^{\prime} \in N_{p}} \begin{aligned}
& \\
& q^{\prime} \in N_{q}
\end{aligned} \quad \Rightarrow \quad p^{\prime} \ll q^{\prime}
$$

Application: $\forall p \in M, I^{+}(p)$ is open.
Topological Properties $\forall p \in M$,

1. int $\overline{I^{+}(p)}=I^{+}(p)$;
2. $\overline{I^{+}(p)}=\left\{x: I^{+}(x) \subset I^{+}(p)\right\}$;
3. $\operatorname{fr} \mathrm{I}^{+}(\mathrm{p})=\left\{\mathrm{x}: \mathrm{x} \notin \mathrm{I}^{+}(\mathrm{p}) \& \mathrm{I}^{+}(\mathrm{x}) \subset \mathrm{I}^{+}(\mathrm{p})\right\}$;
4. int $\mathrm{J}^{+}(\mathrm{p})=\mathrm{I}^{+}(\mathrm{p})$;
5. $J^{+}(p) \subset \overline{I^{+}(p)}$.

Remark: In general, $\mathrm{J}^{+}(\mathrm{p})$ is not closed, hence may very well be a proper subset of $\overline{I^{+}(p)}$.

Let $(M, g)$ be a spacetime -- then ( $M, g$ ) is

$$
\left\{\begin{array}{l}
\text { future distinguishing if } x \neq y \Rightarrow I^{+}(x) \neq I^{+}(y) \\
\text { past distinguishing if } x \neq y \Rightarrow I^{-}(x) \neq I^{-}(y) .
\end{array}\right.
$$

[Note: Call ( $M, g$ ) distinguishing if it is both future and past distinguishing.]
Let $(M, g),\left(M^{\prime}, g^{\prime}\right)$ be spacetimes. Suppose that $f: M \rightarrow M^{\prime}$ is a diffeomorphism -then $f$ is said to be a chronal isomorphism provided

$$
x \ll y \Leftrightarrow f(x) \ll f(y)
$$

THEOREM If ( $M, g$ ) and ( $M^{\prime}, g^{\prime}$ ) are distinguishing and if $f: M \rightarrow M^{\prime}$ is a chronal isomorphism, then $f$ is a conformal isometry.
[Note: Spelled out, $\exists \varphi \in C_{>0}^{\infty}(M): \forall x \in M$,

$$
g_{f(x)}^{\prime}\left(f_{*} X, f_{\star} Y\right)=\varphi(x) g_{X}(X, Y) \quad\left(X, Y \in T_{X} M\right),
$$

thus

$$
\left.\mathrm{f}^{\star} \mathrm{g}^{\prime}=\varphi \mathrm{g} .\right]
$$

Given $p, q \in M$, put

$$
[p, q]=\{x: p<x<q\}
$$

I.e.:

$$
[p, q]=J^{+}(p) \cap J^{-}(q)
$$

Let $S$ be a nonempty subset of $M-$ then $S$ is causally convex if $\forall p, q \in S$, [p,q] $\subset S$.

Definition: A spacetime ( $M, g$ ) is said to be strongly causal if each $x \in M$ has a basis of open neighborhoods consisting of causally convex sets.
[Note: A strongly causal spacetime is necessarily distinguishing.]
FACT Suppose that ( $M, g$ ) is strongly causal -- then the $I^{+}(p) \cap I^{-}(q)$ ( $p, q \in M$ ) are a basis for the topology on $M$.

A time function is a surjective $C^{\infty}$ function $\tau: M \rightarrow \underline{R}$ whose gradient grad $\tau$ is timelike.

Definition: A spacetime ( $M, g$ ) is said to be stably causal if it admits a time function $\tau: M \rightarrow$ R.

FACT Every stably causal spacetime is strongly causal.
Definition: A spacetime ( $M, g$ ) is said to be globally hyperbolic if it is strongly causal and $\forall p, q \in M,[p, q]$ is compact.

LEMMA If ( $\mathrm{M}, \mathrm{g}$ ) is globally hyperbolic, then $\forall \mathrm{p}, \mathrm{J}^{+}(\mathrm{p})$ is closed.
[Note: More generally, $K$ compact $\Rightarrow J(K)$ closed.]

Example: $\underline{R}^{1, n-1}$ is globally hyperbolic but $\underline{R}^{1, n-1}-\{0\}$ is not.
FACT Let $(M, g),\left(M^{\prime}, g^{\prime}\right)$ be distinguishing chronally isomorphic spacetimes --
then ( $M, g$ ) is globally hyperbolic iff ( $M^{\prime}, g^{\prime}$ ) is globally hyperbolic. Remark: If ( $M, g$ ) is globally hyperbolic, then so is ( $M, \varphi)^{\prime}\left(\varphi \in C_{>0}^{\infty}(M)\right)$. On the other hand, if $(M, g)$ and ( $M, g^{\prime}$ ) are globally hyperbolic and if the identity map is a chronal isomorphism, then $g=\varphi g^{\prime}$ for some $\varphi \in C_{>0}^{\infty}(M)$.

Let ( $M, g$ ) be a spacetime. Suppose that $S$ is a nonempty subset of $M$-then the future domain of dependence $D^{+}(S)$ of $S$ is the set of all points $p \in M$ such that every past inextendible causal curve starting at $p$ meets $S$.
[Note: The definition of $\mathrm{D}^{-}(\mathrm{S})$ is dual. The union $\mathrm{D}(\mathrm{S})=\mathrm{D}^{+}(\mathrm{S}) \mathrm{UD}^{-}(\mathrm{S})$ is the domain of dependence of S.]

IENMA If $S$ is a closed achronal subset of $M$, then int $D(S)$, if nonempty, is globally hyperbolic.
[Note: $S$ is achronal provided $\left.S \cap I^{ \pm}(S)=\varnothing.\right]$

Definition: Let $(M, g)$ be a spacetime -- then a Cauchy hypersurface is a closed achronal hypersurface $\Sigma \subset M$ with the property that $D(\Sigma)=M$, hence is met exactly once by every inextendible timelike curve in M.
[Note: A hypersurface per se is an embedded connected submanifold of dimension n - 1.]

Example: In $\underline{R}^{1, n-1}$, the hyperplanes $\mathrm{x}_{0}=$ constant are Cauchy hypersurfaces.
FACT If $\Sigma_{1}$ and $\Sigma_{2}$ are Cauchy hypersurfaces in $M$, then $\Sigma_{1}$ and $\Sigma_{2}$ are diffeomorphic.

In view of the preceding lerma, if ( $M, g$ ) admits a Cauchy hypersurface, then ( $\mathrm{M}, \mathrm{g}$ ) is globally hyperbolic. The converse is also true: Every globally
hyperbolic spacetime admits a Cauchy hypersurface but one can say considerably more than this.

LEMMA If ( $M, g$ ) is globally hyperbolic, then ( $M, g$ ) admits a spacelike Cauchy hypersurface.

FACT A spacelike Cauchy hypersurface $\Sigma$ is acausal, i.e., $\Sigma \cap J^{ \pm}(\Sigma)=\varnothing$.

STRUCIURE THEOREM Suppose that ( $M, g$ ) is globally hyperbolic -- then there exists a connected ( $\mathrm{n}-1$ )-dimensional manifold $\Sigma$ and a diffeomorphism $\Psi: \underline{R} \times \Sigma \rightarrow M$ such that $\forall t, \Sigma_{t}=\Psi(\{t\} \times \Sigma)$ is a spacelike Cauchy hypersurface in $M$, hence

$$
M=\frac{1}{t} \Sigma_{t} .
$$

## Addenda

1. The spacelike leaves $\Sigma_{t}$ of the foliation figuring in the theorem are the level hypersurfaces of a time function $\tau$, i.e., $\forall t, \Sigma_{t}=\tau^{-1}(t)$.
2. The vector field grad $\tau$ is past directed but possibly incomplete. To remedy this technicality, let

$$
x_{\tau}=\frac{\operatorname{grad} \tau}{\|\operatorname{grad} \tau\|}
$$

Here the norm is taken relative to some complete riemannian metric, thus $X_{\tau}$ is a complete vector field. Put $\Sigma=\tau^{-1}(0)$ and define a diffeomorphism $\Phi: M \rightarrow \underline{R} \times \Sigma$ by

$$
\Phi(p)=(\tau(p), \rho(p)),
$$

where $\rho(\mathrm{p})$ is the unique point of $\Sigma$ crossed by the maximal integral curve of $X_{\tau}$ through $p$. Let $\Psi=\Phi^{-1}-$ then $\forall t$,

$$
\Psi(\{t\} \times \Sigma):=\tau^{-1}(t)
$$

3. Put

$$
\frac{\partial}{\partial \tau}=\Psi_{*}\left(\frac{\partial}{\partial t}\right)
$$

Given $x \in \Sigma$, let

$$
r_{x}(t)=\Psi(t, x)
$$

Then $r_{X}: \underline{R} \rightarrow M$ is an integral curve for $\frac{\partial}{\partial \tau}$. It is timelike and

$$
t<t^{\prime} \Rightarrow r_{x}(t) \ll r_{x}\left(t^{\prime}\right)
$$

Furthermore, $\frac{\partial}{\partial \tau}$ is parallel to grad $\tau: \forall t$,

$$
\begin{aligned}
(t, x) & =\Phi \circ \Psi(t, x) \\
& =\Phi\left(r_{X}(t)\right) \\
& =\left(\tau\left(r_{X}(t)\right), \rho\left(r_{X}(t)\right)\right) \\
\Rightarrow \quad & \rho\left(r_{X}(t)\right)=x
\end{aligned}
$$

So $\forall t, r_{X}(t)$ lies on the trajectory of $X_{\tau}$ containing $x$.
4. If $\Sigma_{0} \mathrm{CM}$ is a Cauchy hypersurface, then $\gamma_{x}(t)$ intersects $\Sigma_{0}$ exactly once at the parameter value $t_{\Sigma_{0}}(x)$. The function $t_{\Sigma_{0}}: \Sigma \rightarrow R$ is $C^{\infty}$ and
$\Sigma_{0}=\left\{\Psi\left(t_{\Sigma_{0}}(x), x\right): x \in \Sigma\right\}$. In addition, if $\Sigma_{1}, \Sigma_{2}$ are Cauchy hypersurfaces, then the map $\Sigma_{1} \rightarrow \Sigma_{2}$ which sends $\Psi\left(t_{\Sigma_{1}}(x), x\right)$ to $\Psi\left(t_{\Sigma_{2}}(x), x\right)$ is a diffeomorphism.
5. Since $\tau=t \circ \Phi$, it follows that

$$
\begin{aligned}
d \tau\left(\frac{\partial}{\partial \tau}\right) & =\frac{\partial}{\partial \tau}(\tau) \\
& =\Psi_{\star}\left(\frac{\partial}{\partial t}\right)(t \circ \Phi) \\
& =\frac{d}{d t}(t \circ \Phi \circ \Psi) \\
& =1 .
\end{aligned}
$$

Therefore

$$
\begin{gathered}
\quad g\left(\frac{\partial}{\partial \tau}, \operatorname{grad} \tau\right)=d \tau\left(\frac{\partial}{\partial \tau}\right)=1 \\
\Rightarrow \\
\\
\quad \frac{\partial}{\partial \tau}=\frac{1}{g(\operatorname{grad} \tau, \operatorname{grad} \tau)} \operatorname{grad} \tau \\
\Rightarrow \quad \Psi * g\left(\frac{\partial}{\partial t^{\prime}}, \frac{\partial}{\partial t^{t}}\right)=\frac{1}{g(\operatorname{grad} \tau, \operatorname{grad} \tau)} .
\end{gathered}
$$

6. Let $q(t)$ be the riemannian structure on $\Sigma$ determined by pulling back $g$ via the arrow

$$
\Sigma \approx\{t\} \times \Sigma \xrightarrow{\Psi_{t}} \Sigma_{t} \xrightarrow{i_{t}} M
$$

Put

$$
N_{t}(x)=\frac{1}{\left|g_{\Psi(t, x)}(\operatorname{grad} \tau, \operatorname{grad} \tau)\right|^{1 / 2}} \quad(x \in \Sigma)
$$

Define $g_{\tau} \in \mathcal{M}_{1, n-1}$ (per $\underline{R} \times \Sigma$ ) by the prescription

$$
\begin{gathered}
\left(g_{\tau}\right)(t, x)((r, X),(s, Y)) \\
=-\operatorname{rsN}_{t}^{2}(x)+q_{x}(t)(X, Y) \quad\left(r, s \in \underline{R} \& X, Y \in T_{x} \Sigma\right) .
\end{gathered}
$$

Then

$$
g_{\tau}=\Psi^{*} g
$$

But this implies that

$$
\operatorname{Ein}\left(g_{\tau}\right)=\Psi * \operatorname{Ein}(g)
$$

thus the vanishing of $\operatorname{Ein}\left(g_{\tau}\right)$ is equivalent to the vanishing of $\operatorname{Ein}(\mathrm{g})$.
Terminology Let $(M, g)$ be a globally hyperbolic spacetime.

- M is spatially compact if its Cauchy hypersurfaces are compact.
- M is spatially noncompact if its Cauchy hypersurfaces are noncompact.

FACT Suppose that ( $M, g$ ) is globally hyperbolic. Let $\Sigma \subset M$ be a closed achronal hypersurface. Assume: $\Sigma$ is compact -- then $\Sigma$ is a Cauchy hypersurface.

LEMMA The Cauchy hypersurfaces in a globally hyperbolic spacetime are orientable.

Let

$$
M=]-\varepsilon, \varepsilon[\times \Sigma \quad(0<\varepsilon \leq \infty),
$$

where $\Sigma$ is orientable (hence $\operatorname{dim} \Sigma=n-1$ ). Suppose given a triple $\left(q_{t}, N_{t}, \vec{N}_{t}\right)$ satisfying the usual conditions and let $g$ be the element of $M_{1, n-1}$ determined
thereby (for this, it is not necessary to assume that $\Sigma$ is compact) -- then, in general, the pair ( $M, g$ ) is not globally hyperbolic.
[Note: The spacetime ( $M, g$ ) is, however, stably causal. Thus take for $\tau$ the projection $(t, x) \rightarrow t-$ then

$$
\begin{aligned}
\operatorname{grad} t & =(d t)^{\#} \\
& =\left(-\frac{n^{b}}{N}\right)^{\#} \\
& =-\frac{n}{N}
\end{aligned}
$$

$\Rightarrow$

$$
g(\text { grad } t, \text { grad } t)=-\frac{1}{N^{2}}<0 .
$$

Therefore grad $t$ is timelike.]

- Assume that $\exists$ a complete $q \in Q$ and positive constants $A>0, B>0$ : $\forall t$ and $\forall X \in D^{\perp}(\Sigma)$,

$$
A q(X, X) \leq q_{t}(X, X) \leq B q(X, X)
$$

- Assume that $\exists$ positive constants $C>0, D>0: \forall t \& \forall x \in \Sigma$ :

$$
0<C \leq N_{t}(x) \leq D .
$$

- Assume that $\exists$ a positive constant $K>0: \forall t$,

$$
q_{t}\left(\vec{N}_{t}, \vec{N}_{t}\right) \leq K .
$$

FACT Under these conditions, ( $M, g$ ) is globally hyperbolic and the slices
$\{t\} \times \Sigma$ are spacelike Cauchy hypersurfaces.
[Note: There is also a converse: Make the same assumptions on the data except for the completeness of $q$, form $(M, g)$, and suppose that it is globally hyperbolic -- then q is necessarily complete.]

Example: When $\vec{N}=0$ and $q$ and $N$ are independent of $t, g$ is said to be static. So, in this situation, ( $M, g$ ) is globally hyperbolic if ( $\Sigma, q$ ) is complete and N is bounded above and below on $\Sigma$ (matters being automatic if $\Sigma$ is compact).

Section 39: The Standard Setup The point here is to initiate the transition from a theory based on metrics to a theory based on forms.

LEMMA Every connected orientable 3-manifold $\Sigma$ is parallelizable.
[For the proof, it will be convenient to admit manifolds with boundary. Thus let

$$
\begin{aligned}
& w_{1}(\Sigma)=1^{\text {st }} \text { Stiefel-whitney class } \\
& w_{2}(\Sigma)=2^{\text {nd }} \text { Stiefel-Whitney class. }
\end{aligned}
$$

Then $\Sigma$ is parallelizable provided $w_{1}(\Sigma)=0=w_{2}(\Sigma)$. But $w_{1}(\Sigma)=0$ is automatic ( $\Sigma$ being orientable).

Case 1: $\Sigma$ compact and $\partial \Sigma=\emptyset$. Proof: $w_{1}(\Sigma)=0 \Rightarrow w_{2}(\Sigma)=w_{1}^{2}(\Sigma)=0$ (Wu relations).

Case 2: $\Sigma$ compact and $\partial \Sigma \neq \varnothing$. Proof: Consider the double of $\Sigma$ and apply Case 1.

Case 3: $\Sigma$ noncompact and $\partial \Sigma=\varnothing$. Proof: Let $\alpha \in H_{2}(\Sigma ; \underline{Z} / 2 \underline{Z})$ be arbitrary -- then $a$ is represented by a compact surface $S \rightarrow \Sigma$ (Thom), hence $<w_{2}(\Sigma), a>=0$ (pass to a tubular neighborhood of $S$ ).

Case 4: $\Sigma$ noncompact and $\partial \Sigma \neq \varnothing$. Proof: Consider $\Sigma-\partial \Sigma$ and apply Case 3.]

Take $\mathrm{n}>3$ and let $\Sigma$ be a connected compact ( $\mathrm{n}-1$ )-dimensional orientable $C^{\infty}$ manifold.

Assumption $\Sigma$ is parallelizable.

Put

$$
M=\underline{R} \times \Sigma .
$$

Then $M$ is also parallelizable.
Notation: Indices $\mathrm{a}, \mathrm{b}, \mathrm{c}$ run from 1 to $\mathrm{n}-1$.
Let $E_{1}, \ldots, E_{n-1}$ be time dependent vector fields on $\Sigma$ such that $\forall t$,

$$
\left\{E_{1}(t), \ldots, E_{n-1}(t)\right\}
$$

is a basis for $D^{1}(\Sigma)$. Complete this to a basis

$$
\left.\right|_{-} \begin{gathered}
E_{0} \\
E_{a}
\end{gathered}
$$

for $D^{1}(M)$.
Construction Let $q(t)$ be the element of $Q$ determined by stipulating that the $E_{a}(t)$ are to be an orthonormal frame -- then the prescription

$$
\begin{aligned}
& g_{(t, x)}\left(\left.r E_{0}\right|_{(t, x)}+x,\left.\operatorname{sE}_{0}\right|_{(t, x)}+Y\right) \\
& =-r s+q_{x}(t)(X, Y) \quad\left(r, s \in \underline{R} \& X, Y \in T_{x} \Sigma\right)
\end{aligned}
$$

defines an element of $M_{1, n-1}$.
Remark: This procedure gives rise to a certain class of spacetimes $(M, g)$ ( $E_{0}$ is a timelike vector field). In general, however, if $g \in M_{1, n-1}$ is arbitrary, then one has no guarantee that $g \mid \Sigma$ is nondegenerate, let alone spacelike. On the other hand, there is a gauge-theoretic ambiguity: Distinct E may lead to the same $g$.
[Note: While not necessarily globally hyperbolic, the spacetime ( $\mathrm{M}, \mathrm{g}$ ) is at least stably causal (the projection $(t, x) \rightarrow t$ is a time function).]

In view of the definitions, $\exists C^{\infty}$ functions $N$ and $N^{a}$ on $M$ such that

$$
\frac{\partial}{\partial t}=N E_{0}+N E_{a}
$$

[Note: $N$ has constant sign, i.e., $N$ is strictly positive (or strictly negative).]

Terminology: $N$ is called the lapse and $\vec{N}=N^{a} E_{a}$ is called the shift.
Reality Check Suppose given a triple ( $q_{t}, N_{t}, \vec{N}_{t}$ ) satisfying the usual conditions. Fix time dependent vector fields $\mathrm{E}_{1}, \ldots, \mathrm{E}_{\mathrm{n}-1}$ on $\Sigma$ which at each $t$ constitute an orthonormal frame for $q(t)$. Take

$$
E_{0}=\underline{n}=\frac{1}{N}\left(\frac{\partial}{\partial t}-\vec{N}\right)
$$

Then

$$
\begin{aligned}
& g_{(t, x)}((r, X),(s, Y)) \\
& =g_{(t, x)}\left(r \frac{\partial}{\partial t}+X, s \frac{\partial}{\partial t}+Y\right) \\
& =g_{(t, x)}\left(\left.r N_{t}(x) E_{0}\right|_{(t, x)}+\left.r \vec{N}_{t}\right|_{x}+X,\left.S N_{t}(x) E_{0}\right|_{(t, x)}+\left.s \vec{N}_{t}\right|_{x}+Y\right) \\
& =-\operatorname{rsN}_{t}^{2}(x)+q_{x}(t)\left(\left.r \vec{N}_{t}\right|_{x}+X,\left.\vec{N}_{t}\right|_{x}+Y\right) \\
& =-\operatorname{rsN}_{t}^{2}(x)+\operatorname{sq}_{x}(t)\left(X,\left.\vec{N}_{t}\right|_{x}\right)+r q_{x}(t)\left(Y,\left.\vec{N}_{t}\right|_{x}\right) \\
& +\operatorname{rsq}_{\mathrm{x}}(\mathrm{t})\left(\left.\left.\vec{N}_{\mathrm{t}}\right|_{\mathrm{x}^{\prime}} \vec{N}_{\mathrm{t}}\right|_{\mathrm{x}}\right)+\mathrm{q}_{\mathrm{x}}(\mathrm{t})(\mathrm{X}, \mathrm{Y}) \\
& =-\operatorname{rs}\left(N_{t}^{2}(x)-q_{x}(t)\left(\left.\vec{N}_{t}\right|_{x},\left.\vec{N}_{t}\right|_{x}\right)\right) \\
& +\operatorname{sq}_{X}(t)\left(X,\left.\vec{N}_{t}\right|_{X}\right)+r q_{X}(t)\left(Y,\left.\vec{N}_{t}\right|_{X}\right)+q_{X}(t)(X, Y),
\end{aligned}
$$

4. 

which is in agreement with the earlier considerations.
Let $i_{t}: \Sigma \approx \Sigma_{t} \rightarrow M$ be the embedding ( $\left.\Sigma_{t}=\{t\} \times \Sigma\right)$.
Notation: Given $T \in D_{q}^{0}(M)$, put

$$
\dot{\overline{\mathrm{T}}}=\frac{\mathrm{d}}{\mathrm{dt}} i_{\mathrm{t}}^{\star} \mathrm{T}\left(=\frac{\mathrm{d}}{\mathrm{dt}} \overline{\mathrm{~T}}\right) .
$$

LEMMA We have

$$
\dot{\bar{T}}=i_{t}^{*} L_{\partial / \partial t} T .
$$

[In fact,

$$
i_{t+s}=\phi_{s} \circ i_{t^{\prime}}
$$

where $\phi_{s}$ is the flow attached to $\frac{\partial}{\partial t}$. Therefore

$$
\begin{aligned}
\dot{\bar{T}} & =\left.\frac{d}{d s}\right|_{s=t}\left(i_{s}^{*} T\right) \\
& =\lim _{s \rightarrow 0} \frac{i_{t+s}^{*} T-i_{t}^{*} T}{s} \\
& =\lim _{s \rightarrow 0} \frac{i_{t}^{*} \phi_{S}^{\star} T-i_{t}^{* T}}{s} \\
& =i_{t}^{*} \lim _{s \rightarrow 0} \frac{\phi_{S}^{* T}-T}{s} \\
& \left.=i_{t}^{\star} L_{\partial / \partial t} T .\right]
\end{aligned}
$$

Example: By construction,

$$
i_{t}^{*} g=\bar{g}=q(t) \quad\left(=q_{t}\right)
$$

So

$$
\dot{q}_{t}=\frac{d}{d t} q(t)=\frac{d}{d t} i_{t}^{*} g=\dot{\bar{g}}=i_{t}^{*} L_{\partial / \partial t} g
$$

Let $\nabla$ be the metric connection associated with $g$ (thus $\bar{\nabla}$ is the metric connection associated with $\bar{g}$ ) -- then the $\bar{\omega}_{\mathrm{b}}^{\mathrm{a}}$ are the connection 1-forms of $\bar{\nabla}$.

Consider now the coframe $\left\{\omega^{0}, \omega^{1}, \ldots, \omega^{n-1}\right\}$ per the frame $\left\{E_{0}, E_{1}, \ldots, E_{n-1}\right\}-$ then

$$
g=-\omega^{0} \otimes \omega^{0}+\omega^{a} \otimes \omega^{a}
$$

and

$$
\left.\right|_{-\quad \omega^{0}=N d t} \begin{aligned}
& \omega^{a}=N^{a} d t+\bar{\omega}^{a} .
\end{aligned}
$$

[Note: on $\Sigma$,

$$
\left.\bar{g}=\frac{a}{\omega} \otimes \bar{\omega}^{a} .\right]
$$

$$
\text { - } d \omega^{0}=d(N d t)
$$

$$
=d N \wedge d t
$$

$$
=\left(\bar{d} N+d t \wedge \partial_{t} N\right) \wedge d t
$$

$$
=\bar{d} \mathrm{~N} \wedge \mathrm{~d} t
$$

$$
=\left(E_{a} N\right) \bar{\omega}^{a} \wedge d t
$$

$$
=\left(E_{a} N\right)\left(\omega^{a}-N^{a} d t\right) \wedge d t
$$

$$
\begin{aligned}
& =\left(E_{a} N\right) \omega^{a} \wedge d t \\
& =\frac{E_{a} N}{N} \omega^{a} \wedge \omega^{0} .
\end{aligned}
$$

$$
\begin{aligned}
\bullet d \omega^{a}= & d\left(N^{a} d t+\bar{\omega}^{a}\right) \\
= & d N^{a} \wedge d t+d \bar{\omega}^{a} \\
= & \left(\bar{d} N^{a}+d t \wedge \partial_{t} N\right) \wedge d t \\
& \quad+\bar{d} \bar{\omega}{ }^{-a}+d t \wedge \partial_{t} \bar{\omega}^{a} \\
= & \bar{d} N^{a} \wedge d t+d t \wedge \partial_{t} \bar{\omega}^{a}-\bar{\omega}_{b}^{a} \wedge \bar{\omega}^{b} .
\end{aligned}
$$

Let $x_{t}$ be the extrinsic curvature:

$$
x_{t}=x_{a b} \bar{\omega}^{-a} \otimes \bar{\omega}^{b} \quad\left(x_{a b}=\left(x_{t}\right)_{a b}\right)
$$

Rappel: We have

$$
\bar{\omega}_{b}^{0}=x_{a b} \bar{\omega}^{\mathrm{a}}
$$

or still,

$$
\omega_{a}^{0}\left(E_{b}\right)=x_{a b} .
$$

${ }^{\omega^{0}{ }_{a}\left(E_{0}\right):}$

$$
\begin{aligned}
d \omega^{0} & =-\omega_{i}^{0}{ }_{i} \omega^{i} \\
& =-\omega^{0}{ }_{a} \wedge \omega^{a}
\end{aligned}
$$

$$
\begin{aligned}
\iota_{E_{0}} d \omega^{0} & =-\iota_{E_{0}}\left(\omega^{0} a^{\wedge \omega^{a}}\right) \\
& =-\omega_{a}^{0}\left(E_{0}\right) \omega^{a} .
\end{aligned}
$$

But

$$
d \omega^{0}=\frac{E_{a}{ }^{N}}{N} \omega^{a} \wedge \omega^{0}
$$

$\Rightarrow$

$$
\begin{aligned}
\iota_{E_{0}} d \omega^{0} & =\iota_{E_{0}}\left(\frac{E_{a} N}{N} \omega^{a} \wedge \omega^{0}\right) \\
& =-\frac{E_{a}{ }^{N}}{N} \omega^{a} .
\end{aligned}
$$

Therefore

$$
\omega_{a}^{0}\left(E_{0}\right)=\frac{E_{a} N}{N} .
$$

Corollary:

$$
\omega_{a}^{0}=\frac{E_{a} N}{N} \omega^{0}+x_{a b} \omega^{b} .
$$

[Note:

$$
\begin{aligned}
\omega_{a}^{0} & =-\varepsilon_{0} \varepsilon_{a} \omega_{0}^{a} \text { (no sum) } \\
& =-(-1)(+1) \omega_{0}^{a} \\
& \left.=\omega_{0}^{a} \cdot\right]
\end{aligned}
$$

Rappel: We have

$$
\omega_{b}^{a}\left(E_{C}\right)=\bar{\omega}_{b}^{a}\left(E_{C}\right)
$$

$\omega^{a}{ }_{b}\left(E_{0}\right):$

$$
\begin{aligned}
d \omega^{a} & =-\omega_{i}^{a}{ }_{i} \omega^{i} \\
& =-\omega_{0}^{a}{ }_{0} \omega^{0}-\omega_{b}^{a} \omega^{b}
\end{aligned}
$$

or still,

$$
\begin{aligned}
& d \omega^{a}=-\left(\frac{E_{a} N}{N} \omega^{0}+x^{a}{ }_{b} \omega^{b}\right) \wedge \omega^{0}-\omega^{a}{ }_{b} \wedge \omega^{b} \\
& =-x_{b^{\omega}}{ }^{\mathrm{b}} \wedge \omega^{0}-\omega_{b}{ }_{b}{ }^{\mathrm{A}}{ }^{\mathrm{b}} \\
& \Rightarrow \\
& c_{E_{0}} d \omega^{a}=\left(x_{b}^{a}-\omega_{b}^{a}\left(E_{0}\right)\right) \omega^{b} \\
& \Rightarrow \\
& { }^{c} E_{b}{ }^{c} E_{0} d \omega^{a}=x_{b}^{a}-\omega_{b}^{a}\left(E_{0}\right) .
\end{aligned}
$$

But

$$
\begin{aligned}
& d \omega=\bar{d} N^{a} \wedge d t+d t \wedge \partial_{t} \bar{\omega}^{a}-\bar{\omega}^{a} c^{\wedge} \bar{\omega}^{c} \\
& \Rightarrow \quad \\
& \iota_{E_{0}} d \omega^{a}=\iota_{E_{0}}\left(\bar{d} N^{a} \wedge d t+d t \wedge \partial_{t} \bar{\omega}^{a}-\bar{\omega}_{c}^{a} c^{\wedge} \bar{\omega}^{c}\right) \\
&=-\frac{1}{N} \bar{d} N^{a}+\frac{1}{N} \partial_{t} \bar{\omega}^{a}+\frac{1}{N} \iota_{\stackrel{N}{N}}\left(\bar{\omega}^{a} c^{\wedge} \bar{\omega}^{c}\right)
\end{aligned}
$$

$$
\begin{aligned}
& { }^{L_{E}} L_{b} E_{0} \omega^{a}=\frac{1}{N}\left[-\overline{d N} N^{a}\left(E_{b}\right)+\partial_{t} \bar{\omega}^{a}\left(E_{b}\right)\right. \\
& \left.\quad+\bar{\omega}^{a} c^{\wedge} \bar{\omega}^{c}\left(\vec{N}, E_{b}\right)\right] \\
= & \frac{1}{N} \partial_{t} \bar{\omega}^{a}\left(E_{b}\right)+\frac{1}{N}\left[-E_{b} N^{a}+\bar{\omega}_{c}^{a}(\vec{N}) \bar{\omega}^{c}\left(E_{b}\right)-\bar{\omega}^{c}(\vec{N}) \bar{\omega}_{c}^{a}\left(E_{b}\right)\right] \\
= & \frac{1}{N} \partial_{t} \bar{\omega}^{a}\left(E_{b}\right)+\frac{1}{N}\left[\bar{\omega}_{b}^{a}(\vec{N})-E_{b} N^{a}-N^{c} \bar{\omega}_{c}^{a}\left(E_{b}\right)\right] \\
= & \frac{1}{N} \partial_{t} \bar{\omega}^{a}\left(E_{b}\right)+\frac{1}{N}\left[\bar{\omega}_{b}^{a}(\vec{N})-(\overrightarrow{\nabla N})\left(\bar{\omega}^{a}, E_{b}\right)\right] \\
= & \frac{1}{N} \partial_{t} \bar{\omega}^{a}\left(E_{b}\right)+\frac{1}{N}\left[\bar{\omega}_{b}^{a}(\vec{N})-\bar{\nabla}_{b} N^{a}\right] .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& x_{a b}-\omega_{a b}\left(E_{0}\right) \\
& =\frac{1}{N} \dot{\bar{\omega}}_{a}\left(E_{b}\right)+\frac{1}{N}\left[\bar{\omega}_{a b}(\vec{N})-\bar{\nabla}_{b} N_{a}\right] \\
& =\frac{1}{2 N}\left[\dot{\bar{\omega}}_{a}\left(E_{b}\right)+\dot{\bar{\omega}}_{b}\left(E_{a}\right)\right]-\frac{1}{2 N}\left[\bar{\nabla}_{b} N_{a}+\bar{\nabla}_{a} N_{b}\right] \\
& \\
& \quad+\frac{1}{2 N}\left[\dot{\bar{\omega}}_{a}\left(E_{b}\right)-\dot{\bar{\omega}}_{b}\left(E_{a}\right)\right]-\frac{1}{2 N}\left[\bar{\nabla}_{b} N a-\bar{\nabla}_{a} N_{b}\right] \\
& \\
& \quad+\frac{1}{\bar{N}} \bar{\omega}_{a b}(\vec{N}) \\
& x_{a b}=
\end{aligned}
$$

and

$$
\begin{gathered}
\omega_{a b}\left(E_{0}\right)=-\frac{1}{2 N}\left[\dot{\bar{\omega}}_{a}\left(E_{b}\right)-\dot{\bar{\omega}}_{b}\left(E_{a}\right)\right]+\frac{1}{2 N}\left[\bar{\nabla}_{b} N_{a}-\vec{\nabla}_{a} N_{b}\right] \\
-\frac{1}{N} \bar{\omega}_{a b}(\vec{N}) .
\end{gathered}
$$

[Note: $x_{a b}$ is symmetric while $\omega_{a b}$ is antisymmetric.]
Remark: Since $\bar{g}=\bar{\omega}^{\mathrm{a}} \otimes \bar{\omega}^{\mathrm{a}}$, it follows that

$$
\dot{\bar{g}}_{a b}=\dot{\bar{\omega}}_{a}\left(E_{b}\right)+\dot{\bar{\omega}}_{b}\left(E_{a}\right)
$$

Therefore

$$
x_{a b}=\frac{1}{2 \mathrm{~N}} \dot{\bar{g}}_{\mathrm{ab}}-\frac{1}{2 \mathrm{~N}} \underset{\overrightarrow{\mathrm{~N}}}{\left(L_{\vec{g}}\right)_{\mathrm{ab}} .}
$$

I.e.:

$$
\dot{q}_{t}=2 N_{t} x_{t}+L_{\vec{N}_{t}} q_{t}
$$

Definition: The rotational parameter of the theory is the function

$$
\bar{Q}_{b}^{\mathrm{a}}=-N_{t} i_{t}^{\star} \omega_{b}^{a}\left(E_{0}\right)
$$

LEEMMA We have

$$
\dot{\bar{\omega}}^{\mathrm{a}}=\mathrm{N}_{\mathrm{t}} \bar{\omega}_{0}^{\mathrm{a}}+\overline{\mathrm{Q}}_{\mathrm{b}}^{\mathrm{a}} \bar{\omega}^{\mathrm{b}}+{L_{\vec{N}_{t}}}_{\bar{\omega}^{\mathrm{a}}}
$$

[It is a question of explicating the relation

$$
\dot{\bar{\omega}}{ }^{\mathrm{a}}=i_{\hat{t}^{\star}}{ }^{2} \partial / \partial t^{\omega}{ }^{\mathrm{a}}
$$

Write

$$
L_{\partial / \partial t}=L_{N E_{0}}+L_{\vec{N}}
$$

$$
=\iota_{N E_{0}} \circ d+d \circ \iota_{\mathrm{NE}_{0}}+L_{\overrightarrow{\mathrm{N}}}
$$

Then

$$
\begin{aligned}
L_{\partial / \partial t^{\omega}}{ }^{a} & =\iota_{N E_{0}} d \omega^{a}+d \omega^{a}\left(N E_{0}\right)+L_{\vec{N}} \omega^{a} \\
& =\iota_{N E_{0}} d \omega^{a}+L_{\vec{N}}^{\omega^{a}}
\end{aligned}
$$

But

$$
\begin{aligned}
{ }^{c_{N E_{0}}} d \omega^{a} & =N \varepsilon_{E_{0}} d \omega^{a} \\
& =-N c_{E_{0}}\left(\omega^{a}{ }_{i} \wedge \omega^{i}\right) \\
& =-N\left(\iota_{E_{0}} \omega^{a}{ }_{i} \wedge \omega^{i}-\omega^{a}{ }_{i} \wedge c_{E_{0}} \omega^{i}\right) \\
& =-N\left(\omega_{i}^{a}\left(E_{0}\right) \omega^{i}-\omega^{i}\left(E_{0}\right) \omega_{i}^{a}\right) \\
& =-N\left(\omega_{i}^{a}\left(E_{0}\right) \omega^{i}-\omega_{0}^{a}\right) .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
\dot{\bar{\omega}} & \left.=N_{t} \bar{\omega}_{0}^{-a}-N_{t} i_{t}^{*}{ }_{b}^{a}\left(E_{0}\right)\right)^{b}+L_{\vec{N}_{t}} \bar{\omega}^{a} \\
& \left.=N_{t} \bar{\omega}_{0}^{a}+\bar{Q}_{b}^{a} \bar{\omega}^{b}+L_{\vec{N}_{t}} \bar{\omega}^{a} \cdot\right]
\end{aligned}
$$

[Note: In terms of the extrinsic curvature,

Notation: Put

$$
\left[\begin{array}{l}
\quad \dot{\bar{\omega}}_{S}=\frac{1}{2}\left(\dot{\bar{\omega}} \mathrm{a}+\overline{\mathrm{g}}\left(\dot{\bar{\omega}}^{c}, \bar{\omega}^{\mathrm{a}}\right) \bar{\omega}_{\mathrm{C}}\right) \\
\dot{\bar{\omega}}_{A}=\frac{1}{2}\left(\dot{\bar{\omega}} \mathrm{a}-\overline{\mathrm{g}}\left(\dot{\bar{\omega}}^{c}, \bar{\omega}^{a}\right) \bar{\omega}_{\mathrm{C}}\right) .
\end{array}\right.
$$

Then

$$
\dot{\bar{\omega}} \mathrm{a}=\dot{\bar{\omega}}_{\mathrm{S}}+\dot{\bar{\omega}}_{\mathrm{A}}^{\mathrm{a}} .
$$

Notation:
Put

Then

IEMMA We have

$$
\left[\begin{array}{l}
\quad \dot{\bar{\omega}}_{S}^{a}=L_{\vec{N}_{t}} \bar{\omega}_{S}^{a}+N_{t} \bar{\omega}_{0}^{a} \\
\dot{\omega}_{A}^{a}=L_{\vec{N}_{t}} \bar{\omega}_{A}^{a}+\bar{Q}_{b}^{a} \bar{\omega}^{-b}
\end{array}\right.
$$

13. 

[Consider the first relation. Thus

$$
\begin{aligned}
& \dot{\bar{\omega}}_{S}=\frac{1}{2}\left(\dot{\bar{\omega}} \mathrm{a}+\overline{\mathrm{g}}\left(\dot{\bar{\omega}}, \bar{\omega}^{\mathrm{a}}\right) \bar{\omega}_{\mathrm{C}}\right) \\
& =\frac{1}{2}\left(N_{t} \bar{\omega}_{0}^{\mathrm{a}}+\bar{Q}_{b^{a}}^{\mathrm{\omega}} \overline{\mathrm{a}}^{\mathrm{b}}+{L_{\vec{N}_{t}}}^{\bar{\omega}^{\mathrm{a}}}\right) \\
& +\frac{1}{2} \bar{g}\left(N_{t} \bar{\omega}_{0}^{c}+\bar{Q}_{d}^{-c}{ }_{d}^{-\alpha}+{\underset{\sim}{N}}_{t}{ }^{-c}, \bar{\omega}^{\mathrm{a}}\right) \bar{\omega}_{c} \\
& =\frac{1}{2} \underset{\vec{N}_{t}}{\left.L^{-\mathrm{a}}+\overline{\mathrm{g}}\left(\mathrm{~L}_{\vec{N}_{t}} \bar{\omega}^{\mathrm{c}}, \bar{\omega}^{\mathrm{a}}\right) \bar{\omega}_{\mathrm{C}}\right)} \\
& +\frac{1}{2}\left(N_{t} \bar{\omega}_{0}{ }^{\mathrm{a}}+\overline{\mathrm{g}}\left(\mathrm{~N}_{\mathrm{t}} \bar{\omega}_{0}^{\mathrm{c}}, \bar{\omega}^{\mathrm{a}}\right) \bar{\omega}_{\mathrm{C}}\right. \\
& +\frac{1}{2}\left(\bar{Q}_{b}^{a} \bar{\omega}^{b}+\bar{Q}^{c}{ }_{a} \bar{\omega}_{c}\right)
\end{aligned}
$$

$$
\begin{aligned}
& +\frac{1}{2}\left(N_{t} x^{a}{ }_{d} \bar{\sigma}^{d}+N_{t} x^{c}{ }_{a} \bar{\omega}_{c}\right) \\
& +\frac{1}{2}\left(\bar{Q}_{b}^{a} \bar{\omega}^{\mathrm{b}}-\bar{Q}_{c}^{\mathrm{a}}{ }_{\mathrm{c}} \bar{\omega}^{\mathrm{C}}\right) \\
& \left.=L_{\vec{N}_{t}} \bar{\omega}_{S}^{\mathrm{a}}+\mathrm{N}_{\mathrm{t}} \overline{\bar{\omega}}_{0}^{\mathrm{a}}{ }_{0}\right]
\end{aligned}
$$

[Note:

$$
\left[\begin{array}{l}
\overline{\mathrm{g}}\left(\dot{\bar{\omega}}_{\mathrm{S}^{\prime}}^{\mathrm{a}} \bar{\omega}^{\mathrm{b}}\right)=\overline{\mathrm{g}}\left(\dot{\bar{\omega}}_{S^{\prime}}^{\mathrm{b}} \bar{\omega}^{\mathrm{a}}\right) \\
\overline{\mathrm{g}}\left(\bar{\omega}_{0^{\prime}}^{\mathrm{a}} \bar{\omega}^{\mathrm{b}}\right)=\overline{\mathrm{g}}\left(\bar{\omega}_{0^{\prime}}^{\mathrm{b}} \bar{\omega}^{\mathrm{a}}\right)
\end{array}\right.
$$

$\Rightarrow$

$$
\overline{\mathrm{g}}\left({\stackrel{L}{\hat{N}_{t}}}^{-\bar{\omega}^{a}} S^{\prime,-\bar{\omega}}\right)=\overline{\mathrm{g}}\left(L_{\vec{N}_{t}} \bar{\omega}_{S^{\prime}}, \bar{\omega}^{-\mathrm{a}}\right)
$$

and

$$
\begin{aligned}
& ]^{-} \overline{\mathrm{g}}\left(\dot{\bar{\omega}}_{\mathrm{A}^{\prime}}^{\mathrm{a}} \overline{\bar{\omega}}^{\mathrm{b}}\right)=-\overline{\mathrm{g}}\left(\dot{\bar{\omega}}_{\mathrm{A}^{\prime}}{ }^{\prime} \bar{\omega}^{\mathrm{a}}\right) \\
& \overline{\mathrm{g}}\left(\bar{Q}_{c^{\mathrm{a}}}{ }^{\bar{\omega}}, \bar{\omega}^{\mathrm{b}}\right)=-\overline{\mathrm{g}}\left(\overline{\mathrm{Q}}^{-\mathrm{b}}{ }_{\mathrm{d}} \bar{\omega}^{\mathrm{a}}, \bar{\omega}^{\mathrm{a}}\right) \\
& \Rightarrow \\
& \left.\overline{\mathrm{g}}\left({\stackrel{L}{\vec{N}_{t}}}^{\bar{\omega}_{\mathrm{A}}}{ }^{\mathrm{a}},-\bar{\omega}\right)=-\overline{\mathrm{g}}\left(L_{\overrightarrow{\mathrm{N}}_{\mathrm{t}}} \bar{\omega}_{\mathrm{A}^{\prime}}{ }^{\prime}, \bar{\omega}^{\mathrm{a}}\right) .\right]
\end{aligned}
$$

Let $\mu, \nu$ be indices that run between 1 and $n-1$. Working locally, write

$$
\frac{\partial}{\partial x^{\mu}}=e^{a} E_{L^{\prime}} .
$$

Then

$$
\begin{aligned}
\bar{g}_{\mu \nu} & =\bar{g}\left(\frac{\partial}{\partial x^{\mu^{\prime}}}, \frac{\partial}{\partial x^{\nu}}\right) \\
& =\bar{g}\left(e^{a}{ }_{\mu} E_{a}, e_{\nu}^{b} E_{b}\right) \\
& =\eta_{a b} e_{\mu}^{a} e^{b} .
\end{aligned}
$$

LEMMA We have

$$
\left.\dot{\bar{g}}_{\mu \nu}=\left(\bar{g}^{( } \dot{\bar{\omega}}_{\mathrm{a}},{\overline{\omega_{b}}}_{\mathrm{b}}\right)+\overline{\mathrm{g}}\left(\dot{\bar{\omega}}_{\mathrm{b}}, \bar{\omega}_{\mathrm{a}}\right)\right) \mathrm{e}_{\mu}^{\mathrm{a}} \mathrm{e}_{\nu}^{\mathrm{b}} .
$$

To simplify this, write

$$
\begin{aligned}
& \bar{g}\left(\dot{\bar{\omega}}_{a}, \bar{\omega}_{b}\right)+\bar{g}\left(\dot{\bar{\omega}}_{b}, \bar{\omega}_{a}\right) \\
&= \bar{g}\left(\dot{\bar{\omega}}_{a, S}+\dot{\bar{\omega}}_{a, A}, \bar{\omega}_{b}\right)+\bar{g}\left(\dot{\bar{\omega}}_{b, S}+\dot{\bar{\omega}}_{b, A}, \bar{\omega}_{a}\right) \\
&= \bar{g}\left(\dot{\bar{\omega}}_{a, S}, \bar{\omega}_{b}\right)+\bar{g}\left(\overline{\bar{\omega}}_{b, S}, \bar{\omega}_{a}\right) \\
&\left.+\bar{g}\left(\dot{\bar{\omega}}_{a, A}, \bar{\omega}_{b}\right)+\bar{g}^{\left(\dot{\bar{\omega}}_{b, A},^{\prime}\right.} \bar{\omega}_{a}\right) \\
&= \bar{g}\left(\dot{\bar{\omega}}_{a, S}, \bar{\omega}_{b}\right)+\bar{g}_{\left(\bar{\omega}_{a, S}, \bar{\omega}_{b}\right)} \\
& \quad+\bar{g}\left(\dot{\bar{\omega}}_{a, A}, \bar{\omega}_{b}\right)-\bar{g}\left(\dot{\bar{\omega}}_{a, A}, \bar{\omega}_{b}\right) \\
&= 2 \bar{g}\left(\dot{\bar{\omega}}_{a, S}, \bar{\omega}_{b}\right) .
\end{aligned}
$$

Reality Check The claim is that

$$
2 \mathrm{~N}_{\mathrm{t}}{ }_{\mu \nu}+\left(L_{\vec{N}_{t}} \overline{\mathrm{~g}}\right)_{\mu \nu}
$$

equals

$$
2 \bar{g}\left(\dot{\bar{\omega}}_{a, S^{\prime}} \bar{\omega}_{b}\right) e_{\mu}^{a} e_{v}^{b}
$$

or still,

$$
\begin{aligned}
& 2 \bar{g}\left(N_{t} \bar{\omega}_{a 0}, \bar{\omega}_{b}\right) e_{\mu}^{a} e_{\nu}^{b} \\
& \quad+2 \bar{g}\left(L_{\vec{N}_{t}} \bar{\omega}_{a, S}, \bar{\omega}_{b}\right) e_{\mu}^{a} e_{\nu}^{b}
\end{aligned}
$$

$$
\text { - } 2 \mathrm{~N}_{t^{x} \mu \nu} \begin{aligned}
& \\
&=2 N_{t} x_{t}\left(\frac{\partial}{\partial x^{\mu}}, \frac{\partial}{\partial x^{\nu}}\right) \\
&=2 N_{t} x_{t}\left(e^{a}{ }_{\mu} E_{a}, e^{b} E_{b}\right) \\
&=2 N_{t} e^{a} e^{e^{b}} \nu^{x_{t}}\left(E_{a}, E_{b}\right) \\
&=2 N_{t} e^{a} e^{b} \nu^{x} a b
\end{aligned}
$$

On the other hand,

$$
\begin{aligned}
& 2 \bar{g}\left(N_{t} \bar{\omega}_{a 0}, \bar{\omega}_{b}\right) e_{\mu}^{a} e^{b} \\
& =2 N_{t} e^{a} e^{b}{ }_{\nu}^{b} \bar{g}\left(x_{a c} \bar{\omega}^{c}, \bar{\omega}_{b}\right) \\
& =2 N_{t} e^{a} e^{b} v_{\nu} x_{a b} .
\end{aligned}
$$

$$
=\left({\underset{\sim}{N}}_{t} \bar{g}\right)\left(\frac{\partial}{\partial x^{\mu}}, \frac{\partial}{\partial x^{\nu}}\right)
$$

$$
=\vec{\nabla} \vec{g}^{b} \vec{N}_{t}\left(\frac{\partial}{\partial x^{\mu^{\prime}}}, \frac{\partial}{\partial x^{v}}\right)+\overrightarrow{\nabla g} \vec{N}_{t}\left(\frac{\partial}{\partial x^{\nu}}, \frac{\partial}{\partial x^{\mu}}\right)
$$

$$
=\vec{\nabla}^{-b} \vec{N}_{t}\left(E_{a}, E_{b}\right) e_{\mu}^{a} e_{\nu}^{b}
$$

$$
+\bar{\nabla}_{\bar{g}} \vec{N}_{t}\left(E_{b^{\prime}} E_{a}\right) e_{\mu}^{a} e_{v}^{b}
$$

$$
=\left(\bar{\nabla}_{b} N_{a}\right) e_{\mu}^{a} e_{\nu}^{b}+\left(\bar{\nabla}_{a} N_{b}\right) e_{\mu}^{a} e_{\nu}^{b}
$$

But

$$
\begin{aligned}
& 2 \bar{g}\left(L_{\vec{N}_{t}} \bar{\omega}_{a, S}, \bar{\omega}_{b}\right) e^{a}{ }_{\mu} e^{b}{ }_{\nu} \\
& =\bar{g}\left(L_{\stackrel{N}{N}_{t}} \bar{\omega}_{a}+\bar{g}\left(L_{\vec{N}_{t}} \bar{\omega}^{c}, \bar{\omega}_{a}\right) \bar{\omega}_{c}, \bar{\omega}_{b}\right) e^{a}{ }_{\mu} e^{b}{ }_{\nu} \\
& =\bar{g}\left(L_{\stackrel{N}{N}_{t}} \bar{\omega}_{a}, \bar{\omega}_{b}\right) e^{a}{ }_{\mu} e^{b}{ }_{\nu}+\bar{g}\left(L_{\vec{N}_{t}} \bar{\omega}_{b}, \bar{\omega}_{a}\right) e_{\mu}^{a} e^{b}{ }_{\nu} .
\end{aligned}
$$

Now use the following relations

$$
\left[\begin{array}{l}
\left(\bar{\nabla}_{c} N_{a}\right) \bar{\omega}_{c}=L_{\vec{N}_{t}} \bar{\omega}_{a}+\bar{\omega}_{a c}\left(\vec{N}_{t}\right) \bar{\omega}_{c} \\
\left(\bar{\nabla}_{c} N_{b}\right) \bar{\omega}_{c}=L_{N_{t}} \bar{\omega}_{b}+\bar{\omega}_{b c}\left(\vec{N}_{t}\right) \bar{\omega}_{c}
\end{array}\right.
$$

to get

1. $\bar{g}\left(L_{\vec{N}_{t}} \bar{\omega}_{a}, \bar{\omega}_{b}\right) e^{a}{ }_{\mu} e^{b}{ }_{\nu}$
$=\bar{g}\left(\left(\overline{( }_{c}{ }^{N} a\right) \bar{\omega}_{c}-\bar{\omega}_{a c}\left(\vec{N}_{t}\right) \bar{\omega}_{C}, \bar{\omega}_{b}\right) e^{a}{ }_{\mu} e^{b}{ }_{\nu}$

$$
=\left(\bar{\nabla}_{b} N_{a}\right) e^{a} e^{e}{ }_{\nu}^{b}-\bar{\omega}_{a b}\left(\vec{N}_{t}\right) e^{a}{ }_{\mu} e^{b}{ }_{\nu} .
$$

2. $\bar{g}\left(L_{\bar{N}_{t}} \bar{\omega}_{b}, \bar{\omega}_{a}\right) e_{\mu}^{a}{ }_{\mu}{ }^{b}{ }_{\nu}$
$=\bar{g}\left(\left(\overline{( }_{C}{ }_{N}\right) \bar{\omega}_{C}-\bar{\omega}_{b C}\left(\vec{N}_{t}\right) \bar{\omega}_{C}, \bar{\omega}_{a}\right) e^{a}{ }_{\mu} e^{b}{ }_{v}$
3. 

$$
=\left(\bar{\nabla}_{a} N_{b}\right) e_{\mu}^{a} e_{\nu}^{b}-\bar{\omega}_{b a}\left(\vec{N}_{t}\right) e_{\mu}^{a} e_{\nu}^{b}
$$

Therefore

$$
\begin{aligned}
1+2= & \left(\bar{\nabla}_{b} N_{a}\right) e_{\mu}^{a} e^{b}{ }_{\nu}+\left(\bar{\nabla}_{a} N_{b}\right) e_{\mu}^{a} e^{b} \\
& -\bar{\omega}_{a b}\left(\vec{N}_{t}\right) e_{\mu}^{a} e^{b}{ }_{\nu}-\bar{\omega}_{b a}\left(\vec{N}_{t}\right) e_{\mu}^{a} e^{b} \\
= & \left(\bar{\nabla}_{b} N_{a}\right) e_{\mu}^{a} e_{\nu}^{b}+\left(\bar{\nabla}_{a} N_{b}\right) e_{\mu}^{a} e_{\nu}^{b} \\
& -\bar{\omega}_{a b}\left(\vec{N}_{t}\right) e_{\mu}^{a} e^{b}{ }_{\nu}+\bar{\omega}_{a b}\left(\vec{N}_{t}\right) e_{\mu}^{a} e^{b}{ }_{\nu} \\
& =\left(\bar{\nabla}_{b} N_{a}\right) e_{\mu}^{a} e^{b}+\left(\bar{\nabla}_{a} N_{b}\right) e_{\mu}^{a} e^{b}{ }_{\nu} .
\end{aligned}
$$

N.B. $\forall X \in \mathcal{D}^{1}(\Sigma)$,

$$
\left(\bar{\nabla}_{\mathrm{b}} \mathrm{x}^{\mathrm{a}}\right) \bar{\omega}^{\mathrm{b}}=L_{\mathrm{x}} \bar{\omega}^{\mathrm{a}}+\bar{\omega}_{\mathrm{b}}^{\mathrm{a}}(\mathrm{X}) \bar{\omega}^{\mathrm{b}}
$$

[Note: The verification is an exercise in the definitions and will be detailed later on.]

Section 40: Isolating the Lagrangian The assumptions and notation are those of the standard setup.

Rappel:

$$
\theta^{i j}=*\left(\omega^{i} \omega^{j}\right) \quad(i, j=0,1, \ldots, n-1)
$$

[Note: $\theta^{i j}$ is an ( $n-2$ )-form and the Hodge star is taken per

$$
\left.g=-\omega^{0} \otimes \omega^{0}+\omega^{a} \otimes \omega^{a} .\right]
$$

Consider

$$
\theta^{i j_{\wedge \Omega}}{ }_{1 j}\left(=S(g) \operatorname{vol}_{g}\right)
$$

Write

$$
\begin{aligned}
\theta^{\mathrm{ij}}{ }_{\wedge \Omega_{i j}}= & \theta^{0 j_{\wedge \Omega_{0 j}}+\theta^{i 0}{ }_{\wedge \Omega_{i 0}}} \\
& +\theta^{\mathrm{bc}}{ }_{\wedge \Omega_{b c}} \\
= & 2 \theta^{0 \mathrm{a}_{\wedge \Omega_{0 a}}+\theta^{\mathrm{bc}}{ }_{\wedge \Omega_{b c}}}
\end{aligned}
$$

[Note: Obviously, $\theta^{i j}=-\theta^{j i}$. In addition,

$$
\Rightarrow
$$

$$
\begin{aligned}
\Omega_{j}^{i} & \left.=-\varepsilon_{i} \varepsilon_{j} \Omega_{i}^{j} \quad \text { (no sum }\right) \\
\Omega_{i j} & =\varepsilon_{i}\left(-\varepsilon_{i} \varepsilon_{j} \Omega_{i}^{j}\right) \\
& =-\varepsilon_{j} \Omega_{i}^{j} \\
& \left.=-\Omega_{j i} .\right]
\end{aligned}
$$

Since

$$
\Omega_{0 \mathrm{a}}=d \omega_{0 \mathrm{a}}+\omega_{0 b^{\wedge \omega}}{ }^{\mathrm{b}} \mathrm{a}^{\prime}
$$

it follows that

Rappel: We have

$$
d \theta^{i j}=-\omega_{k}^{i} \wedge \theta^{k j}-\omega_{k}^{j} \wedge \theta^{i k}
$$

Consequently,

$$
\begin{gathered}
d\left(\theta^{0 a} \omega_{0 a}\right)=d \theta^{0 a} \omega_{0 a}+(-1)^{n-2} \theta^{0 a_{\wedge} \lambda \omega_{0 a}} \\
=\left(-\omega_{b^{\wedge}}^{0}{ }^{b a}-\omega_{b^{\wedge}}^{a} \theta^{0 b}\right) \wedge \omega_{0 a}+(-1)^{n-2} \theta^{0 a} \wedge d \omega_{0 a}
\end{gathered}
$$

$$
\Rightarrow
$$

$$
\begin{aligned}
& \theta^{0 a} \wedge d \omega_{0 a}=(-1)^{n-2} d\left(\theta^{0 a} \wedge \omega_{0 a}\right) \\
& +(-1)^{\mathrm{n}-2}\left(\omega^{0}{ }_{b} \wedge \theta^{b a} \wedge \omega_{0 a}+\omega_{b}^{a}{ }_{b} \wedge \theta^{0 b} \wedge \omega_{0 a}\right) \\
& =d\left(\omega_{0 a} \wedge^{0 a}\right)+\theta^{b a}{ }_{\wedge \omega}^{0}{ }_{b}{ }^{\wedge \omega_{0 a}}+\theta^{0 b}{ }_{\wedge \omega}{ }^{a}{ }_{b}{ }^{\wedge \omega_{0 a}} \\
& =d\left(\omega_{0 a} \wedge \theta^{0 a}\right)+\theta^{a b}{ }_{\wedge \omega}{ }^{0} a^{\wedge \omega_{0 b}}+\theta^{0 a}{ }_{\wedge \omega}{ }^{b}{ }_{a}{ }^{\wedge \omega_{0 b}} \\
& =d\left(\omega_{0 a} \wedge \theta^{0 a}\right)+\theta^{a b}{ }_{\wedge \omega}^{0} a_{a} \omega_{0 b}-\theta^{0 a}{ }_{\wedge \omega_{0 b}}{ }^{\wedge}{ }^{b}{ }_{a} .
\end{aligned}
$$

$$
\begin{aligned}
& \theta^{i j}{ }_{\wedge \Omega_{i j}}=2 \theta^{0 a} \wedge d \omega_{0 a}+2 \theta^{0 a} \wedge \omega_{0 b}{ }^{\wedge \omega^{b}} a \\
& +\theta^{b c} \wedge\left(\Omega_{b c}-\omega_{b 0} \wedge \omega_{c}^{0}\right)+\theta^{b c} \wedge \omega_{b 0}{ }_{c} \omega_{c}^{0} .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& \theta^{i j}{ }_{\wedge \Omega_{i j}}=2 \mathrm{~d}\left(\omega_{0 a}{ }^{\wedge \theta}{ }^{0 \mathrm{a}}\right)+2 \theta^{\mathrm{ab}}{ }_{\wedge \omega}{ }^{0}{ }^{\wedge}{ }^{\wedge \omega}{ }_{0 \mathrm{~b}} \\
& +\theta^{b c} \wedge\left(\Omega_{b c}-\omega_{b 0} \wedge^{\Lambda 0^{0}}{ }_{c}\right)+\theta^{b c} \wedge_{\Lambda \omega_{b}}{ }^{\Lambda \omega}{ }_{c}{ }_{c} .
\end{aligned}
$$

But

$$
\theta^{a b} \omega_{\Lambda \omega}{ }_{a}{ }^{\wedge \omega_{0 b}}=\theta^{a b}{ }_{\wedge \omega_{0 a}}{ }^{\wedge \omega^{0}}{ }_{b}
$$

and

$$
\begin{aligned}
& \theta^{b c_{\Lambda \omega}}{ }_{b 0}{ }^{\Lambda \omega}{ }^{0}{ }_{C}=\theta^{a b} \omega_{a 0}{ }^{\wedge \omega}{ }_{b}{ }_{b} \\
& =-\theta^{a b}{ }_{\wedge \omega_{0 a}}{ }^{\wedge \omega}{ }^{0}{ }_{b} \\
& \Rightarrow \\
& \theta^{i j_{\wedge \Omega}}{ }_{i j}=2 d\left(\omega_{0 a}{ }^{\wedge \theta}{ }^{0 a}\right)+\theta^{a b} \wedge \omega_{0 a^{\wedge \omega}}{ }^{0}{ }_{b} \\
& +\theta^{\mathrm{bc}} \wedge\left(\Omega_{\mathrm{bc}}-\omega_{\mathrm{b}} \wedge^{\wedge \omega}{ }^{0}{ }_{\mathrm{c}}\right) \\
& =2 \mathrm{a}\left(\omega_{0 a^{\wedge \theta}}{ }^{0 \mathrm{a}}\right)-\theta^{a b}{ }_{\wedge \omega_{0 a}}{ }^{\wedge \omega_{0 b}} \\
& +\theta^{a b}{ }_{\wedge}\left(\Omega_{a b}-\omega_{a 0} 0^{\wedge \omega}{ }_{b}\right) .
\end{aligned}
$$

Remark: The explanation for singling out the term

$$
\Omega_{a b}-\omega_{a 0^{\wedge}} \omega_{b}^{0}
$$

$$
\bar{\Omega}_{a b}-\bar{\omega}_{a 0^{\wedge} \bar{\omega}_{b}}={ }^{(n-1)} \Omega_{a b}
$$

the overbar standing for pullback by $i_{t}^{*}$.
Notation: Put

$$
\bar{\theta}^{\mathrm{ab}}=*\left(\bar{\omega}^{-\mathrm{a}} \wedge \bar{\omega} \mathrm{~b}\right) .
$$

[Note: The Hodge star is taken per

$$
i_{t}^{*} g=\bar{g}=q(t) \quad\left(=q_{t}\right)
$$

but there is a caveat: $\bar{\theta}^{-\mathrm{ab}}$ is not equal to $i_{t}^{*} \theta^{\mathrm{ab}}$ (which, in fact, is identically zero (cf. infra)).]

Proceeding formally, set aside the differential

$$
2 \mathrm{~d}\left(\omega_{0 a^{\prime}}{ }^{0 \mathrm{a}}\right)
$$

and ignore all issues of convergence -- then

$$
\begin{aligned}
& \int_{M} \theta^{i j^{\prime}}{ }_{i j} \\
& \left.=\int_{\underline{R}} d t \int_{\Sigma} i_{t}^{*}{ }^{*} \partial / \partial t \theta^{a b} \wedge\left(\left(\Omega_{a b}-\omega_{a 0^{\wedge}} \omega_{b}^{0}\right)-\omega_{0 a} \wedge \omega_{0 b}\right)\right] \\
& =\int_{\underline{R}} d t \int_{\Sigma} N_{t} \bar{\theta}^{-a b} \wedge\left({ }^{(n-1)} \Omega_{a b}-\bar{\omega}_{0 a}{ }^{\wedge \bar{\omega}_{O b}}\right) .
\end{aligned}
$$

Details To see the passage from

$$
i_{t}^{*} \iota_{\partial / a t}\left[\theta^{a b} \wedge\left(\left(\Omega_{a b}-\omega_{a 0} \wedge \omega_{b}^{0}\right)-\omega_{0 a} \wedge \omega_{0 b}\right)\right]
$$

to

$$
N_{t} \bar{\theta}^{\mathrm{ab}} \wedge\left({ }^{(\mathrm{n}-1)^{\Omega_{a b}}}-\bar{\omega}_{0 a} \wedge \bar{\omega}_{0 b}\right)
$$

recall first that $\omega^{0}=N d t\left(\Rightarrow \iota_{\partial / \partial t} \omega^{0}=N \iota_{\partial / \partial t} d t=N\right)$, hence $i_{t}^{*} \omega^{0}=N_{t} i^{\star}{ }^{*} d t=0$. This said, write

$$
\begin{aligned}
& \theta^{a b}=\frac{1}{(n-2)!} \varepsilon_{a b j_{3}} \ldots j_{n} \omega^{j_{3}} \wedge \ldots \wedge \omega^{j_{n}} \\
& =\frac{1}{(n-2)!} \varepsilon_{a b 0 j_{4}} \ldots j_{n} \omega^{0}{ }^{{ }^{\prime} j^{j_{4}}} \wedge \ldots \wedge \omega^{j_{n}} \\
& +\cdots+\frac{1}{(n-2)!} \varepsilon_{a b j_{3}} \ldots j_{n-1} 0^{\omega_{3}} \wedge \ldots \wedge \omega^{j_{n-1}}{ }_{\wedge \omega} 0 \\
& +\frac{1}{(n-2)!} \varepsilon_{a b c_{3}} \ldots c_{n} \omega^{C_{3}} \wedge \ldots \wedge \omega^{C_{n}} \\
& =\frac{1}{(n-2)!} \varepsilon_{a b 0 j_{4}} \ldots j_{n} \omega^{0}{ }^{j^{j_{4}}} \wedge \ldots \wedge \omega^{j_{n}} \\
& +\cdots+\frac{1}{(n-2)!} \varepsilon_{a b j_{3}} \ldots j_{n-1} 0^{\omega_{3}} \wedge \ldots \wedge \omega^{j_{n-1}}{ }_{\wedge \omega} 0 \\
& =\frac{(n-2)}{(n-2)!} \varepsilon_{a b 0 c_{4}} \ldots c_{n} \omega^{0}{ }^{\wedge} \omega^{c_{4}} \wedge \ldots \wedge \omega^{c_{n}} \\
& =\omega^{0} \wedge \frac{1}{(n-3)!} \varepsilon_{a b 0 c_{4}} \ldots c_{n} \omega^{C_{4}} \wedge \ldots \wedge \omega^{c_{n}} \\
& =\omega^{0} \wedge \frac{1}{(n-3)!} \varepsilon^{\varepsilon} 0 a b c_{4} \ldots c_{n} \omega^{C_{4}} \wedge \ldots \wedge \omega^{C_{n}} .
\end{aligned}
$$

Put

$$
\mathrm{T}_{\mathrm{ab}}=\left(\Omega_{a b}-\omega_{a 0^{\wedge \omega}}^{0}{ }_{b}\right)-\omega_{0 a}{ }^{\wedge} \omega_{0 b} .
$$

Then

$$
\begin{aligned}
& \left.i_{t}^{*}{ }^{\star} \partial / \partial t^{\left[\theta^{a b}\right.} \wedge \mathrm{T}_{a b}\right] \\
& =i_{t^{*} \iota^{2} / \partial t}\left[\omega^{0} \wedge \frac{l}{(n-3)!} \varepsilon_{0 a b c_{4}} \ldots c_{n} \omega^{c_{4}} \wedge \ldots \wedge \omega^{c_{n}}{ }^{\prime} T_{a b}\right] \\
& =i_{t}^{*}\left[\left(\iota_{\partial / \partial t^{\omega}}{ }^{0}\right) \wedge \frac{1}{(n-3)!} \varepsilon_{0 a b c_{4}} \ldots c_{n} \omega^{c_{4}} \wedge \ldots \wedge \omega^{c} n^{n} T_{a b}\right. \\
& \left.-\omega^{0} \wedge \iota_{\partial / \partial t}\left(\frac{1}{(n-3)!} \varepsilon_{0 a b c_{4}} \ldots c_{n} \omega^{C_{4}} \wedge \ldots \wedge \omega^{C_{n}} \hat{r}_{a b}\right)\right] \\
& =N_{t} \frac{1}{(n-3)!} \varepsilon_{0 a b c_{4}} \ldots c_{n} \bar{\omega}^{C_{4}} \wedge \ldots \wedge \bar{\omega}^{C_{n}} \bar{T}_{a b} \\
& =N_{t} \frac{1}{(n-3)!} \varepsilon_{0 a b c_{4}} \ldots c_{n} \bar{\omega}^{C_{4}} \wedge \ldots \wedge \bar{\omega}^{c_{n}} \wedge\left({ }^{(n-1)_{\Omega}}{ }_{a b}-\bar{\omega}_{0 a} \wedge \bar{\omega}_{0 b}\right) .
\end{aligned}
$$

And

$$
\begin{gathered}
\bar{\theta}^{\mathrm{ab}}=*\left(\bar{\omega}^{\mathrm{a}} \wedge \bar{\omega}\right) \\
=\frac{1}{(n-3)!} \varepsilon_{a b c_{3}} \ldots c_{n-1} \bar{\omega}^{c_{3}} \wedge \ldots \wedge \bar{\omega}^{c_{n-1}} \\
=\frac{1}{(n-3)!} \varepsilon_{0 a b c_{4}} \ldots c_{n} \bar{\omega}^{c_{4}} \wedge \ldots \wedge \bar{\omega}^{c_{n}} .
\end{gathered}
$$

[Note: To discuss the effect of omitting

$$
2 \mathrm{~d}\left(\omega_{0 a^{\wedge \theta}}{ }^{0 \mathrm{a}}\right)
$$

from these considerations, observe that

$$
\begin{aligned}
& \int_{M} d\left(\omega_{0 a} \wedge \theta^{0 a}\right)=\int_{\underline{R}} d t \int_{\Sigma} i_{t^{\star}}^{\iota} \partial / \partial t^{d}\left(\omega_{0 a} \wedge \theta^{0 a}\right) \\
& =\int_{\underline{R}} d t \int_{\Sigma} i_{t}^{*} L_{\partial / \partial t}\left(\omega_{0 a^{\wedge}} \theta^{0 \mathrm{a}}\right)-\int_{\underline{R}} d t \int_{\Sigma} i_{t}^{*} d \iota_{\partial / \partial t}\left(\omega_{0 a^{\wedge}} \theta^{0 a}\right) \\
& =\int_{\underline{R}} d t \int_{\Sigma} \frac{d}{d t} i_{t}^{*}\left(\omega_{0 a} \wedge \theta^{0 \mathrm{a}}\right)-\int_{\underline{R}} d t \int_{\Sigma} d i_{t}^{*}{ }^{\ell} \partial / \partial t\left(\omega_{0 a} \wedge \theta^{0 a}\right) \\
& \left.=\int_{\underline{R}} \frac{d}{d t}\left[\int_{\Sigma} i_{t}^{\star}\left(\omega_{0 a} \wedge \theta^{0 a}\right)\right] d t .\right]
\end{aligned}
$$

It remains to examine the integrand:

$$
\begin{aligned}
& \bar{\theta}^{\mathrm{ab}} \wedge\left({ }^{(\mathrm{n}-1)} \Omega_{a b}-\bar{\omega}_{0 a}{ }^{\wedge \bar{\omega}_{0 b}}\right) \\
& =\bar{\theta}^{\mathrm{ab}}{ }_{\wedge}(\mathrm{n}-1)_{\Omega}{ }_{a b}-*\left(\bar{\omega}^{\mathrm{a}} \wedge \bar{\omega}^{\mathrm{b}}\right) \wedge\left(\bar{\omega}_{0 a} \wedge \bar{\omega}_{0 \mathrm{~b}}\right) \\
& =S(\bar{g}) \operatorname{vol}_{\bar{g}}-(-1)^{2(n-3)}\left(\bar{\omega}_{0 a}{ }^{\wedge \bar{\omega}_{0 b}}\right) \wedge *\left(\bar{\omega}^{\mathrm{a}} \wedge \bar{\omega}^{\mathrm{b}}\right) \\
& =S(\bar{g}) \operatorname{vol}_{\bar{g}}-\bar{g}\left(\bar{\omega}_{0 a} \wedge \bar{\omega}_{0 b^{\prime}}, \bar{\omega}^{\mathrm{a}} \bar{\omega}^{\mathrm{b}}\right)_{\mathrm{Vol}}^{\bar{g}} .
\end{aligned}
$$

And

$$
\left.\begin{aligned}
& -\bar{g}\left(\bar{\omega}_{0 a} \wedge \bar{\omega}_{0 b}, \bar{\omega}^{\mathrm{a}} \wedge \bar{\omega}\right) \\
= & -\operatorname{det} \mid \\
\bar{g}\left(\bar{\omega}_{0 a}, \bar{\omega}^{\mathrm{a}}\right) & \overline{\mathrm{g}}\left(\bar{\omega}_{0 a}, \bar{\omega}^{\mathrm{b}}\right) \\
\bar{g}\left(\bar{\omega}_{0 b}, \bar{\omega}^{\mathrm{a}}\right) & \overline{\mathrm{g}}\left(\bar{\omega}_{0 b}, \bar{\omega}^{\mathrm{b}}\right)
\end{aligned} \right\rvert\, .
$$

But

$$
\left[\begin{array}{l}
\bar{g}\left(\bar{\omega}_{0 a}, \bar{\omega}^{\mathrm{a}}\right)=\overline{\mathrm{g}}\left(-x_{a c} \bar{\omega}^{\mathrm{c}}, \bar{\omega}^{\mathrm{a}}\right)=-x_{a \mathrm{a}} \\
\overline{\mathrm{~g}}\left(\bar{\omega}_{0 a}, \bar{\omega}^{\mathrm{b}}\right)=\bar{g}\left(-x_{a c} \bar{\omega}^{\mathrm{c}}, \bar{\omega}^{\mathrm{b}}\right)=-x_{a b} .
\end{array}\right.
$$

Therefore

$$
\begin{aligned}
& -\bar{g}\left(\bar{\omega}_{0 a} \wedge \bar{\omega}_{0 b^{\prime}} \bar{\omega}^{-a} \wedge \bar{\omega}^{-b}\right) \\
& =-\operatorname{det}\left|\begin{array}{c}
-x_{a a}-x_{a b} \\
-x_{a b}-x_{b b}
\end{array}\right|_{-}^{-\left(x_{a a^{\prime}} x_{b b}-\left(x_{a b}\right)^{2}\right)} \\
& =\left[x_{, x]}^{\bar{g}}-\operatorname{tr}_{\bar{g}}(x)^{2} .\right.
\end{aligned}
$$

Accordingly, at each instant of time,

$$
\begin{aligned}
\int_{\Sigma} & N_{t} \bar{\theta}^{a b} \\
\wedge & (n-1) \\
\Omega_{a b} & \left.-\bar{\omega}_{0 a} \wedge \bar{\omega}_{0 b}\right) \\
& =\int_{\Sigma} N_{t}\left(S\left(q_{t}\right)+\left[x_{t}, x_{t}\right]_{q_{t}}-K_{t}^{2}\right) v o l_{q_{t}}^{\prime}
\end{aligned}
$$

which is in complete agreement with what has been established earlier.

Section 41: The Momentum Form The assumptions and notation are those of the standard setup.

Recall that the momentum of the theory is the path $t \rightarrow p_{t}$ in $s_{d}^{2}(\Sigma)$ defined by the prescription

$$
p_{t}=\pi_{t} \otimes\left|q_{t}\right|^{1 / 2}
$$

where

$$
\pi_{t}=\left(x_{t}-k_{t} q_{t}\right)^{\#}
$$

In this section, we shall show that $p_{t}$ is closely related to a certain element $\vec{p}_{t} \in \Lambda^{n-2}\left(\Sigma ; T_{1}^{0}(\Sigma)\right)$.

Notation: Let

$$
\mathrm{p}_{\mathrm{a}}=\bar{\omega}_{0 \mathrm{~b}} \wedge \star\left(\bar{\omega}^{\mathrm{a}} \wedge \bar{\omega}^{\mathrm{b}}\right)
$$

Definition: The momentum form of the theory is the path $t \rightarrow \vec{p}_{t}$ in $\Lambda^{\mathrm{n}-2}\left(\Sigma ; \mathrm{T}_{1}^{0}(\Sigma)\right)$ defined by the prescription

$$
\vec{p}_{t}\left(x_{1}, \ldots, x_{n-2}\right)=p_{a}\left(x_{1}, \ldots, x_{n-2}\right) \bar{\omega}^{a}
$$

IEMMA We have

$$
p_{a}=q_{t}\left(\bar{\omega}_{0 b}, \bar{\omega}^{b}\right) * \bar{\omega}^{a}-q_{t}\left(\bar{\omega}_{0 b}, \bar{\omega}^{a}\right) * \bar{\omega}^{b}
$$

[To begin with,

But

$$
{ }^{\imath} \bar{\omega}^{\star} \bar{\omega}^{-\mathrm{a}}=*\left(\bar{\omega}^{\mathrm{a}} \wedge \bar{\omega}^{\mathrm{b}}\right) .
$$

Therefore

$$
\begin{aligned}
& \mathrm{p}_{\mathrm{a}}=\bar{\omega}_{0 \mathrm{~b}} \wedge *\left(\bar{\omega}^{\mathrm{a}} \wedge \bar{\omega}^{-\mathrm{b}}\right) \\
& =\iota_{\bar{\omega}} b^{\bar{\omega}} 0 b^{\wedge * \bar{\omega}^{a}}-\iota_{\bar{\omega}} b^{\left(\bar{\omega}_{0}\right.} 0 b^{\left.\wedge \bar{\omega}^{-a}\right)} \\
& =q_{t}\left(\bar{\omega}_{0 b}, \bar{\omega}^{-b}\right) * \bar{\omega}^{-a}-\iota_{\omega}{ }^{b}\left(q_{t}\left(\bar{\omega}_{0 b}, \bar{\omega}^{\mathrm{a}}\right) v o l_{q_{t}}\right) \\
& =q_{t}\left(\bar{\omega}_{0 b}, \bar{\omega}^{b}\right) * \bar{\omega}^{a}-q_{t}\left(\bar{\omega}_{0 b}, \bar{\omega}^{\mathrm{a}}\right) c_{\bar{\omega}} b^{v o l} q_{t} \\
& \left.=q_{t}\left(\bar{\omega}_{0 b^{\prime}} \bar{\omega}^{\mathrm{b}}\right) \star \bar{\omega}^{\mathrm{a}}-q_{t}\left(\bar{\omega}_{0 b^{\prime}}, \bar{\omega}^{\mathrm{a}}\right) \star \bar{\omega}^{\mathrm{b}} .\right]
\end{aligned}
$$

Consider now

$$
\frac{1}{2}\left(\bar{\omega}^{a} \wedge p_{b}+\bar{\omega}^{b} \wedge p_{a}\right)
$$

Write

$$
\left[\begin{array}{l}
p_{a}=q_{t}\left(\bar{\omega}_{0 c}, \bar{\omega}^{c}\right) \star \bar{\omega}^{a}-q_{t}\left(\bar{\omega}_{0 c},^{-a}\right) * \bar{\omega}^{c} \\
p_{b}=q_{t}\left(\bar{\omega}_{0 d}, \bar{\omega}^{-}\right) \star \bar{\omega}^{b}-q_{t}\left(\bar{\omega}_{0 d},^{-\bar{\omega}}\right) * \bar{\omega}^{-d}
\end{array}\right.
$$

Then

$$
\begin{aligned}
& \bar{\omega}^{\mathrm{a}} \wedge \underline{p}_{\mathrm{b}}=q_{t}\left(\bar{\omega}_{0 d}{ }^{\prime-}{ }^{-\mathrm{d}}\right) \bar{\omega}^{-\mathrm{a}} \wedge * \bar{\omega}^{-\mathrm{b}}-q_{\mathrm{t}}\left(\bar{\omega}_{0 d^{\prime}}, \bar{\omega}^{\mathrm{b}}\right) \bar{\omega}^{\mathrm{a}} \wedge \star{ }^{-\mathrm{d}} \\
& =q_{t}\left(\bar{\omega}_{0 d},-\bar{\omega}\right) q_{t}\left(\bar{\omega}^{\mathrm{a}}, \bar{\omega}^{\mathrm{b}}\right) \operatorname{vol}_{q_{t}}-q_{t}\left(\bar{\omega}_{0 d}, \bar{\omega}^{\mathrm{b}}\right) q_{t}\left(\bar{\omega}^{\mathrm{a}},-\bar{\omega}\right) \operatorname{dol} q_{t}
\end{aligned}
$$

and

$$
\begin{aligned}
& \bar{\omega}^{\mathrm{b}} \wedge p_{a}=q_{t}\left(\bar{\omega}_{0 c}, \bar{\omega}^{-c}\right) \bar{\omega}{ }^{\mathrm{b}} \wedge * \bar{\omega}^{\mathrm{a}}-q_{t}\left(\bar{\omega}_{0 c^{\prime}} \bar{\omega}^{\mathrm{a}}\right) \bar{\omega}^{\mathrm{b}} \wedge * \bar{\omega}^{\mathrm{c}} \\
= & q_{t}\left(\bar{\omega}_{0 c}, \bar{\omega}^{\mathrm{c}}\right) q_{t}\left(\bar{\omega}^{\mathrm{b}}, \bar{\omega}^{\mathrm{a}}\right) v o l_{q_{t}}-q_{t}\left(\bar{\omega}_{0 c^{\prime}} \bar{\omega}^{\mathrm{a}}\right) q_{t}\left(\bar{\omega}^{\mathrm{b}}, \bar{\omega}^{\mathrm{c}}\right) v o l_{q_{t}}
\end{aligned}
$$

$$
\frac{1}{2}\left(\bar{\omega} \wedge p_{b}+\bar{\omega}^{b} \wedge p_{a}\right)=c_{a b} v^{v o l} q_{t}
$$

a $\neq \mathrm{b}:$ In this case,

$$
\begin{aligned}
2 C_{a b} & =-q_{t}\left(\bar{\omega}_{0 c}, \bar{\omega}^{a}\right) q_{t}\left(\bar{\omega}^{b}, \bar{\omega}^{c}\right)-q_{t}\left(\bar{\omega}_{0 d}, \bar{\omega}^{b}\right) q_{t}\left(\bar{\omega}^{a}, \bar{\omega}^{d}\right) \\
& =-q_{t}\left(\bar{\omega}_{0 b}, \bar{\omega}^{a}\right)-q_{t}\left(\bar{\omega}_{0 a}, \bar{\omega}^{b}\right) \\
& =-q_{t}\left(\bar{\omega}_{0 b}, E_{a}^{b}\right)-q_{t}\left(\bar{\omega}_{0 a}, E_{b}^{b}\right) \\
& =-\bar{\omega}_{0 b}\left(E_{a}\right)-\bar{\omega}_{0 a}\left(E_{b}\right) \\
& =x_{a b}+x_{b a} \\
& =2 x_{a b} .
\end{aligned}
$$

a=b: In this case,

$$
\begin{aligned}
2 c_{a a} & =q_{t}\left(\bar{\omega}_{0 c}, \bar{\omega}^{c}\right)-q_{t}\left(\bar{\omega}_{0 c^{\prime}}, \bar{\omega}^{-\mathrm{a}}\right) q_{t}\left(\bar{\omega}^{-\mathrm{a}}, \bar{\omega}^{\mathrm{c}}\right) \\
& +q_{t}\left(\bar{\omega}_{0 d^{\prime}} \bar{\omega}^{-\mathrm{a}}\right)-q_{t}\left(\bar{\omega}_{0 d^{\prime}} \bar{\omega}^{-\mathrm{a}}\right) q_{t}\left(\bar{\omega}^{\mathrm{a}}, \bar{\omega}^{\mathrm{d}}\right) \\
& =2 q_{t}\left(\bar{\omega}_{0 c^{\prime}} \bar{\omega}^{\mathrm{c}}\right)-2 q_{t}\left(\bar{\omega}_{0 a^{\prime}} \bar{\omega}^{-\mathrm{a}}\right)
\end{aligned}
$$

$$
\begin{aligned}
& =-2 q_{t}\left(\bar{\omega}_{0 a} \bar{\omega}^{-\mathrm{a}}\right)+2 q_{t}\left(\bar{\omega}_{0 c^{\prime}}-\bar{\omega}^{-}\right) \\
& =2 x_{a a}-2 K_{t} .
\end{aligned}
$$

Since

$$
\left(x_{t}-k_{t} q_{t}\right)_{a b}=\left[\begin{array}{cc}
x_{a b} & (a \neq b) \\
x_{a a}-k_{t}(a=b),
\end{array}\right.
$$

it follows that

$$
\frac{1}{2}\left(\bar{\omega}^{\mathrm{a}} \wedge \mathrm{p}_{\mathrm{b}}+\bar{\omega}^{\mathrm{b}} \wedge \underline{p}_{\mathrm{a}}\right)=\left(x_{\mathrm{t}}-\mathrm{K}_{\mathrm{t}} \mathrm{q}_{\mathrm{t}}\right)_{a b^{v o l} q_{t}} .
$$

By definition,

$$
p_{t}=\pi_{t} \otimes\left|q_{t}\right|^{1 / 2}
$$

where

$$
\pi_{t}=\left(x_{t}-k_{t} q_{t}\right)^{\#} .
$$

And, as elements of $D_{n-1}^{2}(\Sigma)$,

$$
\begin{aligned}
E_{a} \otimes E_{b} & \otimes \frac{1}{2}\left(\bar{\omega}^{a} \wedge p_{b}+\bar{\omega} \wedge \wedge p_{a}\right) \\
& =\left(x_{t}-k_{t} q_{t}\right)_{a b}\left(E_{a} \otimes E_{b}\right) \otimes v o l_{q_{t}} .
\end{aligned}
$$

But

$$
\left(x_{t}-K_{t} q_{t}\right) a b\left(E_{a} \otimes E_{b}\right)=\left(x_{t}-K_{t} q_{t}\right)^{\#}
$$

Indeed,

$$
\left.\left(x_{t}-K_{t} q_{t}\right)\right)^{\#}\left(\bar{\omega}^{a},-\bar{\omega}\right)
$$

$$
\begin{aligned}
& =\left(x_{t}-K_{t} q_{t}\right)\left(E_{a}, E_{b}\right) \\
& =\left(x_{t}-K_{t} q_{t}\right)_{a b} .
\end{aligned}
$$

Let

$$
P_{t}=q_{t}\left(p_{a}, * \bar{\omega}^{a}\right)
$$

Then

$$
\begin{aligned}
& P_{t}=q_{t}\left(q_{t}\left(\bar{\omega}_{0 b}, \bar{\omega}^{b}\right) * \bar{\omega}^{a}-q_{t}\left(\bar{\omega}_{0 b^{\prime}}, \bar{\omega}^{a}\right) * \bar{\omega}^{b}, * \bar{\omega}^{a}\right) \\
= & q_{t}\left(\bar{\omega}_{0 b^{\prime}}, \bar{\omega}^{b}\right) q_{t}\left(* \bar{\omega}^{a}, * \bar{\omega}^{a}\right) \\
& -q_{t}\left(\bar{\omega}_{0 b^{\prime}}, \bar{\omega}^{a}\right) q_{t}\left(* \bar{\omega}^{b}, * \bar{\omega}^{a}\right) \\
= & (n-1) q_{t}\left(\bar{\omega}_{0 b^{\prime}}, \bar{\omega}^{b}\right)-q_{t}\left(\bar{\omega}_{0 a}, \bar{\omega}^{a}\right) \\
= & (n-1) q_{t}\left(\bar{\omega}_{0 a}, \bar{\omega}^{a}\right)-q_{t}\left(\bar{\omega}_{0 a^{\prime}}, \bar{\omega}^{a}\right) \\
= & (n-2) q_{t}\left(\bar{\omega}_{0 a}, \bar{\omega}^{a}\right) .
\end{aligned}
$$

LEMMA We have

$$
\bar{\omega}_{0 a}=-q_{t}\left(p_{b}, * \bar{\omega}^{a}\right) \bar{\omega}^{-b}+\frac{1}{n-2} P_{t} \delta^{b} a^{-b}
$$

[Write

$$
\bar{\omega}_{0 a}=q_{t}\left(\bar{\omega}_{0 a}, \bar{\omega}^{b}\right) \bar{\omega}^{b} .
$$

Then

$$
p_{b}=\frac{1}{n-2} P_{t} \star \bar{\omega}^{b}-q_{t}\left(\bar{\omega}_{0 a}, \bar{\omega}^{b}\right) * \bar{\omega}^{a}
$$

6. 

$$
\begin{array}{ll}
\Rightarrow & q_{t}\left(p_{b}, * \bar{\omega}^{a}\right)=\frac{1}{n-2} p_{t} \delta_{a}^{b}-q_{t}\left(\bar{\omega}_{0 a}, \bar{\omega}^{b}\right) \\
\Rightarrow & \\
& \left.q_{t}\left(\bar{\omega}_{0 a}, \bar{\omega}^{b}\right)=-q_{t}\left(p_{b}, * \bar{\omega}^{-a}\right)+\frac{1}{n-2} P_{t} \delta_{a}^{b} \cdot\right]
\end{array}
$$

Application:

$$
\bar{\omega}^{\mathrm{a}} \wedge \mathrm{p}_{\mathrm{b}}=\bar{\omega}^{\mathrm{b}} \wedge \mathrm{p}_{\mathrm{a}} .
$$

[In fact,

$$
\begin{array}{ll} 
& -\bar{\omega}_{0 a}=x_{b a} \bar{\omega}^{b} \\
\Rightarrow \quad & x_{b a}=q_{t}\left(p_{b}, * \bar{\omega}^{-a}\right)-\frac{1}{n-2} p_{t} \delta_{a}^{b} \\
\Rightarrow \quad & q_{t}\left(p_{b}, * \bar{\omega}^{a}\right)=q_{t}\left(p_{a}, * \bar{\omega}^{b}\right) \quad\left(x_{b a}=x_{a b}\right) \\
\Rightarrow \quad & p_{b} \wedge * * \bar{\omega}^{a}=p_{a} \wedge * * \bar{\omega}^{b} \\
\Rightarrow \quad & p_{b} \wedge \omega^{a}=p_{a} \wedge \omega^{b} \\
\Rightarrow \quad & \left.\bar{\omega}^{a} \wedge p_{b}=\bar{\omega}^{b} \wedge p_{a} \cdot\right]
\end{array}
$$

Section 42: Elimination of the Metric The assumptions and notation are those of the standard setup.

Let $\vec{\omega}_{t}$ be the element of $\Lambda^{1}\left(\Sigma ; T_{0}^{1}(\Sigma)\right)$ given by

$$
\vec{\omega}_{t}(X)=\bar{\omega}^{\mathrm{a}}(X) \mathrm{E}_{\mathrm{a}} \quad\left(X \in D^{l}(\Sigma)\right)
$$

Then the dynamics can be formulated in terms of ( $\vec{\omega}_{t}, \vec{p}_{t}$ ) as opposed to ( $q_{t}, p_{t}$ ), i.e., there are again constraint equations and evolution equations. While this approach does not lead to new results, the methods are instructive, thus are worth examining.

Let $\underline{Q}$ be the set of ordered coframes on $\Sigma$-- then each $\vec{\omega} \in \underline{Q}$ gives rise to a riemannian structure $q \in Q$, viz.

$$
q=\omega^{a} \otimes \omega^{a} .
$$

Conversely, each $q \in Q$ gives rise to a coframe $\vec{\omega} \in \underline{Q}$ which, however, is only determined up to a local rotation.
[Note: At this point, $M$ does not play a role, hence the absence of overbars in the notation.]

Put

$$
\begin{aligned}
& T \underline{Q}=\underline{Q} \times \Lambda^{1}\left(\Sigma ; \mathrm{T}_{0}^{1}(\Sigma)\right) \\
& T^{*} \underline{Q}=\underline{Q} \times \Lambda^{\mathrm{n}-2}\left(\Sigma ; \mathrm{T}_{1}^{0}(\Sigma)\right) .
\end{aligned}
$$

Observation: There is a canonical pairing $<,>$

$$
\begin{gathered}
\Lambda^{1}\left(\Sigma ; \mathrm{T}_{0}^{1}(\Sigma)\right) \times \Lambda^{\mathrm{n}-2}\left(\Sigma ; \mathrm{T}_{1}^{0}(\Sigma)\right) \xrightarrow{\Lambda} \Lambda^{\mathrm{n}-1}\left(\Sigma ; \mathrm{T}_{1}^{1}(\Sigma)\right) \xrightarrow[\Sigma]{\delta_{\Sigma}} \underset{-}{\mathrm{R}} \\
(\alpha, \beta) \longrightarrow \alpha \wedge \beta \longrightarrow \int_{\Sigma} a \wedge \beta .
\end{gathered}
$$

[Note: Explicated, on general grounds,

$$
\Lambda^{1}\left(\Sigma ; \mathrm{T}_{0}^{1}(\Sigma)\right) \times \Lambda^{\mathrm{n}-2}\left(\Sigma ; \mathrm{T}_{1}^{0}(\Sigma)\right) \xrightarrow{\Lambda} \Lambda^{\mathrm{n}-1}\left(\Sigma ; \mathrm{T}_{0}^{1}(\Sigma) \otimes \mathrm{T}_{1}^{0}(\Sigma)\right)
$$

But

$$
\begin{aligned}
& \Lambda^{\mathrm{n}-1}\left(\Sigma ; \mathrm{T}_{1}^{1}(\Sigma)\right)=\Lambda^{\mathrm{n}-1}\left(\Sigma ; \mathrm{T}_{0}^{1}(\Sigma) \otimes \mathrm{T}_{1}^{0}(\Sigma)\right) \\
& \quad=\Lambda^{0}\left(\Sigma ; \mathrm{T}_{0}^{1}(\Sigma) \otimes \mathrm{T}_{1}^{0}(\Sigma)\right) \otimes C^{\infty}(\Sigma) \Lambda^{\mathrm{n}-1} \Sigma \\
& \quad=\left(\Lambda^{0}\left(\Sigma ; \mathrm{T}_{0}^{1}(\Sigma)\right) \otimes C^{\infty}(\Sigma) \Lambda^{0}\left(\Sigma ; \mathrm{T}_{1}^{0}(\Sigma)\right)\right) \otimes C^{\infty}(\Sigma) \Lambda^{\Lambda^{n-1}} \sum_{\Sigma} \\
& \quad=\left(D^{1}(\Sigma) \otimes C^{\infty}(\Sigma) D_{1}(\Sigma)\right) \otimes C^{\infty}(\Sigma) \Lambda^{n-1} \Sigma .
\end{aligned}
$$

One then puts

$$
\left.\int_{\Sigma} X \otimes \omega \otimes \gamma=<X, \omega>\cdot \int_{\Sigma} \gamma_{\cdot}\right]
$$

Consider $T^{*} \underline{Q}=\underline{Q} \times \Lambda^{n-2}\left(\Sigma ; T_{1}^{0}(\Sigma)\right)-$ then

$$
T T^{*} \underline{Q}=\left(\underline{Q} \times \Lambda^{\mathrm{n}-2}\left(\Sigma ; \mathrm{T}_{1}^{0}(\Sigma)\right)\right) \times\left(\Lambda^{1}\left(\Sigma ; \mathrm{T}_{0}^{1}(\Sigma)\right) \times \Lambda^{\mathrm{n}-2}\left(\Sigma ; \mathrm{T}_{1}^{0}(\Sigma)\right)\right)
$$

$\Rightarrow$

$$
\underset{(\vec{\omega}, \overrightarrow{\mathrm{P}})}{ } \mathrm{T}^{*} \underline{\mathrm{Q}}=\Lambda^{1}\left(\Sigma ; \mathrm{T}_{0}^{1}(\Sigma)\right) \times \Lambda^{\mathrm{n}-2}\left(\Sigma ; \mathrm{T}_{1}^{0}(\Sigma)\right)
$$

The Canonical 1-Form $\Theta$ This is the map

$$
\Theta_{(\vec{\omega}, \vec{p})}: T \vec{\omega}_{(\overrightarrow{\mathrm{p}})} \mathrm{T}^{*} \underline{Q} \underline{\underline{R}}
$$

defined by the prescription

$$
\Theta_{(\vec{\omega}, \vec{p})}(\alpha, \beta)=\int_{\Sigma} \alpha \wedge \vec{p} .
$$

The Canonical 2-Form $\Omega$ This is the map

$$
{ }_{(\vec{\omega}, \vec{p})}^{\Omega}:{ }_{(\vec{\omega}, \overrightarrow{\mathrm{p}})}^{T^{*} \underline{Q}} \times \underset{(\vec{\omega}, \overrightarrow{\mathrm{p}})}{T^{*} \underline{Q} \underline{R}}
$$

defined by the prescription

$$
\Omega_{(\vec{\omega}, \overrightarrow{\mathrm{p}})}\left((\alpha, \beta),\left(\alpha^{\prime}, \beta^{\prime}\right)\right)=\int_{\Sigma}\left(\left(\wedge \wedge \beta^{\prime}-\alpha^{\prime} \wedge \beta\right) .\right.
$$

LEMMA We have

$$
\Omega=-\mathrm{d} \theta
$$

[In fact,

$$
\begin{aligned}
& \left.\quad \mathrm{d} \theta\right|_{(\vec{\omega}, \overrightarrow{\mathrm{p}})}\left((\alpha, \beta),\left(\alpha^{\prime}, \beta^{\prime}\right)\right) \\
& \left.=\frac{\mathrm{d}}{\mathrm{~d} \varepsilon} \Theta_{(\vec{\omega}}+\varepsilon a, \overrightarrow{\mathrm{p}}+\varepsilon \beta\right) \\
& \left.\left.\left(\alpha^{\prime}, \beta^{\prime}\right)\right|_{\varepsilon=0}-\frac{\mathrm{d}}{\mathrm{~d} \varepsilon} \theta_{(\vec{\omega}}+\varepsilon \alpha^{\prime}, \overrightarrow{\mathrm{p}}+\varepsilon \beta^{\prime}\right) \\
& =\frac{\mathrm{d}}{\mathrm{~d} \mathrm{\varepsilon}}\left[\left.\alpha_{\Sigma} a^{\prime} \wedge(\overrightarrow{\mathrm{p}}+\varepsilon)\right|_{\varepsilon=0}\right. \\
& =\int_{\Sigma}\left(\alpha^{\prime} \wedge \beta-\alpha \wedge \beta^{\prime}\right) \\
& \left.=-\left.\right|_{\varepsilon=0}-\left.\frac{d}{d \varepsilon}\left[\int_{\Sigma} \alpha \wedge\left(\overrightarrow{\mathrm{p}}+\varepsilon \beta^{\prime}\right)\right]\right|_{\varepsilon=0}\left((\alpha, \beta),\left(\alpha^{\prime}, \beta^{\prime}\right)\right) .\right]
\end{aligned}
$$

Therefore $\Omega$ is exact and the pair ( $T^{*} \underline{Q}, \Omega$ ) is a symplectic manifold.

Suppose given a function $\mathrm{f}: \mathrm{T}^{*} \underline{\underline{Q}} \rightarrow \underline{R}$.

$$
\begin{aligned}
& \Lambda^{\mathrm{n}-2}: \text { Write } \\
& \qquad \frac{\delta f}{\delta \vec{\omega}}
\end{aligned}
$$

for that element of $\Lambda^{n-2}\left(\Sigma ; T_{1}^{0}(\Sigma)\right)$ characterized by the relation

$$
\left.\frac{\mathrm{d}}{\mathrm{~d} \varepsilon} \mathrm{f}\left(\vec{\omega}+\varepsilon \vec{\omega}^{\prime}, \overrightarrow{\mathrm{p}}\right)\right|_{\varepsilon=0}=\int_{\Sigma} \vec{\omega}^{\prime} \wedge \frac{\delta f}{\delta \vec{\omega}} .
$$

$\underline{\Lambda}^{1}:$ Write

$$
\frac{\delta f}{\delta \overrightarrow{\mathrm{p}}}
$$

for that element of $\Lambda^{1}\left(\Sigma ; \mathrm{T}_{0}^{1}(\Sigma)\right)$ characterized by the relation

$$
\left.\frac{\mathrm{d}}{\mathrm{~d} \varepsilon} \mathrm{f}\left(\vec{\omega}, \overrightarrow{\mathrm{p}}+\varepsilon \overrightarrow{\mathrm{p}}^{\prime}\right)\right|_{\varepsilon=0}=\int_{\Sigma} \frac{\delta f}{\delta \overrightarrow{\mathrm{p}}} \wedge \overrightarrow{\mathrm{p}}^{\prime}
$$

[Note: Both $\frac{\delta f}{\delta \vec{\omega}}$ and $\frac{\delta f}{\delta \overrightarrow{\mathrm{P}}}$ depend on $(\vec{\omega}, \overrightarrow{\mathrm{p}})$, thus

$$
\left[\begin{array}{l}
\frac{\delta f}{\delta \vec{\omega}}: T^{*} \underline{Q} \rightarrow \Lambda^{\mathrm{n}-2}\left(\Sigma ; \mathrm{T}_{1}^{0}(\Sigma \downarrow)\right. \\
\left.\frac{\delta \mathrm{f}}{\delta \overrightarrow{\mathrm{p}}}: T^{*} \underline{Q} \rightarrow \Lambda^{1}\left(\Sigma ; \mathrm{T}_{0}^{1}(\Sigma)\right) .\right]
\end{array}\right.
$$

Definition: The hamiltonian vector field

$$
\mathrm{X}_{\mathrm{f}}: \mathrm{T}^{\star} \underline{Q} \rightarrow T T^{*} \underline{Q}
$$

attached to f is defined by

$$
\mathrm{X}_{\mathrm{f}}=\left(\frac{\delta \mathrm{f}}{\delta \overrightarrow{\mathrm{p}}},-\frac{\delta \mathrm{f}}{\delta \vec{\omega}}\right) .
$$

To justify the terminology, let $X$ be any vector field on $T^{*} Q$. Suppose that $X(\vec{\omega}, \overrightarrow{\mathrm{p}})=\left(\vec{\omega}^{\prime}, \overrightarrow{\mathrm{P}}^{\prime}\right)-$ then

$$
\begin{aligned}
& \Omega_{(\vec{\omega}, \vec{p})}\left(X_{f}(\vec{\omega}, \vec{p}), X(\vec{\omega}, \vec{p})\right) \\
& =\Omega_{(\vec{\omega}, \vec{p})}\left(\left(\frac{\delta f}{\delta \vec{p}},-\frac{\delta f}{\delta \vec{\omega}}\right),\left(\vec{\omega}^{\prime}, \overrightarrow{\underline{p}}^{\prime}\right)\right) \\
& =\int_{\Sigma}\left(\frac{\delta f}{\delta \vec{p}} \vec{\wedge}^{\prime}-\vec{\omega}^{\prime} \wedge-\frac{\delta f}{\delta \vec{\omega}}\right) \\
& =\int_{\Sigma}\left(\frac{\delta f}{\delta \overrightarrow{0}} \wedge \overrightarrow{\mathrm{p}}^{\prime}+\vec{\omega}^{\prime} \wedge \frac{\delta f}{\delta \vec{\omega}}\right) \\
& =\left.d f\right|_{(\vec{\omega}, \overrightarrow{\mathrm{p}})}\left(\vec{\omega}^{\prime}, \overrightarrow{\mathrm{p}}^{\prime}\right) .
\end{aligned}
$$

Example: Each coframe $\vec{\omega}$ determines by duality a frame $\vec{E}$, thus

$$
\vec{\omega}(X)=\omega^{a}(X) E_{a}\left(X \in \mathcal{D}^{l}(\Sigma)\right)
$$

Moreover, $\forall \overrightarrow{\mathrm{p}} \in \Lambda^{\mathrm{n}-2}\left(\Sigma ; \mathrm{T}_{1}^{0}(\Sigma)\right)$,

$$
\vec{p}\left(x_{1}, \ldots, x_{n-2}\right)=p_{a}\left(x_{1}, \ldots, x_{n-2}\right) \omega^{a} .
$$

This said, let

$$
f(\vec{\omega}, \overrightarrow{\mathrm{p}})=\int_{\Sigma} \omega^{\mathrm{a}} \wedge \mathrm{p}_{\mathrm{a}} .
$$

6. 

Then it is clear that

$$
\left[\begin{array}{l}
\frac{\delta f}{\delta \omega}\left(=\left(\frac{\delta f}{\delta \vec{\omega}}\right)^{a}\right)=p_{a} \\
\frac{\delta f}{\delta p_{a}}\left(=\left(\frac{\delta f}{\delta \vec{p}}\right)^{a}\right)=\omega
\end{array}\right.
$$

Definition: The configuration space of the theory is $\underline{Q}$, the velocity phase space of the theory is TQ , and the momentum phase space of the theory is $\mathrm{T}^{*} \mathrm{Q}$.

Elements of $\underline{Q}$ are denoted by $\vec{\omega}$, elements of $T \underline{Q}$ are denoted by $(\vec{\omega}, \vec{v})$, and elements of $\mathrm{T}^{*} \underline{\mathrm{Q}}$ are denoted by $(\vec{\omega}, \overrightarrow{\mathrm{p}})$.

The theory carries three external variables, namely

$$
\left[\begin{array}{l}
\mathrm{N} \in C_{>0}^{\infty}(\Sigma) \cup C_{<0}^{\infty}(\Sigma) \\
\overrightarrow{\mathbb{N}} \in \mathcal{D}^{1}(\Sigma)
\end{array}\right.
$$

and

$$
\mathrm{W}=\left[\mathrm{W}_{\mathrm{b}}^{\mathrm{a}}\right]
$$

where $W_{b}^{a} \in C^{\infty}(\Sigma)$ and $W_{b}^{a}=-W_{a}^{b}$.
Given ( $\vec{\omega}, \overrightarrow{\mathrm{V}} ; \mathrm{N}, \overrightarrow{\mathrm{N}}, \mathrm{W})$, put

$$
N \omega_{0}^{a}=v^{a}-W_{b}^{a} \omega^{b}-L_{\stackrel{N}{N}}^{\omega^{a}} .
$$

Definition: The lagrangian of the theory is the function

$$
\mathrm{L}: \mathrm{TQ} \rightarrow \Lambda^{\mathrm{n}-1} \Sigma
$$

defined by the rule

$$
L(\vec{\omega}, \vec{v} ; N, \vec{N}, W)
$$

$$
=N *\left(\omega^{a} \wedge \omega^{b}\right) \wedge\left({ }^{(n-1)} \Omega_{a b}-\omega_{0 a} \wedge \omega_{0 b}\right) .
$$

[Note: As usual, the ${ }^{(n-1)} \Omega_{a b}$ are the curvature forms of the metric connection $\nabla^{q}$ associated with $q$ and, of course, the Hodge star is taken per q.]

Let

$$
L(\vec{\omega}, \vec{v} ; N, \vec{N}, W)=\frac{1}{2} \int_{\Sigma} L(\vec{\omega}, \vec{v} ; N, \vec{N}, W) .
$$

Then, in order to transfer the theory from $T \underline{Q}$ to $T^{*} \underline{Q}$, it will be necessary to calculate the functional derivative

$$
\frac{\delta L}{\delta \overrightarrow{\mathrm{v}}}
$$

which, a priori, is an element of $\Lambda^{\mathrm{n}-2}\left(\Sigma ; \mathrm{T}_{1}^{0}(\Sigma)\right)$ :

$$
\left.\frac{d}{d \varepsilon} L\left(\vec{\omega}, \vec{v}+\varepsilon \vec{V}^{\prime} ; N, \vec{N}, W\right)\right|_{\varepsilon=0}=\int_{\Sigma} \vec{v}^{\prime} \wedge \frac{\delta L}{\delta \vec{V}} .
$$

Notation: Let

$$
\mathrm{p}_{\mathrm{a}}=\omega_{0 \mathrm{~b}} \wedge *\left(\omega^{\mathrm{a}} \wedge \omega^{\mathrm{b}}\right)
$$

[Note: Therefore

$$
\left.\mathrm{p}_{\mathrm{a}}=\mathrm{q}\left(\omega_{0 b^{\prime}} \omega^{\mathrm{b}}\right) * \omega^{\mathrm{a}}-\mathrm{q}\left(\omega_{0 b^{\prime}} \omega^{\mathrm{a}}\right) * \omega^{\mathrm{b}} .\right]
$$

LEMMA We have

$$
\frac{\delta L}{\delta \mathrm{v}^{\mathrm{a}}}=\mathrm{p}_{\mathrm{a}}
$$

[To facilitate the computation, "variational notation" will be employed,
i.e., we shall replace the symbol $\mathrm{v}^{\mathrm{a}}$ by $\delta \mathrm{v}^{\mathrm{a}}$ and abbreviate $\mathrm{D} \mathrm{v}^{\mathrm{a}}$ to $\delta_{a}$ - then

$$
\begin{aligned}
& \delta_{a} \frac{1}{2}[ \left(N *\left(\omega^{c} \wedge \omega^{d}\right) \wedge\left({ }^{(n-1)} \Omega_{c d}-\omega_{0 c} \omega_{0 d}\right)\right] \\
&= \frac{1}{2} *\left(\omega^{c} \wedge \omega^{d}\right) \delta_{a}\left(-N \omega_{0 c}\right) \wedge \omega_{0 d} \\
&+\frac{1}{2} *\left(\omega^{c} \wedge \omega^{d}\right) \omega_{0 c} \wedge \delta_{a}\left(-N \omega_{0 d}\right) \\
&=\frac{1}{2} *\left(\omega^{a} \wedge \omega^{d}\right) \wedge \delta v^{a} \wedge \omega_{0 d} \\
&+\frac{1}{2} *\left(\omega^{c} \wedge \omega^{a}\right) \wedge \omega_{0 c} \wedge \delta v^{a} \\
&=\frac{1}{2} \delta v^{a} \wedge \omega_{0 d^{\wedge}} *\left(\omega^{a} \wedge \omega^{d}\right) \\
&+\frac{1}{2} \omega_{0 c} \wedge \delta v^{a} \wedge *\left(\omega^{c} \wedge \omega^{a}\right) \\
&=\frac{1}{2} \delta v^{a} \wedge \omega_{0 b} \wedge *\left(\omega^{a} \wedge \omega^{b}\right) \\
&+\frac{1}{2}-\left(\delta v^{a} \wedge \omega_{0 b}\right) \wedge-*\left(\omega^{a} \wedge \omega^{b}\right) \\
&\left.=\delta v^{a} \wedge p_{a} \cdot\right]
\end{aligned}
$$

[Note: This result is the reason for the " $1 / 2$ " prefacing the integral $\delta_{\Sigma}$ L.]

Remark: The method employed above for the calculation of $\frac{\delta L}{\delta v^{a}}$ is widely applicable and will be used without comment whenever it is convenient to do so.
9.
[Note: The interior derivative is not a participant, hence the possibility of misinterpretation is minimal.]

Consider now the fiber derivative of $L$ :

$$
\left[\begin{array}{l}
F L: T \underline{Q} \rightarrow T^{*} \underline{Q} \\
F L(\vec{\omega}, \overrightarrow{\mathrm{v}})=\left(\vec{\omega}, \frac{\delta L}{\delta \overrightarrow{\mathrm{v}}}\right)
\end{array}\right.
$$

Then

$$
\begin{aligned}
& <\overrightarrow{\mathrm{v}}, \frac{\delta L}{\delta \overrightarrow{\mathrm{v}}}>-L(\vec{\omega}, \overrightarrow{\mathrm{v}} ; N, \vec{N}, \mathrm{~W}) \\
& =\int_{\Sigma} \mathrm{v}^{\mathrm{a}} \wedge \mathrm{p}_{a}-\frac{1}{2} \int_{\Sigma} N *\left(\omega^{a} \wedge \omega^{b}\right) \wedge\left({ }^{(n-1)} \Omega_{a b}-\omega_{0 a} \wedge \omega_{0 b}\right) .
\end{aligned}
$$

To simplify this, write

$$
\begin{aligned}
& \int_{\Sigma} v^{a} \wedge p_{a} \\
= & \int_{\Sigma} L_{\vec{N}} \omega^{a} \wedge p_{a}+\int_{\Sigma} w_{b}^{a} \omega^{b} \wedge p_{a}-\int_{\Sigma} N \omega_{0 a} \wedge p_{a} .
\end{aligned}
$$

Let

$$
P=q\left(p_{a}, * \omega^{a}\right) \quad\left(=(n-2) q\left(\omega_{0 a}, \omega^{a}\right)\right)
$$

Then

$$
\omega_{0 a}=-q\left(p_{b}, * \omega^{a}\right) \omega^{b}+\frac{p}{n-2} \omega^{a}
$$

$\Rightarrow$

$$
* \omega_{0 a}=-q\left(p_{b}, * \omega^{a}\right) * \omega^{b}+\frac{p}{n-2} * \omega^{a}
$$

10. 

Therefore

$$
\begin{aligned}
& \omega_{0 a} \wedge p_{a}=(-1)^{n-2} p_{a} \wedge \omega_{0 a} \\
& =(-1)^{n} p_{a} \wedge \omega_{0 a} \\
& =(-1)^{n^{n}} \mathrm{p}_{\mathrm{a}}{(-1)^{(\mathrm{n}-1-1)}}_{* * \omega_{0 a}} \\
& =\mathrm{p}_{\mathrm{a}}{ }^{\wedge * * \omega_{0 \mathrm{a}}} \\
& =q\left(p_{a}, * \omega_{0 a}\right)^{\mathrm{VOl}}{ }_{q} \\
& =\left(-q\left(p_{a}, * \omega^{b}\right) q\left(p_{b}, * \omega^{a}\right)+\frac{p}{n-2} q\left(p_{a}, * \omega^{a}\right)\right) \operatorname{vol}_{q} \\
& =\left(-q\left(p_{a}, * \omega^{b}\right) q\left(p_{b}, * \omega^{a}\right)+\frac{P^{2}}{n-2}\right) \operatorname{vol}_{q} \\
& \Rightarrow \\
& -\int_{\Sigma}{ }^{N} \omega_{0 \mathrm{a}}{ }^{\wedge \mathrm{p}} \mathrm{a} \\
& =\int_{\Sigma} N\left(q\left(p_{a}, * \omega^{b}\right) q\left(p_{b}, * \omega^{a}\right)-\frac{p^{2}}{n-2}\right) \operatorname{vol}_{q} .
\end{aligned}
$$

On the other hand,

$$
\begin{aligned}
&-\frac{1}{2} \int_{\Sigma} N *\left(\omega^{a} \wedge \omega^{b}\right) \wedge\left({ }^{(n-1)} \Omega_{a b}-\omega_{0 a} \wedge \omega_{0 b}\right) \\
&=-\frac{1}{2} \int_{\Sigma} N *\left(\omega^{a} \wedge \omega^{b}\right) \wedge{ }^{(n-1)} \Omega_{a b} \\
&+\frac{1}{2} \delta_{\Sigma} N *\left(\omega^{a} \wedge \omega^{b}\right) \wedge\left(\omega_{0 a}{ }^{\wedge} \omega_{0 b}\right) \\
&=-\frac{1}{2} \int_{\Sigma} N S(q) v o l_{q}
\end{aligned}
$$

$$
\left.\begin{array}{rl} 
& +\frac{1}{2} \delta_{\Sigma} N\left(\omega_{0 a} \omega_{0 b}\right) \wedge *\left(\omega^{a} \wedge \omega\right. \\
b
\end{array}\right)
$$

Consequently,

$$
\begin{gathered}
-\int_{\Sigma} N_{0 a} \omega_{a} \\
-\frac{1}{2} \int_{\Sigma} N \star\left(\omega^{a} \wedge \omega^{b}\right) \wedge\left({ }^{(n-1)} \Omega_{a b}-\omega_{0 a} \wedge \omega_{0 b}\right) \\
=\int_{\Sigma} \frac{N}{2}\left[q\left(p_{a}, * \omega^{b}\right) q\left(p_{b}, * \omega^{a}\right)-\frac{p^{2}}{n-2}-S(q)\right] v o l_{q} .
\end{gathered}
$$

Motivated by these considerations, let

$$
H: T^{*} \underline{Q} \rightarrow \underline{R}
$$

be the function defined by the prescription

$$
\begin{aligned}
& H(\vec{\omega}, \vec{p} ; N, \vec{N}, w) \\
& \quad=\int_{\Sigma} L_{\vec{N}} \omega^{a} \wedge p_{a}+\int_{\Sigma} W_{b}^{a} \omega^{b} \wedge p_{a} \\
& +\int_{\Sigma} \frac{N}{2}\left[q\left(p_{a}, * \omega^{b}\right) q\left(p_{b}, * \omega^{a}\right)-\frac{p^{2}}{n-2}-s(q)\right] v o l_{q} .
\end{aligned}
$$

[Note: Here the external variable N is unrestricted, i.e., N can be any element of $\left.C^{\infty}(\Sigma).\right]$

Definition: The physical phase space of the theory (a.k.a. the constraint surface of the theory) is the subset $\mathrm{Con}_{\underline{Q}}$ of $\mathrm{T}^{*} \underline{\underline{Q}}$ whose elements are the points
$(\vec{\omega}, \overrightarrow{\mathrm{p}})$ such that simultaneously

$$
\frac{\delta H}{\delta N}=0, \frac{\delta H}{\delta \vec{N}}=0, \frac{\delta H}{\delta W}=0
$$

The calculation of $\frac{\delta \mathrm{H}}{\delta \mathrm{N}}$ is trivial. Thus define

$$
\mathrm{E}: \mathrm{T}^{*} \underline{Q} \rightarrow \Lambda^{\mathrm{n}-1} \Sigma
$$

by

$$
E(\vec{\omega}, \vec{p})=\frac{1}{2}\left[q\left(p_{a}, * \omega^{b}\right) q\left(p_{b}, * \omega^{a}\right)-\frac{p^{2}}{n-2}-S(q)\right] v_{q} l .
$$

Then

$$
\frac{\delta H}{\delta N}=E .
$$

Turning to $\frac{\delta H}{\delta W_{b}^{a}}$, observe that

$$
\begin{aligned}
& \delta_{b}^{a}\left(W_{d}^{c}{ }_{d}{ }^{d} \wedge p_{c}\right) \\
& \quad=\delta W_{b}^{a}{ }^{\omega}{ }^{b} \wedge p_{a}-\delta W_{b}^{a} \omega^{a} \wedge p_{b} .
\end{aligned}
$$

Therefore

$$
\frac{\delta H}{\delta W_{b}^{a}}=\omega^{b} \wedge p_{a}-\omega^{a} \wedge p_{b}
$$

There remains the determination of $\frac{\delta H}{\delta \vec{N}}$. To this end, fix a -- then

$$
\begin{aligned}
& \delta_{a}\left[L_{\overline{\mathrm{N}}} \omega^{b} \wedge \mathrm{p}_{b}\right] \\
& =L_{\left(\delta N^{a}\right) E_{a}} \omega^{b} \wedge p_{b} .
\end{aligned}
$$

Write

$$
\begin{aligned}
& L_{\left(\delta N^{a}\right) E_{a}}^{\omega}{ }^{b} \wedge p_{b} \\
& =\left(c_{\left(\delta N^{a}\right) E_{a}} \circ d+d \circ \iota_{\left(\delta N^{a}\right) E_{a}}\right) \omega^{b} \wedge p_{b} \\
& =\delta N^{a}\left(c_{E_{a}} d \omega^{b} \wedge p_{b}\right)+d\left(\delta N^{a} \iota_{E_{a}} \omega^{b}\right) \wedge p_{b}
\end{aligned}
$$

But

$$
\begin{aligned}
& d\left(\delta N^{a} \tau_{E_{a}} \omega^{b}\right) \wedge p_{b} \\
& \quad=d\left(\delta N^{a} \omega^{b}\left(E_{a}\right)\right) \wedge p_{b} \\
& \quad=d \delta N^{a} \wedge p_{a}
\end{aligned}
$$

And

$$
\begin{aligned}
& d\left(\delta N^{a} \wedge p_{a}\right)=d \delta N^{a} \wedge p_{a}+\delta N^{a} \wedge d p_{a} \\
& \Rightarrow \\
& \quad d \delta N^{a} \wedge p_{a}=d\left(\delta N^{a} \wedge p_{a}\right)-\delta N^{a} \wedge d p_{a}
\end{aligned}
$$

Since

$$
\int_{\Sigma} d\left(\delta N^{a} \wedge p_{a}\right)=0
$$

it follows that

$$
\frac{\delta H}{\delta N^{\mathrm{a}}}=-d p_{a}+i_{\mathrm{E}_{\mathrm{a}}} \mathrm{~d} \omega^{\mathrm{b}} \wedge \mathrm{p}_{\mathrm{b}}
$$

[Note: The integral

$$
\int_{\Sigma} \stackrel{L}{\vec{N}}^{\omega^{\mathrm{a}} \wedge \mathrm{p}_{\mathrm{a}}}
$$

can be rewritten as

$$
\int_{\Sigma} N^{a} I_{a}
$$

Here

$$
I_{a}: T^{*} \underline{Q} \rightarrow \Lambda^{n-1} \Sigma
$$

is defined by

$$
\left.I_{a}(\vec{\omega}, \vec{p})=-d p_{a}+c_{E_{a}} d \omega^{b} \wedge p_{b} .\right]
$$

Scholitum: Con $\underline{\underline{Q}}$ is the subset of $\mathrm{T}^{*} \underline{\underline{Q}}$ consisting of those pairs $(\vec{\omega}, \overrightarrow{\mathrm{p}})$ such that

$$
E(\vec{\omega}, \overrightarrow{\mathrm{p}})=0
$$

subject to

$$
\left[\begin{array}{l}
\omega{ }^{a} \wedge p_{b}=\omega^{b} \wedge p_{a} \\
-d p_{a}+c_{E_{a}} d \omega^{b} \wedge p_{b}=0 .
\end{array}\right.
$$

Definition: The $\underline{A D M}$ sector of $T^{*} \underline{Q}$ consists of the pairs $(\vec{\omega}, \vec{p})$ for which

$$
\omega^{\mathrm{a}} \wedge \mathrm{p}_{\mathrm{b}}=\omega^{\mathrm{b}} \wedge \mathrm{p}_{\mathrm{a}} .
$$

In the ADM sector of $T^{*} \underline{Q}$, the functional derivative $\frac{\delta H}{\delta N_{a}}$ can be expressed in terms of the $\underline{R}$-linear operator

$$
d^{\nabla^{\mathrm{q}}: \Lambda^{\mathrm{n}-2}\left(\Sigma ; \mathrm{T}_{1}^{0}(\Sigma)\right) \rightarrow \Lambda^{\mathrm{n}-1}\left(\Sigma ; \mathrm{T}_{1}^{0}(\Sigma)\right) . . . . .}
$$

To see this, recall that

$$
d^{\nabla^{q}} p_{a}=d p_{a}-\omega_{a}^{b} \wedge p_{b}
$$

And

$$
\begin{aligned}
& \quad d \omega^{b}=-\omega^{b} c^{\wedge \omega^{c}} \\
& \Rightarrow \quad \iota_{E_{a}} d \omega^{b}=-\iota_{E_{a}}\left(\omega^{b} c^{\wedge} \omega^{c}\right) \\
& =-\left[\iota_{E_{a}} \omega^{b} c^{\wedge \omega^{c}}-\omega^{b} c^{\wedge \iota} E_{a} \omega^{c}\right] \\
& =-\left[\omega_{c}^{b}\left(E_{a}\right) \wedge \omega^{c}-\omega^{b} c^{\left.\wedge \omega^{c}\left(E_{a}\right)\right]}\right. \\
& =-\omega_{c}^{b}\left(E_{a}\right) \wedge \omega^{c}+\omega_{a}^{b} .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& -d p_{a}+c_{E_{a}}^{d \omega^{b} \wedge p_{b}} \\
& =-d^{\nabla}{ }^{q} p_{a}-\omega^{b}{ }_{a}^{\wedge p_{b}} \\
& \quad-\omega_{c}^{b}\left(E_{a}\right) \omega^{c} \wedge p_{b}+\omega_{a}^{b}{ }_{a} p_{b} \\
& = \\
& \left.-d^{\nabla^{q}} p_{a}-\omega_{c}^{b}{ }_{c} E_{a}\right) \omega^{c} \wedge p_{b} .
\end{aligned}
$$

But

$$
\begin{gathered}
\omega^{c} \wedge p_{b}=\omega^{b} \wedge p_{c} \\
\Rightarrow \quad-\omega_{c}^{b}\left(E_{a}\right) \omega^{c} \wedge p_{b} \\
=-\omega_{c}^{b}\left(E_{a}\right) \omega^{b} \wedge p_{c}
\end{gathered}
$$

$$
\begin{aligned}
& =\omega_{b}^{c}\left(E_{a}\right) \omega^{b} \wedge p_{c} \\
& =\omega_{c}^{b}\left(E_{a}\right) \omega^{c} \wedge p_{b} \\
& \Rightarrow \\
& \\
& \frac{\delta H}{\delta N^{a}}=-d^{\nabla} p_{a}^{q} .
\end{aligned}
$$

Since $\mathrm{n}=\operatorname{dim} \mathrm{M}>2$, the vanishing of $\operatorname{Ein}(\mathrm{g})$ is equivalent to the vanishing of Ric (g) and for the latter, conditions have been given in terms of the path $t \rightarrow\left(q_{t}, x_{t}\right)$ in $T Q$ or the path $t \rightarrow\left(q_{t}, p_{t}\right)$ in $T * Q$. However, one can also work instead with the path $t \rightarrow\left(\vec{\omega}_{t}, \overrightarrow{\mathrm{P}}_{t}\right)$ in $\mathrm{T}^{*} \underline{Q}$, there being, as always, two aspects to the analysis: Constraints (i.e., the $G_{0 i}=0$ equations) and evolution (i.e., the $G_{a b}=0$ equations). In the next section, we shall treat the constraints and, in the section after that, evolution.

Rappel: The symmetry of the extrinsic curvature implies that the components $\mathrm{p}_{\mathrm{a}}$ of the momentum form $\overrightarrow{\mathrm{p}}_{\mathrm{t}}$ satisfy the constraint

$$
\bar{\omega}^{\mathrm{a}} \wedge \mathrm{p}_{\mathrm{b}}=\bar{\omega}^{\mathrm{b}} \wedge \mathrm{p}_{\mathrm{a}^{\prime}}
$$

i.e., the path $t \rightarrow\left(\vec{\omega}_{t}, \overrightarrow{\mathrm{P}}_{\mathrm{t}}\right)$ lies in the ADM sector of $\mathrm{T}^{*} \underline{Q}$.

Section 43: Constraints in the Coframe Picture The assumptions and notation are those of the standard setup.

Rappel: $\forall t$,

$$
\bar{G}_{00}=\frac{1}{2} s\left(q_{t}\right)+\frac{1}{2}\left(K_{t}^{2}-\left[{\left.\left.x_{t}, x_{t}\right]_{q_{t}}\right) .} .\right.\right.
$$

IEMMA $\forall t$,

$$
\left.\frac{\delta H}{\delta N}\right|_{\left(\vec{\omega}_{t}, \vec{p}_{t}\right)}=-\bar{G}_{00}{ }^{\mathrm{vol}} \mathrm{q}_{t} .
$$

[Since

$$
x_{a b}=q_{t}\left(p_{a}, \star \dot{\omega}\right)-\frac{1}{n-2} p_{t} \delta_{a b},
$$

we have

$$
\begin{aligned}
& \text { 1. }-\left[x_{t}, x_{t}\right]_{q_{t}}=-x^{a b} x_{a b}=-x_{a b}^{x} a b=-x_{a b} x_{b a} \\
& =\frac{2}{n-2} P_{t} \delta_{a b} q_{t}\left(p_{a}, * \bar{\omega}^{b}\right)-q_{t}\left(p_{a}, * \bar{\omega}^{b}\right) q_{t}\left(p_{b}, * \bar{\omega}^{a}\right)-\frac{1}{(n-2)^{2}} P_{t}^{2} \delta_{a b}^{\delta} a b \\
& = \\
& =\frac{2}{n-2} P_{t} q_{t}\left(p_{a}, * \bar{\omega}^{a}\right)-q_{t}\left(p_{a}, * \bar{\omega}^{b}\right) q_{t}\left(p_{b^{\prime}} * \bar{\omega}^{a}\right)-\frac{(n-1)}{(n-2)^{2}} P_{t}^{2} \\
& =\frac{2}{n-2} P_{t}^{2}-q_{t}\left(p_{a}, * \omega^{b}\right) q_{t}\left(p_{b}, * \bar{\omega}^{a}\right)-\frac{(n-1)}{(n-2)^{2}} P_{t}^{2} \\
& =\left[\frac{2}{n-2}-\frac{(n-1)}{(n-2)^{2}}\right] P_{t}^{2}-q_{t}\left(p_{a}, * \bar{\omega}^{b}\right) q_{t}\left(p_{b^{\prime}} * \bar{\omega}^{a}\right) \\
& =
\end{aligned}
$$

2. $K_{t}^{2}=x_{a a^{x}}{ }_{b b}$

$$
\begin{aligned}
& =\sum_{a}\left(q_{t}\left(p_{a}, * \bar{\omega}^{a}\right)-\frac{1}{n-2} P_{t}\right) \cdot \sum_{b}\left(q_{t}\left(p_{b}, * \bar{\omega}^{b}\right)-\frac{1}{n-2} P_{t}\right) \\
& =\left(P_{t}-\frac{n-1}{n-2} P_{t}\right) \cdot\left(P_{t}-\frac{n-1}{n-2} P_{t}\right) \\
& =\frac{1}{(n-2)^{2}} P_{t}^{2}
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& \frac{1}{2}\left[q_{t}\left(p_{a}, * \bar{\omega}^{b}\right) q_{t}\left(p_{b}, * \bar{\omega}^{a}\right)-\frac{1}{n-2} p_{t}^{2}-s\left(q_{t}\right)\right] \\
& =\frac{1}{2}\left[\left[x_{t}, x_{t}\right]_{t}+\frac{n-3}{(n-2)^{2}} P_{t}^{2}\right]-\frac{1}{2(n-2)} P_{t}^{2}-\frac{1}{2} S\left(q_{t}\right) \\
& =-\frac{1}{2} S\left(q_{t}\right)+\frac{1}{2}\left[x_{t}, x_{t}\right]_{q_{t}}+\left[\frac{n-3}{2(n-2)^{2}}-\frac{1}{2(n-2)}\right] p_{t}^{2} \\
& =-\frac{1}{2} s\left(q_{t}\right)-\frac{1}{2(n-2)^{2}} P_{t}^{2}+\frac{1}{2}\left[x_{t}, x_{t}\right] q_{t} \\
& =-\frac{1}{2} s\left(q_{t}\right)-\frac{1}{2} k_{t}^{2}+\frac{1}{2}\left[x_{t}, x_{t}\right] q_{t} \\
& =-\frac{1}{2} s\left(q_{t}\right)-\frac{1}{2}\left(\kappa_{t}^{2}-\left[x_{t}, x_{t}\right]_{q_{t}}\right) \\
& =-\bar{G}_{00} \\
& \Rightarrow \\
& \left.\left.\frac{\delta H}{\delta N}\right|_{\left(\vec{\omega}_{t}, \vec{p}_{t}\right)}=-\bar{G}_{00}{ }^{\mathrm{vol}} \mathrm{q}_{t} \cdot\right]
\end{aligned}
$$

Rappel: $\forall t$,

$$
\overline{\mathrm{G}}_{0 \mathrm{a}}=\bar{\nabla}_{\mathrm{b}} \chi_{\mathrm{ab}}-\bar{\nabla}_{\mathrm{a}} \mathrm{~K}_{\mathrm{t}} .
$$

[Note: $\bar{\nabla}$ stands for $\nabla^{\mathrm{q}_{\mathrm{t}}}$.]

LEMMA $\forall t$,

$$
\left.\frac{\delta H}{\delta N^{a}}\right|_{\left(\vec{\omega}_{t}, \vec{P}_{t}\right)}=-\bar{G}_{0 a}{ }^{\mathrm{Vol}}{ }_{q_{t}} .
$$

It suffices to deal with

$$
-\mathrm{d}^{\bar{\nabla}} \mathrm{p}_{\mathrm{a}}
$$

as opposed to

$$
-d p_{a}+c_{E_{a}} d \omega^{b} \wedge p_{b}
$$

[Note: Bear in mind that

$$
\left.\bar{\omega}^{a} \wedge p_{b}=\frac{b}{\omega} \wedge p_{a} \cdot\right]
$$

This said,

$$
p_{a}=\left(x_{t}-k_{t} q_{t}\right) a b * \bar{\omega}_{b}
$$

$$
d^{\bar{\nabla}} p_{a}=d^{\bar{\nabla}}\left(x_{t}-k_{t} q_{t}\right) a b^{\wedge * \bar{\omega}_{b}}
$$

$$
+\left(x_{t}-k_{t} q_{t}\right) a b^{d^{\bar{\gamma}} \star \bar{\omega}_{b}} .
$$

Using the definitions, one finds that

$$
\begin{aligned}
& d^{\bar{\nabla}}\left(x_{t}-K_{t} q_{t}\right)_{a b} \wedge \star \bar{\omega}_{b} \\
& =d^{\bar{\nabla}}\left(x_{t}-K_{t} q_{t}\right)_{a b}{ }^{\wedge c} E_{b}{ }^{v o l} q_{t} \\
& =\left(\bar{\nabla}_{b}{ }_{a b}-\delta_{a b} \bar{\nabla}_{b} K_{t}\right) \operatorname{vol}_{q_{t}} \\
& =\left(\bar{\nabla}_{b}{ }_{a b}-\bar{\nabla}_{a} K_{t}\right) \operatorname{vol}_{q_{t}} \\
& =\overline{\mathrm{G}}_{\mathrm{Oa}} \mathrm{vol}_{\mathrm{q}_{\mathrm{t}}} .
\end{aligned}
$$

On the other hand,

$$
\begin{aligned}
d^{\bar{\nabla}} \star \bar{\omega}^{b} & =d \star \bar{\omega}^{b}+\bar{\omega}^{b} c^{\wedge \star \bar{\omega}^{c}} \\
& =-\bar{\omega}^{b} c^{\wedge * \bar{\omega}^{c}+\bar{\omega}^{b} c^{\wedge \star \bar{\omega}^{c}}} \\
& =0 .
\end{aligned}
$$

Therefore

$$
\left.\frac{\delta H}{\delta N^{a}}\right|_{\left(\vec{\omega}_{t}, \vec{P}_{t}\right)}=-\bar{G}_{0 a}{ }^{\mathrm{vol}}{ }_{q_{t}} .
$$

Details The claim is that

$$
\begin{aligned}
d^{\bar{\nabla}}\left(x_{t}\right. & \left.-K_{t} q_{t}\right){ }_{a b^{\wedge}} c_{E_{b}}{ }^{v o l} q_{t} \\
& =\bar{\nabla}_{b}\left(x_{t}-K_{t} q_{t}\right)_{a b}{ }^{v o l}{q_{t}}^{\prime}
\end{aligned}
$$

a relation which is a special case of the following generalities. Thus let

$$
T=T_{a b} \omega^{a} \otimes \omega^{b} \in D_{2}^{0}(\Sigma)
$$

Fix a $\nabla \in \operatorname{con} T \Sigma$ - then $\forall X \in \mathcal{D}^{1}(\Sigma)$,

$$
\begin{aligned}
& \nabla_{X} T^{T}=\nabla_{X}\left(T_{a b} \omega^{a} \otimes \omega^{b}\right) \\
& =\left(X T_{a b}\right)\left(\omega^{a} \otimes \omega^{b}\right)+T_{a b}\left(\nabla_{X} \omega^{a}\right) \otimes \omega^{b}+T_{a b} \omega^{a} \otimes \nabla_{x} \omega^{b} \\
& =(X T a b)\left(\omega^{a} \otimes \omega^{b}\right)+T_{a b}\left(-\omega_{c}^{a}(X) \omega^{c}\right) \otimes \omega^{b}+T_{a b} \omega^{a} \otimes\left(-\omega_{d}^{b}(X) \omega^{d}\right) \\
& =d T_{a b}(X)\left(\omega^{a} \otimes \omega^{b}\right)-\omega_{a}^{c}(X) T_{c b}\left(\omega^{a} \otimes \omega^{b}\right)-\omega_{b}^{d}(X) T_{a d}\left(\omega^{a} \otimes \omega^{b}\right) \\
& =\left(d T_{a b}(X)-\omega_{a}^{c}(X) T_{c b}-\omega_{b}^{d}(X) T_{a d}\right)\left(\omega^{a} \otimes \omega^{b}\right)
\end{aligned}
$$

$$
\begin{aligned}
& =\left\langle X_{r} d^{\nabla} T_{a b}\right\rangle\left(\omega^{\mathrm{a}} \otimes \omega^{\mathrm{b}}\right) .
\end{aligned}
$$

But

1. $\nabla T=\nabla T\left(E_{r^{\prime}} E_{s^{\prime}} E_{C}\right) \omega^{r} \otimes \omega^{s} \otimes \omega^{C}$

$$
\begin{aligned}
& =\left(\nabla_{E_{C}} T\right)\left(E_{r^{\prime}} E_{S}\right) \omega^{r} \otimes \omega^{s} \otimes \omega^{C} \\
& =\left\langle E_{C},{ }^{\left.\nabla_{T} T_{r s}\right\rangle \omega^{r} \otimes \omega^{s} \otimes \omega^{C}} .\right.
\end{aligned}
$$

2. $\omega^{\mathrm{a}} \otimes \omega^{\mathrm{b}} \otimes \mathrm{d}^{\nabla} \mathrm{T}_{a b}\left(\mathrm{E}_{\mathrm{r}^{\prime}} \mathrm{E}_{\mathrm{s}^{\prime}} \mathrm{E}_{\mathrm{C}}\right)$
3. 

$$
\begin{aligned}
& =\omega^{a}\left(E_{r}\right) \omega^{b}\left(E_{s}\right) d^{\nabla} T_{a b}\left(E_{C}\right) \\
& =d^{\nabla} T_{r s}\left(E_{C}\right) \\
& =\left\langle E_{C}, d^{\nabla} T_{r s}\right\rangle .
\end{aligned}
$$

Therefore

$$
\nabla T=\omega^{a} \otimes \omega^{b} \otimes d^{\nabla} T_{a b}
$$

$$
\nabla_{b} T_{a b}=T_{a b ; b}
$$

$$
=(\nabla \mathrm{T})_{a b b}
$$

$$
=\nabla T\left(E_{a^{\prime}} E_{b}, E_{b}\right)
$$

$$
=d^{\nabla} T_{a b}\left(E_{b}\right)
$$

$$
=\tau_{\mathrm{E}_{\mathrm{b}}} \mathrm{~d}^{\mathrm{V}_{\mathrm{T}}}{ }_{\mathrm{ab}} .
$$

And, $\forall q \in Q$,

$$
\Rightarrow
$$

$$
\begin{aligned}
& 0=\iota_{E_{b}}\left(d^{\nabla} \mathrm{T}_{\mathrm{ab}}{ }^{\wedge \mathrm{VOl}_{\mathrm{q}}}\right) \\
& =\tau_{E_{b}} d^{\nabla} T_{a b}{ }^{\wedge \text { Vol }}{ }_{q}-d^{\nabla} T_{a b} \wedge c_{E_{b}}{ }^{\operatorname{Vol}_{q}} \\
& d^{\nabla} T_{a b}{ }^{\wedge} \varepsilon_{E_{b}}{ }^{\text {vol }}{ }_{q}=\iota_{E_{b}} d^{\nabla} T_{a b} \wedge{ }^{\wedge \text { VOl }} q
\end{aligned}
$$

7. 

$$
=\nabla_{b} \mathrm{~T}_{\mathrm{ab}} \mathrm{vol}_{\mathrm{q}}
$$

[Note: These considerations apply in particular to the choices

$$
\left.q=q_{t}, \nabla=\bar{\nabla}\left(=\nabla^{q_{t}}\right), \text { and } T=x_{t}-k_{t} q_{t} .\right]
$$

Section 44: Evolution in the Coframe Picture The assumptions and notation are those of the standard setup.

Rappel:

$$
\begin{aligned}
& H(\vec{\omega}, \vec{p} ; N, \vec{N}, W) \\
& =\int_{\Sigma} L_{\vec{N}} \omega^{a} \wedge p_{a}+\int_{\Sigma}{w^{a}}_{b} \omega^{b} \wedge p_{a}+\int_{\Sigma} N E,
\end{aligned}
$$

where

$$
E(\vec{\omega}, \vec{p})=\frac{1}{2}\left[q\left(p_{a}, * \omega \omega^{b}\right) q\left(p_{b}, * \omega^{a}\right)-\frac{p^{2}}{n-2}-S(q)\right] \mathrm{vol}_{q} .
$$

There are now two central objectives:

1. Compute $\frac{\delta H}{\delta \mathrm{p}_{\mathrm{a}}}$;
2. Compute $\frac{\delta H}{\delta \omega^{a}}$.

We shall start with $\frac{\delta H}{\delta p_{a}}$, which turns out to be the easier of the two.
Obviously

$$
\frac{\delta H}{\delta \mathrm{p}_{\mathrm{a}}}=L_{\overrightarrow{\mathrm{N}}} \omega^{\mathrm{a}}+\mathrm{w}_{\mathrm{b}^{a}} \omega^{\mathrm{b}}+\frac{\delta}{\delta \mathrm{p}_{\mathrm{a}}}\left[\int_{\Sigma} \mathrm{NE}\right] .
$$

And:
I. $\delta_{a} \frac{1}{2}\left(q\left(p_{b}, * \omega^{c}\right) q\left(p_{c}, * \omega^{b}\right) \operatorname{vol}_{q}\right)=q\left(p_{b}, * \omega^{a}\right) \omega^{b} \wedge \delta p_{a}$.
II. $\quad \delta_{a}\left(-\frac{p^{2}}{2(n-2)} \operatorname{vol}{ }_{q}\right)=-\frac{p}{n-2} \omega^{a} \wedge \delta p_{a}$.

Granted I and II, it follows that

$$
\frac{\delta}{\delta p_{a}}\left[\int_{\Sigma} N E\right]=N\left(q\left(p_{b}, * \omega^{a}\right) \omega^{b}-\frac{p}{n-2} \omega^{a}\right)
$$

Ad I: Consider

$$
q\left(p_{b}, * \omega{ }^{c}\right) q\left(p_{c}, * \omega{ }^{b}\right) v o l_{q} .
$$

Then

$$
\left[\begin{array}{l}
q\left(p_{b}, * \omega^{c}\right) v o l_{q}=p_{b} \wedge * * \omega^{c}=\omega^{c} \wedge p_{b} \\
q\left(p_{c}, * \omega^{b}\right)=*\left(\omega^{b} \wedge p_{c}\right) \\
\delta_{a}\left(q\left(p_{b}, * \omega^{c}\right) q\left(p_{c}{ }^{\prime} * \omega^{b}\right) v o l_{q}\right) \\
=\delta_{a}\left(\left(\omega^{c} \wedge p_{b}\right) \wedge *\left(\omega^{b} \wedge p_{c}\right)\right) \\
=\omega^{c} \wedge \delta_{a} p_{b} \wedge *\left(\omega^{b} \wedge p_{c}\right)+\left(\omega^{c} \wedge p_{b}\right) \wedge *\left(\omega^{b} \wedge \delta_{a} p_{c}\right)
\end{array}\right.
$$

But

$$
\begin{aligned}
& \text { - } \omega^{\mathrm{c}} \wedge \delta_{\mathrm{a}} \mathrm{p}_{\mathrm{b}} \wedge *\left(\omega^{\mathrm{b}} \wedge \mathrm{p}_{\mathrm{C}}\right) \\
& =\omega^{\mathrm{c}} \wedge \delta \mathrm{p}_{\mathrm{a}} \wedge *\left(\omega^{\mathrm{a}} \wedge \mathrm{p}_{\mathrm{C}}\right) \\
& =\omega^{\mathrm{b}} \wedge \delta \mathrm{p}_{\mathrm{a}} \wedge *\left(\omega^{\mathrm{a}} \wedge \mathrm{p}_{\mathrm{b}}\right) \\
& =\omega^{\mathrm{b}} \wedge \delta \mathrm{p}_{\mathrm{a}} \wedge \mathrm{q}\left(\mathrm{p}_{\mathrm{b}}, * \omega^{\mathrm{a}}\right) \\
& =q\left(p_{b}, * \omega^{a}\right) \omega \omega^{b} \wedge p_{a} . \\
& \text { - }\left(\omega^{c}{ }_{\wedge} p_{b}\right) \wedge *\left(\omega^{b} \wedge \delta_{a} p_{c}\right) \\
& =\left(\omega^{\mathrm{a}} \wedge \mathrm{p}_{\mathrm{b}}\right) \wedge \star\left(\omega^{\mathrm{b}} \wedge \delta \mathrm{p}_{\mathrm{a}}\right) \\
& =q\left(\mathrm{p}_{\mathrm{b}}, * \omega^{\mathrm{a}}\right) \operatorname{vol}_{q} \wedge *\left(\omega^{\mathrm{b}} \wedge \delta \underline{p}_{\mathrm{a}}\right)
\end{aligned}
$$

$$
\begin{aligned}
& =q\left(\mathrm{p}_{\mathrm{b}^{\prime}} * \omega^{\mathrm{a}}\right) *\left(\omega^{\mathrm{b}} \wedge \delta \mathrm{p}_{\mathrm{a}}\right) v o l_{q} \\
& =\mathrm{q}\left(\mathrm{p}_{\mathrm{b}}, * \omega^{\mathrm{a}}\right) \omega^{\mathrm{b}} \wedge \delta \mathrm{p}_{\mathrm{a}} .
\end{aligned}
$$

So

$$
\left.\begin{array}{c}
\delta_{a}\left(q\left(p_{b^{\prime}} * \omega^{c}\right) q\left(p_{c^{\prime}} * \omega^{b}\right) v o l\right. \\
q
\end{array}\right)
$$

thereby establishing I.

Ad II:

$$
\begin{aligned}
& \delta_{a}\left(-\frac{p^{2}}{2(n-2)} v o l_{q}\right) \\
= & -\frac{p}{n-2}\left(\delta{ }_{a} P^{v o l_{q}}\right. \\
= & -\frac{p}{n-2} q\left(\delta p_{a}, * \omega^{a}\right) v o l_{q} \\
= & -\frac{p}{n-2} \omega^{a} \wedge \delta p_{a} .
\end{aligned}
$$

Summary: We have

$$
\frac{\delta H}{\delta p_{a}}=L_{\vec{N}} \omega^{a}+w_{b}^{a} \omega^{b}+N\left(q\left(p_{b}, * \omega^{a}\right) \omega^{b}-\frac{p}{n-2} \omega^{a}\right)
$$

The calculation of $\frac{\delta H}{\delta \omega^{a}}$ is more difficult. However, it is at least clear that

$$
\frac{\delta H}{\delta \omega^{a}}=-L_{\vec{N}} p_{a}+W^{b}{ }_{a} p_{b}+\frac{\delta}{\delta \omega^{a}}\left[\int_{\Sigma} N E\right] .
$$

[Note: Pinned down,

$$
\begin{aligned}
& \int_{\Sigma} L_{\vec{N}}\left(\omega^{a} \wedge p_{a}\right) \\
& \quad=\int_{\Sigma}\left(\iota_{\vec{N}} \circ d+d \circ \iota_{\vec{N}}\right)\left(\omega^{a} \wedge p_{a}\right) \\
& \quad=\int_{\Sigma} d\left(\iota_{\vec{N}}\left(\omega^{a} \wedge p_{a}\right)\right) \\
& \quad=0 \\
& \left.\Rightarrow \quad \int_{\Sigma} L_{\vec{N}} \omega^{a} \wedge p_{a}=-\delta_{\Sigma} \omega^{a} \wedge L_{\vec{N}} p_{a} \cdot\right]
\end{aligned}
$$

LEMMA We have

$$
\delta_{a}{ }^{v o l}{ }_{q}=\delta \omega^{a} \wedge * \omega
$$

[There are two points:

1. $\operatorname{vol}_{q}=\frac{1}{(n-1)!} \varepsilon_{b_{1}} \ldots b_{n-1} \omega^{b_{1}} \wedge \ldots \wedge \omega^{b_{n-1}}$.
2. $* \omega^{a}=\frac{1}{(n-2)!} \varepsilon_{a c_{2}} \ldots c_{n-1} \omega^{C_{2}} \wedge \ldots \wedge \omega^{c_{n-1}}$.

Accordingly,

$$
\begin{aligned}
& \delta_{a v o l}^{v q}=\frac{1}{(n-1)!} \varepsilon_{b_{1}} \ldots b_{n-1} \delta_{a} \omega^{b_{1}} \wedge \ldots \wedge \omega^{b_{n-1}} \\
& +\ldots+\frac{1}{(n-1)!} \varepsilon_{b_{1}} \ldots b_{n-1} \omega^{b_{1}} \wedge \ldots \wedge \delta_{a} \omega^{b_{n-1}}
\end{aligned}
$$

$$
\begin{aligned}
& =\frac{1}{(n-1)!} \varepsilon_{a b_{2}} \ldots b_{n-1} \delta \omega^{a} \wedge \omega^{b_{2}} \wedge \ldots \wedge \omega^{b_{n-1}} \\
& +\cdots+\frac{1}{(n-1)!} \varepsilon_{b_{1}} \ldots b_{n-2} a^{a^{b_{1}}} \wedge \ldots \wedge \omega^{b_{n-2}} \wedge \delta \omega^{a} \\
& =\frac{(\mathrm{n}-1)}{(\mathrm{n}-1)!} \varepsilon_{\mathrm{ac}_{2}} \ldots \mathrm{c}_{\mathrm{n}-1} \delta \omega^{\mathrm{a}}{ }^{\mathrm{c}_{2}}{ }^{2} \wedge \ldots \wedge \omega^{\mathrm{c} n-1} \\
& =\delta \omega^{a} \wedge \frac{1}{(n-2)!} \varepsilon_{a c_{2}} \ldots c_{n-1} \omega^{c_{2}} \wedge \ldots \wedge \omega^{c_{n-1}} \\
& \left.=\delta \omega^{\mathrm{a}} \wedge \star \omega^{\mathrm{a}} .\right]
\end{aligned}
$$

Claim:

$$
\begin{aligned}
\text { I. } & \delta_{a} \frac{1}{2}\left(q\left(p_{b}, * \omega^{c}\right) q\left(p_{c}, * \omega^{b}\right) v o l_{q}\right) \\
= & \delta \omega^{a} \wedge\left(q\left(p_{a}, * \omega^{b}\right) p_{b}-\frac{1}{2} q\left(p_{b}, * \omega^{c}\right) q\left(p_{c} ; * \omega^{b}\right) * \omega^{a}\right)
\end{aligned}
$$

II. $\quad \delta_{a}\left(-\frac{p^{2}}{2(n-2)} \operatorname{vol}_{q}\right)=-\delta \omega{ }^{a} \wedge\left(\frac{p}{n-2} p_{a}-\frac{p^{2}}{2(n-2)} * \omega^{a}\right)$.

Ad I: Proceeding as above, write

$$
\begin{gathered}
q\left(p_{b^{\prime}} * \omega^{c}\right) q\left(p_{c^{\prime}} * \omega^{b}\right) v o l_{q} \\
\quad=\left(\omega^{c} \wedge p_{b}\right) \wedge *\left(\omega^{b} \wedge p_{c}\right)
\end{gathered}
$$

Then

$$
\delta_{a}\left(\left(\omega^{c} \wedge p_{b}\right) \wedge *\left(\omega^{b} \wedge p_{c}\right)\right)
$$

$$
\begin{aligned}
& =\delta_{a}\left(\omega^{c} \wedge p_{b}\right) \wedge *\left(\omega^{b} \wedge p_{c}\right)+\left(\omega^{c} \wedge p_{b} ; \wedge \delta_{a} *\left(\omega^{b} \wedge p_{c}\right)\right. \\
& =\delta \omega^{a} \wedge p_{b} \wedge *\left(\omega^{b} \wedge p_{a}\right)+\left(\omega^{c} \wedge p_{b}\right) \wedge \delta_{a} *\left(\omega^{b} \wedge p_{c}\right) \\
& =\delta \omega^{a} \wedge q\left(p_{a} ; * \omega^{b}\right) p_{b}+\left(\omega^{c} \wedge p_{b}\right) \wedge \delta_{a} *\left(\omega^{b} \wedge p_{c}\right)
\end{aligned}
$$

Next

$$
\begin{aligned}
& \left.\delta_{a}\left(*(\omega) \mathrm{b}_{\mathrm{C}}\right) \wedge \mathrm{vol}_{\mathrm{q}}\right) \\
& \quad=\delta_{a} *\left(\omega^{\mathrm{b}} \wedge \mathrm{p}_{\mathrm{C}}\right) \wedge v o l_{\mathrm{q}}+*\left(\omega^{\mathrm{b}} \wedge{p_{C}}\right) \wedge \delta_{a} \mathrm{vol}_{q}
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& \left(\omega^{c} \wedge p_{b}\right) \wedge \delta_{a} *\left(\omega^{b} \wedge p_{c}\right) \\
& =q\left(p_{b}, * \omega^{c}\right) v o l_{q} \wedge \delta_{a} *\left(\omega^{b} \wedge p_{c}\right) \\
& =q\left(p_{b}, * \omega^{c}\right) \delta_{a} *\left(\omega^{b} \wedge p_{c}\right) \wedge v o l_{q} \\
& =q\left(p_{b}, * \omega^{c}\right)\left(\delta_{a}\left(*\left(\omega^{b} \wedge p_{c}\right) \wedge v o l_{q}\right)\right. \\
& \left.-*\left(\omega^{b} \wedge p_{c}\right) \wedge \delta_{a} v o l_{q}\right)
\end{aligned}
$$

But

$$
\begin{aligned}
& \delta_{a}\left(*\left(\omega{ }^{b} \wedge p_{c}\right) \wedge v o l_{q}\right) \\
& =\delta_{a}\left(v_{q} l_{q} \wedge *\left(\omega{ }^{b} \wedge p_{C}\right)\right) \\
& =\delta_{a}\left(\left(\omega^{b} \wedge p_{c}\right) \wedge * v o l_{q}\right)
\end{aligned}
$$

$$
\begin{aligned}
& =\delta_{a}\left(\omega^{b} \wedge p_{c}\right) \\
& =\delta_{a} \omega^{b} \wedge p_{c}
\end{aligned}
$$

So, in view of the lemma, it follows that

$$
\begin{aligned}
&\left(\omega^{c} \wedge p_{b}\right) \wedge \delta_{a} *\left(\omega^{b} \wedge p_{c}\right) \\
&= q\left(p_{b}, * \omega^{c}\right)\left(\delta_{a} \omega^{b} \wedge p_{c}-*\left(\omega^{b} \wedge p_{c}\right) \delta \omega^{a} \wedge * \omega^{a}\right) \\
&= q\left(p_{b^{\prime}} * \omega^{c}\right) \delta_{a} \omega^{b} \wedge p_{c} \\
& \quad-q\left(p_{b}, * \omega^{c}\right) *\left(\omega^{b} \wedge p_{c}\right) \delta \omega^{a} \wedge * \omega^{a} \\
&= q\left(p_{a}, * \omega^{b}\right) \delta \omega^{a} \wedge p_{b} \\
& \quad-q\left(p_{b}, * \omega^{c}\right) q\left(p_{c^{\prime}} * \omega^{b}\right) \delta \omega^{a} \wedge * \omega^{a} \\
&= \delta \omega^{a} \wedge\left(q\left(p_{a} * * \omega^{b}\right) p_{b}-q\left(p_{b^{\prime}} * \omega^{c}\right) q\left(p_{c}, * \omega^{b}\right) * \omega^{a}\right)
\end{aligned}
$$

Ad II:

$$
\begin{gathered}
\delta_{a}\left(-\frac{P^{2}}{2(n-2)} \operatorname{vol}_{q}\right) \\
=-\frac{P}{n-2}\left(\delta_{a} P\right) \operatorname{vol}_{q}-\frac{P^{2}}{2(n-2)} \delta_{a} \operatorname{vol}_{q} \\
=-\frac{P}{n-2}\left(\delta_{a}\left(\text { Vol }_{q}\right)-P \delta_{a} \operatorname{vol}_{q}\right)
\end{gathered}
$$

$$
\begin{aligned}
&-\frac{p^{2}}{2(n-2)} \delta_{a} v o l_{q} \\
&=-\frac{P}{n-2}\left(\delta_{a}\left(\omega^{b} \wedge p_{b}\right)-P \delta \omega^{a} \wedge * \omega^{a}\right) \\
&-\frac{P^{2}}{2(n-2)} \delta \omega^{a} \wedge * \omega^{a} \\
&=\delta \omega^{a} \wedge\left(-\frac{P}{n-2} p_{a}\right) \\
&+\delta \omega^{a} \wedge\left(\frac{1}{n-2}-\frac{1}{2(n-2)}\right) P^{2} * \omega^{a} \\
&=- \delta \omega^{a} \wedge\left(\frac{p}{n-2} p_{a}-\frac{p^{2}}{2(n-2)} * \omega^{a}\right) .
\end{aligned}
$$

Now add I and II to get:

$$
\begin{aligned}
& \delta_{a} \frac{1}{2}\left(q\left(p_{b^{\prime}} * \omega^{c}\right) q\left(p_{c^{\prime}} * \omega^{b}\right) \operatorname{vol}_{q}\right) \\
& \quad+\delta_{a}\left(-\frac{p^{2}}{2(n-2)} v o l_{q}\right) \\
& =\delta \omega^{a} \wedge\left(q\left(p_{a}, * \omega^{b}\right) p_{b}-\frac{p}{n-2} p_{a}\right) \\
& +\delta \omega^{a} \wedge \frac{1}{2}\left(\frac{p^{2}}{n-2}-q\left(p_{b^{\prime}} * \omega^{c}\right) q\left(p_{c}, * \omega^{b}\right)\right) * \omega^{a}
\end{aligned}
$$

It remains to evaluate

$$
\delta_{a}\left(-\frac{1}{2} S(q) \operatorname{vol}_{q}\right)
$$

or still,

$$
\delta_{a}\left(-\frac{1}{2} \Omega_{b c} \wedge *\left(\omega^{b} \wedge \omega^{c}\right)\right)
$$

or still,

$$
-\frac{1}{2}\left[\delta_{a} \Omega_{b c} \wedge *\left(\omega^{b} \wedge \omega^{c}\right)+\Omega_{b c} \wedge \delta_{a} *\left(\omega^{b} \wedge \omega^{c}\right)\right]
$$

LEMMA We have

$$
\delta_{a} *\left(\omega^{b} \wedge \omega^{c}\right)=\delta \omega^{a} \wedge *\left(\omega^{a} \wedge \omega^{b} \wedge \omega^{c}\right) .
$$

[In fact,

$$
\begin{aligned}
& \delta_{a} *\left(\omega^{b} \wedge \omega^{c}\right) \\
& =\delta_{a}\left(\frac{1}{(n-3)!} \varepsilon_{b c d_{3}} \ldots d_{n-1} \omega^{d_{3}} \wedge \ldots \wedge \omega^{d_{n-1}}\right) \\
& =\frac{1}{(n-3)!} \varepsilon_{b c d_{3}} \ldots d_{n-1} \delta^{\omega^{d_{3}}} \wedge \ldots \wedge \omega^{d_{n-1}} \\
& +\cdots+\frac{1}{(n-3)!} \varepsilon_{b c d_{3}} \ldots d_{n-1} \omega^{d_{3}} \wedge \ldots \wedge \delta_{a} \omega^{d_{n-1}} \\
& =\frac{1}{(n-3)!} \varepsilon_{b_{c a d}^{4}} \ldots d_{n-1} \delta \omega^{a}{ }^{a^{d_{4}}} \wedge \ldots \wedge \omega^{d_{n-1}} \\
& +\cdots+\frac{1}{(n-3)!} \varepsilon_{b c d_{3}} \ldots d_{n-2} a^{\omega^{d_{3}}} \wedge \ldots \wedge \omega^{d_{n-2}} \wedge \delta \omega_{a} \\
& =\frac{(n-3)}{(n-3)!} \varepsilon_{b c a d}^{4} \ldots_{n-1} \delta \omega^{a}{ }_{\wedge} \omega^{d_{4}} \wedge \ldots \wedge \omega^{d_{n-1}} \\
& =\delta \omega^{a} \wedge \frac{1}{(n-4)!} \varepsilon_{a b c d_{4}} \ldots d_{n-1} \omega^{d_{4}} \wedge \ldots \wedge \omega^{d_{n-1}} \\
& \left.=\delta \omega^{a} \wedge *\left(\omega^{a} \wedge \omega^{b} \wedge \omega^{c}\right) .\right]
\end{aligned}
$$

## Application:

$$
\Omega_{b c}{ }^{\wedge} \delta_{a} *\left(\omega^{b} \wedge \omega^{c}\right)=\delta \omega^{a} \wedge \Omega_{b c} \wedge *\left(\omega^{a} \wedge \omega^{b} \wedge \omega^{c}\right) .
$$

Rappel: By definition,

$$
\iota_{\mathrm{E}_{\mathrm{a}}}^{\Omega_{\mathrm{a}}^{\mathrm{a}}} \quad\left(=\tau_{\mathrm{E}_{\mathrm{a}}}^{\Omega_{a b}}\right)
$$

is the Ricci l-form $\mathrm{Ric}_{\mathrm{b}}$, hence

$$
\begin{aligned}
\operatorname{Ric}_{b}\left(E_{b}\right) & =\Omega_{a b}\left(E_{a}, E_{b}\right) \\
& =R_{a b a b} \\
& =R_{b a b}^{a} \\
& =S(q) .
\end{aligned}
$$

[Note: There is an expansion

$$
\operatorname{Ric}_{b}=R_{b c} \omega^{C}
$$

where

$$
\begin{array}{ll} 
& R_{b c}=R_{c b} \\
= \\
& \left.q\left(R i c_{b}, \omega^{c}\right)=q\left(\text { Ric }_{c}, \omega^{b}\right) \cdot\right]
\end{array}
$$

LEMMA Let $\alpha \in \Lambda^{2} \Sigma$ - then

$$
\begin{aligned}
& \alpha \wedge *\left(\omega^{\mathrm{a}} \wedge \omega^{\mathrm{b}} \wedge \omega^{\mathrm{c}}\right) \\
& =q\left(a, \omega^{a} \wedge \omega^{b}\right) * \omega^{c}+q\left(a, \omega^{b} \wedge \omega^{c}\right) * \omega^{a}+q\left(a, \omega^{c} \wedge \omega^{a}\right) * \omega^{b} .
\end{aligned}
$$

[For any index $d$ between 1 and $n-1$,

$$
\begin{aligned}
& q\left(\alpha \wedge *\left(\omega^{a} \wedge \omega^{b} \wedge \omega^{c}\right), * \omega^{d}\right) \vee o l_{q} \\
& \left.=\alpha \wedge *\left(\omega^{\mathrm{a}} \wedge \omega^{\mathrm{b}} \wedge \omega^{\mathrm{c}}\right)\right) \wedge * * \omega^{\mathrm{d}} \\
& =(-1)^{n}{ }_{\alpha \wedge *\left(\omega^{a} \wedge \omega^{b} \omega^{c}\right) \wedge \omega}{ }^{d} \\
& =(-1)^{\mathrm{n}}(-1)^{\mathrm{n}-4}{ }_{\alpha \wedge \omega}{ }^{\mathrm{d}} \wedge *\left(\omega^{\mathrm{a}} \wedge \omega^{\mathrm{b}}{ }_{\wedge \omega} \mathrm{c}\right) \\
& =\omega^{\mathrm{d}}{ }_{\wedge \Lambda \wedge *}\left(\omega^{\mathrm{a}} \wedge \omega^{\mathrm{b}} \wedge \omega^{\mathrm{c}}\right) \\
& =q\left(\omega^{d} \wedge a, \omega^{a} \wedge \omega^{b} \wedge \omega^{c}\right) \operatorname{vol}_{q} \\
& =\iota_{\omega}{ }^{d} \wedge \alpha\left(\omega^{a} \wedge \omega^{b} \wedge \omega^{c}\right) \operatorname{vol}_{q} \\
& =\iota_{\alpha}{ }_{\omega} \omega^{d}\left(\omega^{a} \wedge \omega^{b} \wedge \omega^{c}\right) v o l^{\prime} q^{\prime}
\end{aligned}
$$

an expression which surely vanishes if $d \neq a, b, c$. Therefore

$$
a \wedge *\left(\omega^{a} \wedge \omega^{b} \wedge \omega^{c}\right)=c_{a} * \omega^{a}+c_{b} * \omega^{b}+c_{c} * \omega^{c}
$$

Here

But

$$
\begin{aligned}
& \text { - } \mathrm{C}_{\mathrm{a}}{ }^{\mathrm{Vol}} \mathrm{q}_{\mathrm{q}}=\mathrm{q}\left(\alpha \wedge *\left(\omega^{\mathrm{a}} \wedge \omega^{\mathrm{b}} \wedge \omega^{\mathrm{c}}\right), * \omega^{\mathrm{a}}\right) \mathrm{VOl}_{\mathrm{q}} \\
& =\imath_{\alpha^{\imath}} a^{a}\left(\omega^{a} \wedge \omega^{b} \wedge \omega^{c}\right) \operatorname{vol}_{q} \\
& \left.=\iota_{\alpha}\left(\omega^{b} \wedge \omega^{c}\right)\right) \operatorname{vol}_{q} \\
& =q\left(\alpha, \omega^{b} \wedge \omega^{c}\right) \operatorname{vol}_{q} . \\
& \text { - } \mathrm{C}_{\mathrm{b}} \mathrm{VOl}_{\mathrm{q}}=\mathrm{q}\left(\alpha \wedge *\left(\omega^{\mathrm{a}} \wedge \omega^{\mathrm{b}} \wedge \omega^{\mathrm{c}}\right), * \omega^{\mathrm{b}}\right) \mathrm{VOl}_{\mathrm{q}} \\
& =\imath_{a^{2}}{ }_{\omega} b^{\left(\omega^{a} \wedge \omega^{b} \omega^{c}\right)}{ }^{c} \operatorname{vol}_{q} \\
& =-\iota_{\alpha}\left(\omega^{a} \wedge \omega^{c}\right) \operatorname{vol}_{q} \\
& =\iota_{\alpha}\left(\omega^{c} \wedge \omega^{a}\right){ }^{\operatorname{vol}}{ }_{q} \\
& =q\left(\alpha, \omega^{c} \wedge \omega^{a}\right) \operatorname{vol}_{q} .
\end{aligned}
$$

- $\mathrm{C}_{\mathrm{C}}{ }^{\operatorname{vol}}{ }_{\mathrm{q}}=\mathrm{q}\left(a \wedge *\left(\omega^{\mathrm{a}} \wedge \omega^{\mathrm{b}} \wedge \omega^{\mathrm{C}}\right), * \omega^{\mathrm{c}}\right) \operatorname{vol}_{\mathrm{q}}$

$$
\begin{aligned}
& =\iota_{\alpha}{ }_{\omega} \omega^{c}\left(\omega^{a} \wedge \omega^{b} \wedge \omega^{c}\right) v^{v o l} \\
& =\iota_{\alpha}\left(\omega^{a} \wedge \omega^{b}\right) v^{b o l} q_{q} \\
& \left.=q\left(a, \omega^{a} \wedge \omega^{b}\right) v o l_{q^{\prime}} .\right]
\end{aligned}
$$

13. 

## Application:

$$
\begin{gathered}
\Omega_{b c} \wedge *\left(\omega^{a} \wedge \omega^{b} \wedge \omega^{c}\right) \\
=q\left(\Omega_{b c}, \omega^{a} \wedge \omega^{b}\right) * \omega^{c}+q\left(\Omega_{b c^{\prime}} \omega^{b} \wedge \omega^{c}\right) * \omega^{a}+q\left(\Omega_{b c} \prime \omega^{c} \wedge \omega^{a}\right) * \omega^{b} .
\end{gathered}
$$

$$
\text { - } q\left(\Omega_{b c^{\prime}} \omega^{a} \wedge \omega^{b}\right) * \omega^{c}
$$

$$
=-q\left(\Omega_{b c}, \omega^{b} \wedge \omega^{a}\right) * \omega^{c}
$$

$$
=-q\left(c_{\omega} b^{\Omega} b c^{\prime} \omega^{a}\right) * \omega^{c}
$$

$$
=-q\left(c_{E_{b}} \Omega_{b c} \omega^{a}\right) * \omega^{c}
$$

$$
=-q\left(\operatorname{Ric}_{c}, \omega^{a}\right) \star \omega \omega^{c}
$$

$$
=-q\left(\operatorname{Ric}_{a}, \omega^{C}\right) * \omega^{c}
$$

$$
=-*\left(R i c_{a}\right)
$$

- $q\left(\Omega_{b c}, \omega^{b} \wedge \omega^{c}\right) * \omega^{a}$

$$
\begin{aligned}
& =\iota_{\omega} b_{\wedge} c^{\Omega_{b}}{ }^{* * \omega^{a}} \\
& =\iota_{\omega^{c}}^{c} \omega^{\iota} b^{\Omega} b c^{* \omega^{a}} \\
& =\left(\iota_{\omega} b_{b c} \Omega_{b c}\right)\left(E_{c}\right) * \omega^{a} \\
& =\Omega_{b c}\left(E_{b^{\prime}}, E_{c}\right) * \omega^{a} \\
& =S(q) * \omega^{a} .
\end{aligned}
$$

- $q\left(\Omega_{b c}, \omega^{c} \wedge \omega^{a}\right) * \omega^{b}$

$$
\begin{aligned}
& =-q\left(\Omega_{c b} \omega^{c} \wedge \omega^{a}\right) * \omega^{b} \\
& =-q\left(\iota_{\omega} c^{\Omega} c b^{\prime} \omega^{a}\right) * \omega^{b} \\
& =-q\left(\varepsilon_{E_{C}}{ }_{C} \mathrm{cb}^{\prime} \omega^{\mathrm{a}}\right) * \omega^{\mathrm{b}} \\
& =-q\left(R i c_{b}, \omega^{a}\right) * \omega^{b} \\
& =-q\left(\text { Ric }_{a}, \omega^{b}\right) * \omega^{b} \\
& =-*\left(\text { Ric }_{a}\right) .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
-\frac{1}{2} & \Omega_{b c} \wedge \delta_{a} *\left(\omega^{b} \wedge \omega^{c}\right) \\
& =\delta \omega^{a} \wedge\left(-\frac{1}{2}\left(-2 *\left(\text { Ric }_{a}\right)+S(q) * \omega^{a}\right)\right) \\
& =\delta \omega^{a} \wedge *\left(R i c_{a}-\frac{1}{2} S(q) \omega^{a}\right)
\end{aligned}
$$

The final point is the analysis of

$$
\delta_{a} a_{b c} \wedge *\left(\omega^{b} \wedge \omega^{c}\right)
$$

or, as is preferable, of

$$
N \delta_{a} Q_{b c} \wedge *\left(\omega^{b} \wedge \omega^{c}\right)
$$

Put

$$
\theta^{b c}=*\left(\omega^{\mathrm{b}} \wedge \omega^{\mathrm{c}}\right) .
$$

15. 

Then the $\theta^{b c}$ are the components of an element

$$
\theta \in \Lambda^{n-3}\left(\Sigma ; T_{0}^{2}(\Sigma)\right)
$$

thus

$$
d^{\nabla^{q}} \theta \in \Lambda n=2\left(\Sigma ; T_{0}^{2}(\Sigma)\right)
$$

and

Rappel: We have

$$
d^{\nabla^{q}} \theta=0
$$

But then

$$
\begin{aligned}
& \delta_{a} \Omega_{b c} \wedge *\left(\omega^{b} \wedge \omega^{c}\right) \\
& =\delta_{a} \Omega b c^{\wedge \theta^{b c}} \\
& =\delta_{a}\left(d \omega_{b c}+\omega_{b d} \wedge \omega_{c}^{d}\right) \wedge \theta^{b c} \\
& =d \delta_{a} \omega_{b c} c^{\wedge \theta^{b c}+}+\delta_{a} \omega_{b d^{\wedge}}{ }^{d} c^{\wedge \theta^{b c}}+\omega_{b d^{\wedge}} \delta_{a} \omega^{d} c^{\wedge \theta^{b c}} \\
& =d\left(\delta_{a} \omega_{b c} \wedge \theta^{b c}\right) \\
& +\delta_{a} \omega_{b c}{ }^{\wedge d \theta^{b c}}+\delta_{a} \omega_{b d^{\wedge}} \omega^{d} c^{\wedge \theta^{b c}}+\omega_{b d}{ }^{\wedge \delta_{a} \omega^{d}} c^{\wedge \theta} \theta^{b c} \\
& =d\left(\delta_{a} \omega_{b c} \wedge \theta^{b c}\right)
\end{aligned}
$$

$$
\begin{aligned}
& =a\left(\delta_{a} \omega_{b c} \wedge \theta^{b c}\right) \\
& +\delta_{a} \omega_{b c} \wedge d \theta^{b c}+\delta_{a} \omega_{b c}{ }^{\wedge \omega^{c}} d^{\wedge} \theta^{b d}+\delta_{a} \omega_{b c}{ }^{\wedge \omega^{b}} d^{\wedge \theta} \theta^{d c} \\
& =d\left(\delta_{a} \omega_{b c} \theta^{b c}\right)+\delta_{a} \omega_{b c} \wedge\left(d^{\nabla^{q}} \theta\right) b c \\
& =d\left(\delta_{a} \omega_{b c} \wedge \theta^{b c}\right) \\
& \Rightarrow \\
& N \delta_{a} \Omega_{b c} \wedge *\left(\omega^{b} \wedge \omega^{c}\right) \\
& =N d\left(\delta_{a} \omega_{b c} \wedge *\left(\omega^{b} \wedge \omega^{c}\right)\right) \\
& =d\left(N \delta_{a} \omega_{b c} \wedge *\left(\omega^{b} \wedge \omega^{c}\right)\right)-d N \wedge \delta_{a} \omega_{b c} \wedge *\left(\omega^{b} \wedge \omega^{c}\right) .
\end{aligned}
$$

The differential

$$
\mathrm{d}\left(N \delta_{a} \omega_{b c} \wedge *\left(\omega^{\mathrm{b}} \wedge \omega^{c}\right)\right)
$$

integrates to zero, hence can be set aside. Write

$$
\begin{aligned}
& d N \wedge \delta_{a} \omega_{b c} \wedge *\left(\omega^{b} \wedge \omega^{c}\right) \\
& \quad=\omega^{b} \wedge \omega^{c} \wedge *\left(d N \wedge \delta_{a} \omega_{b c}\right) \\
& \quad=\omega^{b} \wedge \omega^{c} \wedge c_{\delta_{a} \omega_{b c}} * d N .
\end{aligned}
$$

Then

$$
0=\iota_{\delta_{a}} \omega_{b c}\left(\omega^{b} \wedge \omega^{c} \wedge * d N\right)
$$

$$
\begin{aligned}
& =\iota_{\delta_{a} \omega_{b c}} \omega^{b} \wedge \omega^{c} \wedge * d N-\omega^{b} \wedge \varepsilon_{\delta_{a}} \omega_{b c} \omega^{c} \wedge * d N \\
& +\omega^{b} \wedge \omega^{c} \wedge c_{\varepsilon_{a}} \omega_{b c} * d N \\
& =q\left(\delta_{a} \omega_{b c^{\prime}} \omega^{b}\right) \omega^{c} \wedge * d N-q\left(\delta_{a} \omega_{b c}, \omega^{c}\right) \omega^{b} \wedge * d N \\
& +\omega^{b} \wedge \omega^{c} \wedge \varepsilon_{\delta_{a}} \omega_{b c} * d N \\
& =q\left(\delta_{a} \omega_{b c^{\prime}} \omega^{\mathrm{b}}\right) \omega^{\mathrm{c}} \wedge * d N-\mathrm{q}\left(\delta_{\mathrm{a}} \omega_{\mathrm{cb}}, \omega^{\mathrm{b}}\right) \omega^{\mathrm{c}} \wedge * d N \\
& +\omega^{b} \wedge \omega^{c} \wedge c_{\varepsilon_{a}} \omega_{b c} * d N \\
& =2 q\left(\delta_{a} \omega_{b c} \omega^{b}\right) \omega^{c} \wedge \star d N \\
& +\omega^{b} \wedge \omega^{c} \wedge \varepsilon \delta_{a} \omega_{b c} * d N \\
& \Rightarrow \\
& -d N \wedge \delta_{a} \omega_{b c} \wedge *\left(\omega^{b} \wedge \omega^{c}\right) \\
& =2 q\left(\delta_{a} \omega_{b c} \omega^{b}\right) \omega^{c} \Lambda * d N \text {. }
\end{aligned}
$$

But

$$
\begin{aligned}
d \omega^{b} & =-\omega^{b}{ }_{c} \omega^{c} \\
\Rightarrow \quad & \delta_{a} d \omega^{b}=-\delta_{a} \omega^{b} c^{\wedge \omega^{c}}-\omega_{c}^{b}{ }_{c} \delta_{a} \omega^{c}
\end{aligned}
$$

$$
\begin{aligned}
& \Rightarrow \\
& \left.{ }^{2}{ }_{\omega} b^{\delta} a d \omega^{b}=-\imath_{\omega} b^{(\delta} a^{b} c^{\wedge} \omega^{c}\right)-\imath_{\omega} b^{\left(\omega^{b}\right.} c^{\left.\wedge \delta_{a} \omega^{c}\right)} \\
& \left.=-\left[c{ }_{\omega} b^{\delta} a^{\omega^{b}} c^{\wedge \omega^{c}}-\delta_{a} \omega^{b} c^{\wedge c}{ }_{\omega} b^{\omega^{c}}\right]-\iota_{\omega} b^{\left(\omega^{b}\right.} c^{\wedge \delta} a^{\omega^{c}}\right) \\
& \left.=-\left[q\left(\delta_{a} \omega^{b}{ }_{c} \omega^{b}\right) \omega^{c}-\delta_{a} \omega^{c} c^{c}\right]-\iota_{\omega} b^{\left(\omega^{b}\right.} c^{\wedge} \wedge \delta_{a} \omega^{c}\right) \\
& \left.=-q\left(\delta_{a} \omega_{b c} \omega^{b}\right) \omega^{c}-\imath_{\omega} b^{\left(\omega^{b}\right.} c^{\wedge} \delta_{a} \omega^{c}\right) .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& -\frac{1}{2} d N \wedge \delta_{a} \omega_{b c} \wedge *\left(\omega^{b} \wedge \omega^{c}\right) \\
& =q\left(\delta_{a} \omega_{b c} \omega^{b}\right) \omega^{c} \wedge * d N \\
& =-\iota_{\omega} b^{\left(d \delta_{a} \omega^{b}+\omega^{b} c^{\wedge} \delta_{a} \omega^{c}\right) \wedge * d N} \\
& =-\iota_{\omega} b^{\left(\left(d \delta_{a} \omega^{b}+\omega^{b} c^{\wedge} \delta_{a} \omega^{c}\right) \wedge * d N\right)} \\
& +\left(\mathrm{d} \delta_{a} \omega^{\mathrm{b}}+\omega^{\mathrm{b}}{ }_{c}^{\left.\wedge \delta_{a} \omega^{\mathrm{c}}\right) \wedge c}{ }_{\omega} \mathrm{b}^{* d N}\right. \\
& =0+\left(d \delta_{a} \omega^{b}+\omega^{b} c^{\wedge} \delta_{a} \omega^{c}\right) \wedge c{ }_{\omega} b^{\star d N} \\
& =\left(d \delta_{a} \omega^{b}+\omega^{b} c^{\wedge} \delta_{a} \omega^{c}\right) \wedge *\left(d N \wedge \omega_{b}\right) \\
& =d \delta_{a} \omega^{b} \wedge *\left(d N \wedge \omega_{b}\right) \\
& +\omega^{b} c^{\wedge} \delta_{a}{ }^{c}{ }^{c} \wedge *\left(d N \wedge \omega_{b}\right)
\end{aligned}
$$

$$
\begin{aligned}
= & d\left(\delta_{a} \omega^{b} \wedge *\left(d N \wedge \omega_{b}\right)\right)+\delta_{a} \omega^{b} \wedge d *\left(d N \wedge \omega_{b}\right) \\
& -\delta_{a} \omega^{c} \wedge \omega^{b}{ }_{c} \wedge *\left(d N \wedge \omega_{b}\right) .
\end{aligned}
$$

Omit the differential

$$
d\left(\delta_{a} \omega^{b} \wedge *\left(d N \wedge \omega_{b}\right)\right)
$$

which, of course, will not contribute -- then

$$
\begin{aligned}
& \delta_{a} \omega^{b} \wedge d *\left(d N \wedge \omega_{b}\right)-\delta_{a} \omega^{c} \wedge \omega^{b} c^{\wedge *\left(d N \wedge \omega_{b}\right)} \\
& \quad=\delta \omega^{a} \wedge\left(d *\left(d N \wedge \omega_{a}\right)-\omega^{b} a^{\left.\wedge *\left(d N \wedge \omega_{b}\right)\right)}\right. \\
& \quad=\delta \omega^{a} \wedge d^{\nabla^{q}} *\left(d N \wedge \omega_{a}\right) .
\end{aligned}
$$

LEMMA We have

$$
d^{\nabla^{q}} *\left(d N \wedge \omega_{a}\right)=*\left(\nabla_{a} d N-\left(\Delta_{q} N\right) \omega^{a}\right)
$$

[Write

$$
d N=N_{C} \omega^{C}\left(N_{C}=q\left(d N, \omega^{C}\right)\right)
$$

Then

$$
\begin{aligned}
& d^{\nabla^{q}} *\left(d N \wedge \omega_{a}\right) \\
& \quad=d *\left(d N \wedge \omega_{a}\right)-\omega_{a}^{b} \wedge *\left(d N \wedge \omega_{b}\right) \\
& \quad=d \star\left(N_{c} \omega^{c} \wedge \omega^{a}\right)+\omega_{b}^{a} \wedge *\left(N_{c} \omega^{c} \wedge \omega^{b}\right) .
\end{aligned}
$$

But

$$
\begin{aligned}
& d *\left(N_{C} \omega^{c} \wedge \omega^{a}\right)=d\left(N_{C} \wedge *\left(\omega^{c} \Lambda \omega^{a}\right)\right) \\
& =d N_{C} \wedge *\left(\omega^{c} \wedge \omega^{a}\right)+N_{C} \wedge d *\left(\omega^{c} \wedge \omega^{a}\right) \\
& =d N_{C} \wedge *\left(\omega^{\mathrm{C}} \wedge \omega^{\mathrm{a}}\right) \\
& +N_{c} \wedge\left(-\omega^{c}{ }_{b} \wedge *\left(\omega^{b} \wedge \omega^{a}\right)-\omega^{a}{ }_{b} \wedge *\left(\omega^{c} \wedge \omega^{b}\right)\right) \\
& =d N_{C} \wedge *\left(\omega^{c} \wedge \omega^{a}\right)+N_{C} \wedge\left(-\omega_{b}^{c}{ }_{b} \wedge *\left(\omega^{b} \wedge \omega^{a}\right)\right) \\
& -\omega_{b}^{a}{ }_{b *}\left(N_{c} \omega^{c}{ }^{c} \omega^{b}\right) .
\end{aligned}
$$

Make the obvious cancellation -- then

$$
\begin{aligned}
& d^{\nabla^{q}} *\left(d \wedge \wedge \omega_{a}\right) \\
& \quad=d N_{c} \wedge *\left(\omega^{c} \wedge \omega^{a}\right)+N_{c} \wedge\left(-\omega_{b}^{c} \wedge *\left(\omega^{b} \wedge \omega^{a}\right)\right)
\end{aligned}
$$

$\omega N_{C} \wedge *\left(\omega^{c} \wedge \omega^{a}\right)$

$$
\begin{aligned}
& =q\left(\mathrm{dN}_{c}, \omega^{\mathrm{b}}\right) \omega^{\mathrm{b}} \wedge *\left(\omega^{c} \wedge \omega^{\mathrm{a}}\right) \\
& =\mathrm{q}\left(\mathrm{dN}_{c^{\prime}} \omega^{\mathrm{b}}\right)(-1)^{\mathrm{n}-3} *\left(\omega^{\mathrm{c}} \wedge \omega^{\mathrm{a}}\right) \wedge \omega^{\mathrm{b}} \\
& =(-1)^{\mathrm{n}-3}{ }_{q}\left(d N_{c}, \omega^{\mathrm{b}}\right)(-1)^{\mathrm{n}-2} *\left(c_{\omega} \mathrm{b}^{\left.\left(\omega^{c} \wedge \omega^{\mathrm{a}}\right)\right)}\right.
\end{aligned}
$$

However, by definition,

$$
\mathrm{H}_{\mathrm{N}}=\nabla \mathrm{dN}=\omega^{\mathrm{b}} \otimes\left(\mathrm{dN}_{\mathrm{b}}-\omega_{\mathrm{b}^{\mathrm{c}}} \mathrm{~N}_{\mathrm{c}}\right)
$$

$$
\left.\nabla_{a} d N=<E_{a}, \mathrm{dN}_{b}-\omega_{b}^{c} N_{c}\right\rangle \omega^{b}
$$

$$
=<E_{a}, d N_{b}>\omega^{b}-N_{c}<E_{a}, \omega_{b}^{c}>\omega^{b}
$$

$$
=q\left(d N_{c^{\prime}} \omega^{a}\right) \omega^{c}-N_{c} q\left(\omega_{b^{\prime}}^{c} \omega^{a}\right) \omega^{b}
$$

$$
\begin{aligned}
& =-q\left(d N_{c}, \omega^{b}\right) *\left(q\left(\omega^{b}, \omega^{c}\right) \omega^{a}-q\left(\omega^{b}, \omega^{a}\right) \omega^{c}\right) \\
& =*\left(-q\left(\mathrm{dN}_{\mathrm{c}}, \omega^{\mathrm{C}}\right) \omega^{\mathrm{a}}+\mathrm{q}\left(\mathrm{dN}_{\mathrm{c}}, \omega^{\mathrm{a}}\right) \omega^{\mathrm{C}}\right) . \\
& \text { - } N_{c} \wedge\left(-\omega_{b}^{c}{ }^{\wedge *}\left(\omega^{b} \wedge \omega^{a}\right)\right) \\
& =N_{c} \wedge(-1)(-1)^{n-3} *\left(\omega^{b} \wedge \omega^{a}\right) \wedge \omega_{b}^{c} \\
& =(-1)^{\mathrm{n}_{\mathrm{N}}} \mathrm{~N}_{\mathrm{c}} \wedge *\left(\omega^{\mathrm{b}} \wedge \omega^{\mathrm{a}}\right) \wedge \omega_{\mathrm{b}}{ }_{\mathrm{c}} \\
& =(-1)^{n} N_{c} \wedge(-1)^{\mathrm{n}-2} \star\left(c_{\omega_{\mathrm{c}}}\left(\omega^{\mathrm{b}} \wedge \omega^{\mathrm{a}}\right)\right) \\
& =N_{c} *\left(q\left(\omega_{b^{\prime}}^{c} \omega^{b}\right) \omega^{a}-q\left(\omega_{b^{\prime}}^{c} \omega^{a}\right) \omega^{b}\right) \\
& =*\left(N_{C} q\left(\omega_{b^{\prime}}{ }^{\prime} \omega^{b}\right) \omega^{a}-N_{c} q\left(\omega_{b^{\prime}}{ }^{\prime} \omega^{a}\right) \omega^{b}\right) .
\end{aligned}
$$

In addition,

$$
\begin{aligned}
& \Delta_{q}^{N}=H_{N}\left(E_{d}, E_{d}\right) \\
= & \omega^{b} \otimes\left(d N_{b}-\omega_{b}^{c} N_{c}\right)\left(E_{d^{\prime}} E_{d}\right) \\
= & \omega^{b}\left(E_{d}\right)<E_{d}, d N_{b}-\omega_{b}^{c} N_{c}> \\
= & <E_{b^{\prime}}, d N_{b}-\omega_{b^{c}}^{c} N_{c}> \\
= & q\left(d N_{c}, \omega^{c}\right)-N_{c} q\left(\omega_{b^{\prime}}^{c}, \omega^{b}\right) .
\end{aligned}
$$

Consequently,

$$
\begin{aligned}
& *\left(q\left(d N_{c}, \omega^{a}\right) \omega^{c}-N_{c} q\left(\omega_{b^{\prime}}^{c} \omega^{a}\right) \omega^{b}\right) \\
+ & *\left(-q\left(d N_{c}, \omega^{c}\right)+N_{c} q\left(\omega_{b^{\prime}}^{c} \omega^{b}\right)\right) \omega^{a} \\
= & *\left(\nabla_{a} d N-\left(\Delta_{q} N\right) \omega^{a}\right)
\end{aligned}
$$

which completes the proof of the lema.]

Putting everything together then leads to the conclusion that, modulo an exact form,

$$
\left.-\frac{N}{2} \delta_{a} \Omega_{b c}{ }^{\wedge *\left(\omega^{b} \wedge \omega\right.}{ }^{c}\right)=-\delta \omega^{a} \wedge *\left(\nabla_{a} d N-\left(\Delta_{q} N\right) \omega^{a}\right) .
$$

Summary: We have

$$
\frac{\delta H}{\delta \omega}{ }^{a}=-L_{\vec{N}} p_{a}+w^{b}{ }_{a} p_{b}
$$

$$
\begin{aligned}
& +N\left(q\left(p_{a} * \omega^{b}\right) p_{b}-\frac{p}{n-2} p_{a}\right) \\
& -\frac{N}{2}\left(q\left(p_{b}, * \omega^{c}\right) q\left(p_{c^{\prime}} * \omega^{b}\right)-\frac{p^{2}}{n-2}\right) * \omega^{a} \\
& \quad+N *\left(\text { Ric }_{a}-\frac{1}{2} S(q) \omega^{a}\right)-*\left(\nabla_{a} d N-\left(\Delta_{q} N\right) \omega^{a}\right)
\end{aligned}
$$

Constraint Equations These are the relations

$$
\left[\begin{array}{c}
\frac{1}{2}\left[q_{t}\left(p_{a}, * \bar{\omega}^{b}\right) q_{t}\left(p_{b}, \star \bar{\omega}^{a}\right)-\frac{1}{n-2} p_{t}^{2}-s\left(q_{t}\right)\right] v^{2} q_{t}=0 \\
-d p_{a}+\iota_{E_{a}} d \bar{\omega}^{b} p_{b}=-d^{\bar{\nabla}} p_{a}=0
\end{array}\right.
$$

Evolution Equations These are the relations

$$
\dot{\bar{\omega}} \mathrm{a}=\mathrm{N}_{t} \bar{\omega}_{0}^{\mathrm{a}}+\overline{\mathrm{Q}}_{\mathrm{b}}^{\mathrm{a}} \bar{\omega}^{\mathrm{b}}+{\stackrel{L}{\stackrel{N}{N}_{t}}}^{\bar{\omega}^{\mathrm{a}}}
$$

and

$$
\begin{gathered}
\dot{p}_{a}=-N_{t}\left(q_{t}\left(p_{a} * * \bar{\omega}^{b}\right) p_{b}-\frac{1}{n-2} p_{t} p_{a}\right) \\
+\frac{N_{t}}{2}\left(q_{t}\left(p_{b}, * \bar{\omega}^{c}\right) q_{t}\left(p_{c}, * \omega^{b}\right)-\frac{1}{n-2} p_{t}^{2}\right) * \bar{\omega}^{a} \\
-N_{t} *\left(R_{a}-\frac{1}{2} s\left(q_{t}\right) \bar{\omega}^{a}\right) \\
+*\left(\bar{\nabla}_{a} d N_{t}-\left(\Delta_{q_{t}} N_{t}\right) \bar{\omega}^{a}\right)+L_{\vec{N}_{t}} p_{a}-\bar{Q}_{a}^{b} p_{b}
\end{gathered}
$$

In the last section, we saw that

$$
\left.\frac{\delta H}{\delta N}\right|_{\left(\vec{\omega}_{t}, \vec{p}_{t}\right)}=-\overline{\mathrm{G}}_{00}{ }^{\mathrm{vol}} \mathrm{q}_{t}^{\prime}
$$

i.e.,

$$
\frac{1}{2}\left[q_{t}\left(p_{a}, * \omega^{b}\right) q_{t}\left(p_{b}, * \bar{\omega}^{a}\right)-\frac{1}{n-2} p_{t}^{2}-s\left(q_{t}\right)\right] v o l q_{t}=-\bar{G}_{00} v o l q_{t}^{\prime}
$$

and

$$
\left.\left.\frac{\delta H}{\delta N^{a}}\right|_{\left(\vec{\omega}_{t}\right.} \vec{p}_{t}\right)=-\bar{G}_{0 a}{ }^{v o l} q_{t}^{\prime}
$$

i.e.,

$$
-d p_{a}+c_{E_{a}} d \bar{\omega}^{b} \wedge p_{b}=-d^{\bar{\nabla}} p_{a}=-\bar{G}_{0 a}{ }^{v o l} q_{t}
$$

Therefore the constraint equations are equivalent to

$$
\left[\begin{array}{l}
G_{00}=0 \\
G_{0 a}=0
\end{array}\right.
$$

Turning to the evolution equations, note that

$$
\dot{\bar{\omega}} \mathrm{a}=N_{t}\left(q_{t}\left(p_{b}, * \bar{\omega}^{a}\right) \bar{\omega}^{b}-\frac{1}{n-2} P_{t} \bar{\omega}^{a}\right)+\bar{Q}_{b^{a}}^{-\bar{\omega}}+L_{\vec{N}_{t}} \bar{\omega}^{-a}
$$

which is precisely the functional derivative $\frac{\delta H}{\delta \mathrm{p}_{\mathrm{a}}}$ evaluated at ( $\left.\vec{\omega}_{\mathrm{t}}, \overrightarrow{\mathrm{P}}_{\mathrm{t}} ; \mathrm{N}_{\mathrm{t}}, \overrightarrow{\mathrm{N}}_{\mathrm{t}}, \overline{\mathrm{Q}}_{\mathrm{b}}^{\mathrm{a}}\right)$. In view of this, the evolution equations thus say that

$$
\left[\begin{array}{l}
\dot{\bar{\omega}}^{a}=\frac{\delta H}{\delta p_{a}} \\
\dot{p}_{a}=-\frac{\delta H}{\delta \bar{\omega}} .
\end{array}\right.
$$

In other words: The curve

$$
t \rightarrow\left(\vec{\omega}_{t}, \overrightarrow{\mathrm{p}}_{t}\right) \in \mathrm{T}^{*} \underline{Q}
$$

is an integral curve for the hamiltonian vector field

$$
X_{H}=\left(\frac{\delta H}{\delta \vec{p}},-\frac{\delta H}{\delta \vec{\omega}}\right)
$$

attached to H (all data taken at $t$ ).

MAIN THEOREM Suppose that the constraint equations and the evolution equations are satisfied by the pair $\left(\vec{\omega}_{t}, \vec{p}_{t}\right)-$ then $\operatorname{Ein}(g)=0$.
[Note: It is this result which justifies the passage to the coframe picture.]

To prove the theorem, it suffices to show that if $\forall \mathrm{b}$,

$$
\begin{gathered}
\dot{p}_{b}=-N_{t}\left(q_{t}\left(p_{b}, * \bar{\omega}^{c}\right) p_{c}-\frac{1}{n-2} p_{t} p_{b}\right) \\
+\frac{N_{t}}{2}\left(q_{t}\left(p_{c}, * \bar{\omega}^{d}\right) q_{t}\left(p_{d^{\prime}} * \bar{\omega}^{c}\right)-\frac{1}{n-2} p_{t}^{2}\right) * \bar{\omega}^{b} \\
-N_{t} *\left(R_{b} c_{b}-\frac{1}{2} S\left(q_{t}\right) \bar{\omega}^{b}\right) \\
+*\left(\bar{\nabla}_{b} d N_{t}-\left(\Delta_{q_{t}} N_{t}\right) \bar{\omega}^{-b}\right)+L_{\vec{N}_{t}} p_{b}-\bar{Q}_{b}^{c} p_{c}^{\prime}
\end{gathered}
$$

then

$$
\dot{p}_{t}=-2 N_{t}\left(\pi_{t} * \pi_{t}-\frac{1}{n-2} \operatorname{tr}_{q_{t}}\left(\pi_{t}\right) \pi_{t}\right) \otimes\left|q_{t}\right|^{1 / 2}
$$

$$
\begin{aligned}
& +\frac{N_{t}}{2}\left(\left[\pi_{t}, \pi_{t}\right]_{q_{t}}-\frac{1}{n-2} \operatorname{tr}{q_{t}}\left(\pi_{t}\right)^{2}\right) q_{t}^{\#} \otimes\left|q_{t}\right|^{1 / 2} \\
& \quad-N_{t} \operatorname{Ein}\left(q_{t}\right)^{\#} \otimes\left|q_{t}\right|^{1 / 2} \\
& +\left(H_{N_{t}}-\left(\Delta_{q_{t}} N_{t}\right) q_{t}\right)^{\#} \otimes\left|q_{t}\right|^{1 / 2}+L_{\vec{N}_{t}} p_{t}
\end{aligned}
$$

And for this, one can work locally.
Let $\mu, \nu$ be indices that run between 1 and $n-1$.
Local Formulas

1. $\frac{\partial}{\partial x^{\mu}}=e^{a}{ }_{\mu} E_{a} \& E_{a}=e^{\mu} \frac{\partial}{\partial x^{\mu}}$.
2. $d x^{\mu}=e^{\mu} a^{a} \& \omega^{a}=e_{\mu}^{a} d x^{\mu}$.
3. $e^{\mu} a^{e^{a}}=\delta_{\nu}^{\mu} \& e_{\mu}^{a} e_{b}^{\mu}=\delta_{b}^{a}$.
4. $\bar{g}_{\mu \nu}=\eta_{a b} e_{\mu}^{a} e_{\nu}^{b} \& \bar{g}^{\mu \nu}=\eta^{a b} e_{a}^{\mu} e^{\nu}{ }_{b}$.
5. $e^{a}{ }_{\mu}=\eta^{a b} \bar{g}_{\mu \nu} e_{b}^{\nu} \& e_{a}^{\mu}=\eta_{a b} \bar{g}^{\mu \nu} e_{\nu}^{b}$.
[Note: Bear in mind that $\vec{g}$ and $q_{t}$ are one and the same.]

LEMMA We have

$$
\left(\bar{\omega}^{a} \wedge p_{b}\right) e_{a}^{\mu} e_{b}^{\nu}=\left(x_{t}^{\mu \nu}-k_{t} q_{t}^{\mu \nu}\right) v o l_{q_{t}}^{\prime}
$$

i.e.,

$$
\left(d x^{\mu} \wedge p_{b}\right) e_{b}^{\nu}=\pi_{t}^{\mu \nu} v_{q_{t}}
$$

Strictly speaking, $\pi_{t}{ }^{\mathrm{Vol}}{ }_{q_{t}}$ and $\pi_{t}{ }^{\otimes}\left|q_{t}\right|^{1 / 2}$ are different entities but for the purposes at hand, it is more convenient to use $\pi_{t}{ }^{v o l} q_{t}$. Agreeing to denote it also by $p_{t}$, the evolution equation for $\dot{p}_{t}^{\mu \nu}$ is as above, the only change being that $\left|q_{t}\right|^{1 / 2}$ is replaced throughout by vol ${ }_{q_{t}}$.

LEMMA We have

$$
\dot{p}_{t}^{\mu \nu}=\left(d x^{\mu} \wedge \dot{p}_{b}\right) e_{b}^{\nu}-\left(d x^{\mu} \wedge p_{b}\right) \dot{\bar{\omega}}^{c}\left(E_{b}\right) e_{c}^{\nu} .
$$

[In fact,

$$
\begin{aligned}
& \dot{p}_{t}^{\mu \nu}=\left[\left(d x^{\mu} \wedge p_{b}\right) e_{b}^{\nu}\right] \\
& =\left(d x^{\mu} \wedge \dot{p}_{b}\right) e_{b}^{\nu}+\left(d x^{\mu} \wedge p_{b}\right) e_{b}^{\nu} \\
& =\left(d x^{\mu} \wedge \dot{p}_{b}\right) e_{b}^{\nu}-\left(d x^{\mu} \wedge p_{b}\right) e_{c}^{\nu} \dot{e}_{\nu^{\prime}}^{c} e_{b}^{\nu^{\prime}} \\
& =\left(d x^{\mu} \wedge \dot{p}_{b}\right) e_{b}^{\nu}-\left(d x^{\mu} \wedge p_{b}\right) e^{\nu} \dot{\bar{\omega}}^{c}\left(\frac{\partial}{\partial x^{\nu^{\prime}}}\right) e^{\nu^{\prime}} b \\
& =\left(d x^{\mu} \wedge \dot{p}_{b}\right) e_{b}^{\nu}-\left(d x^{\mu} \wedge p_{b}\right) e^{\nu} c^{-c}\left(e^{\nu^{\prime}}{ }_{b} \frac{\partial}{\partial x^{\nu^{\prime}}}\right)
\end{aligned}
$$

$$
\left.=\left(d x^{\mu} \dot{p}_{b}\right) e_{b}^{\nu}-\left(d x^{\mu} \wedge p_{b}\right) \dot{\bar{\omega}}^{c}\left(E_{b}\right) e_{c}^{\nu} .\right]
$$

The point now is to apply the lemma and replace $\dot{\mathrm{p}}_{\mathrm{b}}$ by its evolution equation, the claim being that the result is the evolution equation for $\dot{p}_{t}^{\mu \nu}$.

The first item on the agenda is to check that there is no net contribution from the rotational terms.

Rot $_{1}$ : The rotational contribution from $\dot{\mathrm{P}}_{\mathrm{b}}$ is

$$
-\left(d x^{\mu} \wedge \bar{Q}_{b}^{c} p_{c}\right) e_{b}^{\nu}
$$

Rot $_{2}$ : The rotational contribution from $\overline{\bar{\omega}}^{\circ} \mathrm{c}\left(E_{b}\right)$ is

$$
-\left(d x^{\mu} \wedge p_{b}\right) \bar{Q}_{d^{\omega}}{ }^{-\alpha}\left(E_{b}\right) e_{c}^{\nu}
$$

or still,

$$
-\left(d x^{\mu} \wedge_{p_{b}}\right) \bar{Q}_{b}^{C} e_{c}^{\nu}
$$

But

$$
\begin{aligned}
- & \left(d x^{\mu} \wedge p_{b}\right) \bar{Q}_{b}^{c} e^{\nu}{ }_{c} \\
& =-\left(d x^{\mu} \wedge \bar{Q}_{b}^{c}{ }_{b} p_{b}\right) e_{c}^{\nu} \\
& =-\left(d x^{\mu} \wedge \bar{Q}^{c}{ }_{d} p_{d}\right) e_{c}^{\nu} \\
& =-\left(d x^{\mu} \wedge \bar{Q}^{b}{ }_{d} p_{d}\right) e_{b}^{\nu} \\
& =-\left(d x^{\mu} \wedge-\bar{Q}_{b}{ }_{b} p_{d}\right) e_{b}^{\nu}
\end{aligned}
$$

$$
=\left(d x^{\mu} \wedge \bar{Q}_{b}^{c}{ }^{p}{ }_{c}\right) e_{b}^{\nu}
$$

So the two rotational terms do indeed cancel out.
Item:

$$
\begin{aligned}
d x^{\mu} \wedge( & -N_{t}\left(q_{t}\left(p_{b}, * \bar{\omega}^{c}\right) p_{c}-\frac{1}{n-2} p_{t} p_{b}\right) e_{b}^{\nu} \\
& -\left(d x^{\mu} \wedge p_{b}\right) N_{t} \bar{\omega}^{c}{ }_{0}\left(E_{b}\right) e_{c}^{\nu}
\end{aligned}
$$

equals

$$
-2 N_{t}\left(\left(\pi_{t} * \pi_{t}\right)^{\mu \nu}-\frac{1}{n-2} \operatorname{tr}_{q_{t}}\left(\pi_{t}\right) \pi_{t}^{\mu \nu}\right) \mathrm{vol}_{q_{t}}
$$

Consider first

$$
d x^{\mu} \wedge\left(N_{t}\left(\frac{l}{n-2}\right) P_{t} p_{b}\right) e_{b}^{\nu}
$$

Since

$$
P_{t}=t r_{t}\left(\pi_{t}\right)
$$

we have

$$
\begin{aligned}
& d x^{\mu} \wedge\left(N_{t}\left(\frac{1}{n-2}\right) P_{t} p_{b}\right) e_{b}^{\nu} \\
& \quad=N_{t}\left(\frac{1}{n-2}\right) t r_{q_{t}}\left(\pi_{t}\right)\left(d x \mu^{\mu} \wedge p_{b}\right) e_{b}^{\nu} \\
& \quad=N_{t}\left(\frac{1}{n-2}\right) t r_{q_{t}}\left(\pi_{t}\right) \pi_{t}^{\mu \nu} v o l_{q_{t}}
\end{aligned}
$$

But there is more, viz.

$$
-\left(d x^{\mu} \wedge p_{b}\right) N_{t} \bar{\omega}_{0}^{c}\left(E_{b}\right) e_{c}^{\nu}
$$

$$
\begin{aligned}
& =-\left(d x^{\mu} \wedge p_{b}\right) N_{t} x^{c}{ }_{d}{ }^{\omega}{ }^{d}\left(E_{b}\right) e^{\nu}{ }_{c} \\
& =-\left(d x^{\mu} \wedge p_{b}\right) N_{t} x^{c}{ }_{b} e^{\nu}{ }_{c} \\
& =-\left(d x^{\mu} \wedge p_{b}\right) N_{t}\left(q_{t}\left(p_{c} * * \bar{\omega}^{b}\right)-\frac{1}{n-2} P_{t} \delta_{c b}\right) e^{\nu}{ }_{c} \\
& =-\left(d x^{\mu} \wedge p_{b}\right) N_{t} q_{t}\left(p_{c}, * \bar{\omega}^{b}\right) e_{c}^{\nu} \\
& +\left(d x^{\mu} \wedge p_{b}\right) N_{t}\left(\frac{l}{n-2}\right) P_{t} \delta_{c b} e^{\nu}{ }_{c} .
\end{aligned}
$$

And

$$
\begin{aligned}
& \left(d x^{\mu} \wedge p_{b}\right) N_{t}\left(\frac{1}{n-2}\right) P_{t} \delta_{c b} e_{c}^{\nu} \\
& \quad=\left(d x{ }^{\mu} \wedge p_{b}\right) N_{t}\left(\frac{1}{n-2}\right) p_{t} e^{\nu}{ }_{b} \\
& \quad=N_{t}\left(\frac{1}{n-2}\right) t r_{q_{t}}\left(\pi_{t}\right)\left(d x^{\mu} \wedge p_{b}\right) e_{b}^{\nu} \\
& \\
& =N_{t}\left(\frac{1}{n-2}\right) t r_{q_{t}}\left(\pi_{t}\right) \pi_{t}^{\mu \nu} v^{v o l} q_{t} .
\end{aligned}
$$

Thus

$$
2 N_{t}\left(\frac{l}{n-2}\right) \operatorname{tr}_{q_{t}}\left(\pi_{t}\right) \pi_{t}^{\mu \nu}{ }^{v o l} q_{t}
$$

is accounted for. There remains

$$
\begin{aligned}
d x^{\mu} \wedge(- & \left.N_{t} q_{t}\left(p_{b} * \bar{\omega}^{-c}\right) p_{c}\right) e_{b}^{\nu} \\
& -\left(d x^{\mu} \wedge p_{b}\right) N_{t} q_{t}\left(p_{c^{\prime}} * \bar{\omega}^{b}\right) e_{c}^{\nu}
\end{aligned}
$$

or still,

$$
-2 N_{t}\left(d x^{\mu} \wedge p_{c}\right) q_{t}\left(p_{b}, * \bar{\omega}^{c}\right) e_{b}^{\nu}
$$

or still,

$$
-2 N_{t}\left(\bar{\omega}^{a} e^{\mu}{ }_{a}^{\wedge p_{c}}\right) q_{t}\left(p_{b}, * \bar{\omega}^{c}\right) e_{b}^{\nu}
$$

or still,

$$
-2 N_{t} q_{t}\left(p_{c}, * \bar{\omega}^{-a}\right) q_{t}\left(p_{b}, * \bar{\omega}^{c}\right) e^{\mu} e^{\nu} b^{v o l} q_{t}
$$

or still,

$$
-2 N_{t} q_{t}\left(p_{a}, * \bar{\omega}^{c}\right) q_{t}\left(p_{b}, * \bar{\omega}^{c}\right) e^{\mu} a^{\nu}{ }_{b} v^{v o l} q_{t}
$$

or still,

$$
-2 N_{t} q_{t}\left(p_{a}, p_{b}\right) e^{\mu} e^{\nu}{ }_{b}^{v o l} q_{t}
$$

or still,

$$
-2 N_{t}\left(\pi_{t} * \pi_{t}\right)^{\mu \nu} v_{v o l_{~}} .
$$

Item:

$$
d x^{\mu} \wedge\left(\frac{N_{t}}{2}\left(q_{t}\left(p_{c}, \star \bar{\omega}^{d}\right) q_{t}\left(p_{d}, * \bar{\omega}^{c}\right)-\frac{1}{n-2} p_{t}^{2}\right) \star \bar{\omega}^{b}\right) e_{b}^{\nu}
$$

equals

$$
\frac{N_{t}}{2}\left(\left[\pi_{t}, \pi_{t}\right]_{q_{t}}-\frac{1}{n-2} \operatorname{tr}_{q_{t}}\left(\pi_{t}\right)^{2}\right) q_{t}^{\mu \nu}{ }^{v o l} q_{t}
$$

To begin with,

$$
-d x^{\mu} \wedge \frac{N_{t}}{2}\left(\frac{1}{n-2}\right) P_{t}^{2}{ }^{-\omega} \bar{\omega}^{\nu}{ }_{b}
$$

$$
\begin{aligned}
& =-\frac{N_{t}}{2}\left(\frac{1}{n-2}\right) t r_{q_{t}}\left(\pi_{t}\right)^{2} d x^{\mu} \wedge * \bar{\omega}^{b} e^{\nu}{ }_{b} \\
& =-\frac{N_{t}}{2}\left(\frac{1}{n-2}\right) t r_{q_{t}}\left(\pi_{t}\right)^{2} q_{t}\left(d x^{\mu},{ }^{\omega}{ }^{b}\right) e^{\nu}{ }_{b} v o l{ }_{q_{t}} \\
& \\
& =-\frac{N_{t}}{2}\left(\frac{1}{n-2}\right) t r_{q_{t}}\left(\pi_{t}\right)^{2} e^{\mu}{ }_{b} e^{\nu}{ }_{b} v o l_{q_{t}} \\
& \\
& =-\frac{N_{t}}{2}\left(\frac{1}{n-2}\right) t r_{q_{t}}\left(\pi_{t}\right)^{2} q_{t}^{\mu \nu} v o l_{q_{t}} .
\end{aligned}
$$

This leaves

$$
d x^{\mu} \wedge \frac{N_{t}}{2} q_{t}\left(p_{c}, * \bar{\omega}^{d}\right) q_{t}\left(p_{d}, * \bar{\omega}^{c}\right) * \hbar^{-b} e_{b}^{\nu}
$$

or still,

$$
\frac{N_{t}}{2} q_{t}\left(p_{c}, * \omega^{-d}\right) q_{t}\left(p_{d}, * \bar{\omega}^{c}\right) d x^{\mu} \wedge * \bar{\omega}^{b} e_{b}^{\nu}
$$

or still,

$$
\frac{N_{t}}{2} q_{t}\left(p_{c^{\prime}} p_{c}\right) q_{t}^{\mu \nu} v_{t o l}
$$

or still,

$$
\frac{N_{t}}{2}\left[\pi_{t}, \pi_{t}\right]_{q_{t}} q_{t}^{\mu \nu}{ }^{\mu v o}{ }_{q_{t}}
$$

Item:

$$
d x^{\mu} \wedge\left(-N_{t} *\left(R i c_{b}-\frac{1}{2} S\left(q_{t}\right) \omega^{b}\right)\right) e_{b}^{\nu}
$$

equals

$$
-N_{t} \operatorname{Ein}\left(q_{t}\right)^{\mu \nu} \operatorname{vol}_{q_{t}}
$$

Here

$$
\begin{aligned}
& -N_{t} \operatorname{Ein}\left(q_{t}\right)^{\mu \nu} v_{v o l}^{q_{t}} \\
& =-N_{t}\left(R^{\mu \nu}-\frac{1}{2} S\left(q_{t}\right) q_{t}^{\mu \nu}\right) v o l_{q_{t}} \\
& =-N_{t} R^{\mu \nu} v^{\operatorname{vol}} q_{t}+\frac{N_{t}}{2} S\left(q_{t}\right) q_{t}^{\mu \nu} v o l_{q_{t}} .
\end{aligned}
$$

But

$$
\begin{aligned}
& d x^{\mu} \wedge\left(-N_{t} *\left(\text { Ric }_{b}-\frac{1}{2} S\left(q_{t}\right) \bar{\omega}^{b}\right)\right) e_{b}^{\nu} \\
& =-N_{t} d x^{\mu} \wedge *\left(\text { Ric }_{b}\right) e_{b}^{\nu} \\
& +\frac{N_{t}}{2} S\left(q_{t}\right) d x^{\mu} \wedge * \bar{\omega}^{b} e_{b}^{\nu} \\
& =-N_{t} d x^{\mu} \wedge *\left(\text { Ric }_{b}\right) e_{b}^{\nu} \\
& +\frac{N_{t}}{2} S\left(q_{t}\right) q_{t}^{\mu \nu}{ }^{\text {vol }}{ }_{q_{t}} .
\end{aligned}
$$

And

$$
\begin{aligned}
& -N_{t} d x^{\mu} \wedge *\left(R_{c}\right) e_{b}^{\nu} \\
= & -N_{t} d x^{\mu} \wedge *\left(R_{b c} \bar{\omega}^{c}\right) e_{b}^{\nu} \\
= & -N_{t} d x^{\mu} \wedge\left(R_{b c}{ }^{-\omega^{c}}\right) e_{b}^{\nu}
\end{aligned}
$$

34. 

$$
\begin{aligned}
& =-N_{t} R_{b c} d x^{\mu} \wedge * \bar{\omega}^{c} e^{\nu}{ }_{b} \\
& =-N_{t} R_{b c} e^{\mu} c e^{\nu}{ }_{b}{ }^{v o l} q_{t} \\
& =-N_{t} \operatorname{Ric}\left(E_{b}, E_{c}\right) e_{c}^{\mu} e^{\nu}{ }_{b} V^{V o l} q_{t} \\
& =-N_{t} \operatorname{Ric}\left(e^{\nu^{\prime}}{ }_{b} \frac{\partial}{\partial x^{\nu^{\prime}}}, e^{\mu^{\prime}} c \frac{\partial}{\partial x^{\mu^{\prime}}}\right) e^{\mu} c^{e^{\nu}}{ }_{b}{ }^{\text {Vol }} q_{t} \\
& =-N_{t} e^{\nu^{\prime}}{ }_{b} e^{\mu^{\prime}}{ }_{c^{R}}^{\nu^{\prime} \mu^{\prime}} e^{\mu} e^{\nu} e_{b}{ }^{\operatorname{Vol}} q_{t} \\
& =-N_{t} e^{\mu} c^{e^{\prime}} c^{e^{\nu}} b^{e^{\nu^{\prime}}} b^{R}{ }_{\mu^{\prime} \nu^{\prime}}{ }^{v o l} q_{t} \\
& =-N_{t} q_{t}^{\mu \mu '} q_{t}^{\nu \nu^{\prime}}{ }_{\mu^{\prime} \nu^{\prime}}{ }^{\operatorname{vol}} q_{t} \\
& =-N_{t} R^{\mu \nu} \operatorname{Vol}_{q_{t}} .
\end{aligned}
$$

Item:

$$
d x^{\mu} \wedge *\left(\bar{\nabla}_{b} d N_{t}-\left(\Delta_{q_{t}} N_{t}\right) \bar{\omega}^{b}\right) e_{b}^{\nu}
$$

equals

$$
\left(H_{N_{t}}^{\mu \nu}-\left(\Delta_{q_{t}} N_{t}\right) q_{t}^{\mu \nu}\right) v^{v o l} q_{t}
$$

For it is clear that

$$
\begin{aligned}
& -d x^{\mu} \wedge\left(\Delta_{q_{t}} N_{t}\right) * \bar{\omega}^{b} e_{b}^{\nu} \\
& =-\left(\Delta_{q_{t}} N_{t}\right) q_{t}^{\mu \nu}{ }^{\mu o l} q_{t}
\end{aligned}
$$

On the other hand,

$$
\begin{aligned}
& d x^{\mu} \wedge *\left(\bar{\nabla}_{b} d N_{t}\right) e_{b}^{\nu} \\
& =d x^{\mu} \wedge q_{t}\left(\bar{\nabla}_{b} d N_{t}, \bar{\omega}^{c}\right) \star \bar{\omega}^{c} e^{\nu}{ }_{b} \\
& =d x^{\mu} \wedge H_{N_{t}}\left(E_{c}, E_{b}\right) * \bar{\omega}^{C} e_{b}^{\nu} \\
& =H_{N_{t}}\left(E_{b}, E_{c}\right) d x^{\mu} \wedge * \bar{\omega}^{c} e^{\nu}{ }_{b} \\
& =H_{N_{t}}\left(E_{b}, E_{c}\right) e^{\mu} e^{\nu}{ }_{b}{ }^{v o l} q_{t},
\end{aligned}
$$

which, in complete analogy with the discussion of Ric, reduces to

$$
{ }_{\mathrm{N}_{\mathrm{t}}^{\mu \nu}}^{\mu \nu}{ }_{q_{\mathrm{t}}} \cdot
$$

Item:

$$
\left(d x^{\mu} \wedge L_{\vec{N}_{t}} p_{b}\right) e_{b}^{\nu}-\left(d x^{\mu} \wedge p_{b}\right)\left(L_{\vec{N}_{t}} \bar{\omega}^{c}\right)\left(E_{b}\right) e_{c}^{\nu}
$$

equals

$$
L_{\overrightarrow{\mathbb{N}_{t}}} p_{t}^{\mu \nu}
$$

i.e., equals

$$
\begin{gathered}
\left(L_{\vec{N}_{t}} d x^{\mu} \hat{p}_{b}\right) e_{b}^{\nu}+\left(d x^{\mu} \wedge L_{\vec{N}_{t}} p_{b}\right) e_{b}^{\nu} \\
+\left(d x^{\mu} \wedge p_{b}\right) L_{\vec{N}_{t}} e_{b}^{\nu}
\end{gathered}
$$

Therefore the issue is the equality of

$$
-\left(d x^{\mu} \wedge p_{b}\right)\left(L_{\vec{N}_{t}} \bar{\omega}^{c}\right)\left(E_{b}\right) e_{c}^{\nu}
$$

and

Write

$$
\begin{aligned}
{\stackrel{L}{\vec{N}_{t}}}\left(d x^{\nu}\right) & ={\underset{\vec{N}_{t}}{ }\left(e^{\nu} c^{-c}\right)} \begin{aligned}
L_{\vec{N}_{t}} & \left.e_{c}^{\nu}\right) \bar{\omega}^{c}+e_{c}^{\nu}\left(L_{\vec{N}_{t}} \bar{\omega}^{c}\right)
\end{aligned}
\end{aligned}
$$

to get

Then

$$
\begin{aligned}
& -\left(d x^{\mu} \wedge p_{b}\right)\left(L_{\vec{N}_{t}}^{\omega^{c}}\right)\left(E_{b}\right) e_{c}^{\nu} \\
& =\left(d x^{\mu} \wedge p_{b}\right) L_{\vec{N}_{t}} e_{b}^{\nu}-\left(d x^{\mu} \wedge p_{b}\right) L_{\vec{N}_{t}}\left(d x^{\nu}\right)\left(E_{b}\right),
\end{aligned}
$$

so what's left is the equality of

$$
\left.\underset{\vec{N}_{t}}{\left(L_{b}\right.} d \mu_{b}\right) e_{b}^{\nu}
$$

and

$$
-\left(d x^{\mu} \wedge p_{b}\right) L_{\vec{N}_{t}}\left(d x^{\nu}\right)\left(E_{b}\right)
$$

or, equivalently, that

$$
\left({\stackrel{L}{N_{t}}}^{\left.d x^{\mu} \wedge p_{b}\right) d x^{\nu}\left(E_{b}\right)+\left(d x^{\mu} \wedge p_{b}\right) L_{\vec{N}_{t}}\left(d x^{\nu}\right)\left(E_{b}\right)=0 . . . ~ . ~}\right.
$$

To see this, take $\mu=\nu$ (the general case is similar (because $\mathrm{p}^{\mu \nu}=\mathrm{p}^{\nu \mu}$ ) ) - then

$$
{\underset{\vec{N}}{t}}_{L_{t}} d x^{\mu} \wedge p_{b} \wedge d x^{\mu}+d x^{\mu} \wedge p_{b} \wedge{\stackrel{N}{N_{t}}}^{d x^{\mu}}=0
$$

Indeed, each term is an $n$-form while $\operatorname{dim} \Sigma=n-1$. Apply $\iota_{E_{b}}$ :

1. ${ }^{2} E_{b}{ }_{b} \vec{N}_{t} d x^{\mu} \wedge p_{b} \wedge d x$.
2. ${\underset{N_{t}}{ }} d x^{\mu} \wedge l_{E_{b}} P_{b} \wedge d x x^{\mu}$.
3. $(-1)^{\mathrm{n}-2}{\underset{\mathrm{~N}_{\mathrm{t}}}{ }} d x^{\mu} \wedge \mathrm{p}_{\mathrm{b}} \wedge c_{\mathrm{E}_{\mathrm{b}}} \mathrm{dx}$.
4. $\iota_{E_{b}} d x^{\mu} \wedge p_{b} \wedge L_{\vec{N}_{t}} d x$.
5. $d x{ }^{\mu} \wedge L_{E_{b}} p_{b} \wedge{\underset{N}{N}}_{t} d x^{\mu}$.
6. $(-1)^{n-2} d x^{\mu} \wedge p_{b} \wedge c_{E_{b}} \stackrel{\rightharpoonup}{\mathrm{~N}}_{t} d x^{\mu}$.

The sum $1+\cdots+6$ is zero.
$\omega_{2}+5$ equals $(-1)^{n-3}$ times

$$
{\underset{\vec{N}_{t}}{ } d x^{\mu} \wedge d x^{\mu} \wedge c_{E_{b}} p_{b}+d x^{\mu} \wedge L_{\vec{N}_{t}} d x^{\mu} \wedge c_{E_{b}} p_{b^{\prime}} .}^{\prime}
$$

$$
\begin{aligned}
& \text { i.e., equals }(-1)^{n-3} \text { times } \\
& \qquad \begin{array}{l}
\left(L_{N_{N}} d x^{\mu} \wedge d x^{\mu}+d x^{\mu} \wedge L_{\vec{N}_{t}} d x^{\mu}\right) \wedge \varepsilon_{E_{b}} p_{b^{\prime}} \\
\text { i.e., equals }(-1)^{n-3} \text { times } \\
L_{\vec{N}_{t}}\left(d x^{\mu} \wedge d x^{\mu}\right) \wedge \varepsilon_{E_{b}} p_{b}
\end{array} .
\end{aligned}
$$

which is zero.

$$
\text { - } \tau_{E_{b}} L_{\vec{N}_{t}} d x^{\mu}=L_{\vec{N}_{t}}\left(d x^{\mu}\right)\left(E_{b}\right)
$$

$$
\Rightarrow
$$

$$
{ }^{\imath} \mathrm{E}_{\mathrm{b}} \stackrel{\rightharpoonup}{\mathrm{~N}}_{\mathrm{t}} d x^{\mu} \wedge \mathrm{p}_{\mathrm{b}} \wedge d x^{\mu}
$$

$$
=p_{b} \wedge d x^{\mu} \wedge c_{E_{b}} \stackrel{\rightharpoonup}{N}_{t} d x^{\mu}
$$

$$
=(-1)^{n-2}\left(d x^{\mu} \wedge_{b}\right) L_{\vec{N}_{t}}\left(d x^{\mu}\right)\left(E_{b}\right)
$$

$\Rightarrow$

$$
1+6=2(-1)^{n-2}\left(d x^{\mu} \wedge p_{b}\right) L_{\vec{N}_{t}}\left(d x^{\mu}\right)\left(E_{b}\right)
$$

$$
\text { - } \varepsilon_{E_{b}} d x^{\mu}=d x^{\mu}\left(E_{b}\right)
$$

$\Rightarrow$

$$
\tau_{E_{b}} d x^{\mu} \wedge p_{b} \wedge L_{\vec{N}_{t}} d x^{\mu}
$$

$$
\begin{aligned}
& =p_{b} \wedge L_{\vec{N}_{t}} d x^{\mu} \wedge c_{E_{b}} d x^{\mu} \\
& =(-1)^{n-2}\left(L_{\vec{N}_{t}} d x^{\mu} \wedge p_{b}\right) d x^{\mu}\left(E_{b}\right) \\
& \Rightarrow \quad 3+4=2(-1)^{n-2}\left(L_{\vec{N}_{t}} d x^{\mu} \wedge p_{b}\right) d x^{\mu}\left(E_{b}\right)
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& 0=(1+6)+(3+4) \\
& =2(-1)^{n-2}\left(\left(L_{\vec{N}_{t}} d x^{\mu} \wedge p_{b}\right) d x^{\mu}\left(E_{b}\right)+\left(d x^{\mu} \wedge p_{b}\right) L_{\vec{N}_{t}}\left(d x^{\mu}\right)\left(E_{b}\right)\right) \\
& \left(L_{\vec{N}_{t}} d x^{\mu} \wedge p_{b}\right) d x^{\mu}\left(E_{b}\right)+\left(d x^{\mu} \wedge p_{b}\right) L_{\vec{N}_{t}}\left(d x^{\mu}\right)\left(E_{b}\right)=0 .
\end{aligned}
$$

Section 45: Computation of the Poisson Brackets The assumptions and notation are those of the standard setup.

Given functions $\mathrm{f}_{1}, \mathrm{f}_{2}: \mathrm{T}^{*} \underline{\underline{Q}} \rightarrow \underline{R}$, let $\mathrm{X}_{1}, \mathrm{X}_{2}$ be the corresponding hamiltonian vector fields -- then the Poisson bracket of $f_{1}, f_{2}$ is the function

$$
\left\{\mathrm{f}_{1}, \mathrm{f}_{2}\right\}: \mathrm{T}^{*} \underline{\underline{Q}} \rightarrow \underline{R}
$$

defined by the rule

$$
\left\{\mathrm{f}_{1}, \mathrm{f}_{2}\right\}(\vec{\omega}, \overrightarrow{\mathrm{p}})=\Omega\left(\mathrm{X}_{1}(\vec{\omega}, \overrightarrow{\mathrm{p}}), \mathrm{X}_{2}(\vec{\omega}, \overrightarrow{\mathrm{p}})\right)
$$

Therefore

$$
\left\{\mathrm{f}_{1}, \mathrm{f}_{2}\right\}=\int_{\Sigma}\left[\frac{\delta \mathrm{f}_{2}}{\delta \overrightarrow{\mathrm{p}}} \wedge \frac{\delta \mathrm{f}_{1}}{\delta \vec{\omega}}-\frac{\delta \mathrm{f}_{1}}{\delta \overrightarrow{\mathrm{p}}} \wedge \frac{\delta \mathrm{f}_{2}}{\delta \vec{\omega}}\right]
$$

[Note: Tacitly, it is assumed that the functional derivatives exist.] Rappel:

$$
\begin{aligned}
& H(\vec{\omega}, \vec{p} ; N, \vec{N}, W) \\
& \quad=\int_{\Sigma} L_{\vec{N}}^{L} \omega^{a} \wedge p_{a}+\int_{\Sigma} w_{b}^{a} \omega^{b} \wedge p_{a}+\int_{\Sigma} N E,
\end{aligned}
$$

where

$$
E(\vec{\omega}, \vec{p})=\frac{1}{2}\left[q\left(p_{a}, * \omega^{b}\right) q\left(p_{b}, * \omega^{a}\right)-\frac{p^{2}}{n-2}-s(q)\right] v^{2} l_{q}
$$

Definition:

$$
H_{D}(\vec{N})=\int_{\Sigma} L_{\vec{N}} \omega{ }^{\mathrm{a}} \wedge \mathrm{p}_{\mathrm{a}}
$$

is the integrated diffeomorphism constraint;

$$
H_{R}(W)=\int_{\Sigma} W_{b}^{a} \omega^{b} \wedge p_{a}
$$

is the integrated rotational constraint;

$$
H_{H}(N)=\int_{\Sigma} N E
$$

is the integrated hamiltonian constraint.
Therefore

$$
H=H_{D}+H_{R}+H_{H}
$$

and we have:

1. $\left\{H_{D}\left(\vec{N}_{1}\right), H_{D}\left(\vec{N}_{2}\right)\right\}=H_{D}\left(\left[\vec{N}_{1}, \vec{N}_{2}\right]\right)$;
2. $\left\{H_{D}(\vec{N}), H_{R}(W)\right\}=H_{R}\left(L_{\vec{N}} W\right)$;
3. $\left\{H_{D}(\overrightarrow{\mathrm{~N}}), H_{\mathrm{H}}(\mathrm{N})\right\}=\mathrm{H}_{\mathrm{H}}\left(\underset{\vec{N}}{\left(L_{\mathrm{N}}\right)}\right.$;
4. $\left\{H_{R}\left(W_{1}\right), H_{R}\left(W_{2}\right)\right\}=H_{R}\left(\left[W_{1}, W_{2}\right]\right)$;
5. $\left\{H_{R}(W), H_{H}(N)\right\}=0$;
6. $\left\{H_{H}\left(\mathrm{~N}_{1}\right), H_{H}\left(\mathrm{~N}_{2}\right)\right\}$

$$
\begin{aligned}
&=H_{D}\left(N_{1} \operatorname{grad} N_{2}-N_{2} \operatorname{grad} N_{1}\right) \\
&+H_{R}\left(q\left(d N_{1} \wedge d N_{2}, \omega^{a} \wedge \omega_{b}\right)+q\left(N_{1} d N_{2}-N_{2} d N_{1}, \omega_{b}^{a}\right)\right) .
\end{aligned}
$$

Remark: A constraint is a function $\mathrm{f}: \mathrm{T}^{*} \underline{\underline{Q}} \rightarrow \underline{\mathrm{R}}$ such that $\mathrm{f} \mid \mathrm{Con}_{\underline{Q}}=0$. Thus, by construction, $H_{D}(\vec{N}), H_{R}(W)$, and $H_{H}(N)$ are constraints, these being termed primary. The foregoing relations then imply that the Poisson bracket of two primary constraints is a constraint.
3.

LEMMA $\forall X \in D^{1}(\Sigma), \forall \gamma \in \Lambda^{\mathrm{n}-1} \Sigma$,

$$
\int_{\Sigma} L_{X} \gamma=0 .
$$

[Apply the formula

$$
\left.L_{x}=c_{X} \circ d+d \circ \iota_{x} \cdot\right]
$$

Ad 1: We have

$$
\begin{aligned}
& \left\{H_{D}\left(\vec{N}_{1}\right), H_{D}\left(\vec{N}_{2}\right)\right\} \\
= & \int_{\Sigma}\left[\frac{\delta H_{D}\left(\vec{N}_{2}\right)}{\delta \vec{p}} \wedge \frac{\delta H_{D}\left(\vec{N}_{1}\right)}{\delta \vec{\omega}}-\frac{\delta H_{D}\left(\vec{N}_{1}\right)}{\delta \vec{p}} \wedge \frac{\delta H_{D}\left(\vec{N}_{2}\right)}{\delta \vec{\omega}}\right] \\
= & \int_{\Sigma}\left[\frac{\delta H_{D}\left(\vec{N}_{2}\right)}{\delta p_{a}} \wedge \frac{\delta H_{D}\left(\vec{N}_{1}\right)}{\delta \omega^{a}}-\frac{\delta H_{D}\left(\vec{N}_{1}\right)}{\delta p_{a}} \wedge \frac{\delta H_{D}\left(\vec{N}_{2}\right)}{\delta \omega^{a}}\right] \\
= & \int_{\Sigma}\left[L_{\vec{N}_{2}} \omega^{a} \wedge-L_{\vec{N}_{1}} p_{a}-L_{\vec{N}_{1}} \omega^{a} \wedge-L_{\vec{N}_{2}} p_{a}\right] \\
= & \int_{\Sigma}\left[-L_{\vec{N}_{2}} \omega^{a} \wedge L_{\vec{N}_{1}} p_{a}+L_{\vec{N}_{1}} \omega^{a} \wedge L_{\mathbb{N}_{2}} p_{a}\right] .
\end{aligned}
$$

But

$$
\left[\begin{array}{l}
L_{\vec{N}_{1}}\left(L_{\vec{N}_{2}} \omega^{a} \wedge p_{a}\right)=L_{\vec{N}_{1}} L_{\vec{N}_{2}} \omega^{a} \wedge p_{a}+L_{\vec{N}_{2}} \omega^{a} \wedge L_{\vec{N}_{1}} p_{a} \\
L_{\vec{N}_{2}}\left(L_{\vec{N}_{1}} \omega^{a} \wedge p_{a}\right)=L_{\vec{N}_{2}} L_{\vec{N}_{1}} \omega^{a} \wedge p_{a}+L_{\vec{N}_{1}} \omega^{a} \wedge L_{\vec{N}_{2}} p_{a}
\end{array}\right.
$$

Therefore

$$
\begin{aligned}
& \left.\left\{H_{D}\left(\vec{N}_{1}\right)\right)_{r} H_{D}\left(\vec{N}_{2}\right)\right\} \\
& \quad=\int_{\Sigma}\left(L_{\vec{N}_{1}} L_{\vec{N}_{2}}-L_{\vec{N}_{2}} L_{\vec{N}_{l}}\right) \omega^{a} \wedge p_{a} \\
& \quad=\int_{\Sigma} L_{\left[\vec{N}_{1}, \vec{N}_{2}\right]} \omega^{a} \wedge p_{a} \\
& \quad=H_{D}\left(\left[\vec{N}_{1}, \vec{N}_{2}\right]\right)
\end{aligned}
$$

Remark: The canonical left action of Diff $\Sigma$ on $T^{*} \underline{Q}$ is symplectic (i.e., $\forall \varphi \in \operatorname{Diff} \Sigma, \varphi \cdot \Omega=\Omega$ ) and admits a momentum map

$$
\mathrm{J}: \mathrm{T}^{\star} \underline{\mathrm{Q}} \rightarrow \operatorname{Hom}\left(\mathcal{D}^{\mathrm{l}}(\Sigma), \underline{\mathrm{R}}\right)
$$

namely

$$
\begin{aligned}
J(\vec{\omega}, \overrightarrow{\mathrm{p}})(\overrightarrow{\mathrm{N}}) & =\int_{\Sigma} L_{\vec{N}} \omega^{\mathrm{a}} \wedge \mathrm{p}_{\mathrm{a}} \\
& =H_{\mathrm{D}}(\overrightarrow{\mathrm{~N}})(\vec{\omega}, \overrightarrow{\mathrm{p}}),
\end{aligned}
$$

which provides an interpretation of $H_{D}$.

Ad 2: We have

$$
\begin{aligned}
& \left\{H_{D}(\vec{N}), H_{R}(W)\right\} \\
= & \int_{\Sigma}\left[\frac{\delta H_{R}(W)}{\overrightarrow{\delta p}} \wedge \frac{\delta H_{D}(\vec{N})}{\delta \vec{\omega}}-\frac{\delta H_{D}(\vec{N})}{\delta \vec{p}} \wedge \frac{\delta H_{R}(W)}{\delta \vec{\omega}}\right] \\
= & \int_{\Sigma}\left[\frac{\delta H_{R}(W)}{\delta p_{a}} \wedge \frac{\delta H_{D}(\vec{N})}{\delta \omega^{a}}-\frac{\delta H_{D}(\vec{N})}{\delta p_{a}} \wedge \frac{\delta H_{R}(W)}{\delta \omega^{a}}\right] \\
= & \int_{\Sigma}\left[W^{a}{ }_{b} \omega^{b} \wedge-L_{\vec{N}} p_{a}-L_{\vec{N}} \omega^{a} \wedge W_{a}{ }_{a} p_{b}\right] \\
= & -\int_{\Sigma}\left[W_{b}^{a}{ }^{\omega}{ }^{\omega} \wedge L_{\vec{N}} p_{a}+L_{\vec{N}} \omega^{a} \wedge W^{b}{ }_{a} p_{b}\right] .
\end{aligned}
$$

But

$$
\begin{aligned}
& L_{\vec{N}}\left(W_{b}^{a}{ }^{\omega}{ }^{b} \wedge p_{a}\right) \\
& =L_{\vec{N}}\left(W_{b}^{a}{ }^{\omega}{ }^{b}\right) \wedge p_{a}+W_{b}^{a}{ }^{\omega} \wedge L_{\vec{N}} p^{a} \\
& =\left(L_{\overrightarrow{\mathrm{N}}} \mathrm{~W}^{\mathrm{a}}\right)^{\mathrm{b}} \omega^{\mathrm{b}} \wedge \mathrm{p}_{\mathrm{a}} \\
& +W_{b}^{a}\left(L_{\vec{N}}{ }^{b}\right) \wedge p_{a}+W_{b}^{a}{ }^{b} \wedge L_{\vec{N}} p^{a} \\
& =\left(\underset{\vec{N}}{ } W^{a}{ }_{b}\right) \omega^{b} \wedge p_{a}
\end{aligned}
$$

$$
\begin{aligned}
&+W_{b}^{a} \omega^{b} \wedge L_{\vec{N}} p_{a}+L_{\vec{N}} \omega^{a} \wedge W^{b}{ }_{a} p_{b} \\
& \Rightarrow \\
&-\int_{\Sigma}\left[W_{b}^{a} \omega^{b} \wedge L_{\vec{N}} p_{a}+L_{\vec{N}} \omega^{a} \wedge W_{a}^{b} p_{b}\right] \\
&=\int_{\Sigma}\left(L_{\vec{N}} W_{b}^{a}\right) \omega^{b} \wedge p_{a} .
\end{aligned}
$$

Therefore

$$
\left\{H_{D}(\vec{N}), H_{R}(W)\right\}=H_{R}\left(L_{\vec{N}} W\right) .
$$

Ad 3: We have

$$
\begin{aligned}
& \left\{H_{D}(\vec{N}), H_{H}(\mathrm{~N})\right\} \\
= & \int_{\Sigma}\left[\frac{\delta H_{H}(\mathrm{~N})}{\delta \overrightarrow{\mathrm{p}}} \wedge \frac{\delta H_{D}(\overrightarrow{\mathrm{~N}})}{\delta \vec{\omega}}-\frac{\delta H_{D}(\overrightarrow{\mathrm{~N}})}{\delta \overrightarrow{\mathrm{P}}} \wedge \frac{\delta H_{H}(\mathrm{~N})}{\delta \vec{\omega}}\right] \\
= & \int_{\Sigma}\left[\frac{\delta H_{H}(\mathrm{~N})}{\delta \mathrm{p}_{\mathrm{a}}} \wedge \frac{\delta H_{\mathrm{D}}(\overrightarrow{\mathrm{~N}})}{\delta \omega^{a}}-\frac{\delta H_{D}(\overrightarrow{\mathrm{~N}})}{\delta \mathrm{p}_{\mathrm{a}}} \wedge \frac{\delta H_{H}(\mathrm{~N})}{\delta \omega}\right] .
\end{aligned}
$$

Let

$$
\left[\begin{array}{l}
E_{k i n}(\vec{\omega}, \vec{p})=\frac{1}{2}\left[q\left(p_{b}, * \omega^{c}\right) q\left(p_{c}, * \omega^{b}\right)-\frac{p^{2}}{n-2}\right] \operatorname{vol}_{q} \\
E_{p o t}(\vec{\omega}, \vec{p})=-\frac{1}{2} S(q) v o l_{q} .
\end{array}\right.
$$

Then

$$
\mathrm{E}=\mathrm{E}_{\text {kin }}+\mathrm{E}_{\text {pot }}{ }^{\prime}
$$

thus

$$
\begin{aligned}
H_{H}(\mathrm{~N}) & =\int_{\Sigma} \mathrm{NE} \\
& =\int_{\Sigma} \mathrm{NE}_{\mathrm{kin}}+\int_{\Sigma} \mathrm{NE}_{\mathrm{pot}} \\
& =H_{\mathrm{H}_{\mathrm{kin}}}(\mathrm{~N})+H_{\mathrm{H}}^{\mathrm{pot}}
\end{aligned}
$$

and so

$$
\left\{H_{D}(\overrightarrow{\mathrm{~N}}), H_{H}(\mathrm{~N})\right\}=\left\{H_{D}(\overrightarrow{\mathrm{~N}}), H_{H_{k i n}}(\mathrm{~N})\right\}+\left\{H_{D}(\overrightarrow{\mathrm{~N}}), H_{H_{\text {pot }}}(\mathrm{N})\right\}
$$

- kin: We have

$$
\begin{aligned}
& \left\{H_{D}(\vec{N}), H_{H_{k i n}}(N)\right\} \\
& =\int_{\Sigma}\left[\frac{\partial}{\partial p_{a}}\left(N E_{k i n}\right) \wedge-L_{\vec{N}} p_{a}-L_{\vec{N}} \omega^{a} \wedge \frac{\partial}{\partial \omega^{a}}\left(N E_{k i n}\right)\right] \\
& =-\int_{\Sigma} N\left[\frac{\partial}{\partial p_{a}}\left(E_{k i n}\right) \wedge L_{N}^{N} p_{a}+L_{\vec{N}} \omega^{a} \wedge \frac{\partial}{\partial \omega^{a}}\left(E_{k i n}\right)\right]
\end{aligned}
$$

But

$$
\underset{\vec{N}}{L_{k i n}}\left(E_{k i n}\right)=\frac{\partial}{\partial p_{a}} E_{k i n} L_{\vec{N}} p_{a}+L_{\vec{N}} \omega^{a} \wedge \frac{\partial}{\partial \omega^{a}} E_{k i n}
$$

$\Rightarrow$

$$
\begin{aligned}
-\int_{\Sigma} N\left[\frac{\partial}{\partial p_{a}}\right. & \left.\left(E_{k i n}\right) \wedge L_{\vec{N}} p_{a}+L_{\vec{N}} \omega^{a} \wedge \frac{\partial}{\partial \omega^{a}}\left(E_{\text {kin }}\right)\right] \\
& =-\int_{\Sigma} \underset{\vec{N}}{N L_{\vec{N}}}\left(E_{k_{i n}}\right) \\
& =\int_{\Sigma}\left(L_{\vec{N}} N\right) E_{\text {kin }}
\end{aligned}
$$

Therefore

$$
\left\{H_{D}(\vec{N}), H_{H_{k i n}}(N)\right\}=H_{H_{k i n}}\left(L_{\vec{N}} N\right) .
$$

- pot: We have

$$
\begin{aligned}
& \left\{H_{D}(\overrightarrow{\mathrm{~N}}), H_{H_{\text {pot }}}^{(\mathrm{N})\}}\right. \\
& =-\int_{\Sigma} \stackrel{L}{\mathrm{~N}}^{L^{a}} \wedge \frac{\delta H_{\text {pot }}(\mathrm{N})}{\delta \omega} .
\end{aligned}
$$

it being clear that

$$
\frac{\delta \mathrm{H}_{\mathrm{pot}}}{\delta \mathrm{~N})} \mathrm{Dp}_{\mathrm{a}} \quad=0 .
$$

Write

$$
\begin{aligned}
\frac{\delta H_{H_{\text {pot }}}(N)}{\delta \omega^{a}}=- & \frac{N}{2}\left(\Omega_{b c} \wedge *\left(\omega^{b} \wedge \omega^{c} \wedge \omega_{a}\right)\right) \\
& -*\left(\nabla_{a} d N-\left(\Delta_{q} N\right) \omega^{a}\right)
\end{aligned}
$$

and hold the second term in abeyance for the moment -- then

$$
\begin{aligned}
& \frac{1}{2} \int_{\Sigma}{\underset{\vec{N}}{ }}_{L^{a}}^{a} \wedge N\left(\Omega_{b c} \wedge *\left(\omega^{b} \wedge \omega^{c} \wedge \omega_{a}\right)\right) \\
= & \frac{1}{2} \int_{\Sigma} \underset{\vec{N}}{L_{\vec{*}} *}\left(\omega^{b} \wedge \omega^{c}\right) \wedge N \Omega_{b c}
\end{aligned}
$$

But

$$
{\underset{\vec{N}}{ }}_{L_{N}}\left(\wedge *\left(\omega^{b} \wedge \omega^{c}\right) \wedge \Omega_{b c}\right)
$$

$$
\begin{aligned}
& =\underset{\overrightarrow{\mathrm{N}}}{\left(L_{\mathrm{N}}\right) \wedge *\left(\omega^{\mathrm{b}} \wedge \omega^{\mathrm{c}}\right) \wedge \Omega_{\mathrm{bc}} .} \\
& +N \underset{\vec{N}}{N} *\left(\omega^{b} \wedge \omega^{c}\right) \wedge \Omega_{b c}+N *\left(\omega^{b} \wedge \omega^{c}\right) \wedge L_{\vec{N}} \Omega_{b c} \\
& \frac{1}{2} \int_{\Sigma} \underset{\vec{N}}{L_{\vec{N}}} *\left(\omega^{b} \wedge \omega^{c}\right) \wedge N \Omega_{b c} \\
& =-\frac{1}{2} \int_{\Sigma}\left(\underset{\vec{N}}{L_{N} N}\right) \wedge *\left(\omega^{b} \wedge \omega^{c}\right) \wedge \Omega_{b c} \\
& -\frac{1}{2} \int_{\Sigma} N *\left(\omega^{b} \wedge \omega^{c}\right) \wedge \underset{\vec{N}}{L} b c \\
& =-\frac{1}{2} \int_{\Sigma} \underset{\vec{N}}{ }\left(L_{\mathrm{N}}\right) S(\mathrm{q}) \mathrm{VOl}_{\mathrm{q}} \\
& -\frac{1}{2} \int_{\Sigma} N \star\left(\omega^{b} \wedge \omega^{c}\right) \wedge L_{\vec{N}}^{\Omega} b c \\
& =H_{H_{\text {pot }}}\left(L_{\vec{N}}^{N} N\right)-\frac{1}{2} \int_{\Sigma} N *\left(\omega^{b} \wedge \omega^{c}\right) \wedge L_{\vec{N}}^{\Omega} b c \cdot
\end{aligned}
$$

It remains to consider the contribution

$$
\int_{\Sigma} L_{\vec{N}}^{L_{\mathrm{N}}} \omega^{\mathrm{a}} \wedge_{*}\left(\nabla_{a} d \mathrm{~N}-\left(\Delta_{q} \mathrm{~N}\right) \omega^{\mathrm{a}}\right)
$$

Bearing in mind that this is a sum over the index $a$, replace $\delta_{a}$ in the earlier analysis by $\underset{\vec{N}}{L_{\vec{N}}}$ - then

$$
L_{\vec{N}}^{L_{0}} \omega^{a} \wedge *\left(\nabla_{a} d N-\left(\Delta_{q} N\right) \omega^{a}\right)
$$

$$
=\frac{N}{2} *\left(\omega^{b} \wedge \omega^{c}\right) \wedge L_{\vec{N}} \Omega_{b c} .
$$

Therefore

$$
\left\{H_{\mathrm{D}}(\overrightarrow{\mathrm{~N}}), H_{\mathrm{H}_{\mathrm{pot}}}(\mathbb{N})\right\}=H_{\mathrm{H}_{\mathrm{pot}}}\left(L_{\overrightarrow{\mathrm{N}}} \mathrm{~N}\right)
$$

Ad 4: We have

$$
\begin{aligned}
& \left\{H_{R}\left(W_{1}\right), H_{R}\left(W_{2}\right)\right\} \\
= & \int_{\Sigma}\left[\frac{\delta H_{R}\left(W_{2}\right)}{\delta \vec{p}} \wedge \frac{\delta H_{R}\left(W_{1}\right)}{\vec{\omega}}-\frac{\delta H_{R}\left(W_{1}\right)}{\delta \vec{p}} \wedge \frac{\delta H_{R}\left(W_{2}\right)}{\delta \vec{\omega}}\right] \\
= & \int_{\Sigma}\left[\frac{\delta H_{R}\left(W_{2}\right)}{\delta p_{c}} \wedge \frac{\delta H_{R}\left(W_{1}\right)}{\delta \omega^{c}}-\frac{\delta H_{R}\left(W_{1}\right)}{\delta p_{C}} \wedge \frac{\delta H_{R}\left(W_{2}\right)}{\delta \omega^{c}}\right. \\
= & \int_{\Sigma}\left[\left(W_{2}\right)^{c}{ }_{b} \omega^{b} \wedge\left(W_{1}\right)^{a}{ }_{c} p_{a}-\left(W_{1}\right)^{c}{ }_{b} \omega^{b} \wedge \wedge\left(W_{2}\right)^{a}{ }_{c} p_{a}\right] \\
= & \int_{\Sigma}\left[\left(W_{1}\right)^{a}{ }_{c}\left(W_{2}\right)^{c}{ }_{b}-\left(W_{2}\right)^{a}{ }_{c}\left(W_{1}\right)^{c}{ }_{b}\right] \omega^{b} \wedge p_{a} \\
= & \int_{\Sigma}\left[W_{1}, W_{2}\right]_{b}^{a} \omega^{b} \wedge p_{a} \\
= & H_{R}\left(\left[W_{1}, W_{2}\right]\right) .
\end{aligned}
$$

Remark: The elements figuring in the integrated rotational constraint are smooth functions $W: \Sigma \rightarrow \underline{s o}(n-1)$. Agreeing to view $C^{\infty}(\Sigma$; 으 $(n-1))$ as a Lie algebra, it follows that the arrow $W \rightarrow H_{R}(W)$ is a homomorphism.
[Note: On the basis of Items 2, 4, and 5, the integrated rotational constraints are an ideal in the full constraint algebra.]
11.

Ad 5: We have

$$
\begin{aligned}
& \left\{H_{R}(W), H_{H}(N)\right\} \\
& =\int_{\Sigma}\left[\frac{\delta H_{H}(\mathrm{~N})}{\delta \overrightarrow{\mathrm{p}}} \wedge \frac{\delta H_{\mathrm{R}}(\mathrm{~W})}{\delta \vec{\omega}}-\frac{\delta H_{\mathrm{R}}(\mathrm{~W})}{\delta \overrightarrow{\mathrm{p}}} \wedge \frac{\delta H_{H}(\mathrm{~N})}{\delta \vec{\omega}}\right] \\
& =\int_{\Sigma}\left[\frac{\delta H_{H}(\mathrm{~N})}{\delta \mathrm{p}_{\mathrm{a}}} \wedge \frac{\delta H_{\mathrm{R}}(\mathrm{~W})}{\delta \omega^{a}}-\frac{\delta H_{R}(\mathrm{~W})}{\delta \mathrm{p}_{\mathrm{a}}} \wedge \frac{\delta H_{H}(\mathrm{~N})}{\delta \omega^{a}}\right] \\
& =\int_{\Sigma}\left[N\left(q\left(p_{c}, * \omega^{a}\right) \omega^{c}-\frac{p}{n-2} \omega^{a}\right) \wedge \omega^{b}{ }_{a} p_{b}\right. \\
& -W_{b}^{a} \omega^{b} \wedge N\left(q\left(p_{a} * * \omega^{c}\right) p_{c}-\frac{P}{n-2} p_{a}\right) \\
& -W^{a}{ }_{b} \omega^{b} \wedge-\frac{N}{2}\left(q\left(p_{c}, * \omega^{d}\right) q\left(p_{d^{\prime}} * \omega^{c}\right)-\frac{p^{2}}{n-2}\right) * \omega^{a} \\
& -W_{b}^{a}{ }^{\omega}{ }^{b} \wedge N *\left(R i c a-\frac{1}{2} S(q) \omega^{a}\right) \\
& \left.-W_{b}^{a}{ }^{\omega}{ }^{b} \wedge-*\left(\nabla_{a} d N-\left(\Delta_{q} N\right) \omega^{a}\right)\right] .
\end{aligned}
$$

Obviously,

- $N\left(-\frac{P}{n-2}\right) \omega^{a} \wedge W^{b}{ }_{a} P_{b}$

$$
\begin{gathered}
+w_{b^{\omega}}^{a}{ }^{b} \wedge N\left(\frac{p}{n-2}\right) p_{a} \\
=0 .
\end{gathered}
$$

- $N q\left(p_{c}, * \omega \omega^{a}\right) \omega^{c} \wedge \omega^{b}{ }_{a} p_{b}$

$$
\begin{aligned}
& -W_{b}^{a}{ }^{\omega} \wedge N q^{b}\left(p_{a}, * \omega^{c}\right) p_{c} \\
& =N W_{a}^{b} q\left(p_{C}, * \omega^{a}\right) q\left(p_{b}, * \omega^{c}\right) \operatorname{vol}_{q} \\
& -N^{a}{ }_{b} q\left(p_{C}, * \omega^{b}\right) q\left(p_{a}, * \omega^{c}\right) \operatorname{vol}_{q} \\
& =N W^{b}{ }_{a}\left(p_{c}, * \omega^{a}\right) q\left(p_{b}, * \omega^{c}\right) \operatorname{vol}_{q} \\
& -\mathrm{NW}^{\mathrm{b}}{ }_{a} \mathrm{q}\left(\mathrm{p}_{\mathrm{C}}, * \omega^{\mathrm{a}}\right) \mathrm{q}\left(\mathrm{p}_{\mathrm{b}}, * \omega^{\mathrm{c}}\right) \mathrm{VOI}_{q} \\
& =0 \text {. }
\end{aligned}
$$

Proceeding, note that

$$
\begin{aligned}
w_{b}^{a} \omega^{b} \wedge * \omega & =w_{b}^{a} q\left(\omega^{b}, \omega^{a}\right) v o l_{q} \\
& =w_{a}^{a}{ }_{a}^{v o l}{ }_{q}=0 .
\end{aligned}
$$

So now, all that's left is

$$
\begin{aligned}
& -W_{b}^{a}{ }^{b} \wedge N * R i c_{a} \\
& \quad+W_{b}^{a}{ }^{b} \wedge \wedge * \nabla_{a} d N .
\end{aligned}
$$

Write

$$
\operatorname{Ric}_{\mathrm{a}}=\operatorname{Ric}_{\mathrm{ac}} \omega^{\mathrm{C}}
$$

Then

$$
\begin{aligned}
& N W_{b}^{a} \omega^{b}{ }_{\wedge * R i c} \\
& \quad=N W_{a}^{a}{ }_{b}{ }^{R i c}{ }_{a c} \omega^{b} \wedge \star \omega \omega^{c}
\end{aligned}
$$

$$
\begin{aligned}
& =N W_{b}^{a}{ }^{R i c} c_{a c} q^{( }\left(\omega^{b}, \omega^{c}\right) v o l_{q} \\
& =N W_{b}{ }^{R i c}{ }_{a b} v o l_{q} .
\end{aligned}
$$

But Ric is symmetric and $W$ is antisymmetric, hence

$$
\int_{\Sigma} \mathbb{N W}_{b}^{\mathrm{a}} \mathrm{Ric}_{a b}{ }^{\mathrm{VOl}}{ }_{\mathrm{q}}=0
$$

Finally

$$
\begin{aligned}
& W_{b}^{a} \omega^{b} \wedge * \nabla_{a} d N \\
& =W_{b}^{a} \omega^{b} \wedge H_{N}\left(E_{c}, E_{a}\right) * \omega^{c} \\
& =W_{b}^{a} H_{N}\left(E_{c}, E_{a}\right) \omega^{b}{ }_{\wedge * \omega}^{c} \\
& =W_{b}^{a} H_{N}\left(E_{c^{\prime}} E_{a}\right) q\left(\omega^{b}, \omega^{c}\right) v o l_{q} \\
& =W_{b}^{a} H_{N}\left(E_{b^{\prime}}, E_{a}\right) v o l_{q} .
\end{aligned}
$$

And, since $\mathrm{H}_{\mathrm{N}}$ is symmetric,

$$
\int_{\Sigma} W_{b}^{a} H_{N}\left(E_{b}, E_{a}\right) V_{q}=0
$$

Ad 6: We have

$$
\begin{aligned}
& \left\{H_{H}\left(\mathrm{~N}_{1}\right), H_{H}\left(\mathrm{~N}_{2}\right)\right\} \\
= & \int_{\Sigma}\left[\frac{\delta H_{H}\left(\mathrm{~N}_{2}\right)}{\delta \overrightarrow{\mathrm{p}}} \wedge \frac{\delta H_{\mathrm{H}}\left(\mathrm{~N}_{1}\right)}{\delta \vec{\omega}}-\frac{\delta H_{\mathrm{H}}\left(\mathrm{~N}_{1}\right)}{\delta \overrightarrow{\mathrm{p}}} \wedge \frac{\delta H_{\mathrm{H}}\left(\mathrm{~N}_{2}\right)}{\delta \vec{\omega}}\right]
\end{aligned}
$$

$$
=\int_{\Sigma}\left[\frac{\delta H_{H}\left(\mathrm{~N}_{2}\right)}{\delta p_{a}} \wedge \frac{\delta H_{H}\left(\mathrm{~N}_{1}\right)}{\delta \omega^{a}}-\frac{\delta H_{H}\left(\mathrm{~N}_{1}\right)}{\delta \mathrm{p}_{a}} \wedge \frac{\delta H_{H}\left(\mathrm{~N}_{2}\right)}{\delta \omega^{a}}\right] .
$$

Insert the explicit formulas for

$$
\left[\begin{array}{r}
\frac{\delta H_{H}\left(N_{i}\right)}{\delta p_{a}} \\
\frac{\delta H_{H}\left(N_{i}\right)}{\delta \omega^{a}}
\end{array} \quad(i=1,2) .\right.
$$

Then, after cancellation, matters reduce to

$$
\begin{aligned}
\int_{\Sigma} & {\left[N_{2}\left(q\left(p_{b}, * \omega^{a}\right) \omega^{b}-\frac{p}{n-2} \omega^{a}\right) \wedge-*\left(\nabla_{a} d N_{1}-\left(\Delta_{q} N_{1}\right) \omega^{a}\right)\right.} \\
& \left.+N_{1}\left(q\left(p_{b}, * \omega^{a}\right) \omega^{b}-\frac{p}{n-2} \omega^{a}\right) \wedge *\left(\nabla_{a} d N_{2}-\left(\Delta_{q} N_{2}\right) \omega^{a}\right)\right]
\end{aligned}
$$

which we claim is the same as

$$
\int_{\Sigma}\left(N_{1} \nabla_{a} \nabla_{b} N_{2}-N_{2} \nabla_{a} \nabla_{b} N_{1}\right) \omega^{a} \wedge p_{b}
$$

To see this, recall that

$$
q\left(p_{b}, * \omega^{a}\right) \omega^{b}-\frac{p}{n-2} \omega^{a}=-\omega_{0 a} .
$$

But

$$
p_{b}=q\left(\omega_{0 c}, \omega^{c}\right) * \omega^{b}-q\left(\omega_{0 c}, \omega^{b}\right) * \omega^{c}
$$

$\Rightarrow$

$$
\omega^{a} \wedge p_{b}=\left(q\left(\omega_{0 c}, \omega^{c}\right) \delta_{a b}-q\left(\omega_{0 a}, \omega^{b}\right)\right) v_{o l}{ }_{q}
$$

Therefore

$$
N_{1}\left(q\left(p_{b}, * \omega^{a}\right) \omega^{b}-\frac{p}{n-2} \omega^{a}\right) \wedge\left(* \nabla_{a} d N_{2}\right)
$$

$$
\begin{aligned}
& =N_{1}\left(-\omega_{0 a}\right) \wedge \nabla_{a} \nabla_{b} N_{2} * \omega^{b} \\
& =N_{1} \nabla_{a} \nabla_{b} N_{2}\left(-q\left(\omega_{0 a^{\prime}} \omega^{b}\right) v o l_{q}\right) \\
& =N_{1} \nabla_{a} \nabla_{b} N_{2}\left(\omega^{a} \wedge p_{b}-q\left(\omega_{0 c^{\prime}} \omega^{c}\right) \delta_{a b} v o l_{q}\right) \\
& =\left(N_{1} \nabla_{a} \nabla_{b} N_{2}\right) \omega^{a} \wedge p_{b}-\left(N_{1} \nabla_{a} \nabla_{a} N_{2}\right) q\left(\omega_{0 c^{\prime}} \omega^{c}\right) v o l_{q} \\
& =\left(N_{1} \nabla_{a} \nabla_{b} N_{2}\right) \omega^{a} \wedge p_{b}-\left(N_{1} \Delta_{q} N_{2}\right) q\left(\omega_{0 a^{\prime}} \omega^{a}\right) v_{0} l_{q} .
\end{aligned}
$$

On the other hand,

$$
\begin{aligned}
& N_{1}\left(q\left(p_{b}, * \omega^{a}\right) \omega^{b}-\frac{p}{n-2} \omega^{a}\right) \wedge-\left(\Delta_{q} N_{2}\right) * \omega^{a} \\
& =N_{1}\left(-\omega_{0 a}\right) \wedge-\left(\Delta_{q} N_{2}\right) * \omega^{a} \\
& =\left(N_{1} \Delta_{q} N_{2}\right) \omega_{0 a} \wedge * \omega^{a} \\
& =\left(N_{1} \Delta_{q} N_{2}\right) q\left(\omega_{0 a}, \omega^{a}\right) v_{0} q_{q} .
\end{aligned}
$$

Reversing the roles of $\mathrm{N}_{1}$ and $\mathrm{N}_{2}$ then completes the verification. Moving on, write

$$
\begin{aligned}
& \int_{\Sigma}\left(N_{1} \nabla_{a} \nabla_{b} N_{2}-N_{2} \nabla_{a} \nabla_{b} N_{1}\right) \omega{ }^{a} \wedge p_{b} \\
= & \int_{\Sigma}\left[\nabla_{a}\left(N_{1} \nabla_{b} N_{2}-N_{2} \nabla_{b} N_{1}\right)\right. \\
& \left.\quad-\left(\nabla_{a} N_{1} \nabla_{b} N_{2}-\nabla_{a} N_{2} \nabla_{b} N_{1}\right)\right] \omega \omega^{a} \wedge p_{b}
\end{aligned}
$$

Now use the identity

$$
\left(\nabla_{a} x^{b}\right) \omega^{a}=L_{x} \omega^{b}+\omega_{a}^{b}(x) \omega^{a}
$$

valid for any $X \in D^{l}(\Sigma)$ (cf infra). Thus let

$$
X=N_{1} \operatorname{grad} N_{2}-N_{2} \text { grad } N_{1}
$$

Then

$$
\begin{aligned}
& \nabla_{a}\left(N_{1} \nabla_{b} N_{2}-N_{2} \nabla_{b} N_{1}\right) \omega^{a} \wedge p_{b} \\
= & \left.L_{\left(N_{1}\right.} \operatorname{grad} N_{2}-N_{2} \operatorname{grad} N_{1}\right)^{b} \wedge p_{b} \\
& +\omega_{a}^{b}\left(N_{1} \operatorname{grad} N_{2}-N_{2} \operatorname{grad} N_{1}\right) \omega^{a} \wedge p_{b} \\
=\quad & H_{\Sigma}\left(N_{1} \nabla_{a}\left(N_{1} \nabla_{b} N_{2}-N_{2} \nabla_{b} N_{1}\right) \omega^{a} \wedge p_{b}\right. \\
& +H_{R}\left(q\left(N_{1} d N_{2}-N_{2} d N_{1}, \omega_{b}^{a}\right)\right)
\end{aligned}
$$

As for what remains, viz.

$$
\delta_{\Sigma}-\left(\nabla_{a} N_{1} \nabla_{b} N_{2}-\nabla_{a} N_{2} \nabla_{b} N_{1}\right) \omega^{a} \wedge p_{b}
$$

observe that
17.

$$
\begin{aligned}
& q\left(\mathrm{dN}_{1} \wedge \mathrm{dN}_{2}, \omega^{\mathrm{b}} \wedge \omega^{\mathrm{a}}\right) \\
& =\operatorname{det}\left[\begin{array}{cc}
q\left(d N_{1}, \omega^{b}\right) & q\left(d N_{1}, \omega^{a}\right) \\
q\left(d N_{2}, \omega^{b}\right) & q\left(d N_{2}, \omega^{a}\right)
\end{array}\right] \\
& \left.=\operatorname{det} \left\lvert\, \begin{array}{cc}
\nabla_{b} N_{1} & \nabla_{a} N_{1} \\
\nabla_{b} N_{2} & \nabla_{a} N_{2}
\end{array}\right.\right] \\
& =-\left(\nabla_{a} N_{1} \nabla_{b} N_{2}-\nabla_{a} N_{2} \nabla_{b} N_{1}\right) \\
& \text { => } \\
& \delta_{\Sigma}-\left(\nabla_{a} N_{1} \nabla_{b} N_{2}-\nabla_{a} N_{2} \nabla_{b} N_{1}\right) \omega^{a} \wedge p_{b} \\
& =\int_{\Sigma} q\left(d N_{1} \wedge d N_{2}, \omega^{b} \wedge \omega^{a}\right) \omega^{a} \wedge p_{b} \\
& =\int_{\Sigma} \mathrm{q}\left(d \mathrm{~N}_{1} \wedge \mathrm{dN}_{2}, \omega^{\mathrm{a}} \wedge \omega^{\mathrm{b}}\right) \omega^{\mathrm{b}} \wedge \mathrm{p}_{\mathrm{a}} \\
& =H_{R}\left(q\left(\mathrm{dN}_{1} \wedge \mathrm{AN}_{2}, \omega^{\mathrm{a}} \wedge \omega_{\mathrm{b}}\right)\right) .
\end{aligned}
$$

[Note: In the ADM sector of $T^{*} \underline{Q}$, the Poisson bracket

$$
\left\{H_{H}\left(N_{1}\right), H_{H}\left(N_{2}\right)\right\}
$$

equals

$$
\left.H_{D}\left(N_{1} \operatorname{grad} N_{2}-N_{2} \operatorname{grad} N_{1}\right) \cdot\right]
$$

Details Here is the proof that $\forall \mathrm{X} \in \mathcal{D}^{1}(\Sigma)$,

$$
\left(\nabla_{b} x^{a}\right) \omega^{b}=L_{x} \omega^{a}+\omega_{b}^{a}(x) \omega^{b}
$$

I.e.:

$$
\left(\nabla_{b} x^{a}\right) \omega^{b}=L_{x} \omega^{a}-\nabla_{x} \omega^{a}
$$

Start with the RHS - then

$$
\begin{gathered}
\left.\quad\right|_{-} \quad\left(L_{X} \omega^{a}\right)(Y)=X \omega^{a}(Y)-\omega^{a}([X, Y]) \\
\Rightarrow \quad\left(\nabla_{X} \omega^{a}\right)(Y)=X \omega^{a}(Y)-\omega^{a}\left(\nabla_{X} Y\right) \\
\quad=\omega^{a}\left(\nabla_{X} Y-[X, Y]\right) \\
\quad=\omega^{a}\left(\nabla_{Y} \omega^{a}\right)(Y)-\left(\nabla_{X} \omega^{a}\right)(Y)
\end{gathered}
$$

Write $\mathrm{X}=\mathrm{X}^{\mathrm{C}} \mathrm{E}_{\mathrm{C}}$ and take $\mathrm{Y}=\mathrm{E}_{\mathrm{b}}$ :

$$
\begin{aligned}
\omega^{a}\left(\nabla_{E_{b}} x\right) & =\omega^{a}\left(\nabla_{E_{b}}\left(x^{c} E_{c}\right)\right) \\
& =\omega^{a}\left(\left(\nabla_{E_{b}} x^{c}\right) E_{c}+x^{c} \nabla_{E_{b}} E_{c}\right) \\
& =\nabla_{E_{b}} x^{a}+x^{c} \omega^{a}\left(\omega_{c}^{d}\left(E_{b}\right) E_{d}\right) \\
& =\nabla_{E_{b}} x^{a}+x^{c} \omega_{c}^{a}\left(E_{b}\right)
\end{aligned}
$$

$$
\begin{aligned}
& =E_{b} x^{a}+x^{c} \omega_{c}^{a}\left(E_{b}\right) \\
& =d x^{a}\left(E_{b}\right)+x^{c} \omega_{c}^{a}\left(E_{b}\right) .
\end{aligned}
$$

Turning to the LHS,

$$
\begin{aligned}
& \nabla x=E_{a} \otimes\left(d x^{a}+\omega_{c}^{a} x_{c}\right) \\
& \Rightarrow \quad \\
& \nabla_{b} x^{a}=\nabla x\left(\omega^{a}, E_{b}\right) \\
&=d x^{a}\left(E_{b}\right)+\omega_{c}^{a}\left(E_{b}\right) x^{c}
\end{aligned}
$$

Remark: The relation

$$
\omega_{0 a}=-q\left(p_{b}, * \omega^{a}\right) \omega^{b}+\frac{p}{n-2} \omega^{a}
$$

is really a definition, though, for consistency, one should check that

$$
p_{a}=\omega_{0 b} \wedge *\left(\omega^{a} \wedge \omega^{b}\right)
$$

or still,

$$
\mathrm{p}_{\mathrm{a}}=\mathrm{q}\left(\omega_{0 b^{\prime}} \omega^{\mathrm{b}}\right) * \omega^{\mathrm{a}}-\mathrm{q}\left(\omega_{0 b^{\prime}}, \omega^{\mathrm{a}}\right) * \omega^{\mathrm{b}}
$$

1. $q\left(\omega_{0 b}, \omega^{b}\right) * \omega^{a}$

$$
=q\left(-q\left(p_{c}, * \omega^{b}\right) \omega^{c}+\frac{p}{n-2} \omega^{b}, \omega^{b}\right) * \omega^{a}
$$

$$
=-q\left(p_{c} * * \omega^{b}\right) \delta_{c b} * \omega^{a}+\frac{n-1}{n-2} p * \omega^{a}
$$

$$
\begin{aligned}
& =-q\left(p_{b} * * \omega^{b}\right) * \omega^{a}+\frac{n-1}{n-2} P * \omega^{a} \\
& =-P * \omega^{a}+\frac{n-1}{n-2} P * \omega^{a} \\
& =\frac{p}{n-2} * \omega^{a}
\end{aligned}
$$

2. $-q\left(\omega_{0 b^{\prime}}, \omega^{a}\right) * \omega^{b}$

$$
\begin{aligned}
& =-q\left(-q\left(p_{c}, * \omega^{b}\right) \omega^{c}+\frac{p}{n-2} \omega^{b}, \omega^{a}\right) * \omega^{b} \\
& =q\left(p_{c^{\prime}} * \omega^{b}\right) \delta_{c a} * \omega^{b}-\frac{p}{n-2} \delta_{b a} * \omega^{b} \\
& =q\left(p_{a} * * \omega^{b}\right) * \omega^{b}-\frac{p}{n-2} * \omega^{a} .
\end{aligned}
$$

So

$$
1+2=q\left(p_{a} * \omega^{b}\right) * w^{b}=p_{a}
$$

Section 46: Field Equations Let $M$ be a connected $C^{\infty}$ manifold of dimension $n$. Assume: M is parallelizable.

Notation: $\operatorname{cof}_{M}$ is the set of ordered coframes on $M$.
[Note: Each $\omega=\left\{\omega^{1}, \ldots, \omega^{n}\right\}$ in $\operatorname{cof}_{M}$ gives rise to an element $g \in M_{-k, n-k}$, viz.

$$
\left.g=-\omega^{1} \otimes \omega^{1}-\cdots-\omega^{k} \otimes \omega^{k}+\omega^{k+1} \otimes \omega^{k+1}+\cdots+\omega^{n} \otimes \omega^{n} .\right]
$$

Definition: Let $\omega=\left\{\omega^{1}, \ldots, \omega^{n_{n}}\right\}$ be an element of $\operatorname{cof}_{M}$ - then a variation of $\omega$ is a curve

$$
\varepsilon \rightarrow \omega(\varepsilon)=\left(\omega^{l}(\varepsilon), \ldots, \omega^{n}(\varepsilon)\right)
$$

where

$$
\omega^{\mathbf{i}}(\varepsilon)=\omega^{\mathbf{i}}+\varepsilon \delta \omega^{\mathbf{i}}
$$

and the $\delta \omega^{\mathbf{i}^{\prime} \in \Lambda^{1} M}$ have compact support.
[Note: This usage of the symbol $\delta$ conflicts with that used for the interior derivative which, to eliminate any possibility of confusion, will be denoted in this section by $d^{*}$.]

Let $F: \operatorname{cof}_{M} \rightarrow V$, where $V$ is a vector space over $\underline{R}$-- then by definition,

$$
\mathrm{D}_{\omega} F(\delta \omega)=\left.\frac{\mathrm{d}}{\mathrm{~d} \varepsilon} F(\omega(\varepsilon))\right|_{\varepsilon=0^{*}}
$$

[Note: It is customary to write $\delta F$ instead of $D_{\omega} F(\delta \omega)$ and $F$ instead of $F(\omega)$. This shorthand is computationally convenient and normally should not lead to misunderstandings. 1

In what follows, we shall use the abbreviation $\omega+\varepsilon \delta \omega$ to designate $a$ variation of $\omega$.

Rules

- Suppose that $\alpha:$ cof $_{M} \rightarrow \Lambda^{P_{M}}-$ then

$$
\delta d \alpha=d \delta \alpha
$$

[Note: Spelled out,

$$
\left.\left.\frac{d}{d \varepsilon} d(\alpha(\omega+\varepsilon \delta \omega))\right|_{\varepsilon=0}=\left.d \frac{d}{d \varepsilon} \alpha(\omega+\varepsilon \delta \omega)\right|_{\varepsilon=0^{.}}\right]
$$

- Suppose that $\alpha: \operatorname{cof}_{M} \rightarrow \Lambda^{P_{M}}$ and $\beta: \operatorname{cof}_{M} \rightarrow \Lambda^{q_{M}}-$ then

$$
\delta(\alpha \wedge \beta)=\delta \alpha \wedge \beta+\alpha \wedge \delta \beta .
$$

[Note: Spelled out,

$$
\begin{aligned}
& \frac{d}{d \varepsilon} \alpha(\omega+\varepsilon \delta \omega) \wedge \beta(\omega+\varepsilon \delta \omega) \\
&= \frac{d}{d \varepsilon} \alpha(\omega+\varepsilon \delta \omega) \\
&\left.\left.\right|_{\varepsilon=0} \wedge \beta(\omega)+\left.\alpha(\omega) \wedge \frac{d}{d \varepsilon} \beta(\omega+\varepsilon \delta \omega)\right|_{\varepsilon=0^{\prime}} .\right]
\end{aligned}
$$

## NeB.

1. In general, $\delta$ does not commute with the Hodge star:

$$
\delta \circ * \neq * \circ \delta
$$

2. In general, $\delta$ does not commute with the interior derivative:

$$
\delta \circ \mathrm{d}^{*} \neq \mathrm{d}^{*} \circ \delta .
$$

Rappel:

$$
\omega_{j}=\varepsilon_{j} \omega^{j}
$$

$$
\Rightarrow
$$

$$
{ }^{\imath} \omega_{j} \omega^{i}=g\left(\omega^{i}, \omega_{j}\right)=\delta^{i}{ }_{j}
$$

LEEMMA We have

$$
\delta\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i} p^{i}\right)=\delta \omega^{j} \wedge{ }_{\omega_{j}}\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i} p^{i}\right) .
$$

[For

$$
\begin{aligned}
& \delta\left(\omega^{i}{ }^{1} \wedge \ldots \wedge \omega^{i} p^{\prime}\right) \\
& =\delta \omega^{i_{1}}{ }_{\wedge \omega}^{i_{2}} \wedge \ldots \wedge \omega^{i_{p}}+\ldots+\omega^{i_{1}} \wedge \ldots \wedge \omega^{i_{p-1}}{ }_{\wedge \delta \omega}{ }^{i_{p}} .
\end{aligned}
$$

On the other hand,

$$
\begin{aligned}
& { }^{l}{ }_{\omega_{j}}\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i^{p}}\right) \\
& ={ }_{i_{j}}\left(\omega^{i_{1}}\right) \wedge \omega^{i_{2}} \wedge \ldots \wedge \omega^{i_{p}}-\omega^{i_{1}}{ }_{\wedge 1}{ }_{\omega_{j}}\left(\omega^{i_{2}}\right) \wedge \ldots \wedge \omega^{i_{p}}+\ldots
\end{aligned}
$$

$$
\begin{aligned}
& \text { => } \\
& \delta \omega^{j_{\wedge i}} \omega_{j}\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i} p^{\prime}\right) \\
& =\delta \omega^{i_{1}} l_{\Lambda \omega}^{i_{2}} \wedge \ldots \wedge \omega^{i} p-\delta \omega^{i_{2}}{ }_{\wedge \omega}{ }^{i_{1}} \wedge \ldots \wedge \omega^{i^{i}} p+\ldots \\
& \left.=\delta\left(\omega^{{ }^{i}}{ }^{1} \wedge \ldots \wedge \omega^{i}{ }^{i}\right) .\right]
\end{aligned}
$$

Rappel:

$$
\theta^{i_{1} \ldots i_{p}}=*\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i_{p}}\right.
$$

$$
=\frac{1}{(n-p)!} \varepsilon_{i_{1}} \ldots \varepsilon_{i_{p}} \varepsilon_{i_{1}} \ldots i_{p} j_{p+1} \ldots j_{n} \omega^{j_{p+1}} \wedge \ldots \wedge \omega^{j_{n}}
$$

LEMMA We have

$$
{ }_{\delta \theta}{ }^{i_{1} \cdots i_{p}}=\delta \omega^{j^{\prime}}{ }_{\omega_{j}}{ }^{i_{1} \cdots i_{p}}
$$

[In fact,

$$
\begin{aligned}
& { }_{\delta \theta} i_{1} \cdots i_{p} \\
& =\frac{n-p}{(n-p)!} \varepsilon_{i_{1}} \ldots \varepsilon_{i_{p}} \varepsilon_{i_{1}} \ldots i_{p} j_{p+1} j_{p+2} \ldots j_{n}\left(\delta \omega{ }^{j_{p+1}}\right) \wedge\left(\omega{ }^{j_{p+2}} \wedge \ldots \wedge \omega^{j_{n}}\right) \\
& =\frac{1}{(n-p-1)!} \varepsilon_{i_{1}} \ldots \varepsilon_{i_{p}} \varepsilon_{j_{p+1}} \varepsilon_{j_{p+1}} \varepsilon_{i_{1}} \ldots i_{p} j_{p+1} j_{p+2} \ldots j_{n}\left(\delta \omega{ }^{j}{ }^{j}+1\right) \wedge\left(\omega{ }^{j} p+2 \wedge \ldots \wedge \omega^{j_{n}}\right) \\
& =\delta \omega{ }^{j_{p+1}}{ }_{\Lambda \varepsilon_{j}} \theta^{i_{1}+1}{ }^{i_{1} \cdot i_{p} j_{p+1}} \\
& =\delta \omega{ }^{j_{p+1}}{ }_{\wedge \theta} i_{1} \cdots i_{p_{p+1}} \\
& =\delta_{\delta \omega^{j} p+1}{ }_{\omega_{j_{p+1}}} \theta^{i_{1} \ldots i_{p}} \\
& =\delta \omega^{j}{ }_{\wedge}{ }_{\omega_{j}} \theta^{i_{1} \cdots i_{p}}{ }_{.1}
\end{aligned}
$$

Example:

$$
\text { - } \delta \mathrm{vol}_{g}=\delta * l
$$

5. 

$$
\begin{aligned}
& =\delta \omega^{j_{\wedge l}} \omega_{j}^{* l} \\
& =\delta \omega^{j}{ }_{\wedge *\left(l \wedge \omega_{j}\right)} \\
& =\delta \omega^{j_{\wedge * \omega_{j}}} .
\end{aligned}
$$

- $\delta * \operatorname{vol}_{\mathrm{g}}=\delta *\left(\omega^{1} \wedge \ldots \wedge \omega^{\mathrm{n}}\right)$

$$
\begin{aligned}
& =\delta \theta^{l \ldots n} \\
& =\delta \omega^{j} \wedge \imath \omega_{j} \theta^{1 \ldots n} \\
& =0 .
\end{aligned}
$$

For another example, define

$$
\mathrm{L}: \operatorname{cof}_{\mathrm{M}} \rightarrow \Lambda^{\mathrm{n}} \mathrm{M}
$$

by

$$
L(\omega)=\frac{1}{2} \Omega_{i j} \wedge \theta^{i j} .
$$

Then

$$
\delta L=\frac{1}{2}\left(\delta \Omega_{i j} \wedge \theta^{i j}+\Omega_{i j} \wedge \delta \theta^{i j}\right)
$$

The computation of $\Omega_{i j} \wedge \delta \theta^{i j}$ is inmediate:

$$
\begin{aligned}
\Omega_{i j} \wedge \delta \theta^{i j} & =\Omega_{i j} \wedge \delta \omega^{k} \wedge \theta^{i j}{ }_{k} \\
& =\delta \omega^{k} \wedge \Omega_{i j} \wedge \theta^{i j}{ }_{k}
\end{aligned}
$$

Turning to the computation of $\delta \Omega_{i j} \wedge \theta^{i j}$, note first that

$$
\begin{aligned}
\delta \Omega_{i j} & =\delta\left(d \omega_{i j}+\omega_{i k} \omega_{j}^{k}\right) \\
& =d \delta \omega_{i j}+\delta \omega_{i k}{ }^{\wedge \omega}{ }_{j}{ }_{j}+\omega_{i k} \wedge \delta \omega_{j}^{k}
\end{aligned}
$$

so

$$
\begin{aligned}
& \delta \Omega_{i j}{ }^{\wedge \theta^{i j}}=\delta \Omega_{i j} \wedge *\left(\omega^{i} \wedge \omega^{j}\right) \\
& \quad=d \delta \omega_{i j} \wedge \star\left(\omega^{i} \wedge \omega^{j}\right) \\
& +\delta \omega_{i k^{\wedge}}{ }^{k}{ }_{j} \wedge \star\left(\omega^{i} \wedge \omega^{j}\right)+\omega_{i j} \wedge \delta \omega^{k}{ }_{j} \wedge *\left(\omega^{i} \wedge \omega^{j}\right) .
\end{aligned}
$$

On the other hand,

$$
\begin{aligned}
& d\left(\delta \omega_{i j} \wedge *\left(\omega^{i} \wedge \omega^{j}\right)\right) \\
& \quad=d \delta \omega_{i j} \wedge *\left(\omega^{i} \wedge \omega^{j}\right)-\delta \omega_{i j} \wedge d \star\left(\omega^{i} \wedge \omega^{j}\right) .
\end{aligned}
$$

And

$$
\begin{aligned}
& d *\left(\omega^{i} \wedge \omega^{j}\right) \\
& \left.\quad=-\omega^{i}{ }_{a^{\wedge *}}\left(\omega^{a} \wedge \omega^{j}\right)-\omega^{j}{ }_{a^{\wedge *}} \omega^{i}{ }^{i} \wedge \omega^{a}\right) .
\end{aligned}
$$

But

1. $\delta \omega_{i j} \wedge \omega^{i}{ }_{a} \wedge *\left(\omega^{a} \wedge \omega^{\mathbf{j}}\right)$

$$
\left.=\delta \omega_{a j}{ }^{\wedge \omega^{a}}{ }_{i}{ }^{\wedge *\left(\omega^{i} \wedge \omega^{j}\right.}\right)
$$

$$
\begin{aligned}
& =\delta \omega_{a i} \wedge \omega^{a}{ }_{j} \wedge *\left(\omega^{j} \wedge \omega^{i}\right) \\
& =\delta \omega_{k i} \wedge \omega^{k}{ }_{j} \wedge *\left(\omega^{j} \wedge \omega^{i}\right) \\
& =\delta \omega_{i k} \wedge \omega^{k}{ }_{j} \wedge *\left(\omega^{i} \wedge \omega^{j}\right)
\end{aligned}
$$

2. $\delta \omega_{i j} \wedge \omega^{j}{ }_{a} \wedge *\left(\omega^{i} \wedge \omega^{a}\right)$

$$
\begin{aligned}
& =\delta \omega_{i a^{\prime}} \wedge \omega_{j}^{a}{ }_{j}{ }_{*}\left(\omega^{i} \wedge \omega^{j}\right) \\
& =-\omega_{j}^{a} \wedge \delta \omega_{i a} \wedge *\left(\omega^{i} \wedge \omega^{j}\right)
\end{aligned}
$$

$$
=-\omega_{a j} \wedge \delta \omega_{\dot{i}} a_{\wedge *\left(\omega^{i} \wedge \omega^{j}\right)}
$$

$$
=\omega_{a j} \wedge \delta \omega_{i}^{a} \wedge *\left(\omega^{i} \wedge \omega^{j}\right)
$$

$$
=\omega_{k j} \wedge \delta \omega_{i}^{k}{ }_{i} \wedge *\left(\omega^{i} \wedge \omega \omega^{j}\right)
$$

$$
\begin{aligned}
& =\omega_{k i} \wedge \delta \omega_{j}^{k}{ }_{j *\left(\omega^{j} \wedge \omega^{i}\right)} \\
& =\omega_{i k} \wedge \delta \omega_{j}^{k}{ }_{j} \wedge *\left(\omega^{i} \wedge \omega^{j}\right)
\end{aligned}
$$

Therefore

$$
\delta \Omega_{i j} \wedge \theta^{i j}=d\left(\delta \omega_{i j} \wedge *\left(\omega^{i} \wedge \omega^{j}\right)\right)=d\left(\delta \omega_{i j} \wedge \theta^{i j}\right)
$$

Modulo the usual provisos, put

$$
L(\omega)=\int_{M} L(\omega)
$$

Since the exact term $\delta \Omega_{i j} \wedge \theta^{i j}$ is dynamically irrelevant, the formalism dictates that

$$
\frac{\delta L}{\delta \omega^{k}}=\frac{1}{2} \Omega_{i j} \wedge^{i j}{ }_{k} .
$$

To see the significance of this, write

$$
\begin{gathered}
\frac{1}{2} \Omega_{i j} \wedge \theta_{k}^{i j} \\
=\frac{1}{2}\left[g\left(\Omega_{i j}, \omega^{i} \wedge \omega^{j}\right) * \omega_{k}+g\left(\Omega_{i j} \prime \omega^{j} \wedge \omega_{k}\right) * \omega^{i}+g\left(\Omega_{i j} \prime \omega_{k} \wedge \omega^{i}\right) * \omega^{j}\right] \\
=-*\left(\text { Ric }_{k}-\frac{1}{2} S(g) \omega_{k}\right)
\end{gathered}
$$

Ric ${ }_{k}$ the Ricci l-form. Accordingly, if we define the Einstein l-form by

$$
\operatorname{Ein}_{k}=\operatorname{Ric}_{k}-\frac{1}{2} S(g) g_{k^{\prime}}
$$

then the vanishing of the $\frac{\delta L}{\delta \omega^{k}}(k=1, \ldots, n)$ is equivalent to the vanishing of $\operatorname{Ein}(\mathrm{g})$.
[Note:

$$
\begin{aligned}
& \operatorname{Ein}=\operatorname{Ric}-\frac{1}{2} S(g) g \\
\Rightarrow \quad & \\
& \operatorname{Ein}_{k}=\operatorname{Ric}_{k}-\frac{1}{2} S(g) g_{k^{\prime}}
\end{aligned}
$$

where

$$
\begin{aligned}
g_{k} & =g_{k} \ell^{\omega} \\
& =g_{k k} \omega^{k}=\varepsilon_{k} \omega^{k}=\omega_{k} .
\end{aligned}
$$

9. 

One can also incorporate a cosmological constant $\lambda$ : Take

$$
L_{\lambda}(\omega)=\frac{1}{2} \Omega_{i j} \wedge \theta^{i j}-\lambda \operatorname{vol}_{g}
$$

and let

$$
L_{\lambda}(\omega)=\int_{M} L_{\lambda}(\omega)
$$

Since $\delta v o l_{g}=\delta \omega^{k} \wedge * \omega_{k}$, the foregoing analysis implies that

$$
\left.\frac{\delta L_{\lambda}}{\delta \omega^{k}}=-*\left(\operatorname{Ric}_{k}-\frac{1}{2} S(g) \omega_{k}+\lambda \omega_{k}\right) \cdot\right]
$$

Exercise: Compute $\frac{\delta L}{\delta \omega^{k}}$ if $L=$

$$
\left[\begin{array}{l}
\frac{1}{2} \Omega^{i j}{ }_{\wedge * \Omega_{i j}} \\
\frac{1}{2} \Omega^{i j} \wedge \omega_{j} \wedge *\left(\Omega_{i k} \wedge \omega^{k}\right) \\
\frac{1}{2} \Omega^{i j} \wedge \omega^{k} \wedge *\left(\Omega_{i k} \wedge \omega_{j}\right) \\
\frac{1}{2} \Omega^{i j} \wedge\left(\omega_{i} \wedge \omega_{j}\right) \wedge *\left(\Omega^{k} \ell \wedge\left(\omega_{k} \wedge \omega_{\ell}\right)\right) \\
\frac{1}{2} \Omega^{i j} \wedge\left(\omega_{j} \wedge \omega_{k}\right) \wedge *\left(\Omega^{k} \ell \wedge\left(\omega_{\ell} \wedge \omega_{i}\right)\right) \\
\frac{1}{2} \Omega^{i j} \wedge\left(\omega^{k} \wedge \omega^{\ell}\right) \wedge *\left(\Omega_{k} \ell^{\left.\wedge\left(\omega_{i} \wedge \omega_{j}\right)\right)}\right.
\end{array}\right.
$$

Given $\alpha: \operatorname{cof}_{M} \rightarrow \Lambda^{P} M$, write
10.

$$
\alpha=\frac{1}{p!} \alpha_{i_{1}} \ldots i_{p}{ }^{i_{l}} \wedge \ldots \wedge \omega^{i_{p}}
$$

$\delta \star \alpha:$

$$
\begin{aligned}
& * \alpha=\frac{1}{p!} \alpha_{i_{1} \ldots i_{p}} \theta^{i_{1} \ldots i_{p}} \\
& \Rightarrow \\
& \delta \star \alpha=\frac{1}{p!} \delta \alpha_{i_{1} \ldots i_{p}} \theta^{i_{1} \cdots i_{p}} \\
& +\frac{1}{p!} \alpha_{i_{1} \ldots i_{p}}{ }^{i_{1} \ldots i_{p}} \\
& =\frac{1}{p!} \delta \alpha_{i_{1}} \ldots i_{p} \theta^{i_{1} \ldots i_{p}} \\
& +\frac{1}{p!} \alpha_{i_{1} \ldots i_{p}}{ }^{\delta \omega}{ }^{j_{\wedge}}{ }_{\omega_{j}}{ }^{i i_{1} \ldots i_{p}} \\
& =\frac{1}{p!} \delta \alpha_{i_{1}} \ldots i_{p} \theta^{i_{1} \ldots i_{p}} \\
& +\delta \omega^{j}{ }_{\omega_{j}}{ }_{j} \alpha .
\end{aligned}
$$

* $\delta \alpha$ :

$$
\begin{aligned}
\delta \alpha=\frac{1}{p!} & \delta \alpha_{i_{1}} \ldots i_{p} \omega^{i_{1}} \wedge \ldots \wedge \omega^{i_{p}} \\
& +\frac{1}{p!} \alpha_{i_{1}} \ldots i_{p} \delta\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i_{p}}\right)
\end{aligned}
$$

$$
\begin{aligned}
& =\frac{1}{p!} \delta \alpha_{i_{1}} \ldots i_{p} \omega^{i_{1}} \wedge \ldots \wedge \omega^{i_{p}} \\
& +\frac{1}{p!} \alpha_{i_{1}} \ldots i_{p}{ }^{\delta \omega^{j}}{ }_{j_{j}}\left(\omega^{i_{1}} \wedge \ldots \wedge \omega^{i_{p}}\right) \\
& =\frac{1}{p!} \delta \alpha_{i_{1}} \ldots i_{p} \omega^{i_{1}} \wedge \ldots \wedge \omega^{i_{p}} \\
& +\delta \omega^{j}{ }_{\wedge} \omega_{j}{ }^{\alpha} \\
& \text { => } \\
& \star \delta \alpha=\frac{1}{p!} \delta \alpha_{i_{1}} \ldots i_{p} \theta^{i_{1} \ldots i_{p}}+*\left(\delta \omega^{j}{ }_{\wedge}{ }_{\omega_{j}}{ }^{\alpha)} .\right.
\end{aligned}
$$

Therefore

$$
\begin{aligned}
\delta * \alpha- & \star \delta \alpha \alpha \\
& =\delta \omega^{j}{ }_{{ }_{\omega}} \omega_{j} * \alpha-\star\left(\delta \omega^{j}{ }_{\wedge}{ }_{\omega_{j}}^{\alpha)} .\right.
\end{aligned}
$$

Remark:

$$
\begin{aligned}
& \left.{ }^{*(\underline{\imath}} \delta \omega^{j}\left(\omega_{j} \wedge \alpha\right)\right) \\
& \quad=(-1)^{n-1} *\left(\omega_{j} \wedge \alpha\right) \wedge \delta \omega^{j} \\
& \quad=(-1)^{n-1}(-1)^{n-p-1} \delta \omega^{j} \wedge *\left(\omega_{j} \wedge \alpha\right)
\end{aligned}
$$

$$
\begin{aligned}
& =(-1)^{p_{\delta \omega}} j_{\wedge *}\left(\omega_{j} \wedge \alpha\right) \\
& =(-1)^{p_{(-1)}} p_{\delta \omega} j_{\wedge *\left(\alpha \wedge \omega_{j}\right)} \\
& =\delta \omega^{j_{\wedge 1}} \omega_{j}^{* \alpha .}
\end{aligned}
$$

Thus

$$
\begin{aligned}
\delta * \alpha- & \star \delta \alpha \\
& =\star\left(\imath_{\delta \omega^{j}}{ }^{\left(\omega_{j} \wedge \alpha\right)-\delta \omega^{j}{ }^{j} \omega_{j}} \alpha\right)
\end{aligned}
$$

or still,

$$
\begin{aligned}
\delta \star \alpha- & \star \delta \alpha \\
& =\star\left(\imath_{\delta \omega_{j}}\left(\omega^{j} \wedge \alpha\right)-\delta \omega_{j} \wedge \underline{\imath}{ }_{\omega^{j}}{ }^{\alpha)} .\right.
\end{aligned}
$$

THEOREM Suppose that $\alpha, \beta:$ cof $_{M} \rightarrow \Lambda^{P_{M}}-$ then

$$
\delta(\alpha \wedge * \beta)=\delta \alpha \wedge * \beta+\alpha \wedge * \delta \beta-\delta \omega_{\ell} \wedge J^{l}
$$

where

$$
J^{\ell}=\imath_{\omega} \ell^{\beta \wedge * \alpha-(-1)^{p} \alpha \wedge 1} \omega^{\ell^{* \beta}}
$$

[We have

$$
\delta(\alpha \wedge * \beta)=\delta \alpha \wedge * \beta+\alpha \wedge \delta * \beta
$$

$$
\begin{aligned}
& =\delta \alpha \wedge * \beta+\alpha \wedge * \delta \beta+\alpha \wedge\left(\delta \omega_{l}{ }^{\wedge \imath}{ }_{\omega} e^{\star \beta}-*\left(\delta \omega_{l} \ell^{\wedge \imath} e^{\beta)}\right)\right. \\
& =\delta \alpha \wedge * \beta+\alpha \wedge \star \delta \beta+(-1)^{\mathrm{p}} \delta \omega_{l^{\wedge}{ }^{\wedge \Lambda \imath}}^{\omega} e^{* \beta-\delta \omega_{l} \wedge \imath}{ }_{\omega} e^{\beta \wedge \star \alpha} \\
& =\delta \alpha \wedge \star \beta+\alpha \wedge * \delta \beta+\delta \omega_{l} \wedge\left((-1)^{\mathrm{P}} \alpha \wedge \imath{ }_{\omega} e^{\star \beta-1}{ }_{\omega} e^{\beta \wedge \star \alpha)}\right. \\
& \left.=\delta \alpha \wedge \star \beta+\alpha \wedge \star \delta \beta-\delta \omega_{\ell} \wedge J^{\ell} .\right]
\end{aligned}
$$

The $J^{\ell}$ are $(n-1)$-forms and the collection $\left\{J^{1}, \ldots, J^{n}\right\}$ is called the current attached to the pair $(\alpha, \beta)$.

Construction Let $J^{\ell} \in \Lambda^{n-1} M(\ell=1, \ldots, n)$. Write

$$
J^{l}=J^{l k} * \omega_{k} .
$$

Then

$$
\begin{aligned}
*\left(\omega^{k} J^{l}\right) & =*\left(\omega^{k} \wedge J^{l m} * \omega_{m}\right) \\
& =J^{l m} *\left(\omega^{k} \wedge * \omega_{m}\right) \\
& =J^{l m} *\left(g\left(\omega^{k}, \omega_{m}\right) v o l_{g}\right) \\
& =(-1)^{l} J^{l k} .
\end{aligned}
$$

Therefore $J^{l k}=J^{k l}$ iff $\omega^{k} \wedge J^{l}=\omega^{l} \Lambda J^{k}$.

- ${ }^{1} \omega_{l} J^{l}={ }^{l} \omega_{l} J^{l k} \star \omega_{k}$

$$
\begin{aligned}
& =J^{l k} \omega_{\ell} * \omega_{k} \\
& =J^{l k} *\left(\omega_{k} \wedge \omega_{\ell}\right)
\end{aligned}
$$

$$
=\frac{J^{l k}}{2} *\left(\omega_{k} \wedge \omega_{\ell}\right)+\frac{J^{l k}}{2} *\left(\omega_{k} \wedge \omega_{\ell}\right)
$$

$$
=\frac{J^{\ell k}}{2} *\left(\omega_{k} \wedge \omega_{\ell}\right)-\frac{J^{l k}}{2} *\left(\omega_{\ell} \wedge \omega_{k}\right)
$$

$$
=\frac{J^{\ell k}}{2} *\left(\omega_{k} \wedge \omega_{\ell}\right)-\frac{J^{k \ell}}{2} *\left(\omega_{k} \wedge \omega_{\ell}\right)
$$

$$
\begin{aligned}
& \text { - } \omega_{\ell} \wedge J^{\ell}=\omega_{l} \wedge J^{l k} * \omega_{k} \\
& =J^{l k} \omega_{l} \wedge \star \omega_{k} \\
& =J^{l k_{g}\left(\omega_{\ell}, \omega_{K}\right) \operatorname{vol}_{g}} \\
& =J^{l k} \varepsilon_{k} g\left(\omega_{\ell}, \omega^{k k}\right) V^{\text {Vol }}{ }_{g} \\
& =J_{k}^{\ell}{ }^{\delta}{ }^{k} \ell^{\mathrm{VOl}} \mathrm{~g} \\
& =J_{l}^{\ell}{ }^{\star l} \text {. }
\end{aligned}
$$

$$
\begin{aligned}
& =\frac{1}{2}\left(J^{\ell k}-J^{k l}\right) *\left(\omega_{k} \wedge \omega_{\ell}\right) \\
& =J^{[\ell k]} *\left(\omega_{k} \wedge \omega_{\ell}\right)
\end{aligned}
$$

Consider the trace of the current attached to the pair $(\alpha, \beta)$ :

$$
\begin{aligned}
& (-1)^{1} J_{l}^{\ell}=*\left(\omega_{l} \wedge J^{l}\right) \\
& =*\left(\omega _ { \ell } \wedge \left(1{ }_{\omega} \ell^{\beta \wedge \star \alpha-(-1)^{\mathrm{P}} \alpha \wedge 1} \omega^{\left.\left.\ell^{* \beta}\right)\right)}\right.\right. \\
& =*\left(\omega_{l^{\wedge}}{ }_{\omega} l^{\beta \wedge * \alpha-\alpha \wedge \omega^{\wedge}} l^{\wedge}{ }_{\omega} l^{* \beta}\right) \\
& =*(\mathrm{p} \beta \wedge * \alpha-(\mathrm{n}-\mathrm{p}) \alpha \wedge * \beta) \\
& =*(\alpha \wedge * p \beta-(n-p) \alpha \wedge * \beta) \\
& =-(\mathrm{n}-2 \mathrm{p}) *(\alpha \wedge * \beta) .
\end{aligned}
$$

Therefore $J_{\ell}^{\ell}=0$ iff $n=2 p$.
Now take $\alpha=\beta$ - then

$$
J^{\ell}={ }_{\omega}{ }^{\ell}{ }^{\alpha \wedge * \alpha-(-1)^{p_{\alpha \wedge 1}}{ }_{\omega} \ell^{* \alpha} .}
$$

Observation:

$$
\begin{aligned}
&{ }_{\omega}^{\imath} \ell^{(\alpha \wedge * \alpha)}={ }^{\imath} \ell^{\alpha \wedge * \alpha+(-1)^{p_{\alpha \wedge 1}} e^{* \alpha}} \\
& \Rightarrow \quad-\frac{1}{2}{ }_{\omega}{ }_{\omega} \ell^{(\alpha \wedge * \alpha)}=-\frac{1}{2}{ }_{\omega} \omega \ell^{\alpha \wedge * \alpha-\frac{1}{2}(-1)^{p_{\alpha \wedge 1}}{ }_{\omega} e^{* \alpha}}
\end{aligned}
$$

$$
\begin{aligned}
& \Rightarrow \\
& \quad \omega^{\imath} e^{\alpha \wedge * \alpha-\frac{1}{2}{ }_{\omega}^{l} e^{(\alpha \wedge * \alpha)}} \\
& =\frac{1}{2}{ }_{\omega} \omega^{\alpha \wedge * \alpha-\frac{1}{2}(-1)^{p_{\alpha \wedge ı}}{ }_{\omega} e^{\star \alpha}} \\
& =\frac{1}{2} J^{\ell}
\end{aligned}
$$

Rappel: $\forall \alpha \in \Lambda{ }^{\mathrm{P}} \mathrm{M}_{\mathrm{M}}$

$$
{ }_{E} \ell^{\alpha \wedge l_{E_{l}}}{ }^{* \alpha=0 .}
$$

I.e.:

$$
{ }_{\omega} \ell^{\alpha \wedge t} \omega_{l}{ }^{* \alpha=}=0
$$

Thus

$$
\begin{aligned}
& { }^{\imath} \omega_{l}{ }^{J^{\ell}}=2 \imath \omega_{l}{ }^{(\imath}{ }_{\omega} \ell^{\alpha \wedge * \alpha-\frac{1}{2}}{ }^{\imath} \omega^{\ell}{ }^{(\alpha \wedge * \alpha))} \\
& =2\left({ }_{1} \omega_{l}{ }^{\imath} \omega^{\alpha \wedge * \alpha+(-1)^{p-1}{ }_{l}} \omega^{\alpha \wedge \imath} \omega_{l}^{* \alpha-\frac{1}{2}}{ }^{\imath} \omega_{l}{ }^{l} \omega^{\ell^{(\alpha \wedge * \alpha))}}\right. \\
& =2(-1)^{p-1}{ }_{\imath} \ell^{\alpha \wedge 1} \omega_{l}{ }^{\star \alpha} \\
& =0 \text {. }
\end{aligned}
$$

But then

$$
J^{[\ell k]}=0,
$$

so in this case,

$$
J^{l k}=J^{k l}
$$

Let $L: \operatorname{cof}_{M} \rightarrow \Lambda^{n} M$, where $L$ depends on $\omega$ and $d w$ :

$$
\mathrm{L}=\mathrm{L}\left(\omega^{1}, \ldots, \omega^{\mathrm{n}}, \mathrm{~d} \omega^{1}, \ldots, \mathrm{~d} \omega^{\mathrm{n}}\right) .
$$

Then

$$
\begin{aligned}
\delta L & =D_{\omega} L(\omega) \\
& =\left.\frac{d}{d \varepsilon} L(\omega+\varepsilon \delta \omega)\right|_{\varepsilon=0} \\
& =\delta \omega^{i} \wedge \frac{\partial L}{\partial \omega^{i}}+\delta d \omega^{i} \wedge \frac{\partial L}{\partial d \omega^{i}} .
\end{aligned}
$$

Here

$$
\left[\begin{array}{l}
\frac{\partial L}{\partial \omega^{i}} \in \Lambda^{n-1} M \\
\frac{\partial L}{\partial d \omega^{i}} \in \Lambda^{n-2} M .
\end{array}\right.
$$

Now rewrite $\delta \mathrm{L}$ as

$$
\delta \omega^{i} \wedge\left[\frac{\partial L}{\partial \omega^{i}}+d \frac{\partial L}{\partial d \omega^{i}}\right]+d\left(\delta \omega^{i} \wedge \frac{\partial L}{\partial d \omega^{i}}\right) .
$$

Definition: $\omega$ satisfies the field equations per $L$ provided $\forall i$,

$$
\frac{\partial L}{\partial \omega^{i}}+d \frac{\partial L}{\partial d \omega^{i}}=0 .
$$

[Note: Formally, if $L=\int_{M} L$, then
18.

$$
\left.\frac{\delta L}{\delta \omega^{I}}=\frac{\partial L}{\partial \omega^{i}}+d \frac{\partial L}{\partial d \omega^{i}} \cdot\right]
$$

Example: Take $\mathrm{n}=4$ and put

$$
L(\omega)=d \omega_{i} \wedge d \omega^{i}
$$

Then

$$
\begin{aligned}
\delta L & =\delta d \omega_{i} \wedge d \omega^{i}+d \omega_{i} \wedge \delta d \omega^{i} \\
& =\delta d \omega^{i} \wedge d \omega_{i}+\delta d \omega^{i} \wedge d \omega_{i} \\
& =2\left(\delta d \omega^{i} \wedge d \omega_{i}\right) \\
& =2\left(\delta \omega^{i} \wedge d d \omega_{i}+d\left(\delta \omega^{i} \wedge d \omega_{i}\right)\right) \\
\Rightarrow \quad & \frac{\partial L}{\partial \omega^{i}}=2 d d \omega_{i}=0 .
\end{aligned}
$$

Definition: The lagrangian of teleparallel gravity is the combination

$$
L\left(=L\left(\rho_{0}, \rho_{1}, \rho_{2}, \rho_{3}\right)\right)=\frac{1}{2}\left(\rho_{0} L^{0}+\rho_{1} L^{1}+\rho_{2} L^{2}+\rho_{3} L^{3}\right),
$$

where the $\rho_{i}$ are real and

$$
\left\{\begin{array}{l}
L^{0}=\frac{1}{n}\left(\omega_{i} \wedge * \omega^{i}\right)=v o l_{g} \\
L^{1}=d \omega_{i} \wedge * d \omega^{i} \\
L^{2}=\left(d \omega_{i} \wedge \omega^{i}\right) \wedge *\left(d \omega_{j} \wedge \omega^{j}\right) \\
L^{3}=\left(d \omega_{i} \wedge \omega^{j}\right) \wedge *\left(d \omega_{j} \wedge \omega^{i}\right)
\end{array}\right.
$$

Rappel: We have

$$
\begin{aligned}
& \frac{1}{2} \Omega_{i j} \wedge \theta^{i j}=-d\left(\omega_{i} \wedge * d \omega^{i}\right) \\
+ & \frac{1}{4}\left(d \omega_{i} \wedge \omega^{i}\right) \wedge *\left(d \omega_{j} \wedge \omega^{j}\right)-\frac{1}{2}\left(d \omega_{i} \wedge \omega^{j}\right) \wedge *\left(d \omega_{j} \wedge \omega^{i}\right) .
\end{aligned}
$$

Because of this, the choice $\rho_{0}=0, \rho_{1}=0, \rho_{2}=\frac{1}{2}, \rho_{3}=-1$ is called the teleparallel equivalent of $G R$ (sometimes denoted $G R|\mid$ ).
[Note: If desired, a cosmological constant $\lambda$ can be introduced by setting $\left.\frac{\rho_{0}}{2}=-\lambda.\right]$

Rappel:

$$
d \omega^{i}=\frac{1}{2} c_{j k}^{i} \omega^{j} \omega^{k} \quad\left(C_{j k}^{i}=-C_{k j}^{i}\right)
$$

[Note: In terms of the interior product,

$$
C_{j k}^{i}={ }^{l} E_{k}{ }^{l} E_{j} d \omega^{i} .
$$

Thus

$$
\begin{aligned}
& { }^{2} E_{k}{ }^{l} E_{j} d \omega^{i} \\
& \quad=\frac{1}{2} C^{i} u v^{2} E_{k}{ }^{2} E_{j} \omega^{u} \wedge \omega^{v} \\
& \quad=\frac{1}{2} C^{i} u v^{2} E_{k}\left(\delta^{u}{ }_{j} \omega^{v}-\omega^{u} \delta_{\delta}^{v}{ }_{j}\right) \\
& \quad=\frac{1}{2} C^{i}{ }_{j v^{2} E_{k}} \omega^{v}-\frac{1}{2} C^{i} u j^{2} E_{k} \omega^{u}
\end{aligned}
$$

$$
\begin{aligned}
& =\frac{1}{2} c^{i}{ }_{j k}-\frac{1}{2} c^{i}{ }_{k j} \\
& \left.=c^{i}{ }_{j k} \cdot\right]
\end{aligned}
$$

Example (Anti Yang-Mills): Consider

$$
\frac{\rho}{2} d^{*} \omega_{i} \wedge \star d^{*} \omega^{i}
$$

- ${ }_{\omega_{j}}{ }^{\mathrm{d} \omega}{ }^{j}=c^{j}{ }_{j k}{ }^{\mathrm{k}}$
=>

$$
{ }^{\imath} \omega_{i}{ }^{2} \omega_{j} d \omega^{j}=c_{j i}^{j}=-c_{i j}^{j}
$$

=>

$$
\begin{aligned}
{ }^{{ }^{2}}{ }^{i^{2} \omega_{j}}{ }^{d \omega^{j}} & =\varepsilon_{i}{ }^{2} \omega_{i}{ }^{i} \omega_{j}{ }^{d \omega^{j}} \\
& =-\varepsilon_{i} C^{j}{ }_{i j} \\
& =d^{*} \omega^{i} .
\end{aligned}
$$

- ${ } \omega_{j}{ }^{d}{ }^{j}$

$$
\begin{aligned}
& =(-1)^{l}(-1)^{2(n-2)}{ }_{1} \omega_{j} * * d \omega^{j} \\
& =(-1)^{l} *\left(* d \omega^{j} \wedge \omega_{j}\right) \\
& =(-1)^{l}(-1)^{n-2} *\left(\omega_{j} \wedge * d \omega^{j}\right)
\end{aligned}
$$

$$
=(-1)^{l}(-1)^{n} \star\left(\omega_{j} \wedge * d \omega^{j}\right)
$$

=>

$$
\begin{aligned}
d^{*} \omega^{i} & ={ }_{\omega}{ }_{\omega^{i}}{ }^{l} \omega_{j} d \omega^{j} \\
& =(-1)^{l}(-1)^{n}{ }_{\omega^{i}}{ }^{*}{ }^{*\left(\omega_{j} \wedge * d \omega^{j}\right)} \\
& =(-1)^{l}(-1)^{n} *\left(\omega_{j} \wedge * d \omega^{j} \wedge \omega^{i}\right) \\
& =(-1)^{\imath}(-1)^{n}(-1)^{n-2} *\left(\omega_{j} \wedge \omega^{i} \wedge * d \omega^{j}\right) \\
& =(-1)^{\imath} \star\left(\omega_{j} \wedge \omega^{i} \wedge * d \omega^{j}\right) \\
& =(-1)^{\imath} \star\left(\omega^{j} \wedge \omega^{i} \wedge * d \omega_{j}\right) \\
& =(-1)^{\tau+1} *\left(\omega^{i} \wedge \omega^{j} \wedge * d \omega_{j}\right) .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& \frac{\rho}{2} d^{*} \omega_{i} \wedge \star d^{*} \omega^{i} \\
& \quad=\frac{\rho}{2}\left(\imath_{\omega_{i}}{ }^{l} \omega_{k} d \omega^{k}\right) \wedge(-1)^{i+1} \star *\left(\omega^{i} \wedge \omega^{j} \wedge * d \omega_{j}\right) \\
& \quad=\frac{\rho}{2}\left({ }_{\omega} \omega_{i} \omega_{k} d \omega^{k}\right) \wedge(-1)^{1+1}(-1)^{l} \omega^{i} \wedge \omega^{j} \wedge * d \omega_{j} \\
& \\
& =-\frac{\rho}{2}\left(l_{\omega_{i}}{ }^{l} \omega_{k} d \omega^{k}\right) \wedge \omega^{i} \wedge \omega^{j} \wedge \star d \omega_{j}
\end{aligned}
$$

$$
\begin{aligned}
& =-\frac{\rho}{2} \omega^{i} \wedge \imath_{\omega_{i}}\left(\imath_{\omega_{k}} d \omega^{k}\right) \wedge \omega^{j} \wedge * d \omega_{j} \\
& =-\frac{\rho}{2}\left(\tau_{\omega_{k}} d \omega^{k} \wedge \omega^{j}\right) \wedge * d \omega_{j} \\
& =-\frac{\rho}{2}\left(\imath_{\omega_{k}}\left(d \omega^{k} \wedge \omega^{j}\right)-d \omega^{k} \wedge \imath_{\omega_{k}} \omega^{j}\right) \wedge * d \omega_{j} \\
& =-\frac{\rho}{2}\left(\imath_{\omega_{k}}\left(d \omega^{k} \wedge \omega^{j}\right)-d \omega^{j}\right) \wedge * d \omega_{j} \\
& =\frac{\rho}{2} d \omega_{j} \wedge * d \omega^{j}-\frac{\rho}{2} \imath_{\omega_{k}}\left(d \omega^{k} \wedge \omega^{j}\right) \wedge * d \omega_{j}
\end{aligned}
$$

Write

$$
\begin{aligned}
& { }^{\imath} \omega_{k}\left(d \omega^{k} \wedge \omega^{j}\right) \\
& \quad=(-1)^{l}(-1)^{(n-3)(3+1)} *\left(\omega_{k} \wedge *\left(d \omega^{k} \wedge \omega^{j}\right)\right) \\
& \quad=(-1)^{l} *\left(\omega_{k} \wedge *\left(d \omega^{k} \wedge \omega^{j}\right)\right)
\end{aligned}
$$

Then

$$
\begin{aligned}
& -\frac{\rho}{2}{ }^{\imath} \omega_{k}\left(d \omega^{k} \wedge \omega^{j}\right) \wedge * d \omega_{j} \\
& \quad=(-1)^{l+1} \frac{\rho}{2} *\left(\omega_{k} \wedge *\left(d \omega^{k} \wedge \omega^{j}\right)\right) \wedge * d \omega_{j} \\
& \quad=(-1)^{\imath+1} \frac{\rho}{2} d \omega_{j} \wedge * *\left(\omega_{k} \wedge *\left(d \omega^{k} \wedge \omega^{j}\right)\right) \\
& \quad=(-1)^{l+1} \frac{\rho}{2} d \omega_{j} \wedge(-1)^{\imath}(-1)
\end{aligned}
$$

$$
\begin{aligned}
& =-\frac{\rho}{2}\left(d \omega_{j} \wedge \omega_{k}\right) \wedge *\left(d \omega^{k} \wedge \omega^{j}\right) \\
& =-\frac{\rho}{2}\left(d \omega_{j} \wedge \omega^{k}\right) \wedge *\left(d \omega_{k} \wedge \omega^{j}\right)
\end{aligned}
$$

## Therefore

$$
\begin{aligned}
& \frac{\rho}{2} d^{*} \omega_{i} \wedge * d^{*} \omega^{i} \\
& \quad=\frac{1}{2}\left(\rho L^{1}-\rho L^{3}\right) \quad(=L(0, \rho, 0,-\rho))
\end{aligned}
$$

Using the theorem, one can calculate $\delta L^{\perp}, \delta L^{2}$, and $\delta L^{3}$. The field equations obtained thereby are, however, rather unwieldly. To illustrate, consider $\delta \mathrm{L}^{2}$.
$\delta L^{2}$ : We have

$$
\begin{aligned}
& \begin{array}{l}
\delta\left(\left(d \omega_{i} \wedge \omega^{i}\right) \wedge *\left(d \omega_{j} \wedge \omega^{j}\right)\right) \\
= \\
\quad \delta\left(d \omega_{i} \wedge \omega^{i}\right) \wedge *\left(d \omega_{j} \wedge \omega^{j}\right) \\
\\
+\left(d \omega_{i} \wedge \omega^{i}\right) \wedge * \delta\left(d \omega_{j} \wedge \omega^{j}\right) \\
\\
\quad-\delta \omega_{\ell} \wedge J^{2, \ell} \\
=\delta\left(d \omega_{i} \wedge \omega^{i}\right) \wedge *\left(d \omega_{j} \wedge \omega^{j}\right) \\
\end{array} \quad \begin{array}{l}
\delta\left(d \omega_{j} \wedge \omega^{j}\right) \wedge *\left(d \omega_{i} \wedge \omega^{i}\right) \\
\quad-\delta \omega_{\ell} \wedge J^{2, \ell}
\end{array} \\
& =2 \delta\left(d \omega_{i} \wedge \omega^{i}\right) \wedge *\left(d \omega_{j} \wedge \omega^{j}\right)-\delta \omega_{\ell} \wedge J^{2, \ell}
\end{aligned}
$$

$$
=2 d \delta \omega_{i} \wedge \omega^{\mathbf{i}} \wedge *\left(d \omega_{j} \wedge \omega^{\mathbf{j}}\right)
$$

$$
+2 d \omega_{i} \wedge \delta \omega^{i} \wedge *\left(d \omega_{j} \wedge \omega^{j}\right)
$$

$$
-\delta \omega_{\ell} \wedge J^{2, \ell}
$$

$$
=2 \mathrm{~d}\left(\delta \omega_{i} \wedge \omega^{i} \wedge *\left(d \omega_{j} \wedge \omega^{j}\right)\right)
$$

$$
+2 \delta \omega_{i} \wedge d\left(\omega^{i} \wedge *\left(d \omega_{j} \wedge \omega^{j}\right)\right)
$$

$$
+2 \delta \omega^{i} \wedge d \omega_{i} \wedge *\left(d \omega_{j} \wedge \omega^{j}\right)
$$

$$
-\delta \omega_{\ell} \wedge J^{2, \ell}
$$

$$
=2 d\left(\delta \omega_{i} \wedge \omega^{i} \wedge *\left(d \omega_{j} \wedge \omega^{j}\right)\right)
$$

$$
-2 \delta \omega_{i} \wedge \omega^{i} \wedge d *\left(d \omega_{j} \wedge \omega^{j}\right)
$$

$$
+2 \delta \omega_{i} \wedge d \omega^{i} \wedge *\left(d \omega_{j} \wedge \omega^{j}\right)
$$

$$
+2 \delta \omega^{i} \wedge d \omega_{i} \wedge *\left(d \omega_{j} \wedge \omega^{j}\right)
$$

$$
-\delta \omega_{\ell} \wedge^{2, \ell}
$$

$$
=2 \mathrm{~d}\left(\delta \omega_{i} \wedge \omega^{i} \wedge *\left(d \omega_{j} \wedge \omega^{j}\right)\right)
$$

$$
-2 \delta \omega^{i} \wedge \omega_{i} \wedge d *\left(d \omega_{j} \wedge \omega^{j}\right)
$$

25. 

$$
\begin{array}{r}
+4 \delta \omega^{i} \wedge d \omega_{i} \wedge *\left(d \omega_{j} \wedge \omega^{j}\right) \\
\\
-\delta \omega_{l} \wedge J^{2, l}
\end{array}
$$

where

$$
\begin{aligned}
& \mathrm{J}^{2, \ell}={ }_{\omega}{ }^{\ell} \ell^{\left(d \omega_{j} \wedge \omega^{j}\right) \wedge *\left(d \omega_{i} \wedge \omega^{i}\right)} \\
&-(-1)^{3}\left(d \omega_{i} \wedge \omega^{i}\right) \wedge \tau \\
& \omega^{*} \ell^{*\left(d \omega_{j} \wedge \omega^{j}\right)} \\
&=-\omega_{\omega^{\ell}} \ell^{\left(\left(d \omega_{i} \wedge \omega^{i}\right) \wedge *\left(d \omega_{j} \wedge \omega^{j}\right)\right)} \\
&+2 t e^{\ell^{\left(d \omega_{i} \wedge \omega^{i}\right) \wedge *\left(d \omega_{j} \wedge \omega^{j}\right)}}
\end{aligned}
$$

But

$$
\begin{aligned}
& -\delta \omega_{\ell} \wedge J^{2, \ell} \\
& =-\delta \omega^{\ell} \wedge J^{2}, \ell \\
& =-\delta \omega^{i} \wedge J_{, i}^{2} \\
& =-\delta \omega^{i} \wedge\left[-l_{\omega_{i}}\left(\left(d \omega_{j} \wedge \omega^{j}\right) \wedge *\left(d \omega_{k} \wedge \omega^{k}\right)\right)\right. \\
& \left.+2 l_{\omega_{i}}\left(d \omega_{j} \wedge \omega^{j}\right) \wedge *\left(d \omega_{k} \wedge \omega^{k}\right)\right] \\
& \quad=\delta \omega^{i} \wedge l_{w_{i}}\left(\left(d \omega_{j} \wedge \omega^{j}\right) \wedge *\left(d \omega_{k} \wedge \omega^{k}\right)\right)
\end{aligned}
$$

$$
\begin{aligned}
& -\delta \omega^{i} \wedge 2 l_{\omega_{i}} d \omega_{j} \wedge \omega^{j} \wedge *\left(d \omega_{k} \wedge \omega^{k}\right) \\
& -\delta \omega^{i} \wedge 2 d \omega_{j} \wedge l_{\omega_{i}} \omega^{j} \wedge *\left(d \omega_{k} \wedge \omega^{k}\right) \\
= & \delta \omega^{i} \wedge l_{\omega_{i}}\left(\left(d \omega_{j} \wedge \omega^{j}\right) \wedge *\left(d \omega_{k} \wedge \omega^{k}\right)\right) \\
& -\delta \omega^{i} \wedge 2 l_{\omega_{i}} d \omega_{j} \wedge \omega^{j} \wedge_{*}\left(d \omega_{k} \wedge \omega^{k}\right) \\
& -2 \delta \omega^{i} \wedge d \omega_{i} \wedge *\left(d \omega_{j} \wedge \omega^{j}\right) .
\end{aligned}
$$

Consequently, the field equations for $\omega$ per $L^{2}$ are

$$
\begin{gathered}
-2 \omega_{i} \wedge d *\left(d \omega_{j} \wedge \omega^{j}\right)+2 d \omega_{i} \wedge *\left(d \omega_{j} \wedge \omega^{j}\right) \\
+{ }_{l_{i}}\left(\left(d \omega_{j} \wedge \omega^{j}\right) \wedge *\left(d \omega_{k} \wedge \omega^{k}\right)\right) \\
-2 \imath_{\omega_{i}} d \omega_{j} \wedge \omega^{j} \wedge *\left(d \omega_{k} \wedge \omega^{k}\right) \\
=0 .
\end{gathered}
$$

Take $\rho_{0}=0$ - then there is another approach to the field equations for $\omega$ per

$$
L=\frac{1}{2}\left(\rho_{1} L^{1}+\rho_{2} L^{2}+\rho_{3} L^{3}\right)
$$

which is more economical in its execution.

We have

$$
\left\{\begin{array}{l}
L^{1}=\frac{1}{2} C_{i j k} C^{i j k} \star l \\
L^{2}=\frac{1}{2} C_{i j k}\left(C^{i j k}+C^{j k i}+C^{k i j}\right) * l \\
L^{3}=\frac{1}{2}\left(C_{i j k} C^{i j k}-2 C^{i}{ }_{i k} C_{j}^{j k}\right) * l
\end{array}\right.
$$

Put

$$
\begin{aligned}
\gamma^{i j k r s t} & =\left(\rho_{1}+\rho_{2}+\rho_{3}\right) \eta^{i r} \eta^{j s_{\eta} k t} \\
& +\rho_{2}\left(\eta^{i s_{\eta} j t_{\eta} k r}+\eta^{i t_{\eta} j r_{\eta} k s}\right) \\
& -2 \rho_{3} \eta^{i k_{n} r t_{\eta} j s}
\end{aligned}
$$

Then

$$
L=\frac{1}{4} C_{i j k} C_{r s t} \gamma^{i j k r s t} * 1
$$

or still,

$$
L=\frac{1}{4} C_{i j k} F^{i j k} \star l
$$

where

$$
F^{i j k}=\gamma^{i j k r s t} C_{r s t} .
$$

Notation:

$$
\text { - } C^{i}=\frac{1}{2} c^{i j k} \omega_{j} \wedge \omega_{k} \quad\left(=d \omega^{i}\right)
$$

$$
\cdot F^{i}=\frac{1}{2} F^{i j k_{\omega_{j}} \wedge \omega_{k}}
$$

28. 

FACT

$$
F^{i}=\left(\rho_{1}+\rho_{3}\right) \mathcal{C}^{i}+\rho_{2}{ }_{\omega^{i}}\left(\omega_{j} \wedge \mathcal{C}^{j}\right)-\rho_{3} \omega^{i} \wedge t \omega_{j} \mathcal{C}^{j}
$$

LEMMA We have

$$
L=\frac{1}{2} C_{i} \wedge * F^{i}
$$

[For

$$
\begin{aligned}
& C_{i} \wedge * F^{i} \\
& =\frac{1}{2} C_{i j k} \omega^{j} \wedge \omega^{k} \wedge \frac{1}{2} F^{i u v_{*}}{ }_{*}\left(\omega_{u} \wedge \omega_{v}\right) \\
& \left.=\frac{1}{4} C_{i j k} F^{i u v}{ }_{g\left(\omega^{j} \wedge \omega^{k}\right.}, \omega_{u} \wedge \omega_{v}\right) * l \\
& \left.=\frac{1}{4} C_{i j k} F^{i u v} \operatorname{det} \left\lvert\, \begin{array}{cc}
g\left(\omega^{j}, \omega_{u}\right) & g\left(\omega^{j}, \omega_{v}\right) \\
g\left(\omega^{k}, \omega_{u}\right) & g\left(\omega^{k}, \omega_{v}\right)
\end{array}\right.\right] * I \\
& =\frac{1}{4} C_{i j k} F^{i u v v}\left(\delta_{u}^{j} \delta^{k}{ }_{v}-\delta^{j} v_{v}^{k}{ }_{u}\right) * l \\
& =\frac{1}{4} C_{i j k} F^{i j k}{ }_{\star 1}-\frac{1}{4} C_{i j k} F^{i k j} * 1 \\
& =\frac{1}{4} C_{i j k} F^{i j k} * 1-\frac{1}{4} C_{i k j} F^{i j k} * 1
\end{aligned}
$$

$$
\begin{aligned}
& =\frac{1}{4} C_{i j k} F^{i j j k} * 1+\frac{1}{4} C_{i j k} F^{i j k_{* 1}} \\
& =\frac{1}{2} C_{i j k} F^{i j k_{* l}} \\
& =2 \mathrm{~L} \cdot]
\end{aligned}
$$

We shall now turn to the calculation of $\delta \mathrm{L}$.
First

$$
\begin{aligned}
& \delta\left(C_{i j k} F^{i j k} * 1\right) \\
& =\left(\delta C_{i j k}\right) F^{i j k} * l+C_{i j k}\left(\delta F^{i j k}\right) * 1+C_{i j k} F^{i j k}{ }_{\delta * l}
\end{aligned}
$$

But

$$
\begin{aligned}
& \delta F^{i j k}=\delta\left(\gamma^{i j k r s t} C_{r s t}\right) \\
&=\gamma^{i j k r s t}{ }_{\delta C_{r s t}} \\
&=\gamma^{r s t i j k_{\delta C_{r s t}}} \\
& \Rightarrow \\
& C_{i j k}\left(\delta F^{i j k}\right) \\
&=C_{i j k} \gamma^{r s t i j k} \delta C_{r s t} \\
&=\gamma^{i j k r s t} C_{r s t} \delta C_{i j k}
\end{aligned}
$$

$$
\begin{aligned}
&=\left(\delta C_{i j k}\right) F^{i j k} \\
& \Rightarrow \\
& \delta L=\frac{1}{4}\left(2\left(\delta C_{i j k}\right) F^{i j k} * l+C_{i j k} F^{\left.i j k_{\delta * l}\right)}\right. \\
&=\frac{1}{2}\left(\delta C_{i j k}\right) F^{i j k} \star l+\frac{1}{4} C_{i j k} F^{i j k_{\delta * l}} \\
&=\frac{1}{2}\left(\delta C_{i j k}\right) F^{i j k} * l+\frac{1}{4} C_{i j k} F^{i j k^{i j \omega}}{ }^{\ell}{ }_{\wedge * \omega_{\ell}} .
\end{aligned}
$$

Observation:

$$
\begin{aligned}
{ }^{\imath} \omega_{l}{ }^{L} & ={ }^{\imath} \omega_{l}\left(\frac{1}{4} c_{i j k} F^{i j k} \mathrm{VOl}_{g}\right) \\
& =\frac{1}{4} c_{i j k} F^{i j k}{ }_{i} \omega_{l}{ }^{\mathrm{VOl}} g \\
& =\frac{1}{4} c_{i j k} F^{i j k}{ }_{* \omega_{l}}
\end{aligned}
$$

So

$$
\delta L=\frac{1}{2}\left(\delta C_{i j k}\right) F^{i j k} \star l+\delta \omega^{\ell} \wedge z \omega_{l}^{L} .
$$

LEMMA We have

$$
\begin{aligned}
& \delta C_{i j k}{ }^{\star l} \\
& \quad=\delta d \omega_{i} \wedge \star\left(\omega_{j} \wedge \omega_{k}\right)+\delta \omega^{\ell} \wedge\left(C_{i \ell j} * \omega_{k}-C_{i \ell k} * \omega_{j}\right)
\end{aligned}
$$

[From the definitions,

$$
\delta d \omega_{i}=\frac{1}{2} \delta C_{i j k} \omega^{j} \wedge \omega^{k}+C_{i j k} \delta \omega^{j} \wedge \omega^{k}
$$

hence

$$
\begin{aligned}
& \delta d \omega_{\mathrm{i}} \wedge *\left(\omega_{\mathrm{u}} \wedge \omega_{\mathrm{v}}\right) \\
& =\frac{1}{2} \delta C_{i j k} \omega^{j} \wedge \omega^{k} \wedge *\left(\omega_{\mathrm{u}} \wedge \omega_{\mathrm{v}}\right) \\
& \\
& \quad+C_{i j k} \delta \omega^{j} \wedge \omega^{k} \wedge *\left(\omega_{\mathrm{u}} \wedge \omega_{\mathrm{v}}\right)
\end{aligned}
$$

Write

$$
\begin{aligned}
& *\left(\tau_{\omega^{k}}\left(\omega_{u} \wedge \omega_{v}\right)\right) \\
& =(-1)^{n-1} *\left(\omega_{u} \wedge \omega_{v}\right) \wedge \omega^{k} \\
& =(-1)^{n-1}(-1)^{n-2} \omega^{k} \wedge *\left(\omega_{u} \wedge \omega_{v}\right) \\
& =-\omega^{k} \wedge *\left(\omega_{u} \wedge \omega_{v}\right)
\end{aligned}
$$

to get

$$
\begin{aligned}
& \delta d \omega_{i} \wedge *\left(\omega_{u} \wedge \omega_{\mathrm{v}}\right) \\
& =-\frac{1}{2} \delta C_{i j k} \omega^{j} \wedge *\left(l{ }_{\omega} k^{\left.\left(\omega_{u} \wedge \omega_{v}\right)\right)}\right. \\
& -C_{i j k} \delta \omega^{j}{ }_{\wedge *}\left(\imath_{\omega}{ }^{k}\left(\omega_{u} \wedge \omega_{v}\right)\right) \\
& =-\frac{1}{2} \delta C_{i j k} \omega^{j}{ }_{\wedge *}\left(\delta^{k}{ }_{u}{ }^{\omega} V_{v}-\omega_{u} \delta^{k}{ }_{v}\right) \\
& -C_{i j k} \delta \omega^{j} \wedge^{*}\left(\delta^{k} u^{\omega}{ }_{v}-\omega_{u} \delta^{k}{ }_{v}\right)
\end{aligned}
$$

$$
\begin{aligned}
& =-\frac{1}{2} \delta C_{i j k} \omega^{j} \wedge \delta^{k}{ }_{u}{ }^{* \omega}{ }_{v}+\frac{1}{2} \delta C_{i j k} \omega^{j}{ }_{\wedge} \delta^{k}{ }_{v}{ }^{* \omega_{u}}
\end{aligned}
$$

$$
\begin{aligned}
& =-\frac{1}{2} \delta C_{i j u} \omega^{j^{j}}{ }_{\wedge * \omega_{v}}+\frac{1}{2} \delta C_{i j v}{ }^{\omega}{ }^{j}{ }_{\wedge * \omega_{u}} \\
& -C_{i j u} \delta \omega^{j}{ }_{\wedge * \omega_{v}}+C_{i j v} \delta \omega^{j}{ }_{\wedge * \omega_{u}} \\
& =-\frac{1}{2} \delta C_{i j u}{ }^{\delta j} v_{v}^{* l}+\frac{1}{2} \delta C_{i j v}{ }^{\delta}{ }_{u}{ }^{j}{ }^{* l} \\
& -\delta \omega \omega^{j}\left(C_{i j u}{ }^{* \omega} v_{v}-C_{i j v}{ }^{* \omega}{ }_{u}\right) \\
& =-\frac{1}{2} \delta C_{i v u} * 1+\frac{1}{2} \delta C_{i u v} * 1 \\
& -\delta \omega^{\ell} \wedge\left(C_{i \ell u^{*} \omega_{v}}-C_{i \ell v}{ }^{* \omega_{u}}\right) \\
& =\delta C_{i u v}{ }^{\star l}-\delta \omega^{\ell} \wedge\left(C_{i \ell u}{ }^{* \omega_{v}}-C_{i \ell v} * \omega_{u}\right) .
\end{aligned}
$$

The replacements $u \rightarrow j, v \rightarrow k$ then serve to complete the proof.]

So

$$
\begin{aligned}
\delta L= & \frac{1}{2}\left(\delta d \omega_{i} \wedge *\left(\omega_{j} \wedge \omega_{k}\right)\right. \\
& \left.+\delta \omega^{\ell} \wedge\left(C_{i \ell j} * \omega_{k}-C_{i \ell k}^{* \omega_{j}}\right)\right) F^{i j k} \\
& +\delta \omega^{\ell} \wedge t \omega_{\ell}^{L}
\end{aligned}
$$

$$
\begin{aligned}
& \text { - } d\left(\delta \omega_{i} \wedge F^{i j k} \wedge *\left(\omega_{j} \wedge \omega_{k}\right)\right) \\
& =\delta d \omega_{i} \wedge F^{i j k} \wedge *\left(\omega_{j} \wedge \omega_{k}\right) \\
& -\delta \omega_{i} \wedge\left(d F^{i j k} \wedge \star\left(\omega_{j} \wedge \omega_{k}\right)+F^{i j k} \wedge d *\left(\omega_{j} \wedge \omega_{k}\right)\right) . \\
& \text { - } d\left(F^{\ell j k_{\wedge *}\left(\omega_{j} \wedge \omega_{k}\right)}\right) \\
& =d F^{\ell j k_{\wedge *}\left(\omega_{j} \wedge \omega_{k}\right)+F^{l j k_{\wedge}} d_{*}\left(\omega_{j} \wedge \omega_{k}\right) .}
\end{aligned}
$$

Thus

$$
\begin{aligned}
& \delta L=\frac{1}{2} \delta \omega_{\ell} \wedge\left(\mathrm{d}\left(\mathrm{~F}^{\ell j k^{\wedge}}{ }_{*}\left(\omega_{j} \wedge \omega_{k}\right)\right)\right. \\
& \left.+F^{i j k}\left(C_{i}^{\ell} j^{* \omega \omega_{k}}-C_{i}^{\ell} k_{j}^{* \omega_{j}}\right)+2 l{ }_{\omega^{L}}\right) \\
& +\frac{1}{2} \mathrm{~d}\left(\delta \omega_{i} \wedge F^{i j k_{\wedge *}\left(\omega_{j} \wedge \omega_{k}\right)}\right) \\
& =\delta \omega_{l} \wedge\left(d * F^{l}\right. \\
& \left.+\frac{1}{2} F^{i j k}\left(C_{i} j^{\ell} \omega_{k}-C_{i} k^{\ell} \omega_{j}\right)+1{ }_{\omega} \ell^{L}\right) \\
& +d\left(\delta \omega_{i} \wedge \star F^{i}\right) . \\
& \bullet \frac{1}{2} F^{i j k}\left(C_{i}{ }_{j}^{\ell} * \omega_{k}-C_{i}{ }_{k}^{\ell} \omega_{j}\right) \\
& =\frac{1}{2}\left(F^{i j k}-F^{i k j}\right) C_{i}^{l}{ }_{j} * \omega_{k} .
\end{aligned}
$$

$$
\begin{aligned}
& \text { - *( } \left.{ }_{\omega}{ }_{j} F^{i}\right) \\
& =*\left(\imath_{\omega}{ }_{j} \frac{1}{2} F^{i u v_{0}}{ }_{\left.\omega_{u} \wedge \omega_{v}\right)}\right. \\
& =*\left(\frac{1}{2} F^{\text {iuv }}\left(\delta^{j}{ }_{u}{ }^{\omega} v_{v}-\omega_{u} \delta^{j}{ }_{v}\right)\right. \\
& =\frac{1}{2} F^{i j v_{* \omega_{V}}}-\frac{1}{2} F^{i u j_{* \omega}}{ }_{u} \\
& =\frac{1}{2} F^{i j k}{ }_{\star \omega_{k}}-\frac{1}{2} F^{i k j} * \omega_{k} \\
& =\frac{1}{2}\left(F^{i j k}-F^{i k j}\right) * \omega_{k} .
\end{aligned}
$$

Thus

$$
\begin{aligned}
& \delta L=\delta \omega_{\ell^{\wedge}}\left(d * F^{\ell}+c_{i}^{\ell} j^{*}\left(\imath{ }_{\omega} j^{F^{i}}\right)+{ }_{\omega}{ }_{\omega} L^{L}\right) \\
& +d\left(\delta \omega_{i} \wedge * F^{i}\right) \\
& \left.=\delta \omega^{\ell} \wedge\left(d \star F_{\ell}+C_{i \ell j}{ }^{\star(\imath}{ }_{\omega}{ }^{j} F^{i}\right)+{ }^{\imath} \omega_{l}{ }_{L}\right) \\
& +d\left(\delta \omega_{i} \wedge * F^{i}\right) . \\
& \text { - * }\left(\imath_{\omega}{ }^{j}{ }^{i}\right)
\end{aligned}
$$

$$
\begin{aligned}
& =(-1)^{\mathrm{n}-1}(-1)^{\mathrm{n}-2}{ }_{\omega}{ }^{\mathrm{j}} \wedge_{\star} F^{\mathrm{i}} \\
& =-\omega^{j}{ }_{\wedge *} F^{i} \text {. }
\end{aligned}
$$

$$
\begin{aligned}
& \text { - }{ }^{l} \omega_{l}{ }^{C_{i}} \\
& ={ }^{2} \omega_{\ell}{ }^{\mathrm{d}} \omega_{i} \\
& =\frac{1}{2} C_{i u v}{ }^{2} \omega_{l}\left(\omega^{\mathrm{u}} \wedge \omega^{\mathrm{v}}\right) \\
& =\frac{1}{2} C_{i u v}\left(\delta^{u} \ell^{\omega}{ }^{v}-\omega^{u} \delta^{v}{ }_{\ell}\right) \\
& =\frac{1}{2} c_{i \ell v{ }^{\omega}}{ }^{v}-\frac{1}{2} c_{i u \ell}{ }^{\omega}{ }^{u} \\
& =c_{i \ell j}{ }^{\omega} .
\end{aligned}
$$

Thus

$$
\begin{aligned}
\delta L=\delta \omega^{l} \wedge(d * F & \left.-{ }_{l} \omega_{l} C_{i} \wedge * F^{i}+{ }^{\imath} \omega_{l}{ }^{L}\right) \\
& +d\left(\delta \omega_{i} \wedge * F^{i}\right) .
\end{aligned}
$$

Notation:

$$
J_{l}={ }^{\imath} \omega_{l} c_{i} \wedge * F^{i}-{ }^{\imath} \omega_{l}^{L}
$$

Scholium: We have

$$
\delta L=\delta \omega^{l} \wedge\left(d * F_{l}-J_{l}\right)+d\left(\delta \omega^{i} \wedge * F_{i}\right)
$$

Definition: $\omega$ satisfies the field equations per $L$ provided $\forall \ell$,

$$
d * F_{\ell}=J_{\ell}
$$

[Note: Matters are consistent in that

$$
\left.\frac{\partial L}{\partial \omega^{l}}=-J_{\ell} \text { and } \frac{\partial L}{\partial d \omega}{ }^{l}=* F_{\ell \cdot}\right]
$$

Reality Check Take $\rho_{1}=0, \rho_{3}=0$ - then the claim is that the field equations per $\mathrm{L}_{2}$ derived earlier agree with those obtained above. For, in this situation,

$$
\begin{aligned}
F_{i} & =\rho_{2}{ }^{2} \omega_{i}\left(\omega_{j} \wedge C^{j}\right) \\
& =\rho_{2}{ }_{\omega_{i}}\left(d \omega_{j} \wedge \omega^{j}\right) \\
& =\rho_{2}(-1)^{l}(-1)^{3(n-3)}{ }_{\omega_{i}} * *\left(d \omega_{j} \wedge \omega^{j}\right) \\
& =\rho_{2}(-1)^{\imath}(-1)^{3(n-3)} *\left(*\left(d \omega_{j} \wedge \omega^{j}\right) \wedge \omega_{i}\right) \\
& =\rho_{2}(-1)^{\imath}(-1)^{3(n-3)}(-1)^{n-3} *\left(\omega_{i} \wedge *\left(d \omega_{j} \wedge \omega^{j}\right)\right) \\
& =\rho_{2}(-1)^{l}(-1)^{(n-3)(3+1)} *\left(\omega_{i} \wedge *\left(d \omega_{j} \wedge \omega^{j}\right)\right) \\
& =\rho_{2}(-1)^{l} *\left(\omega_{i} \wedge *\left(d \omega_{j} \wedge \omega^{j}\right)\right) \\
\Rightarrow \quad &
\end{aligned}
$$

$$
d * F_{i}=\rho_{2}\left(d \omega_{i} \wedge *\left(d \omega_{j} \wedge \omega^{j}\right)-\omega_{i} \wedge d *\left(d \omega_{j} \wedge \omega^{j}\right)\right)
$$

Therefore

$$
\begin{aligned}
& \rho_{2}\left[-2 \omega_{i} \wedge d *\left(d \omega_{j} \wedge \omega^{j}\right)+2 d \omega_{i} \wedge *\left(d \omega_{j} \wedge \omega^{j}\right)\right. \\
& +{ }_{\imath_{i}}\left(\left(d \omega_{j} \wedge \omega^{j}\right) \wedge *\left(d \omega_{k} \wedge \omega^{k}\right)\right) \\
& \left.-2{ }_{\omega_{i}} d \omega_{j} \wedge \omega^{j} \wedge *\left(d \omega_{k} \wedge \omega^{k}\right)\right] \\
& =2 d * F_{i} \\
& +\rho_{2}\left[{ }_{t_{i}} \omega_{i}\left(\left(d \omega_{j} \wedge \omega^{j}\right) \wedge *\left(d \omega_{k} \wedge \omega^{k}\right)\right)\right. \\
& \left.-2 \imath_{\omega_{i}} d \omega_{j} \wedge \omega^{j} \wedge *\left(d \omega_{k} \wedge \omega^{k}\right)\right] \\
& =2 \mathrm{~d} * \mathrm{~F}_{\mathrm{i}} \\
& +\rho_{2}\left[\imath_{\omega_{i}}\left(\left(d \omega^{j} \wedge \omega_{j}\right) \wedge *\left(d \omega_{k} \wedge \omega^{k}\right)\right)\right. \\
& \left.-2{ }_{\omega_{i}} d \omega^{j} \wedge \omega_{j} \wedge *\left(d \omega_{k} \wedge \omega^{k}\right)\right] \\
& =2 \mathrm{~d} * \mathrm{~F}_{\mathrm{i}} \\
& +\rho_{2}\left({ }_{\omega_{i}} d \omega^{j} \wedge \omega_{j}+d \omega^{j} \wedge t_{\omega_{i}} \omega_{j}\right) \wedge *\left(d \omega_{k} \wedge \omega^{k}\right) \\
& -\rho_{2}\left(d \omega^{j} \wedge \omega_{j}\right) \wedge t_{\omega_{i}} *\left(d \omega_{k} \wedge \omega^{k}\right) \\
& -2 \rho_{2}{ }^{l} \omega_{i} d \omega^{j} \wedge \omega_{j} \wedge *\left(d \omega_{k} \wedge \omega^{k}\right)
\end{aligned}
$$

$$
\begin{aligned}
& =2 d_{*} F_{i} \\
& +l_{\omega_{i}} C^{j} \wedge * F_{j}+\rho_{2} d \omega_{i} \wedge *\left(d \omega_{k} \wedge \omega^{k}\right) \\
& -\rho_{2}\left(d \omega_{j} \wedge \omega^{j}\right) \wedge l_{\omega_{i}} *\left(d \omega_{k} \wedge \omega^{k}\right) \\
& -2{ }_{i} \omega_{i}{ }^{C^{j}}{ }_{\wedge *} F_{j} \\
& =2 d * F_{i}-{ }^{\imath} \omega_{i} \mathcal{C}^{j}{ }_{\wedge *} F_{j} \\
& +\rho_{2} d \omega_{i} \wedge *\left(d \omega_{k} \wedge \omega^{k}\right) \\
& -\rho_{2}\left(\mathrm{~d} \omega_{j} \wedge \omega^{j}\right) \wedge \imath_{i} *\left(d \omega_{k} \wedge \omega^{k}\right) .
\end{aligned}
$$

But

$$
\begin{aligned}
& \mathcal{C}^{j} \wedge l_{\omega_{i}} * F_{j} \\
& =c^{j} \wedge \rho_{2}{ }^{\imath} \omega_{i}\left(\omega_{j} \wedge *\left(d \omega_{k} \wedge \omega^{k}\right)\right) \\
& =\rho_{2}{ }^{\mathcal{C}^{\mathrm{j}}} \omega_{i} \omega_{j} \wedge *\left(\mathrm{~d} \omega_{k} \wedge \omega^{k}\right) \\
& -\rho_{2} \mathcal{C}^{j} \wedge \omega_{j} \wedge{ }^{\wedge} \omega_{i} *\left(d \omega_{k} \wedge \omega^{k}\right) \\
& =\rho_{2} C_{i} \wedge *\left(d \omega_{k} \wedge \omega^{k}\right) \\
& -\rho_{2} \mathcal{C}^{j} \wedge \omega_{j} \wedge l_{\omega_{i}} *\left(d \omega_{k} \wedge \omega^{k}\right)
\end{aligned}
$$

$$
\begin{aligned}
&=\rho_{2} d \omega_{i} \wedge *\left(d \omega_{k} \wedge \omega^{k}\right) \\
&-\rho_{2}\left(d \omega_{j} \wedge \omega^{j}\right) \wedge \tau_{\omega_{i}} *\left(d \omega_{k} \wedge \omega^{k}\right) .
\end{aligned}
$$

Inserting this then leads to

$$
2 d * F_{i}-{ }_{\omega_{i}} c^{j}{ }_{\wedge * F_{j}}+C^{j}{ }_{\wedge} \omega_{i} * F_{j}
$$

or still,

$$
\begin{aligned}
& 2 d * F_{i}-{ }_{\omega_{i}} c^{C^{j}}{ }_{\wedge *} F_{j} \\
& +{ }_{\omega_{i}}\left(\mathcal{C}^{j} \wedge \star F_{j}\right)-{ }_{\omega_{i}} \mathcal{C}^{j}{ }_{\wedge * F_{i}} \\
& =2\left(d * F_{i}-{ }^{\imath} \omega_{i} C_{j} \wedge * F^{j}+\frac{1}{2}{ }^{l} \omega_{i}\left(C_{j} \wedge * F^{j}\right)\right) \\
& =2\left(\mathrm{~d} * F_{i}-{ }^{\imath} \omega_{i} C_{j} \wedge \star F^{j}+{ }^{\imath} \omega_{i}{ }^{L}\right) \\
& =2\left(\mathrm{~d}_{*} F_{i}-J_{i}\right),
\end{aligned}
$$

from which the claim.
Remark: In $G R|\mid$, the field equations

$$
d \star F_{l}=J_{l} \quad(\ell=1, \ldots, n)
$$

are equivalent to the vanishing of $\operatorname{Ein}(\mathrm{g})$.
The $J^{l}$ are $(n-1)$-forms and the collection $\left\{J^{1}, \ldots, J^{n}\right\}$ is called the energymomentum current attached to $\omega$.

LEMMA We have

$$
J_{\ell}^{\ell}=\left(2-\frac{n}{2}\right) C_{i} \wedge_{*} F^{i}
$$

[In fact,

$$
\begin{aligned}
& J_{\ell}^{\ell}{ }^{\star I}=\omega^{\ell} \wedge J_{\ell} \\
& =\omega^{\ell} \wedge\left({ }_{2} \omega_{l} C_{i} \wedge \star F^{i}-{ }^{2} \omega_{l}{ }^{L}\right) \\
& =\left(\omega^{\ell} \wedge \tau \omega_{l} C_{i}\right) \wedge * F^{i}-\omega^{\ell} \wedge \imath \omega_{l}^{L} \\
& =2 C_{i} \wedge \star F^{i}-n L \\
& =2 C_{i} \wedge * F^{i}-\frac{n}{2} C_{i} \wedge * F^{i} \\
& \left.=\left(2-\frac{n}{2}\right) C_{i} \wedge \star F^{i} .\right]
\end{aligned}
$$

Application: If $\mathrm{n}=4$, then $\mathrm{J}_{\ell}^{\ell}=0$.
Let

$$
E_{\ell}=d * F_{l}-J_{l} .
$$

Then

$$
{ }^{\imath} \omega_{l} E^{l}=E^{[l k]} *\left(\omega_{k} \wedge \omega_{l}\right) .
$$

FACT We have

$$
E^{[\ell k]}=-2\left(\rho_{1}-2 \rho_{2}-\rho_{3}\right) A_{[\ell k]}+\left(2 \rho_{2}+\rho_{3}\right) B_{[\ell k]}
$$

So, if $\rho_{1}=0$ and $2 \rho_{2}+\rho_{3}=0$, then $E^{[\ell k]}=0$.
[Note: This applies to $\mathrm{GR}_{\|} \|^{\text {.] }}$

Section 47: Lovelock Gravity Let $M$ be a connected $C^{\infty}$ manifold of dimension $n$. Assume: $M$ is parallelizable. Definition: The $p^{\text {th }}$ Lovelock lagrangian is the function

$$
L_{p}: \operatorname{cof}_{M} \rightarrow \Lambda^{n} M
$$

given by

$$
L_{p}(\omega)=\frac{1}{2} \Omega_{i_{1} j_{1}} \wedge \ldots \wedge \Omega_{i_{p} j_{p}} \wedge \theta \theta^{i_{1} j_{l} \cdots i_{p} j_{p}} \quad(2 p \leq n)
$$

[Note: Conventionally, $\mathrm{L}_{0}(\omega)=\frac{1}{2} \mathrm{vol}_{\mathrm{g}}$, where, as before,

$$
\left.g=-\omega^{l} \otimes \omega^{1}-\cdots-\omega^{k} \otimes \omega^{k}+\omega^{k+1} \otimes \omega^{k+1}+\cdots+\omega^{n} \otimes \omega^{n} \cdot\right]
$$

Rappel: The

$$
E(p)_{k}=\Omega_{i_{l} j_{1}} \wedge \ldots \wedge \Omega_{i_{p} j_{p}} \wedge \theta{ }^{i_{l} j_{1} \cdots i_{p} j_{p}}{ }_{k} \quad(k=1, \ldots, n)
$$

are the Lovelock ( $\mathrm{n}-1$ )-forms.
[Note: Recall that

$$
\left.E(\mathrm{p})_{k}=-2\left(\mathrm{G}_{\mathrm{p}}\right)_{k} \ell^{* \omega^{\ell}} \cdot\right]
$$

LEMMA Fix $p \geq 1(n \geq 2 p)$-- then

$$
\begin{aligned}
\delta L_{p}= & \frac{1}{2} \delta \omega^{k} \wedge E(\mathrm{p})_{k} \\
& +\frac{p}{2} d\left(\delta \omega_{i_{1} j_{1}} \wedge \Omega_{i_{2} j_{2}} \wedge \ldots \wedge \Omega_{i_{p} j_{p}} \wedge \theta^{i_{1} j_{1} \ldots i_{p} j_{p}}\right)
\end{aligned}
$$

The case $p=1$ was treated in the last section. There we saw that

$$
\delta L_{1}=\frac{1}{2} \delta \omega^{k} \wedge \Omega_{i j} \wedge \theta_{k}^{i j}+\frac{1}{2} d\left(\delta \omega_{i j} \wedge \theta^{i j}\right)
$$

And

$$
\begin{aligned}
\frac{1}{2} \Omega_{i j} \theta^{i j} & =-*\left(R_{k} c_{k}-\frac{1}{2} S(g) g_{k}\right) \\
& =-*\left(R_{k} \ell^{\omega^{\ell}}-\frac{1}{2} S(g) g_{k} \ell^{\omega}{ }^{\ell}\right) \\
& =-\left(G_{1}\right)_{k \ell^{*} \omega^{\ell}} \\
& =\frac{1}{2} \Xi(1)_{k}
\end{aligned}
$$

Proceeding by iteration, take $\mathrm{p}=2$ - then

$$
\begin{aligned}
\delta L_{2} & =\frac{1}{2} \delta\left(\Omega_{i_{1} j_{1}} \wedge \Omega_{i_{2} j_{2}}\right. \\
& \left.\wedge \theta^{i_{1} j_{1} i_{2} j_{2}}\right) \\
= & \frac{1}{2} \delta\left(\Omega_{i_{1} j_{1}} \wedge \Omega_{i_{2} j_{2}}\right) \wedge \theta^{i_{1} j_{1} i_{2} j_{2}} \\
& +\frac{1}{2} \Omega_{i_{1} j_{1}} \wedge \Omega_{i_{2} j_{2}} \wedge \delta\left(\theta^{i_{1} j_{1} i_{2} j_{2}}\right)
\end{aligned}
$$

But

$$
\begin{aligned}
& \Omega_{i_{1} j_{1}}{ }^{\wedge \Omega_{i_{2}} j_{2} \wedge \delta\left(\theta^{i_{1} j_{1} i_{2} j_{2}}\right)} \\
& \quad=\Omega_{i_{1} j_{1}}{ }^{\wedge \Omega_{i_{2}} j_{2}}{ }^{\wedge \delta \omega^{k} \wedge \theta^{i_{1} j_{1} i_{2} j_{2}}} k \\
& \quad=\delta \omega^{k} \wedge \Omega_{i_{1} j_{1}}{ }^{\wedge \Omega_{i_{2}} j_{2}}{ }^{\wedge \theta^{i_{1} j_{1} i_{2} j_{2}}} k
\end{aligned}
$$

$$
=\delta \omega^{k} \wedge \Xi(2) k .
$$

As for what remains, observe first that

$$
\begin{aligned}
& \delta\left(\Omega_{i_{1} j_{1}} \wedge_{\mathrm{i}_{2} \mathrm{j}_{2}}\right) \wedge \theta^{\mathrm{i}_{1} \mathrm{j}_{1} \mathrm{i}_{2} \mathrm{j}_{2}} \\
& =\left(\delta \Omega_{i_{1} j_{1}} \wedge \Omega_{i_{2} j_{2}}+\Omega_{i_{1} j_{1}}{ }^{\wedge \delta \Omega_{i_{2} j_{2}}}\right)^{\wedge \theta^{i_{1} j_{1} i_{2} j_{2}}} \\
& =\delta \Omega_{i_{1} j_{1}} \wedge \Omega_{i_{2} j_{2}} \wedge \theta^{i_{1} j_{1} i_{2} j_{2}} \\
& +\Omega_{i_{2} j_{2}}{ }^{\wedge \delta \Omega_{i_{1}} j_{1}}{ }^{\wedge \theta}{ }^{i_{2} j_{2} i_{1} j_{1}} \\
& =\delta \Omega_{i_{1} j_{1}} \wedge_{i_{2} j_{2}} \wedge \theta^{i_{1} j_{1} i_{2} j_{2}} \\
& +\delta \Omega_{i_{1} j_{1}}{ }^{\wedge \Omega_{i_{2}} j_{2}}{ }^{\wedge \theta}{ }^{i_{2} j_{2} i_{1} j_{1}} \\
& =\delta \Omega_{i_{1} j_{1}} \wedge \Omega_{i_{2} j_{2}}{ }^{\mathrm{i}_{1} \mathrm{j}_{1} \mathrm{i}_{2} \mathrm{j}_{2}} \\
& +\delta \Omega_{i_{1} j_{1}} \wedge_{i_{i_{2}} j_{2}} \wedge \theta^{i_{1} j_{1} i_{2} j_{2}} \\
& =2\left(\delta \Omega_{i_{1} j_{1}} \wedge \Omega_{i_{2} j_{2}} \wedge \theta^{i_{1} j_{1}{ }_{1}{ }_{2}{ }^{j}{ }_{2}}\right) .
\end{aligned}
$$

And

$$
\delta \Omega_{i_{1} j_{1}}{ }^{\wedge \Omega_{i_{2}} j_{2}}{ }^{\wedge \theta}{ }^{i_{1} j_{1} i_{2} j_{2}}
$$

$$
\begin{aligned}
& 4 . \\
& =\delta\left(d \omega_{i_{1} j_{1}}+\omega_{i_{1} k} k^{\wedge \omega^{k}}{ }_{j_{l}}\right) \wedge \Omega_{i_{2} j_{2}} \wedge \theta{ }^{i_{1} j_{1} i_{2} j_{2}} \\
& =\left(d \delta \omega_{i_{1} j_{1}}+\delta \omega_{i_{1}} k^{\wedge \omega^{k}}{ }_{j_{1}}+\omega_{i_{1} k^{\wedge}}{ }^{\wedge} \omega^{k}{ }_{j_{1}}\right)
\end{aligned}
$$

$$
\begin{aligned}
& =d \delta \omega_{i_{1} j_{l}}{ }^{\wedge \Omega_{i_{2}} j_{2}}{ }^{\wedge \theta^{i_{1} j_{1} i_{2} j_{2}}}
\end{aligned}
$$

Now write

$$
\begin{aligned}
& d\left(\delta \omega_{\dot{i}_{1} j_{l}}{ }^{\wedge \Omega_{i_{2}} j_{2}}{ }^{\wedge \theta}{ }^{\dot{i}_{1} \dot{j}_{1} \dot{i}_{2} \dot{j}_{2}}\right) \\
& =d \delta \omega_{\dot{i}_{1} \dot{j}_{l}}{\wedge \Omega_{i_{2}} j_{2}}^{\wedge \theta}{ }^{\dot{i}_{1} \dot{j}_{1} \dot{i}_{2} \dot{j}_{2}} \\
& \left.-\delta \omega_{i_{1}} j_{1}{ }^{\wedge d\left(\Omega_{i_{2}} j_{2}\right.}{ }^{\wedge \theta_{1} j_{1} i_{2} j_{2}}\right) \\
& =d \delta \omega_{i_{1} j_{1}}{ }^{\wedge \Omega_{i_{2}}} j_{2}{ }^{\wedge \theta}{ }^{i_{1} j_{1} i_{2} j_{2}}
\end{aligned}
$$

Then this already accounts for

$$
\mathrm{d} \delta \omega_{i_{1} j_{1}} \wedge \Omega_{i_{2} j_{2}}{ }^{\wedge \theta}{ }^{i_{1} \dot{j}_{1} i_{2} j_{2}} .
$$

To see how the other terms are taken care of, express

$$
d \theta \theta_{1}^{i_{1} j_{1} i_{2} j_{2}}
$$

as

$$
\begin{aligned}
& -\omega^{i_{1}}{ }_{k}{ }^{\wedge *}\left(\omega^{k}{ }^{k}{ }^{j_{1}}{ }^{1}{ }_{\Lambda \omega}{ }^{i_{2}}{ }_{\wedge \omega}{ }^{j_{2}}\right) \\
& \left.-\omega^{j_{1}}{ }_{k}{ }^{\wedge *\left(\omega^{i}\right.}{ }^{i_{\Lambda \omega}}{ }^{k}{ }_{\Lambda \omega}{ }^{i_{2}}{ }_{\wedge \omega}{ }^{j_{2}}\right) \\
& \left.-\omega^{i_{2}}{ }_{k \wedge *\left(\omega^{i} l^{i}\right.}{ }^{j_{1}}{ }^{1}{ }_{\Lambda \omega}{ }^{k}{ }_{\Lambda \omega}{ }^{j_{2}}\right) \\
& \left.-\omega^{j_{2}}{ }_{k}{ }^{i *(\omega}{ }^{i} l_{\Lambda \omega}{ }^{j} l_{\Lambda \omega}{ }^{i}{ }_{2}{ }_{\Lambda \omega}{ }^{k}\right) .
\end{aligned}
$$

1. 

$$
\begin{aligned}
& \delta \omega_{i_{1} j_{1}}{ }^{\wedge \Omega_{i_{2}} j_{2}}{ }^{\wedge \omega}{ }^{i_{1}}{ }_{k} \wedge *\left(\omega{ }^{k}{ }_{\wedge \omega}{ }^{j_{1}}{ }_{\wedge \omega}{ }^{i_{2}}{ }_{\Lambda \omega}{ }^{j_{2}}\right)
\end{aligned}
$$

$$
\begin{aligned}
& =\delta \omega_{k i_{1}}{ }^{\wedge \Omega_{i_{2}} j_{2}}{ }^{\wedge \omega}{ }^{k}{ }_{j_{1}}{ }_{1}{ }^{*}\left(\omega^{j_{1}}{ }_{\Lambda \omega}{ }^{i_{1}}{ }_{\Lambda \omega}{ }^{i_{2}}{ }_{\Lambda \omega}{ }^{j_{2}}\right) \\
& \left.=\delta \omega_{i_{1}} k^{\wedge \Omega_{i_{2}} j_{2}}{ }^{\wedge \omega}{ }^{k}{ }_{j_{1}}{ }^{\wedge *(\omega}{ }^{i_{1}}{ }_{\Lambda \omega}{ }^{j_{1}}{ }_{\wedge \omega}{ }^{i_{2}}{ }_{\Lambda \omega}{ }^{j_{2}}\right) \\
& =\delta \omega_{i_{1}}{ }^{\wedge \omega}{ }^{k}{ }_{j_{1}} \wedge_{i_{i_{2}} j_{2}} \wedge \theta^{i_{1} j_{1} i_{2} j_{2}} .
\end{aligned}
$$

2. 

$$
\begin{aligned}
& \delta \omega_{i_{1} j_{1}}{ }^{\wedge \Omega_{i_{2}} j_{2}}{ }^{\wedge \omega}{ }^{j_{1}}{ }_{k} \wedge *\left(\omega^{i_{1}}{ }_{\Lambda \omega} k_{\Lambda \omega}{ }^{i_{2}}{ }_{\Lambda \omega}{ }^{j_{2}}\right) \\
& \left.=\delta \omega_{i_{1} k}{ }^{\wedge \Omega_{i_{2}} j_{2}}{ }^{\wedge \omega}{ }^{k}{ }_{j_{1}}{ }^{\wedge *(\omega}{ }^{i_{1}}{ }_{\wedge \omega}{ }^{j_{1}}{ }_{\Lambda \omega}{ }^{i_{2}}{ }_{\wedge \omega}{ }^{j_{2}}\right) \\
& =-\omega^{k}{ }_{j_{1}} \wedge \delta \omega_{i_{1}} k^{\wedge \Omega_{i_{2}} j_{2}}{ }^{\wedge *}\left(\omega^{i_{1}}{ }_{\wedge \omega}{ }^{j_{1}}{ }_{\wedge \omega}{ }^{i_{2}}{ }_{\wedge \omega}{ }^{j_{2}}\right) \\
& \left.=-\omega_{k j_{1}} \wedge \delta \omega_{i_{1}}{ }^{k_{\wedge \Omega}}{ }_{\mathrm{i}_{2} \dot{j}_{2}}{ }^{\wedge *}{ }^{\mathrm{i}_{1}}{ }^{1}{ }_{\wedge \omega}{ }^{\mathrm{j}_{1}}{ }_{\wedge \omega}{ }^{\mathrm{i}_{2}}{ }_{\wedge \omega}{ }^{\mathrm{j}_{2}}\right) \\
& \left.=\omega_{k j_{1}} \wedge \delta \omega^{k}{ }_{i_{1}}{ }^{\wedge \Omega_{i_{2}} j_{2}}{ }^{\wedge *\left(\omega^{i} l^{\prime}\right.}{ }_{\Lambda \omega}{ }^{j_{1}}{ }_{\Lambda \omega}{ }^{i_{2}}{ }_{\wedge \omega}{ }^{j_{2}}\right) \\
& =\omega_{k i_{1}} \wedge \delta \omega^{k}{ }_{j_{1}}{ }^{\wedge \Omega_{i_{2}} j_{2}}{ }^{\wedge *\left(\omega^{j}{ }^{1}{ }_{\wedge \omega}{ }^{i_{1}}{ }_{\Lambda \omega}{ }^{i_{2}}{ }_{\wedge \omega}{ }^{j_{2}}\right)} \\
& \left.=\omega_{i_{1} k^{\wedge \Lambda \omega}}{ }_{j_{1}}{ }^{\wedge \Omega}{\mathbf{i}_{2} j_{2}}^{\wedge *\left(\omega^{i_{1}}\right.}{ }_{\wedge \omega}{ }^{j_{1}}{ }_{\wedge \omega}{ }^{i_{2}}{ }_{\wedge \omega}{ }^{j_{2}}\right) \\
& =\omega_{i_{1} k^{\wedge \delta \omega^{\prime}}}^{j_{1}}{ }^{\wedge \Omega_{i_{2}} j_{2}}{ }^{\wedge \theta_{1} \dot{j}_{1} \dot{i}_{2} j_{2}} .
\end{aligned}
$$

So, to finish the verification, we must show that

$$
\begin{gathered}
-\delta \omega_{i_{1} j_{1}} \wedge d_{\Omega_{i_{2}} j_{2}}^{\wedge \theta^{i_{1} j_{1} i_{2} j_{2}}} \\
+\delta \omega_{i_{1} j_{1}}^{\wedge \Omega_{i_{2}} j_{2}}
\end{gathered}
$$

$$
\begin{aligned}
& \left.\left.\wedge\left(\omega{ }_{k}^{i_{2}}{ }_{k *(\omega}{ }^{i_{1}}{ }_{\wedge \omega}{ }^{j_{1}}{ }_{\wedge \omega}{ }^{k}{ }_{\wedge \omega} \dot{j}_{2}\right)+\omega^{j_{2}}{ }_{k} \wedge *(\omega){ }^{i_{1}}{ }_{\wedge \omega} \dot{j}_{1}{ }_{\wedge \omega}^{i_{2}}{ }_{\wedge \omega}{ }^{k}\right)\right) \\
& \quad=0
\end{aligned}
$$

the key being that

$$
\begin{aligned}
& -d \Omega_{\dot{i}_{2} j_{2}}{ }^{\wedge \theta}{ }^{i_{1} j_{1} i_{2} j_{2}} \\
& =-\left(\Omega_{i_{2} k^{\wedge \omega}}{ }_{j_{2}}-\omega_{i_{2} k^{\wedge}} \Omega_{j_{2}}^{k}\right) \wedge \theta^{i_{1} j_{1} i_{2} j_{2}}
\end{aligned}
$$

3. 

$$
\begin{aligned}
& \Omega_{j_{2}}^{k} \wedge \omega_{i_{2} k} \wedge \theta^{i_{1} j_{1} i_{2} j_{2}} \\
& \left.=\Omega_{j_{2}}{ }^{\wedge \omega_{i_{2} k} \wedge *}{ }^{i^{i_{1}}}{ }_{\wedge \omega \omega}{ }^{j_{1}}{ }_{\wedge \omega}{ }^{i_{2}}{ }_{\wedge \omega}{ }^{j_{2}}\right) \\
& \left.=\Omega_{k j_{2}}{ }^{\wedge \omega}{ }_{i_{2}}{ }^{k_{\wedge *}}{ }^{i^{i}} l_{\wedge \omega}{ }^{j_{1}}{ }_{\wedge \omega}{ }^{i_{2}}{ }_{\wedge \omega}{ }^{j_{2}}\right)
\end{aligned}
$$

4. 

$$
-\Omega_{i_{2} k} \wedge \omega^{k} j_{2}^{\wedge \theta}{ }^{i_{1} j_{1} \dot{i}_{2} \dot{j}_{2}}
$$

$$
\begin{aligned}
& \left.=-\Omega_{i_{2} k^{\wedge \omega}}{ }_{j_{2}}{ }_{2 *(\omega}{ }^{i_{1}}{ }_{\wedge \omega}{ }^{j_{1}}{ }_{\wedge \omega} i_{2}{ }_{\wedge \omega}{ }^{j_{2}}\right) \\
& =-\Omega_{i_{2} j_{2}}{ }^{\wedge \omega}{ }^{j_{2}}{ }_{k} \wedge *\left(\omega^{i_{1}}{ }_{\wedge \omega}{ }^{j_{1}}{ }_{\wedge \omega}{ }^{i_{2}}{ }_{\Lambda \omega}{ }^{k}\right) .
\end{aligned}
$$

Thus the terms in question do in fact cancel one another.
Remark: The condition on $p \geq 1$ is that $2 p \leq n$. If $n=2 p$, then $E\left(\frac{n}{2}\right)=0$, hence $\delta \mathrm{L}_{\frac{\mathrm{n}}{2}}$ is exact.
[Note: This also follows from an earlier observation, viz. that $I_{\frac{n}{2}}$ itself is exact:

$$
\begin{aligned}
& L_{p}=(4 \pi)^{p} P_{p!d I_{p}} \\
& \Rightarrow \quad(n=2 p) \\
& \delta L_{p}=(4 \pi) P_{\left.p!d \delta \Pi_{p} .\right]} \quad
\end{aligned}
$$

Notation: Let

$$
\sigma(p)_{i}=-\omega^{j k^{j}} \theta_{i j k i_{2} j_{2}} \ldots i_{p} j_{p} \wedge^{i_{2} j_{2}} \wedge \ldots \wedge \Omega^{i_{p} j_{p}}
$$

and

$$
\begin{gathered}
\tau(p)_{i}=\left(\omega_{i}^{j} j_{\Lambda \omega}^{k \ell} \wedge \theta_{\left.j k \ell i_{2} j_{2} \ldots i_{p} j_{p}-\omega^{j} \ell^{\wedge \omega}{ }^{l k} \theta_{i j k i_{2} j_{2} \ldots i_{p} j_{p}}\right)}^{{ }_{\wedge \Omega}{ }_{2} j_{2} \wedge \ldots \wedge \Omega^{i_{p} j_{p}}} .\right.
\end{gathered}
$$

[Note: Therefore

$$
\left[\begin{array}{l}
\quad \sigma(p)_{i} \in \Lambda^{n-2} M \\
\\
\left.\tau(p)_{i} \in \Lambda^{n-1} M \cdot\right]
\end{array}\right.
$$

LEMMA We have

$$
E(\mathrm{p})_{k}=\tau(\mathrm{p})_{k}-d \sigma(\mathrm{p})_{k}
$$

Definition: $\omega$ satisfies the field equations per $L_{p}$ provided $\forall k$,

$$
\Xi(\mathrm{p})_{k}=0
$$

[Note: In view of the lemma, this amounts to requiring that

$$
d \sigma(p)_{k}=\tau(p)_{k} \quad(k=1, \ldots, n)
$$

Reality Check Take $p=1$ - then

$$
\begin{aligned}
& \mathrm{do}(1)_{\mathrm{k}}=\tau(1)_{\mathrm{k}} \\
& \Leftrightarrow \\
& E(I)_{k}=0 \\
& \text { < }> \\
& \left(G_{1}\right)_{k \ell}=0 \\
& \Leftrightarrow \\
& R_{k \ell}-\frac{1}{2} S(g) g_{k \ell}=0
\end{aligned}
$$

<=>

$$
\operatorname{Ein}_{k}=0
$$

Therefore $\omega$ satisfies the field equations per $L_{1}$ iff $\operatorname{Ein}(g)=0$.

Remark: Suppose that the standard setup is in force -- then it would be of interest to transcribe the problem of the vanishing of $E(p)(1 \leq p)(n>2 p)$ to a time dependent issue on $\Sigma$. Thus, if $p=1$, the vanishing of $\Xi(1)$ is equivalent to the vanishing of $\operatorname{Ein}(g)$ and for this, one has the constraint equations and the evolution equations in $T^{*} Q$ or $T^{*} \underline{Q}$. Nothing this precise is known for $p>1$. If $p=2$, one can isolate the lagrangian as was done when $p=1$, but even in this situation, the passage to $T^{*} Q$ or $T^{*} \underline{\underline{Q}}$ along the lines that $I$ would like to see has never been carried out.

Section 48: The Palatini Formalism Let $M$ be a connected $C^{\infty}$ manifold of dimension $n>2$.

Assume: $M$ is parallelizable.
Rappel: con TM is an affine space with translation group $D_{2}^{1}(M)$.
Let con ${ }_{0}$ TM stand for the set of torsion free connections on TM.
Denote by $S_{2}^{1}(M)$ the subspace of $D_{2}^{1}(M)$ consisting of those 4 such that

$$
\mathrm{Y}(\Lambda, X, Y)=Y(\Lambda, Y, X)
$$

- Let $\nabla^{\prime}, \nabla^{\prime \prime} \in \operatorname{con}_{0}$ TM -- then the assignment

$$
\left[\begin{array}{c}
D_{1}(\mathrm{M}) \times D^{1}(\mathrm{M}) \times D^{1}(\mathrm{M}) \rightarrow C^{\infty}(\mathrm{M}) \\
(\Lambda, \mathrm{X}, \mathrm{Y}) \rightarrow \Lambda\left(\nabla_{\mathrm{X}}^{\mathrm{Y}}-\nabla_{\mathrm{X}}^{\mathrm{Y}} \mathrm{Y}\right)
\end{array}\right.
$$

defines an element of $S_{2}^{1}(\mathrm{M})$.
[In fact,

$$
\begin{aligned}
& \Lambda\left(\nabla_{\mathrm{X}}^{\prime} \mathrm{Y}-\nabla_{\mathrm{X}}^{\prime \prime \mathrm{Y}}\right) \\
& \quad=\Lambda\left(\nabla_{Y}^{\prime} \mathrm{X}+[\mathrm{X}, \mathrm{Y}]-\left(\nabla_{\mathrm{Y}}^{\prime \prime} \mathrm{X}+[\mathrm{X}, \mathrm{Y}]\right)\right) \\
& \left.\quad=\Lambda\left(\nabla_{Y}^{\prime} \mathrm{X}-\nabla_{\mathrm{Y}}^{\prime \prime \mathrm{X}}\right) .\right]
\end{aligned}
$$

- Let $\nabla \in \operatorname{con}_{0} T M$ - then $\forall \Psi \in S_{2}^{1}(M)$, the assignment

$$
\left[\begin{array}{l}
\quad D^{l}(\mathrm{M}) \times D^{l}(\mathrm{M}) \rightarrow D^{l}(\mathrm{M}) \\
(\mathrm{X}, \mathrm{Y})
\end{array}\right) \nabla_{\mathrm{X}} \mathrm{Y}+\mathrm{Y}(\mathrm{X}, \mathrm{Y}), ~ \$
$$

is a torsion free connection.
[In fact,

$$
\begin{aligned}
\nabla_{X} Y & +Y(X, Y)-\nabla_{Y} X-Y(Y, X) \\
& =\nabla_{X} Y-\nabla_{Y} X+Y(X, Y)-Y(Y, X) \\
& =[X, Y] .]
\end{aligned}
$$

Scholium: con ${ }_{0} T M$ is an affine space with translation group $S_{2}^{l}(M)$. Definition: Let $\nabla \in c o n_{0}$ TM - then a variation of $\nabla$ is a curve

$$
\varepsilon \rightarrow \nabla+\varepsilon Ч
$$

where $\mathrm{U} \in \mathrm{S}_{2}^{1}(\mathrm{M})$ has compact support.
Fix $\omega \in \operatorname{cof}_{M}$ and define

$$
\mathrm{L}_{\omega}: \text { con }_{0} \mathrm{TM} \rightarrow \Lambda^{\mathrm{n}} \mathrm{M}
$$

by

$$
L_{\omega}(\nabla)=\frac{1}{2} \Omega_{i j}(\nabla) \wedge \theta^{i j} .
$$

Here

$$
\Omega_{i j}(\nabla)
$$

is computed per $\nabla$ while

$$
\theta^{i j}=*\left(\omega^{i} \wedge \omega^{j}\right)
$$

is computed per $g \in M_{k, n-k}$ (conventions as in the previous section).
Remark: Actually, in the considerations that follow, it will be simplest to use the local representation of $L_{\omega^{\prime}}$ i.e.,

$$
L_{\omega}(\nabla)=\frac{1}{2} g^{i j_{R i c}(\nabla)_{i j}}{ }_{g o l} .
$$

Of course, in this context, the indices refer to a chart ( $\mathrm{U},\left\{\mathrm{x}^{1}, \ldots, \mathrm{x}^{n}\right\}$ ).
[Note: As a map,

$$
\text { Ric: } \text { con }_{0} \mathrm{TM} \rightarrow D_{2}^{0}(\mathrm{M})
$$

but Ric( $\nabla$ ) need not be symmetric.]
Let $R^{\mathrm{i}}{ }_{j k \ell}(\nabla+\varepsilon Y)$ be the curvature components of $\nabla+\varepsilon \Psi$.

LEMMA We have

$$
\begin{aligned}
& \left.\frac{d}{d \varepsilon} R^{i}{ }_{j k \ell}(\nabla+\varepsilon \Psi)\right|_{\varepsilon=0} \\
& =\partial_{k}{ }^{\Psi^{i}} \ell{ }_{l}-\partial_{\ell}{ }^{\Psi^{i}}{ }_{k j} \\
& +Y^{\mathrm{a}}{ }_{\ell j} \Gamma^{\mathrm{i}}{ }_{k a}+\Gamma_{\ell j}^{\mathrm{a}} \mathrm{Y}^{\mathrm{i}}{ }_{k a}-Y^{\mathrm{a}}{ }_{k j} \Gamma^{\mathrm{i}}{ }_{\ell a}-\Gamma_{k j}^{\mathrm{a}} \mathrm{Y}^{\mathrm{i}}{ }_{\ell \mathrm{a}} \cdot
\end{aligned}
$$

[In fact,

$$
\begin{aligned}
& \mathrm{R}^{\mathrm{i}}{ }_{\mathrm{jk} \ell}(\nabla+\varepsilon 4) \\
& =\partial_{k} \Gamma^{i}{ }_{\ell j}(\nabla+\varepsilon \Psi)-\partial_{\ell} \Gamma^{i}{ }_{k j}(\nabla+\varepsilon \Psi) \\
& +\Gamma_{\ell j}^{a}(\nabla+\varepsilon \varphi) \Gamma_{k a}^{i}(\nabla+\varepsilon \varphi) \\
& -\Gamma_{k j}^{a}(\nabla+\varepsilon \Psi) \Gamma_{\ell a}^{i}(\nabla+\varepsilon \Psi) .
\end{aligned}
$$

But, from the definitions,

$$
\Gamma_{b c}^{a}(\nabla+\varepsilon \Psi)=\Gamma_{b c}^{a}(\nabla)+\varepsilon 4_{b c}^{a}
$$

Therefore

$$
\begin{aligned}
& \left.\frac{d}{d \varepsilon} R_{j k \ell}^{i}{ }_{j}(\nabla+\varepsilon \Psi)\right|_{\varepsilon=0} \\
& \quad=\partial_{k} \Psi_{\ell j}^{i}-\partial_{\ell} \Psi^{i}{ }_{k j} \\
& +4_{\ell j}^{a} \Gamma_{k a}^{i}+\Gamma_{\ell j}^{a} \Psi_{k a}^{i}-4_{k j}^{a} \Gamma_{l a}^{i}-\Gamma_{k j}^{a} \Psi^{i} l a
\end{aligned}
$$

as contended.]

Application: We have

$$
\begin{aligned}
& \left.\frac{d}{d \varepsilon} \operatorname{Ric}(\nabla+\varepsilon \Psi) j \ell\right|_{\varepsilon=0} \\
& =\left.\frac{d}{d \varepsilon} R_{j i \ell}^{i}(\nabla+\varepsilon \Psi)\right|_{\varepsilon=0} \\
& =\partial_{k}{ }^{4}{ }_{\ell j}-\partial_{\ell}{ }^{U^{k}}{ }_{k j}
\end{aligned}
$$

$$
\begin{aligned}
& =\partial_{k}{ }^{4}{ }^{k} j \ell-\partial_{l}{ }^{4^{k}} j k
\end{aligned}
$$

$$
+\Gamma_{\ell k}^{a} \mathrm{U}^{\mathrm{k}}{ }_{j a}-\Gamma_{k l^{\mathrm{Y}^{k}}}^{\mathrm{k} a}
$$

[Note: Since $\nabla$ is torsion free, $\Gamma$ is symmetric in its covariant indices (by construction, the same holds for $Ч$ ).]

$$
\begin{aligned}
& \text { Rappel: } \forall T \in \mathcal{D}_{2}^{l}(\mathrm{M}) \text {, } \\
& \nabla_{d} T^{C}{ }_{a b}=\partial_{d}{ }^{C}{ }_{a b} \\
& +\Gamma^{C}{ }_{d e}{ }^{T T^{e}}{ }_{a b}-\Gamma^{e}{ }_{d a^{T}}{ }^{C}{ }_{e b}-\Gamma^{e}{ }_{d b}{ }^{T}{ }^{c}{ }_{a e} . \\
& \text { - } \nabla_{k} प^{k}{ }_{j \ell}=\partial_{k} प^{k}{ }_{j \ell} \\
& +\Gamma_{k a}^{k} \mathrm{C}_{j \ell}^{\mathrm{a}}-\Gamma_{k j}^{\mathrm{a}} \mathrm{H}^{\mathrm{k}}{ }_{a \ell}-\Gamma_{k \ell}^{\mathrm{a}} \mathrm{Y}^{\mathrm{k}}{ }_{j a} . \\
& --\nabla_{\ell}{ }^{\mathrm{u}^{k}}{ }_{j k}=-\partial_{\ell}{ }^{\mathrm{L}}{ }_{j k} \\
& -\Gamma_{l a}^{k} Y^{\mathrm{a}}{ }_{j k}+\Gamma_{\ell j}^{\mathrm{a}} \mathrm{Y}^{\mathrm{k}}{ }_{a k}+\Gamma_{\ell k}^{a} \mathrm{Y}^{\mathrm{k}}{ }_{j a} .
\end{aligned}
$$

Therefore

$$
\left.\frac{d}{d \varepsilon} \operatorname{Ric}(\nabla+\varepsilon \Psi) j \ell\right|_{\varepsilon=0}=\nabla_{k} \mathrm{H}^{\mathrm{k}} j \ell-\nabla_{\ell} \mathrm{Y}^{\mathrm{k}}{ }_{j k} .
$$

Let $\nabla^{g}$ be the metric connection - then $\nabla^{g} E_{C o n_{0} T M, ~ h e n c e ~ t h e ~ d i f f e r e n c e ~}^{D}$ defined by

$$
\nabla=\nabla^{g}+D
$$

6. 

is in $S_{2}^{1}(M)$.

Observation:

$$
\begin{aligned}
& \nabla_{d}{ }^{C^{c}}{ }_{a b}=\nabla_{d}^{g_{U}{ }^{c}}{ }_{a b}+D^{c}{ }_{d e}{ }^{Y^{e}} a b \\
& -D^{e}{ }_{d b}{ }^{Y^{C}} a e-D^{e}{ }_{d a} Y^{C}{ }_{b e} .
\end{aligned}
$$

Consequently,

$$
\begin{aligned}
& \left.g^{j \ell} \frac{d}{d \varepsilon} \operatorname{Ric}(\nabla+\varepsilon प) j \ell\right|_{\varepsilon=0} \\
& =g^{j \ell}\left(\nabla_{k} \Psi^{k}{ }_{j \ell}-\nabla_{\ell} \mathrm{H}^{\mathrm{k}}{ }_{j k}\right) \\
& =g^{j \ell}\left(\nabla_{k}^{g_{\mathrm{Y}}{ }^{k}}{ }_{j \ell}+D^{\mathrm{k}}{ }_{k a} \mathrm{Y}^{\mathrm{a}}{ }_{j \ell}-\mathrm{D}_{k \ell}^{\mathrm{a}} \mathrm{Y}^{\mathrm{k}}{ }_{j a}-\mathrm{D}_{\mathrm{kj}} \mathrm{Y}^{\mathrm{k}} \ell \mathrm{a}\right. \\
& \left.-\nabla_{l}^{g^{4}{ }^{k}}{ }_{j k}-D_{l a}^{k}{ }^{4^{a}}{ }_{j k}+D^{a}{ }_{l k} \mathrm{U}^{k}{ }_{j a}+D^{a}{ }_{l j} \mathrm{U}^{\mathrm{k}}{ }_{k a}\right) \\
& =g^{j \ell}\left(\nabla_{k}^{g}{ }_{\mathrm{G}}^{\mathrm{k}}{ }_{j \ell}-\nabla_{\ell}^{g_{\mathrm{Y}}^{\mathrm{k}}}{ }_{j \mathrm{k}}\right)
\end{aligned}
$$

[Note: The term

$$
g^{j \ell}\left(\nabla_{\mathrm{k}}^{\mathrm{G}}{ }_{j \ell}^{\mathrm{k}}-\nabla_{\ell}^{\mathrm{g}}{ }_{j \mathrm{k}}^{\mathrm{k}}\right)
$$

is the divergence of a compactly supported vector field $X_{Y}$, hence integrates to zero.]

- $g^{j \ell_{D}^{a}}{ }_{\ell j}{ }^{4^{k}}{ }_{k a}$
$=g^{j l_{D}}{ }_{l j} g^{\mathrm{kb}} \mathrm{H}_{\mathrm{bka}}$

$$
=g^{j l_{\mathrm{D}} \mathrm{k}_{\ell j} g^{\mathrm{ab}} \mathrm{q}_{\text {bak }}}
$$

$$
=g^{b l_{D} k_{l_{b}} g^{a j_{Y_{j a k}}}}
$$

$$
=g^{b k_{D}^{l}}{ }_{k b} g^{a j_{4}}{ }_{j a l}
$$

$$
\begin{aligned}
& \text { - }-g^{j l_{D}}{ }_{k j}{ }^{\mathrm{Y}^{k}}{ }_{l a} \\
& =-g^{j \ell_{D}^{k}}{ }_{a j}{ }^{4^{a}}{ }_{l k} \\
& =-g^{k \ell}{ }^{j}{ }_{a k}{ }^{4^{a}} \ell j \\
& =-g^{k \ell}{ }_{D}^{j}{ }_{a k}{ }^{\text {r }}{ }_{j \ell} . \\
& \text { - }-g^{j l_{D} k}{ }_{l a}{ }^{4}{ }_{j k} \\
& =-g^{j k}{ }_{D}^{\ell}{ }_{k a^{4}}{ }^{\mathrm{a}}{ }_{j \ell} \\
& =-g^{\ell k}{ }_{D}{ }_{k a} \mathrm{Y}^{\mathrm{a}}{ }_{\ell j} \\
& =-g^{k \ell \ell_{D}^{j}}{ }_{a k}{ }^{\text {r }}{ }_{j \ell} .
\end{aligned}
$$

$$
\begin{aligned}
& =g^{b k_{D}}{ }_{b k^{\ell}}^{q^{a}} a l \\
& =g^{b k} D_{b k}^{\ell} \delta^{j}{ }^{q^{a}}{ }_{j \ell} .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& =\left(g^{j \ell_{D}^{k}}{ }_{k a}-2 g^{k \ell_{D} j_{a k}}+g^{b k_{D}^{\ell}}{ }_{b k} \delta^{j}{ }_{a}\right) Y^{\mathrm{a}}{ }_{j \ell} \\
& =\left(g^{j \ell}{ }_{D}^{k}{ }_{k a}-2 D_{a}^{j \ell}+\delta_{a}^{j}{ }_{a}^{l k}{ }_{k}\right) Y_{j \ell}^{a} .
\end{aligned}
$$

Let $T(\nabla)$ be the element of $D_{2}^{1}(M)$ given locally by

$$
T(\nabla)^{j \ell}=g^{j \ell_{D} k}{ }_{k a}-2 D_{a}^{j} \ell+\delta_{a}^{j} D_{k}^{\ell k}
$$

Then the conclusion is that

$$
\begin{aligned}
& \left.g^{j \ell} \frac{d}{d \varepsilon} \operatorname{Ric}(\nabla+\varepsilon \Psi)_{j \ell}\right|_{\varepsilon=0} \\
& \quad=\operatorname{div}_{g} X_{Y}+\operatorname{tr}_{g}(T(\nabla), \varphi) .
\end{aligned}
$$

[Note: Here $\operatorname{tr}_{g}$ stands for the pairing

$$
\left[\begin{array}{rl}
D_{1}^{2}(\mathrm{M}) \times D_{2}^{1}(\mathrm{M}) & \rightarrow \mathrm{C}^{\infty}(\mathrm{M}) \\
\quad(\mathrm{T}, \mathrm{~S}) & \longrightarrow \mathrm{T}^{\mathrm{ij}}{ }_{\left.k^{\prime} \mathrm{S}_{\mathrm{ij}} \cdot\right]} \cdot
\end{array}\right.
$$

Definition: An element $\nabla \in \operatorname{con}_{0} T M$ is said to be critical if

$$
T(\nabla)=0 .
$$

[Note: To motivate this, adopt the usual shorthand and let

$$
L_{\omega}(\nabla)=\int_{M} L_{\omega}(\nabla)
$$

Then

$$
\begin{aligned}
& \left.\frac{d}{d \varepsilon} L_{\omega}(\nabla+\varepsilon \varphi)\right|_{\varepsilon=0} \\
& =\left.\int_{M} \frac{d}{d \varepsilon} L_{\omega}(\nabla+\varepsilon \Psi)\right|_{\varepsilon=0} \\
& =\left.\frac{1}{2} \int_{M} g^{j \ell} \frac{d}{d \varepsilon} \operatorname{Ric}(\nabla+\varepsilon \Psi) \quad j \ell\right|_{\varepsilon=0} \operatorname{vol}_{g} \\
& =\frac{1}{2} \int_{M} \operatorname{div}_{g} X_{Y} \operatorname{vol}_{g}+\frac{1}{2} \delta_{M} \operatorname{tr}_{g}(T(\nabla), Y) \mathrm{vol}_{g} \\
& =\frac{1}{2} \int_{M} \operatorname{tr}_{g}(T(\nabla), \Psi) \mathrm{vol}_{g} .
\end{aligned}
$$

So $\nabla$ is critical iff $\forall Ч$,

$$
\left.\frac{\mathrm{d}}{\mathrm{~d} \varepsilon} L_{\omega}(\nabla+\varepsilon \varphi)\right|_{\varepsilon=0}=0
$$

or still, $\nabla$ is critical iff

$$
\left.\frac{\delta L_{\omega}}{\delta \nabla}=0 .\right]
$$

THEOREM Suppose that $n>2$ - then $\nabla \in \operatorname{con}_{0}$ TM is critical eff $\nabla=\nabla^{9}$.

It is clear that $\nabla^{9}$ is critical $\forall \mathrm{n}$ (since in this case $\mathrm{D}=0$ ). To go the other way, the assumption that $T(\nabla)=0$ implies that

$$
\begin{aligned}
& \int^{-} T(\nabla)^{i j}{ }_{k}=g^{i j_{D}{ }^{\ell}}{ }_{l k}-2 D_{k}^{i}{ }_{k}^{j}+\delta_{k}^{i} D_{l}^{j \ell}=0 \\
& T(\nabla){ }_{k}^{j i}=g^{j i_{D} \ell}{ }_{\ell k}-2 D_{k}^{j}{ }_{k}^{i}+\delta_{k}^{j} D^{i \ell} \ell=0 .
\end{aligned}
$$

Thus

$$
\begin{aligned}
& 2 g^{i j_{D}}{ }_{l k}-2 D_{k}^{i}{ }_{k}^{j}-2 D_{k}^{j}{ }^{i}+\delta_{k}^{i}{ }^{j}{ }^{j \ell}{ }_{\ell}+\delta^{j}{ }_{k} D^{i \ell}{ }_{\ell}=0 \\
& \text { => } \\
& 2 g^{i j_{j}}{ }_{l}^{\ell}{ }_{\ell j}-2 D^{i}{ }_{j}^{j}-2 D_{j}^{j}{ }_{j}^{i}+\delta^{i}{ }_{j} D^{j \ell}{ }_{\ell}+\delta^{j}{ }_{j} D^{i \ell}{ }_{\ell}=0 \\
& \text { => } \\
& 2 g^{i j_{D}}{ }_{\ell j}-2 D_{l}^{i} \ell-2 D_{l}^{\ell}+D_{l}^{i \ell}+\delta_{j}^{j} D_{l}^{i \ell}=0 \\
& \text { => } \\
& 2 D_{l}^{\ell}{ }_{l}^{i}-2 D_{l}^{i} \ell-2 D_{\ell}^{\ell}{ }_{l}^{i}+D_{l}^{i \ell}+D^{i \ell} \ell=0 \\
& \text { => } \\
& (n+1) D_{l}^{i \ell}-2 D_{l}^{i} \ell=0 .
\end{aligned}
$$

But

$$
\left[\begin{array}{l}
D_{\ell}^{i \ell}=g^{l k_{D}^{i}} k l \\
D_{\ell}^{i \ell}=g^{l k} D_{l k}^{i}
\end{array} \quad \& D_{k \ell}^{i}=D_{l k}^{i}\right.
$$

Therefore

$$
(n-1) D_{\ell}^{i \ell}=0
$$

and, by the symmetry in $i \& j$,

$$
(n-1) D_{\ell}^{j \ell}=0
$$

Similarly

$$
2(n-2) D_{l k}^{\ell}=0
$$

But then

$$
\begin{aligned}
& 0=2 g^{i j_{D}^{l}}{ }_{\ell k}-2 D_{k}^{i}{ }^{j}-2 D_{k}^{j} i_{k}^{i}+\delta_{k}^{i} D^{j \ell} \ell+\delta_{k}^{j} D^{i \ell} \\
= & -2 D_{k}^{i j}-2 D_{k}^{j i} \\
\Rightarrow \quad & D_{k}^{i} j=-D_{k}^{j}{ }^{i} \\
\Rightarrow \quad & D_{i k j}=-D_{j k i} \\
\Rightarrow \quad & D_{i j k}=-D_{j i k} \\
\Rightarrow \quad & D_{i j k}+D_{j k i}+D_{k i j}+D_{i k j}+D_{j i k}+D_{k j i}=0 .
\end{aligned}
$$

Add to this the relation

$$
D_{i j k}+D_{j k i}+D_{k i j}-\left(D_{i k j}+D_{j i k}+D_{k j i}\right)=0
$$

to get

$$
D_{i j k}+D_{j k i}+D_{k i j}=0
$$

or still,

$$
D_{i j k}+D_{j i k}+D_{k i j}=0
$$

or still,

$$
D_{k i j}=0
$$

I.e.:

$$
\begin{aligned}
& D \\
& \Rightarrow \quad 0 \\
& \Rightarrow \\
&=\nabla^{g} .
\end{aligned}
$$

Fix $\omega \in \operatorname{cof}_{M}$ - then instead of working with $\operatorname{con}_{0} T M$, one can work with con $g^{T M}$ which, as will be recalled, is an affine space with translation group $D_{2}^{1}(M)$ (the subspace of $D_{2}^{l}(M)$ consisting of those $Y$ such that $\forall X, Y, Z \in \mathcal{D}^{l}(M)$,

$$
g(U(X, Y), Z)+g(X, Y(X, Z))=0)
$$

Definition: Let $\nabla \in \mathrm{con}{ }_{g}$ TM -- then a variation of $\nabla$ is a curve

$$
\varepsilon \rightarrow \nabla+\varepsilon Ч
$$

where $\Psi \in D_{2}^{1}(M) g$ has compact support.
[Note: Write

$$
Y\left(E_{k}, E_{j}\right)=Y_{k j}^{i} E_{i}
$$

Then

$$
\begin{aligned}
& g\left(\mathrm{Y}\left(\mathrm{E}_{k^{\prime}}, E_{j}\right), E_{i}\right)+g\left(E_{j}, \mathrm{Y}\left(E_{k^{\prime}}, E_{i}\right)\right)=0 \\
\Rightarrow \quad & \\
& \left.Y_{k j}^{i}=-\varepsilon_{i} \varepsilon_{j} \Psi_{k i}^{j} \quad \text { (no sum) } .\right]
\end{aligned}
$$

As before, define

$$
\mathrm{I}_{\omega}: \text { con }_{\mathrm{g}} \mathrm{TM} \rightarrow \Lambda^{\mathrm{n}} \mathrm{M}
$$

by

$$
L_{\omega}(\nabla)=\frac{1}{2} \Omega_{i j}(\nabla) \wedge \theta^{i j}
$$

Here

$$
\Omega_{i j}(\nabla)
$$

is computed per $\nabla$ while

$$
\theta^{i j}=*\left(\omega^{i} \wedge \omega^{j}\right)
$$

is computed per g.

Given $\nabla \in \operatorname{con}_{\mathrm{g}} \mathrm{TM}^{\text {, consider }}$

$$
\left.\frac{\mathrm{d}}{\mathrm{~d} \varepsilon} \Omega_{i j}(\nabla+\varepsilon \Psi)\right|_{\varepsilon=0} \wedge \theta^{i j}
$$

or, in brief,

$$
\left.\frac{d}{d \varepsilon} \Omega_{i j}(\varepsilon)\right|_{\varepsilon=0} \wedge \theta^{i j}
$$

[Note: Since

$$
(\nabla+\varepsilon \Psi){ }^{E_{j}}=\nabla_{X} E_{j}+\varepsilon U\left(X, E_{j}\right)
$$

$$
\begin{aligned}
& =\nabla_{X} E_{j}+\varepsilon X^{k_{Y}}\left(E_{k^{\prime}} E_{j}\right) \\
& =\left(\omega_{j}^{i}(X)+\varepsilon X^{k^{\prime}} Y_{k j}^{i}\right) E_{i^{\prime}}
\end{aligned}
$$

it follows that the connection l-forms of $\nabla+\varepsilon \Psi$ are the

$$
\left.\omega_{j}^{i}(\varepsilon)=\omega_{j}^{i}+\varepsilon \Psi_{k j}^{i} \omega^{k} \cdot\right]
$$

Put

$$
\mathrm{D}=\left.\frac{\mathrm{d}}{\mathrm{~d} \varepsilon}\right|_{\varepsilon=0}
$$

Then

$$
\begin{gathered}
\left.\frac{d}{d \varepsilon} \Omega_{i j}(\varepsilon)\right|_{\varepsilon=0} \wedge \theta^{i j} \\
=D\left(d \omega_{i j}(\varepsilon)+\omega_{i k}(\varepsilon) \wedge \omega_{j}^{k}(\varepsilon)\right) \wedge \theta^{i j} \\
=\left(d D \omega_{i j}(\varepsilon)+D \omega_{i k}(\varepsilon) \wedge \omega_{j}^{k}+\omega_{i k} \wedge D \omega_{j}^{k}(\varepsilon)\right) \wedge \theta^{i j} \\
=d\left(D \omega_{i j}(\varepsilon) \wedge *\left(\omega^{i} \wedge \omega^{j}\right)\right) \\
\quad+D \omega_{i j}(\varepsilon) \wedge \theta^{a}(\nabla) \wedge *\left(\omega^{i} \wedge \omega^{j} \wedge \omega_{a}\right) \\
=d\left(U_{i k j} \omega^{k} \wedge *\left(\omega^{i} \wedge \omega^{j}\right)\right) \\
\quad+U_{i k j} \omega^{k} \wedge \theta^{a}(\nabla) \wedge *\left(\omega^{i} \wedge \omega^{j} \wedge \omega_{a}\right) .
\end{gathered}
$$

N.B.

$$
\begin{gathered}
d *\left(\omega^{i} \wedge \omega^{\dot{j}}\right) \\
=\theta^{a}(\nabla) \wedge *\left(\omega^{i} \wedge \omega^{j} \wedge \omega_{a}\right)-\omega^{i}{ }_{a} \wedge *\left(\omega^{a} \wedge \omega^{j}\right)-\omega_{a}^{j} \wedge *\left(\omega^{i} \wedge \omega^{a}\right)
\end{gathered}
$$

Definition: An element $\nabla \in c o{ }_{g} T M$ is said to be critical if $\forall i, j$ :

$$
\theta^{a}(\nabla) \wedge \star\left(\omega^{i} \wedge \omega^{j} \omega_{a}\right)=0
$$

[Note: Set

$$
L_{\omega}(\nabla)=\int_{M} L_{\omega}(\nabla)
$$

Then $\nabla$ is critical iff $\forall \Psi$,

$$
\left.\frac{d}{d \varepsilon} L_{\omega}(\nabla+\varepsilon \varphi)\right|_{\varepsilon=0}=0
$$

or still, $\nabla$ is critical iff

$$
\frac{\delta L}{\delta \nabla}=0.1
$$

Remark: Our assumption is that $n>2$. If $n$ were 2 , then

$$
\omega^{i} \wedge \omega^{j} \wedge \omega_{a}=0
$$

so every $\nabla \in \operatorname{con}_{\mathrm{g}}$ TM would be critical and the methods used below are not applicable.

THEOREM Suppose that $n>2$ - then $\nabla \in \operatorname{con}_{g}$ TM is critical iff $\nabla=\nabla^{g}$.

It is clear that $\nabla^{g}$ is critical $\forall \mathrm{n}$ (the metric connection is torsion free).
As for the converse, it suffices to prove that

$$
\nabla \text { critical } \Rightarrow \nabla \text { torsion free. }
$$

I.e.:

$$
\nabla \text { critical } \Rightarrow \theta^{a}(\nabla)=0 \quad(a=1, \ldots, n)
$$

To see how the argument runs, take $\mathrm{a}=1$-- then the claim is that

$$
g\left(\theta^{l}(\nabla), \omega^{k} \wedge \omega^{\ell}\right)=0
$$

for all $k \neq \ell$, there being two possibilities:

1. $k>1, \ell>1$
2. $\mathrm{k}>1, \ell=1$.

Write

$$
\begin{aligned}
0 & =\sum_{a} \theta^{a}(\nabla) \wedge *\left(\omega^{i} \wedge \omega^{j} \wedge \omega_{a}\right) \\
& =\sum_{a \neq i, j} \theta^{a}(\nabla) \wedge *\left(\omega^{i} \wedge \omega^{j} \wedge \omega_{a}\right) \\
& =\sum_{a \neq i, j} g\left(\theta^{a}(\nabla), \omega^{i} \wedge \omega^{j}\right) * \omega_{a} \\
& +* \omega^{i} \sum_{a \neq i, j} g\left(\theta^{a}(\nabla), \omega^{j} \wedge \omega_{a}\right)+* \omega^{j} \sum_{a \neq i, j} g\left(\theta^{a}(\nabla), \omega_{a} \wedge \omega^{i}\right) .
\end{aligned}
$$

Then

$$
\begin{array}{ll} 
& g\left(\theta^{a}(\nabla), \omega^{i} \wedge \omega^{j}\right)=0 \quad(a \neq i, j) \\
\Rightarrow \quad & g\left(\theta^{l}(\nabla), \omega^{k} \wedge \omega^{\ell}\right)=0 \quad(k>1, \ell>1) .
\end{array}
$$

In addition,

$$
\sum_{a \neq i, j} g\left(\theta^{a}(\nabla), \omega^{j} \wedge \omega_{a}\right)=0
$$

Now put

$$
x^{a}=g\left(\theta^{a}(\nabla), \omega^{j} \wedge \omega_{a}\right)
$$

and

$$
A=\left[A^{i}\right] \quad\left(A_{a}^{i}=1-\delta^{i},\right.
$$

to get

$$
\begin{aligned}
& A_{a}^{i} x^{a} \\
&=\left(1-\delta^{i} a^{a} g\left(\theta^{a}(\nabla), \omega^{j} \wedge \omega_{a}\right)\right. \\
&=\sum_{a \neq j} g\left(\theta^{a}(\nabla), \omega^{j} \Lambda \omega_{a}\right)-g\left(\theta^{i}(\nabla), \omega^{j} \Lambda \omega_{i}\right) \\
&=\sum_{a \neq i, j} g\left(\theta^{a}(\nabla), \omega^{j} \Lambda \omega_{a}\right) \\
&=0 \\
& \Rightarrow \quad A X=0 .
\end{aligned}
$$

But $A$ is nonsingular:

$$
\operatorname{det} A=(-1)^{\mathrm{n}+1}(\mathrm{n}-1) .
$$

Therefore

$$
x^{a}=g\left(\theta^{a}(\nabla), \omega^{j} \omega_{a}\right)=0
$$

In particular:

$$
g\left(\theta^{l}(\nabla), \omega^{k} \wedge \omega_{1}\right)=0 \quad(k>1) .
$$

Remark: It is not difficult to extend the Lovelock theory so as to incorporate con ${ }_{g} \mathrm{TM}$ : Simply define

$$
\mathrm{L}_{\omega, \mathrm{p}}: \mathrm{con}_{\mathrm{g}} \mathrm{TM} \rightarrow \Lambda^{\mathrm{n} M}
$$

18. 

by

$$
L_{\omega, p}(\nabla)=\frac{1}{2} \Omega_{i_{1} j_{1}}(\nabla) \wedge \ldots \wedge \Omega_{i_{p} j_{p}}(\nabla) \wedge \theta^{i_{1} j_{1} \ldots i_{p} j_{p}}(2 p \leq n) .
$$

The condition for criticality at level $p$ then becomes the requirement that $\forall i_{1}, j_{1}$ :

$$
\theta^{a}(\nabla) \wedge \Omega_{i_{2} j_{2}}(\nabla) \wedge \ldots \wedge \Omega_{i_{p} j_{p}}(\nabla) \wedge \theta^{i_{1} j_{1} \cdots i_{p} j_{p}}=0
$$

[Note: If $p>1$, then these equations do not necessarily imply that $\nabla$ is torsion free.]

Section 49: Torsion Let $M$ be a connected $C^{\infty}$ manifold of dimension $n>2$. Assume: M is parallelizable.

Fix $\omega \in \operatorname{cof}_{M}$ and let $\nabla$ be a $g$-connection - then, per the previous section,

$$
L_{\omega}(\nabla)=\frac{1}{2} \Omega_{i j}(\nabla) \wedge \theta^{i j}
$$

and, as was shown there, $\nabla$ is critical, i.e.,

$$
\theta^{a}(\nabla) \wedge *\left(\omega^{i} \wedge \omega^{j} \dot{j}_{a}\right)=0
$$

$\forall i, j$ iff $\nabla=\nabla^{g}$.
Rappel: Suppose that $\nabla=\nabla^{9}$ (in which case we write $\Omega_{i j}$ in place of $\left.\Omega_{i j}\left(\nabla^{9}\right)\right)$-- then

$$
\begin{aligned}
& \frac{1}{2} \Omega_{i j} \wedge \theta^{i j}=-d\left(\omega_{i} \wedge * d \omega^{i}\right) \\
+ & \frac{1}{4}\left(d \omega_{i} \wedge \omega^{i}\right) \wedge *\left(d \omega_{j} \wedge \omega^{j}\right)-\frac{1}{2}\left(d \omega_{i} \wedge \omega^{j}\right) \wedge *\left(d \omega_{j} \wedge \omega^{i}\right) .
\end{aligned}
$$

LEMMA We have

$$
\begin{aligned}
& \frac{1}{2} \Omega_{i j}(\nabla) \wedge \theta^{i j}=\frac{1}{2} \Omega_{i j} \wedge \theta^{i j}+d\left(\omega_{i} \wedge * \theta^{i}(\nabla)\right) \\
- & \frac{1}{4}\left(\omega_{i} \wedge \theta^{i}(\nabla)\right) \wedge *\left(\omega_{j} \wedge \Theta^{j}(\nabla)\right)+\frac{1}{2}\left(\omega_{i} \wedge \Theta^{j}(\nabla)\right) \wedge *\left(\omega_{j} \wedge \theta^{i}(\nabla)\right) .
\end{aligned}
$$

Assume now that the standard setup is in force -- then

$$
\nabla \in \operatorname{con}_{\mathrm{g}} \mathrm{TM} \Rightarrow \bar{\nabla} \in \operatorname{con}_{\overline{\mathrm{g}}} \mathrm{~T} \mathrm{\Sigma} .
$$

[Note: By definition, $\bar{\nabla}$ is the connection on TE which is obtained from the induced connection $i_{t}^{*} \nabla$ on $i_{t}^{*}$ TM via the prescription

$$
\left.\bar{\nabla}_{X} Y=\tan i_{t}^{*} \nabla_{X} Y \quad\left(X, Y \in \mathcal{D}^{1}(\Sigma)\right) .\right]
$$

This said, let us consider the significance of the following conditions.
Equation l: $i_{t}^{*} \theta^{0}(\nabla)=0$.
[We have

$$
\begin{aligned}
& i_{\dot{t}}^{\star \epsilon}{ }^{0}(\nabla)=i_{t}^{\star}\left(d \omega^{0}+\omega_{i}{ }_{i}{ }^{\wedge}{ }^{i}\right)
\end{aligned}
$$

$$
\begin{aligned}
& =d i_{t}^{*}(N d t)+\bar{\omega}_{i}^{0}{ }_{i} \bar{\omega}^{i} \\
& =d N_{t}{ }^{i} \mathrm{t} d t+\bar{\omega}^{0}{ }_{i} \Lambda^{-i} \\
& =\bar{\omega}_{a}^{0}{ }^{n \omega^{a}} \\
& =\left(\bar{\omega}^{0} a\left(E_{b}\right) \bar{\omega}^{b}\right) \wedge \bar{\omega}^{a} \\
& =\bar{\omega}_{a}^{0}\left(E_{b}\right)\left(\bar{\omega}^{b} \wedge \bar{\omega}^{a}\right) .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& i_{t}^{*} \theta^{0}(\nabla)=0 \\
& \text { < }= \\
& \bar{\omega}_{a}^{0}\left(E_{b}\right)=\bar{\omega}_{b}^{0}\left(E_{a}\right) .
\end{aligned}
$$

But

$$
\left[\begin{array}{l}
\bar{\omega}_{a}^{0}\left(E_{b}\right)=k_{b a}=\kappa_{t}\left(E_{b}, E_{a}\right) \\
\bar{\omega}_{b}^{0}\left(E_{a}\right)=\kappa_{a b}=\kappa_{t}\left(E_{a}, E_{b}\right) .
\end{array} \quad(\kappa=\mu)\right.
$$

Accordingly, $i_{t}^{*} \theta^{0}(\nabla)=0$ iff the extinsic curvature $k_{t}$ is symmetric.]

Equation 2: $\quad i_{t}^{\star} \theta^{a}(\nabla)=0 \quad(a=1, \ldots, n-1)$.
[We have

$$
\begin{aligned}
i_{t}^{\star \theta^{a}}(\nabla) & =i_{t}^{\star}\left(d \omega^{a}+\omega_{i}^{a} \wedge \omega^{i}\right) \\
& =d \bar{\omega}^{a}+\bar{\omega}_{b}^{a} \wedge \bar{\omega}^{b}
\end{aligned}
$$

So, if $i_{t}^{*} \Theta^{a}(\nabla)=0 \forall a$, then $\bar{\nabla}$ is torsion free (and conversely).]
Equation 3: $\quad i_{t}^{*}{ }_{t} E_{0} \Theta^{0}(\nabla)=0$.
[We have

$$
\begin{aligned}
i_{t}^{*} l_{E_{0}} \Theta^{0}(\nabla) & =i_{t}^{*} l_{E_{0}}\left(d \omega^{0}+\omega_{i}^{0}{ }_{i} \Lambda \omega^{i}\right) \\
& =i_{t}^{*} l_{E_{0}} d \omega^{0}+i_{t}^{*} l_{E_{0}}\left(\omega^{0}{ }_{i} \wedge \omega^{i}\right)
\end{aligned}
$$

1. $i_{t}^{*} l_{E_{0}} d \omega^{0}=i_{t}^{*} l_{E_{0}}^{d(N d t)}$

$$
\begin{aligned}
& =i_{t}^{*} v_{E_{0}}(d N \wedge d t) \\
& =i_{t}^{*}\left(\imath_{E_{0}} d N \wedge d t-d N \wedge v_{E_{0}} d t\right)
\end{aligned}
$$

$$
\begin{aligned}
& =i_{t}^{*}\left(d N\left(E_{0}\right) \wedge d t-d N \wedge d t\left(E_{0}\right)\right) \\
& =d N\left(E_{0}\right) i_{t}^{* d t}-i_{t}^{*}\left(d N \wedge d t\left(E_{0}\right)\right) \\
& =-i_{t}^{*}\left(d N \wedge d t\left(E_{0}\right)\right) \\
& =-i_{t}^{*}\left(\frac{\omega^{0}\left(E_{0}\right)}{N} d N\right) \\
& =-\left(\frac{1}{N_{t}}\right) d N_{t} .
\end{aligned}
$$

2. $i_{t}^{*} \underline{E}_{0}\left(\omega_{i}^{0} \wedge \omega^{i}\right)$

$$
\begin{aligned}
& =i_{t}^{\star}\left(l_{E_{0}} \omega^{0}{ }_{i} \wedge \omega^{i}-\omega^{0}{ }_{i} \wedge \underline{v}_{0} \omega^{i}\right) \\
& =i_{t}^{\star}\left(\omega_{i}^{0}\left(E_{0}\right) \omega^{i}-\omega^{i}\left(E_{0}\right) \omega^{0}{ }_{i}\right)
\end{aligned}
$$

$$
=i_{t}^{*}\left(\omega_{a}^{0}\left(E_{0}\right) \omega^{a}\right)
$$

$$
=-\left(i_{t}^{*} \omega_{0 a}\left(E_{0}\right)\right) \bar{\omega}^{a}
$$

Thus

$$
\begin{gathered}
\qquad i_{t}^{*} E_{0}^{\Theta}(\nabla)=0 \\
\Leftrightarrow \quad\left(\frac{1}{N_{t}}\right) d N_{t}+\left(i_{t}^{*} \omega_{0 a}\left(E_{0}\right)\right) \bar{\omega}^{a}=0 \\
\text { or still, } \\
\\
\end{gathered}
$$

Equation 4: $i_{t}^{*} l^{\prime} E_{0} \theta^{a}(\nabla)=0 \quad(a=1, \ldots, n-1)$.
[We have

$$
\begin{gathered}
i_{t}^{*} l_{E_{0}} \theta^{a}(\nabla)=i_{t}^{*} l_{E_{0}}\left(d \omega^{a}+\omega_{i}^{a} \Lambda \omega^{i}\right) \\
=i_{t}^{*} l_{E_{0}} d \omega^{a}+i_{t}^{*} l_{E_{0}}\left(\omega^{a}{ }_{i} \omega^{i}\right) .
\end{gathered}
$$

1. $i_{t}^{*} i_{E_{0}}^{d \omega^{a}}$

$$
\begin{aligned}
& =i_{t}^{\star}\left(L_{E_{0}}-d \circ i_{E_{0}}\right) \omega^{a} \\
& =i_{t}^{*} L_{E_{0}} \omega^{a} .
\end{aligned}
$$

2. $i_{t}^{\star_{1}} E_{0}\left(\omega_{i}^{a}{ }_{i} \wedge \omega^{i}\right)$

$$
\begin{aligned}
& =i_{t}^{\star}\left(\imath_{E_{0}} \omega^{a}{ }_{i} \Lambda \omega^{i}-\omega_{i}^{a}{ }_{i} \wedge v_{E_{0}} \omega^{i}\right) \\
& =i_{t}^{\star}\left(\omega_{i}^{a}\left(E_{0}\right) \omega^{i}-\omega^{a}\right) \\
& =\left(i_{t}^{\star} \omega_{b}^{a}\left(E_{0}\right)\right) \bar{\omega}^{-b}-\bar{\omega}_{0}^{a} .
\end{aligned}
$$

Consequently,

$$
\begin{gathered}
i_{\hat{t}}^{\star} l_{E_{0}} \theta^{a}(\nabla)=0 \\
\Leftrightarrow \\
\\
i_{\hat{t}}^{\star} L_{E_{0}} \omega^{a}=\bar{\omega}_{0}^{a}-\left(i_{\hat{t}}^{\star} \omega{ }_{b}^{a}\left(E_{0}\right)\right) \bar{\omega}
\end{gathered}
$$

6. 

or still,

$$
N_{t} i^{i} L_{E_{0}} \omega^{a}=N_{t}{ }^{-a}{ }_{0}^{a}-\left(N_{t} i_{t}^{*}{ }^{a}{ }_{b}\left(E_{0}\right)\right) \bar{\omega}^{-b}
$$

But

$$
\begin{aligned}
i_{t}^{*} L_{N E_{0}} \omega^{a} & =i_{t}^{*}\left(N L_{E_{0}} \omega^{a}+d N \wedge l_{E_{0}} \omega^{a}\right) \\
& =i_{t}^{\star}\left(N L_{E_{0}} \omega^{a}\right) \\
& =N_{t} i \star t L_{0} \omega^{a} .
\end{aligned}
$$

On the other hand,

$$
\begin{aligned}
i_{t}^{*} L_{N E_{0}} \omega^{a} & =i_{t}^{*}\left(L_{\partial / \partial t} \omega^{a}-L_{\vec{N}} \omega^{a}\right) \\
& =\dot{\bar{\omega}}^{a}-L_{\vec{N}_{t}} \bar{\omega}^{a} .
\end{aligned}
$$

Therefore

$$
\begin{gathered}
i_{t}^{\star} l_{E_{0}} \theta^{a}(\nabla)=0 \\
\Leftrightarrow \\
\left.\dot{\bar{\omega}}^{a}=N_{t} \bar{\omega}_{0}^{a}-\left(N_{t} i^{\star} \omega^{a}{ }_{b}^{a}\left(E_{0}\right)\right) \bar{\omega}^{b}+L_{\vec{N}_{t}} \bar{\omega}^{a} .\right]
\end{gathered}
$$

Notation: Put

$$
\left[\begin{array}{ll}
\bar{P}_{a}=N_{t} i_{t}^{*} \omega_{0 a}\left(E_{0}\right) & (c f . \text { Equation 3) } \\
\bar{Q}_{b}^{a}=-N_{t} i_{t}^{*} \omega_{b}^{a}\left(E_{0}\right) \quad \text { (cf. Equation 4) }
\end{array}\right.
$$

## 7.

LEMMA Suppose that Equations 1 - 4 are satisfied for all $t-$ then $\nabla$ is torsion free, i.e., $\Theta(\nabla)=0$.
[It is a question of showing that $\theta^{0}(\nabla)=0$ and $\theta^{a}(\nabla)=0(a=1, \ldots, n-1)$. Write

$$
\begin{aligned}
\theta^{0}(\nabla)= & c_{0 a}^{0} \omega^{0} \wedge \omega^{a} \\
& +\frac{1}{2} c^{0}{ }_{a b} \omega^{a} \wedge \omega^{b} \quad\left(c_{a b}^{0}=-c_{b a}^{0}\right)
\end{aligned}
$$

Then

$$
\begin{array}{ll} 
& i_{t}^{\star \theta^{0}}(\nabla)=0 \forall t \\
\Rightarrow & \frac{1}{2} \overline{\mathrm{C}}_{a b^{0} \bar{\omega}^{a} \wedge \bar{\omega}^{b}=0 \forall t} \Rightarrow \\
\Rightarrow \quad & \bar{c}_{a b}^{0}=0 \forall t \\
& c_{a b}^{0}=0
\end{array}
$$

and

$$
\begin{array}{ll} 
& i_{\hat{t}}^{\star} \mathrm{E}_{0} \theta^{0}(\nabla)=0 \forall t \\
\Rightarrow & \overline{\mathrm{C}}_{0 \mathrm{a}}^{0} \bar{\omega}^{-\mathrm{a}}=0 \forall t \\
\Rightarrow & \\
& \overline{\mathrm{C}}_{0 \mathrm{a}}^{0}=0 \forall t
\end{array}
$$

$$
\Rightarrow
$$

$$
c_{0 a}^{0}=0
$$

So $\theta^{0}(\nabla)=0$. The proof that $\theta^{a}(\nabla)=0(a=1, \ldots, n-1)$ is analogous.]

Section 50: Extending the Theory The assumptions and notation are those of the standard setup.

Throughout this section, $\nabla$ stands for an arbitrary element of con $\mathrm{g}^{\text {TM }}$.
[Note: Here, of course,

$$
\left.g=-\omega^{0} \otimes \omega^{0}+\omega^{a} \wedge \omega^{a} .\right]
$$

Rappel: If $\nabla=\nabla^{g}$, then

$$
\begin{aligned}
\Omega_{i j} \wedge \theta^{i j}=\theta^{i j} & \wedge \Omega_{i j} \\
= & 2 d\left(\omega_{0 a} \wedge \theta^{0 a}\right)-\theta^{a b} \wedge \omega_{0 a} \wedge \omega_{0 b} \\
& +\theta^{a b} \wedge\left(\Omega_{a b}-\omega_{a 0} \wedge \omega_{b}^{0}\right)
\end{aligned}
$$

This relation was the initial step in isolating the lagrangian and our first objective is to generalize it in order to cover the case when $\nabla \neq \nabla^{9}$.

Since $\nabla$ is a $g$-connection, it is still true that $\Omega_{i j}(\nabla)=-\Omega_{j i}(\nabla)$, hence

$$
\theta^{i j} \wedge_{i j}(\nabla)=2 \theta^{0 \mathrm{a}} \wedge \Omega_{0 \mathrm{a}}(\nabla)+\theta^{\mathrm{bc}}{ }_{\wedge \Omega_{b c}}(\nabla),
$$

thus as before

$$
\begin{aligned}
& \quad \theta^{i j} \wedge \Omega_{i j}(\nabla)=2 \theta^{0 a} \wedge d \omega_{0 a}+2 \theta^{0 a_{\Lambda \omega_{0 b}} \wedge \omega_{a}^{b}} \\
& +\theta^{b c} \wedge\left(\Omega_{b c}(\nabla)-\omega_{b 0} \wedge \omega_{c}^{0}\right)+\theta^{b c}{ }_{\wedge \omega_{b 0}} \wedge \omega_{c}^{0}
\end{aligned}
$$

Write

$$
\mathrm{d}\left(\theta^{0 \mathrm{a}}{ }_{\wedge \omega_{0 a}}\right)=\mathrm{d} \theta^{0 \mathrm{a}} \wedge \omega_{0 \mathrm{a}}+(-1)^{\mathrm{n}-2} \theta^{0 \mathrm{a}} \wedge d \omega_{0 \mathrm{a}}
$$

to get

$$
\begin{aligned}
& 2 \theta^{0}{ }^{\mathrm{a}}{ }^{d \omega_{0}}{ }_{0} \\
& =2(-1)^{\mathrm{n}-2} \mathrm{~d}\left(\theta^{0 \mathrm{a}}{ }_{\wedge \omega_{0 a}}\right)-2(-1)^{\mathrm{n}-2}{ }_{\mathrm{d} \theta}{ }^{0 \mathrm{a}}{ }_{\wedge \omega_{0 a}} \\
& =2(-1)^{\mathrm{n}-2}(-1)^{\mathrm{n}-2} \mathrm{~d}\left(\omega_{0 a}{ }^{\wedge \theta} \theta^{0 \mathrm{a}}\right)-2(-1)^{\mathrm{n}-2}(-1)^{\mathrm{n}-1} \omega_{0 a} \wedge d \theta^{0 \mathrm{a}} \\
& =2 d\left(\omega_{0 a} \wedge \theta^{0 a}\right)+2 \omega_{0 a} \wedge d \theta^{0 a} .
\end{aligned}
$$

Then

$$
\begin{aligned}
& \theta^{i j}{ }_{\wedge \Omega_{i j}}(\nabla)=2 d\left(\omega_{0 a} \wedge \theta^{0 a}\right)+2 \omega_{0 a} \wedge d \theta^{0 a}+2 \theta^{0 a} \wedge \omega_{0 b} \Lambda \omega_{a}^{b} \\
& \left.+\theta^{a b}{ }_{\wedge\left(\Omega_{a b}\right.}(\nabla)-\omega_{a 0} \wedge \omega_{b}^{0}\right)+\theta^{a b}{ }_{\wedge \omega_{a 0}} \wedge \omega_{b}^{0} .
\end{aligned}
$$

But on general grounds,

$$
\begin{aligned}
d \theta^{0 a} & =d *\left(\omega^{0} \wedge \omega^{a}\right) \\
& =d \omega_{b} \wedge *\left(\omega^{0} \wedge \omega^{a} \wedge \omega^{b}\right),
\end{aligned}
$$

so modulo the differential $2 \mathrm{~d}\left(\omega_{0 a} \wedge \theta^{0 \mathrm{a}}\right)$,

$$
\begin{aligned}
& \theta^{i j} \wedge \Omega_{i j}(\nabla)=2 \omega_{0 a} \wedge d \omega_{b} \wedge *\left(\omega^{0} \wedge \omega^{a} \wedge \omega^{b}\right)+2 \theta^{0 a} \wedge \omega_{0 b} \wedge \omega^{b} \\
& +\theta^{a b}{ }^{a}\left(\Omega_{a b}(\nabla)-\omega_{a 0^{\wedge}} \omega_{b}^{0}\right)+\theta^{a b} \wedge \omega_{a 0^{\prime}} \wedge \omega_{b}^{0} .
\end{aligned}
$$

## 3.

We have

$$
\begin{aligned}
& 0={ }^{\imath} E_{0}\left(\omega_{0 a} \wedge d \omega_{b} \wedge \theta^{a b}\right) \\
&= \imath_{E_{0}} \omega_{0 a} \wedge d \omega_{b} \wedge \theta^{a b}-\omega_{0 a} \wedge \tau_{E_{0}}\left(d \omega_{b} \wedge \theta^{a b}\right) \\
&={ }^{\imath_{E}} E_{0} \omega_{0 a} \wedge d \omega_{b} \wedge \theta^{a b}-\omega_{0 a} \wedge \imath_{E_{0}} d \omega_{b} \wedge \theta^{a b} \\
&-\omega_{0 a}^{\wedge d \omega_{b} \wedge \imath_{E_{0}}} \theta^{a b} \\
& \Rightarrow \quad \omega_{0 a}^{\wedge d \omega_{b} \wedge l_{E_{0}} \theta^{a b}} \\
&= \omega_{0 a}\left(E_{0}\right) d \omega_{b} \wedge \theta^{a b}-\omega_{0 a} \wedge l_{E_{0}} d \omega_{b} \wedge \theta^{a b}
\end{aligned}
$$

And

$$
\begin{aligned}
{ }^{t} E_{0}{ }^{\theta^{a b}} & ={ }^{z} E_{0} *\left(\omega^{a} \wedge \omega^{b}\right) \\
& =*\left(\omega^{a} \wedge \omega^{b} \wedge g^{b} E_{0}\right) \\
& =*\left(\omega^{a} \wedge \omega^{b} \wedge \omega_{0}\right) \\
& =*\left(\omega_{0} \wedge \omega^{a} \wedge \omega^{b}\right) \\
& =-*\left(\omega^{0} \wedge \omega^{a} \wedge \omega^{b}\right)
\end{aligned}
$$

- We have

$$
\begin{aligned}
& 0={ }^{l^{2}} \mathrm{E}_{0}\left(* \omega^{a} \wedge \omega_{0 b} \wedge \omega_{a}^{b}\right) \\
& ={ }^{l_{E_{0}}}{ }_{0} * \omega^{a} \wedge \omega_{0 b} \wedge \omega^{b} a+(-1)^{n-1} * \omega \omega^{a} \wedge v_{E_{0}}\left(\omega_{0 b} \wedge \omega^{b}\right) \\
& ={ }^{1} E_{0} * \omega^{a} \wedge \omega_{0 b} \wedge \omega_{a}^{b}+(-1)^{n-1} \star \omega \omega^{a} \wedge l_{E_{0}} \omega_{0 b} \Lambda \omega^{b} a \\
& +(-1)^{n} \star \omega^{a} \wedge \omega_{0 b} \wedge v_{E_{0}} \omega^{b} a \\
& \text { => } \\
& { }^{l} E_{0} * \omega^{a} \Lambda \omega_{0 b} \Lambda \omega^{b} a \\
& =(-1)^{n} \omega_{0 b}\left(E_{0}\right) * \omega^{a} \wedge \omega_{a}^{b}+(-1)^{n-1} \omega_{a}^{b}\left(E_{0}\right) * \omega^{a} \wedge \omega_{0 b} \\
& =(-1)^{n}(-1)^{n-1} \omega_{0 b}\left(E_{0}\right) \omega_{a}^{b} \wedge * \omega^{a}+(-1)^{n-1}(-1)^{n-1} \omega_{a}^{b}\left(E_{0}\right) \omega_{0 b} \wedge * \omega^{a} \\
& =-\omega_{0 b}\left(E_{0}\right) \omega_{a}^{b}{ }_{a} \wedge \omega^{a}+\omega_{a}^{b}\left(E_{0}\right) \omega_{0 b} \wedge * \omega^{a} .
\end{aligned}
$$

And

$$
\begin{aligned}
{ }^{{ }^{E_{0}}}{ }_{0}^{* \omega^{a}} & =*\left(\omega^{a} \wedge g^{b} E_{0}\right) \\
& =*\left(\omega^{a} \wedge \omega_{0}\right) \\
& =-*\left(\omega_{0} \wedge \omega^{a}\right) \\
& =*\left(\omega^{0} \wedge \omega^{a}\right)=\theta^{0 a}
\end{aligned}
$$

Therefore, up to the differential $2 \mathrm{~d}\left(\omega_{0 a}{ }^{\wedge \theta}{ }^{0 \mathrm{a}}\right)$,

$$
\begin{aligned}
& \theta^{i j} \wedge_{\wedge \delta_{i j}}(\nabla)=2 \omega_{0 a} \wedge l_{E_{0}} d \omega_{b} \wedge \theta^{a b}-2 \omega_{0 a}\left(E_{0}\right) d \omega_{b} \wedge \theta^{a b} \\
& -2 \omega_{0 b}\left(E_{0}\right) \omega_{a}^{b}{ }_{a} \wedge * \omega^{a}+2 \omega_{a}^{b}\left(E_{0}\right) \omega_{0 b} \wedge * \omega^{a} \\
& \left.+\theta^{a b}{ }_{\Lambda\left(\Omega_{a b}\right.}(\nabla)-\omega_{a 0} \wedge^{\Lambda \omega}{ }_{b}^{0}\right)+\theta^{a b}{ }_{\Lambda \omega}{ }_{a 0}{ }^{\Lambda \omega^{0}}{ }_{b} .
\end{aligned}
$$

N.B.

$$
\begin{aligned}
- & 2 \omega_{0 b}\left(E_{0}\right) \omega_{a}^{b}{ }_{a}^{\wedge * \omega^{a}}+2 \omega_{a}^{b}\left(E_{0}\right) \omega_{0 b} \wedge * \omega^{a} \\
& =-2 \omega_{0 a}\left(E_{0}\right) \omega_{b}^{a} \wedge * \omega^{b}+2 \omega_{b}^{a}\left(E_{0}\right) \omega_{0 a} \wedge * \omega^{b} .
\end{aligned}
$$

Rappel:

$$
\left\lvert\, \begin{aligned}
& -\bar{P}_{a}=N_{t} i_{t}^{\star} \omega_{0 a}\left(E_{0}\right) \\
& \bar{Q}_{b}^{a}=-N_{t} i^{i} t^{a}{ }_{b}\left(E_{0}\right) .
\end{aligned}\right.
$$

Using now the same methods that were employed in the study of $\theta^{i j}{ }_{\wedge \Omega_{i j}}$, we then find that

$$
\begin{aligned}
& \text { 1. } i_{t}^{\star}{ }^{l} \partial / \partial t\left(\omega_{0} \wedge{ }^{\wedge} E_{0}{ }^{d \omega_{b}} \wedge \theta^{a b}\right) \\
& =\bar{\omega}_{0 \mathrm{a}} \wedge N_{t} \dot{i}_{\underline{t}}^{\star} \mathrm{E}_{0}{ }^{d u_{b}} \wedge *\left(\bar{\omega}^{\mathrm{a}} \wedge \bar{\omega}^{\mathrm{b}}\right) .
\end{aligned}
$$

2. $\left.-i_{t}^{*} \partial / \partial t{ }^{\mathrm{t}}{ }^{\left(\omega_{0 a}\right.}\left(\mathrm{E}_{0}\right) \partial \omega_{b} \wedge \theta^{a b}\right)$

$$
=-\overline{\mathrm{P}}_{\mathrm{a}} \overline{\mathrm{a}}_{\mathrm{b}} \wedge *\left(\bar{\omega}^{\mathrm{a}} \wedge \bar{\omega}^{\mathrm{b}}\right) .
$$

3. $\left.-i_{t}^{*}{ }^{l} \partial / \partial t{ }^{\left(\omega_{0 a}\right.}\left(E_{0}\right) \omega^{a}{ }_{b} \wedge \star \omega^{b}\right)$

$$
=-\overline{\mathrm{P}}_{\mathrm{a}} \bar{\omega}^{\mathrm{a}} \mathrm{~b}^{\wedge * \bar{\omega}^{\mathrm{b}}}
$$

4. $\left.i_{t}^{*}{ }^{1} \partial / \partial t{ }^{\left(\omega^{a}\right.}{ }_{b}\left(E_{0}\right) \omega_{0 a} \wedge * \omega^{b}\right)$

$$
=-\bar{Q}_{b}^{\mathrm{a}} \bar{\omega}_{0 a} \wedge \star \bar{\omega}^{\mathrm{b}}
$$

5. $\left.i_{t}^{*^{l}} \partial / \partial t{ }^{\left(\theta^{a b}\right.} \wedge\left(\Omega_{a b}(\nabla)-\omega_{a 0^{\wedge \omega}}{ }_{b}\right)\right)$

$$
=N_{t} *\left(\bar{\omega}^{\mathrm{a}} \wedge \bar{\omega}^{\mathrm{b}}\right) \wedge^{(\mathrm{n}-1)} \Omega_{a b}(\bar{\nabla})
$$

6. $\left.i_{t}^{\star_{2}} \partial / \partial t \theta^{a b} \Lambda \omega_{a 0^{\prime}} \omega_{b}^{0}\right)$

$$
=N_{t} *\left(\bar{\omega}^{\mathrm{a}} \wedge \bar{\omega}^{\mathrm{b}}\right) \bar{\omega}_{0 a} \bar{\omega}_{0 b}
$$

Details Items 1, 2, 5, and 6 are handled as before but one has to be careful with items 3 and 4 and make sure that the signs are correct. Thus write

$$
\begin{aligned}
* \omega^{b}= & \frac{1}{(n-1)!} \varepsilon_{b j_{2}} \ldots j_{n} \omega^{j_{2}} \wedge \ldots \wedge \omega^{j_{n}} \\
= & \frac{1}{(n-1)!} \varepsilon_{b 0 j_{3}} \ldots j_{n} \omega^{0} \wedge \omega^{j_{3}} \wedge \ldots \wedge \omega^{j_{n}} \\
& +\cdots+\frac{1}{(n-1)!} \varepsilon_{b j_{2}} \ldots j_{n-1} 0^{\omega^{j}} \wedge \ldots \wedge \omega^{j_{n-1}}{ }_{\wedge \omega} 0 \\
& +\frac{1}{(n-1)!} \varepsilon_{b c_{2}} \ldots c_{n} \omega^{c_{2}} \wedge \ldots \wedge \omega^{c_{n}}
\end{aligned}
$$

$$
\begin{aligned}
= & \frac{1}{(n-1)!} \varepsilon_{b 0 j_{3}} \ldots j_{n} \omega^{0} \wedge \omega^{j_{3}} \wedge \ldots \wedge \omega^{j_{n}} \\
& +\ldots+\frac{1}{(n-1)!} \varepsilon_{b j_{2}} \ldots j_{n-1} 0^{\omega^{j}} \wedge \ldots \wedge \omega^{j_{n-1}}{ }_{\wedge \omega}^{0} \\
= & \frac{(n-1)}{(n-1)!} \varepsilon_{b 0 c_{3}} \ldots c_{n} \omega^{0} \wedge \omega^{c_{3}} \wedge \ldots \wedge \omega^{c_{n}} \\
= & \omega^{0} \wedge \frac{1}{(n-2)!} \varepsilon_{b 0 c_{3}} \ldots c_{n} \omega^{c_{3}} \wedge \ldots \wedge \omega^{c_{n}} \\
= & -\omega^{0} \wedge \frac{1}{(n-2)!} \varepsilon_{0 b c_{3}} \ldots c_{n} \omega^{c_{3}} \wedge \ldots \wedge \omega^{c_{n}} .
\end{aligned}
$$

Then

$$
\begin{aligned}
& \left.-i_{t}^{\star} \imath^{\imath} \partial / \partial t{ }^{\left(\omega_{0 a}\right.}\left(E_{0}\right) \omega^{a} b^{\wedge * \omega^{b}}\right) \\
& \left.=+i_{t}^{\star}{ }_{l} \partial / \partial t{ }^{\left[\omega_{0 a}\right.}\left(E_{0}\right) \omega_{b}^{a} \wedge \omega^{0} \wedge \frac{1}{(n-2)!} \varepsilon_{0 b c_{3}} \ldots c_{n}{ }^{C_{3}} \wedge \ldots \wedge \omega^{c_{n}}\right] \\
& \left.=-i_{t}^{*}{ }^{2} \partial / \partial t^{\left[\omega^{0} \wedge \omega_{0 a}\right.}\left(E_{0}\right) \omega^{a}{ }_{b} \wedge \frac{1}{(n-2)!} \varepsilon_{0 b c_{3}} \ldots c_{n} \omega^{c_{3}} \wedge \ldots \wedge \omega^{C_{n}}\right] \\
& =-i_{t}^{\star}\left[\left(l_{\partial / \partial t} \omega^{0}\right) \wedge \omega_{0 a}\left(E_{0}\right) \omega^{a}{ }_{b} \wedge \frac{1}{(n-2)!} \varepsilon_{0 b c_{3}} \ldots c_{n}{ }^{c_{3}} \wedge \ldots \wedge \omega^{c_{n}}\right. \\
& \left.-\omega^{0} \wedge z_{\partial / \partial t}\left(\omega_{0 a}\left(E_{0}\right) \omega^{a}{ }_{b} \wedge \frac{1}{(n-2)!} \varepsilon_{0 b c_{3} \ldots c_{n}} \omega^{c_{3}} \wedge \ldots \wedge \omega^{C_{n}}\right)\right] \\
& \left.=-N_{t} i^{*} \omega_{0 a}\left(E_{0}\right)\right)^{-a}{ }_{b} \wedge \frac{1}{(n-2)!} \varepsilon_{0 b c_{3}} \ldots c_{n}{ }^{\bar{c}_{3}} \wedge \ldots \wedge \bar{\omega}^{c_{n}} \\
& =-\bar{P}_{a} \bar{\omega}^{\mathrm{a}}{ }_{\mathrm{b}}{ }^{\wedge \star \bar{\omega}^{b}} .
\end{aligned}
$$

8. 

The fact that

$$
\begin{array}{r}
i_{t^{t} \partial / \partial t}^{*}\left(\omega_{b}^{a}\left(E_{0}\right) \omega_{0 a} \wedge * \omega^{b}\right) \\
=-\bar{Q}_{b}^{a} \bar{\omega}_{0 a} \wedge * \bar{\omega}^{b}
\end{array}
$$

is proved in exactly the same way.

## Summary:

$$
\begin{gathered}
1+2+3+4+5+6 \\
=2\left[\bar{\omega}_{0 a} \wedge N_{t} i_{t}^{*}{ }^{*} E_{0} d \omega_{b}-\bar{P}_{a} d \bar{\omega}_{b}\right. \\
+ \\
\left.\frac{1}{2} N_{t}\left({ }^{(n-1)} \Omega_{a b}(\bar{\nabla})+\bar{\omega}_{0 a} \wedge \bar{\omega}_{0 b}\right)\right] \wedge *\left(\bar{\omega}^{a} \wedge \bar{\omega}^{b}\right) \\
\\
-2\left(\bar{Q}_{b}^{a} \bar{\omega}_{0 a}+\overline{\mathrm{P}}_{a} \bar{\omega}_{b}^{a}\right) \wedge * \bar{\omega}^{b} .
\end{gathered}
$$

Claim:

$$
\bar{Q}_{b}^{\mathrm{a}} \bar{\omega}_{0 \mathrm{a}} \wedge * \bar{\omega}^{\mathrm{b}}=\overline{\mathrm{Q}}_{\mathrm{b}}^{\mathrm{c}} \bar{c}^{\wedge \bar{\omega}} 0 a^{\wedge *}\left(\bar{\omega}^{\mathrm{a}} \bar{\omega}^{\mathrm{b}}\right)
$$

[The issue is the equality of

$$
\overline{\mathrm{Q}}_{\mathrm{b}}^{\mathrm{a}} \overline{\mathrm{~g}}\left(\bar{\omega}_{0 a^{\prime}}, \bar{\omega}^{\mathrm{b}}\right)
$$

and

$$
\bar{Q}_{b}^{\mathrm{c}} \overline{\mathrm{~g}}\left(\bar{\omega}_{\mathrm{C}} \wedge \bar{\omega}_{0 \cdot}{ }^{\prime} \bar{\omega}^{\mathrm{a}} \wedge \bar{\omega}^{\mathrm{b}}\right)
$$

But

$$
\begin{aligned}
& \bar{g}\left(\bar{\omega}_{c} \wedge \bar{\omega}_{0 a^{\prime}}, \bar{\omega}^{a} \wedge \bar{\omega}^{b}\right) \\
= & \bar{g}\left(l_{\bar{\omega}} a^{\left.\left(\bar{\omega}_{C} \wedge \bar{\omega}_{0 a}\right), \bar{\omega}^{b}\right)}\right.
\end{aligned}
$$

$$
\begin{aligned}
& =\bar{g}\left(\bar{\omega}^{\mathrm{a}}, \bar{\omega}_{c}\right) \bar{g}\left(\bar{\omega}_{0 a},{ }^{\prime}{ }^{\mathrm{b}}\right)-\bar{g}\left(\bar{\omega}^{\mathrm{a}}, \bar{\omega}_{0 a}\right) \overline{\mathrm{g}}\left(\bar{\omega}_{c}, \bar{\omega}^{\mathrm{b}}\right) \\
& \text { => } \\
& \left.\bar{Q}_{b}^{c} \bar{g}^{\left(\bar{\omega}_{c} \wedge \bar{\omega}_{0 a}, \bar{\omega}\right.}{ }^{\mathrm{a}} \wedge \bar{\omega}^{\mathrm{b}}\right) \\
& =\bar{Q}_{b}^{c} \bar{g}\left(\bar{\omega}^{\mathrm{a}}, \bar{\omega}_{c}\right) \overline{\mathrm{g}}\left(\bar{\omega}_{0 a}, \bar{\omega}^{\mathrm{b}}\right)-\bar{Q}_{\mathrm{b}}^{\mathrm{c}} \overline{\mathrm{~g}}^{\left(\bar{\omega}^{\mathrm{a}}, \bar{\omega}_{0 a}\right)} \overline{\mathrm{g}}\left(\bar{\omega}_{\mathrm{c}}, \bar{\omega}^{\mathrm{b}}\right)
\end{aligned}
$$

$$
\begin{aligned}
& \left.\left.=\bar{Q}_{b}^{a} \bar{g}^{(\bar{\omega}} 0 a^{\prime}, \bar{\omega}^{\mathrm{b}}\right) .\right]
\end{aligned}
$$

Claim:

$$
\overline{\mathrm{P}}_{\mathrm{a}} \bar{\omega}_{\mathrm{b}}{ }^{\wedge} \bar{\omega}^{\mathrm{b}}=\overline{\mathrm{P}}_{\mathrm{a}} \overline{\mathrm{w}}_{\mathrm{bc}} \wedge^{\bar{\omega}^{\mathrm{c}} \wedge *\left(\bar{\omega}^{\mathrm{a}} \wedge \bar{\omega}^{\mathrm{b}}\right) .}
$$

[The issue is the equality of

$$
\overline{\mathrm{P}}_{\mathrm{a}} \overline{\mathrm{~g}}\left(\bar{\omega}_{\mathrm{b}}^{\mathrm{a}}, \bar{w}^{\mathrm{b}}\right)
$$

and

$$
\overline{\mathrm{P}}_{\mathrm{a}} \overline{\mathrm{~g}}\left(\bar{\omega}_{\mathrm{bc}} \wedge \bar{\omega}^{\mathrm{c}}, \bar{\omega}^{\mathrm{a}} \wedge \bar{\omega}^{\mathrm{b}}\right) .
$$

But

$$
\begin{aligned}
& \bar{g}\left(\bar{\omega}_{b c} \wedge \bar{\omega}^{c}, \bar{\omega}^{a} \wedge \bar{\omega}^{b}\right) \\
= & \bar{g}\left(\frac{1_{\bar{\omega}}}{}\left(\bar{\omega}_{b c} \wedge \Lambda^{c}\right), \bar{\omega}^{b}\right) \\
= & \bar{g}\left(\frac{1}{\omega^{-}} \bar{\omega}_{b c} \bar{\omega}^{c}-\bar{\omega}_{b c} \Lambda_{\bar{\omega}^{-}} \bar{\omega}^{\bar{c}}, \bar{\omega}^{b}\right)
\end{aligned}
$$

$$
\begin{aligned}
& =\bar{g}\left(\bar{\omega}^{\mathrm{a}}, \bar{\omega}_{b c}\right) \overline{\mathrm{g}}\left(\bar{\omega}^{\mathrm{c}}, \bar{\omega}^{\mathrm{b}}\right)-\overline{\mathrm{g}}\left(\bar{\omega}^{\mathrm{a}}, \bar{\omega}^{\mathrm{c}}\right) \overline{\mathrm{g}}\left(\bar{\omega}_{\mathrm{bc}}, \bar{\omega}^{\mathrm{b}}\right) \\
& \text { => } \\
& \bar{P}_{a} \bar{g}\left(\bar{\omega}_{b c} \wedge \bar{\omega}^{c}, \bar{\omega}^{a} \wedge \bar{\omega}^{b}\right) \\
& =\bar{P}_{\mathrm{a}} \overline{\mathrm{~g}}\left(\bar{\omega}^{\mathrm{a}}, \bar{\omega}_{\mathrm{bc}}\right) \overline{\mathrm{g}}\left(\bar{\omega}^{\mathrm{c}}, \bar{\omega}^{\mathrm{b}}\right)-\overline{\mathrm{P}}_{\mathrm{a}} \overline{\mathrm{~g}}\left(\bar{\omega}^{\mathrm{a}}, \bar{\omega}^{\mathrm{c}}\right) \overline{\mathrm{g}}\left(\bar{\omega}_{\mathrm{bc}}, \bar{\omega}^{\mathrm{b}}\right) \\
& =\bar{P}_{a} \overline{\mathrm{~g}}\left(\bar{\omega}^{\mathrm{a}}, \bar{\omega}_{b b}\right)-\bar{P}_{\mathrm{a}} \bar{g}_{\mathrm{g}}\left(\bar{\omega}_{b a}, \bar{\omega}^{\mathrm{b}}\right) \\
& =-\bar{P}_{a} \bar{g}\left(\bar{u}_{b a}, \bar{\omega}^{b}\right) \\
& =\bar{P}_{a} \bar{g}\left(\bar{\omega}_{a b} \prime^{\prime} \bar{w}^{\prime}\right) \\
& \left.=\bar{P}_{\mathrm{a}} \overline{\bar{g}}\left(\bar{\omega}^{\mathrm{a}} \mathrm{~b}^{\prime} \bar{\omega}^{\mathrm{b}}\right) .\right]
\end{aligned}
$$

From these considerations, it follows that

$$
\begin{gathered}
1+2+3+4+5+6 \\
=2\left[\frac{1}{2} N_{t}\left({ }^{(n-1)} \Omega_{a b}(\bar{\nabla})+\bar{\omega}_{0 a} \wedge \bar{\omega}_{0 b}\right)-\overline{\mathrm{P}}_{a}\left(\mathrm{~d}_{\mathrm{b}}+\bar{\omega}_{b c} \wedge \bar{\omega}^{\mathrm{c}}\right)\right. \\
\left.-\bar{Q}_{b}^{c} \bar{\omega}_{c} \wedge_{0 a}+\bar{\omega}_{0 a} \wedge N_{t} i_{t}^{*} l_{E_{0}} d \omega_{b}\right] \wedge \star\left(\bar{\omega}^{a} \wedge \bar{\omega}^{b}\right) .
\end{gathered}
$$

Consequently, if we set aside the differential

$$
2 \mathrm{~d}\left(\omega_{0 \mathrm{a}} \wedge \theta^{0 \mathrm{a}}\right)
$$

then formally

$$
\delta_{M} \theta^{i j} \Omega_{i j}(\nabla)
$$

$$
\begin{aligned}
& =\int_{\underline{R}} d t \int_{\Sigma} i_{t}^{*} l^{\prime} \partial / \partial t{ }^{\left[2 \omega_{0 a}\right.}{ }^{\wedge 1} E_{0} d \omega_{b} \wedge \theta^{a b}-2 \omega_{0 a}\left(E_{0}\right) d \omega_{b} \wedge \theta^{a b} \\
& -2 \omega_{0 a}\left(E_{0}\right) \omega_{b}^{a}{ }_{b}^{\wedge * \omega}{ }^{b}+2 \omega_{b}^{a}\left(E_{0}\right) \omega_{0 a} \wedge \star \omega^{b} \\
& \left.+\theta^{a b} \wedge\left(\Omega_{a b}(\nabla)-\omega_{a 0} \Lambda \omega_{b}^{0}\right)+\theta^{a b}{ }_{\wedge \omega_{a 0}} \wedge \omega_{b}^{0}{ }_{b}\right] \\
& =\int_{\underline{R}} d t \int_{\Sigma}(1+2+3+4+5+6) \\
& =\delta_{\underline{R}} d t \delta_{\Sigma} 2\left[\frac{1}{2} N_{t}\left({ }^{(n-1)} \Omega_{a b}(\bar{\nabla})+\bar{\omega}_{0 a} \wedge_{0 b}\right)-\bar{p}_{a}\left(d \bar{\omega}_{b}+\bar{\omega}_{b c}{ }^{\bar{\omega}}{ }^{c}\right)\right. \\
& \left.-\bar{Q}_{b}^{c} \bar{\omega}_{c} \wedge \bar{\omega} 0 a+\bar{\omega}_{0 a} \wedge N_{t} i^{*}{ }^{\star}{ }^{l} E_{0} d \omega_{b}\right] \wedge *\left(\bar{\omega}^{\mathrm{a}} \wedge \bar{\omega}^{\mathrm{b}}\right) .
\end{aligned}
$$

Remark: As far as I can tell, an analysis of the

$$
{ }_{\theta}^{i_{l} j_{l} \ldots i_{p} j_{p_{\wedge \Omega_{i_{l}} j_{l}}}(\nabla) \wedge \ldots \wedge \Omega_{i_{p} j_{p}}(\nabla) \quad(p>l)}
$$

along the foregoing lines has never been carried out.

LEMMA We have

$$
N_{t} \dot{i}_{t}^{*} l_{E_{0}} d \omega_{b}=\dot{\bar{\omega}}^{b}-L_{\vec{N}_{t}} \bar{\omega}^{b}
$$

[In fact,

$$
\begin{aligned}
\dot{\omega} b & =i_{t}^{*} L_{\partial / \partial t} \omega^{b} \\
& =i_{t}^{*}\left(L_{N E_{0}}+L_{\vec{N}}\right) \omega^{b}
\end{aligned}
$$

$$
\begin{aligned}
& =i_{t}^{\star} L_{N E_{0}} \omega^{b}+i_{t}^{\star} L_{\vec{N}} \omega^{b} \\
& =i_{t}^{*}\left(N L_{E_{0}} \omega^{b}+d N \wedge t_{E_{0}} \omega^{b}\right)+L_{\vec{N}_{t}} \vec{\omega}^{-b} \\
& =i_{t}^{*}\left(N L_{E_{0}} \omega^{b}\right)+{\underset{\vec{N}}{t}}^{\bar{\omega}^{b}} \\
& =N_{t} i_{t}^{\star} L_{E_{0}} \omega^{b}+\underset{\vec{N}_{t}}{\omega^{-b}} \\
& =N_{t} i_{t}^{\star}\left(l_{E_{0}} \circ d+d \circ \imath_{E_{0}}\right) \omega^{b}+\underset{\vec{N}_{t}}{L^{-b}} \\
& \left.=N_{t} i^{\star}{ }^{\star} E_{0} d \omega^{b}+\underset{\vec{N}_{t}}{L^{-b}} .\right]
\end{aligned}
$$

Because of this, one can replace

$$
\bar{w}_{0 a} N N_{t} i_{t}^{\star} E_{0} d \omega_{b}
$$

by

$$
\bar{\omega}_{0 a} \wedge\left(\dot{\bar{w}}^{b}-L_{\vec{N}_{t}} \bar{\omega}^{b}\right)
$$

Summary:

$$
\begin{aligned}
& \int_{\underline{R}} d t \int_{\Sigma}(1+2+3+4+5+6) \\
& =\int_{\underline{R}} d t \int_{\Sigma} 2\left[\frac{1}{2} N_{t}\left({ }^{(n-1)} \Omega_{a b}(\bar{\nabla})+\bar{\omega}_{0 a} \bar{\omega}_{0 b}\right)-\overline{\mathrm{P}}_{a}\left(d \bar{\omega}_{b}+\bar{\omega}_{b c} \wedge \bar{\omega}^{-c}\right)\right. \\
& \left.+\bar{Q}^{c}{ }_{a} \bar{\omega}_{C} \wedge \bar{\omega}_{0 b}+\dot{\bar{\omega}}^{a} \wedge \bar{\omega}_{0 b}-L_{\vec{N}_{t}} \bar{\omega}^{\mathrm{a}} \wedge \bar{\omega}_{0 b}\right] \wedge \star\left(\bar{\omega}^{\mathrm{a}} \wedge \bar{\omega}^{\mathrm{b}}\right) .
\end{aligned}
$$

Reality Check Specialize and take $\nabla=\nabla^{9}$ - then

$$
1+2+3+4+5+6
$$

reduces to

$$
N_{t}\left({ }^{(n-1)} \Omega_{a b}-\bar{\omega}_{0 a} \wedge \bar{\omega}_{0 b}\right) \wedge *\left(\bar{\omega}^{a} \wedge \bar{\omega}^{b}\right)
$$

as it should. First, since $\nabla^{9}$ is torsion free,

$$
0=\bar{\theta}_{b}=d \bar{\omega}_{b}+\bar{\omega}_{b c} \wedge \bar{\omega}^{c},
$$

hence

$$
\overline{\mathrm{P}}_{\mathrm{a}}\left(\mathrm{~d}{\overline{\omega_{b}}}+\bar{\omega}_{b c} \wedge \bar{\omega}^{-c}\right)=0
$$

It remains to consider

$$
N_{t}\left(\bar{\omega}_{0 a} \wedge \bar{\omega}_{0 b}\right)+2\left[\bar{Q}_{a}^{c} \bar{\omega}_{c} \wedge \bar{\omega}_{0 b}+\dot{\bar{\omega}}^{a} \wedge \bar{\omega}_{0 b}-L_{\stackrel{N}{N}_{t}} \bar{\omega}^{a} \wedge \bar{\omega}_{0 b}\right]
$$

or still,

$$
\left[N_{t} \bar{\omega}_{0 a}+2\left(\bar{Q}_{a}^{c} \bar{\omega}_{c}+\dot{\bar{\omega}}^{\mathrm{a}}-L_{\stackrel{N}{N}_{t}} \bar{\omega}^{\mathrm{a}}\right)\right] \wedge \bar{\omega}_{0 b}
$$

or still,

$$
\left[N_{t} \bar{\omega}_{0 a}+2\left(-\bar{Q}_{c}^{a} \bar{\omega}^{c}+\dot{\bar{\omega}}^{a}-L_{\vec{N}_{t}} \bar{\omega}^{\mathrm{a}}\right)\right] \bar{\omega}_{0 b}
$$

or still,

$$
\begin{aligned}
& {\left[N_{t} \bar{\omega}_{0 a}+2\left(-\dot{\bar{\omega}}^{a}+N_{t} \bar{\omega}_{0}^{a}+L_{\vec{N}_{t}} \bar{\omega}^{a}\right)\right.} \\
&\left.+2\left(\dot{\bar{\omega}} \dot{a}-L_{\vec{N}_{t}} \bar{\omega}^{a}\right)\right] \wedge \bar{\omega}_{0 b}
\end{aligned}
$$

or still,

$$
\left[N_{t} \bar{\omega}_{0 a}+2 N_{t} \bar{\omega}_{0}^{a}\right] \wedge \bar{\omega}_{0 b}
$$

or still,

$$
\left[N_{t} \bar{\omega}_{0 a}+2 N_{t} \bar{\omega}_{a 0}\right]^{\wedge \bar{\omega}_{0 b}}
$$

or still,

$$
\left[N_{t} \bar{\omega}_{0 a}-2 N_{t} \bar{\omega}_{0 a}\right] \wedge \bar{\omega}_{0 b}
$$

which equals

$$
-N_{t} \bar{\omega}_{0 a} \bar{\omega}_{0 b}
$$

Before extrapolating the foregoing, let us recall the notation: Elements of $\underline{Q}$ are denoted by $\vec{\omega}$, elements of $T \underline{Q}$ are denoted by $(\vec{\omega}, \vec{v})$, and elements of $T * \underline{Q}$ are denoted by $(\vec{\omega}, \overrightarrow{\mathrm{p}})$.

External Variables These are $\mathrm{N}, \mathrm{N}$, and W plus three others, viz.:

1. $\underline{\omega}=\left[\omega_{b}^{a}\right] \in \Lambda^{1}(\Sigma$; $\underline{\underline{s o}}(n-1))$.
2. $\underline{\omega}_{0}=\left[\omega_{0 \mathrm{a}}\right] \in \Lambda^{1}\left(\Sigma ; \underline{R}^{\mathrm{n}-1}\right)$.
3. $\vec{B}=\left[B_{a}\right] \in C^{\infty}\left(\sum ; \underline{R}^{n-1}\right)$.

Definition: The lagrangian of the theory is the function

$$
L: T \underline{Q} \rightarrow \Lambda^{\mathrm{n}-1} \Sigma
$$

defined by the rule

$$
\begin{aligned}
& L\left(\vec{\omega}, \vec{v} ; N, \vec{N}, W ; \underline{\omega}, \underline{\omega}_{0}, \vec{B}\right) \\
& =2\left[\frac{N}{2}\left(\Omega_{a b}(\underline{\omega})+\omega_{0 a} \wedge \omega_{0 b}\right)-B_{a}\left(d \omega_{b}+\omega_{b c} \wedge \omega^{c}\right)\right. \\
& \left.+W^{c} a^{\omega} \omega_{c} \wedge \omega_{0 b}+v^{a} \wedge \omega_{0 b}-L_{\vec{N}} \omega^{a} \wedge \omega_{0 b}\right] \wedge *\left(\omega^{a} \wedge \omega^{b}\right) .
\end{aligned}
$$

[Note: The precise meaning of the symbol $\Omega_{a b}(\underline{\omega})$ is this. Let $\vec{E}$ be the frame associated with $\vec{\omega}$ by duality - then the prescription

$$
\nabla_{X} Y=\left\langle X, d Y^{a}+\omega_{b}^{a} Y^{b}\right\rangle E_{a}
$$

defines a $q$-connection $\nabla(\underline{\omega}) \quad\left(\right.$ since $\left.\omega_{a b}+\omega_{b a}=0\right)$ and the

$$
\Omega_{a b}(\underline{\omega})=d \omega_{a b}+\omega_{a c} \wedge \omega_{b}^{c}
$$

are the associated curvature forms.]
Reality Check Let $\underline{\omega}=\left[\omega_{b}^{a}\right]$ be the connection l-forms per the metric connection $\nabla^{q}$ associated with $q$ and, as in the earlier theory, put

$$
N \omega_{0}^{a}=v^{a}-w_{b}^{a} w^{b}-L_{\vec{N}} \omega^{a}
$$

Since $\nabla^{q}$ is torsion free, with these specializations,

$$
\begin{aligned}
& L\left(\vec{\omega}, \vec{v} ; N, \vec{N}, W ; \omega_{\omega}, \omega_{0}, \vec{B}\right) \\
= & N\left({ }^{(n-1)} \Omega_{a b}+\omega_{0 a} \wedge \omega_{0 b}\right) \wedge *\left(\omega^{a} \wedge \omega^{b}\right) \\
& +2\left(W_{a}^{c} \omega_{c}+v^{a}-L_{\vec{N}} \omega^{a}\right) \wedge \omega_{0 b} \wedge *\left(\omega^{a} \wedge \omega^{b}\right) \\
= & N\left({ }^{(n-1)} \Omega_{a b}+\omega_{0 a} \wedge \omega_{0 b}\right) \wedge *\left(\omega^{a} \wedge \omega^{b}\right) \\
& +2\left(W_{a}^{c}{ }_{a}^{\omega_{c}}+\omega_{0}^{a}+W_{b}^{a} \omega^{b}+L_{\vec{N}} \omega^{a}-L_{\vec{N}} \omega^{a}\right) \wedge \omega_{0 b} \wedge *\left(\omega^{a} \wedge \omega^{b}\right) \\
= & N\left({ }^{(n-1)} \Omega_{a b}+\omega_{0 a} \wedge \omega_{0 b}\right) \wedge *\left(\omega^{a} \wedge \omega^{b}\right)
\end{aligned}
$$

$$
\begin{aligned}
& +2\left(w_{a}^{b} \omega_{b}+N \omega_{a 0}+W_{b}^{a} \omega^{b}\right) \wedge \omega_{0 b} \wedge *\left(\omega^{a} \wedge \omega^{b}\right) \\
& =N\left({ }^{\left.(n-1)_{\Omega_{a b}}+\omega_{0 a} \wedge \omega_{0 b}\right) \wedge *\left(\omega^{a} \wedge \omega^{b}\right)}\right. \\
& +2\left(-W_{b}^{a} \omega^{b}-N \omega_{0 a}+W_{b}^{a} \omega^{b}\right) \wedge_{0 b} \wedge_{*}\left(\omega^{a} \wedge \omega^{b}\right) \\
& =N\left({ }^{(n-1)} \Omega_{a b}-\omega_{0 a} \wedge \omega_{0 b}\right) \wedge *\left(\omega^{a} \wedge \omega^{b}\right) \\
& =N *\left(\omega^{a} \wedge \omega^{b}\right) \wedge\left({ }^{(n-1)} \Omega_{a b}-\omega_{0 a} \wedge \omega_{0 b}\right) \\
& =L(\vec{\omega}, \vec{V} ; N, \vec{N}, W) .
\end{aligned}
$$

Let

$$
\begin{aligned}
& L\left(\vec{\omega}, \vec{v} ; N, \vec{N}, W ; \underline{\omega}, \underline{\omega}_{0}, \vec{B}\right) \\
& \quad=\frac{1}{2} \int_{\Sigma} L\left(\vec{\omega}, \vec{v} ; N, \vec{N}, W ; \underline{\omega}_{,},{ }_{-0}, \vec{B}\right) .
\end{aligned}
$$

LEMMA We have

$$
\frac{\delta L}{\delta v^{a}}=p_{a}=\omega_{0 b^{\wedge}} \wedge\left(\omega^{a} \wedge \omega^{b}\right)
$$

Let

$$
F L: T \underline{Q} \rightarrow T^{\star} \underline{Q}
$$

be the fiber derivative of $L$ :

$$
F L(\vec{\omega}, \vec{v})=\left(\vec{w}, \frac{\delta L}{\delta \vec{v}}\right)
$$

Then

$$
\begin{aligned}
\langle & \vec{v}, \frac{\delta L}{\delta \vec{v}}>-L\left(\vec{\omega}, \vec{v} ; N, \vec{N}, W ; \omega_{r} \underline{\omega}_{0}, \vec{B}\right) \\
= & \int_{\Sigma} v^{a} \wedge p_{a}-\delta_{\Sigma}\left(\underline{w}_{a}^{c} \omega_{c}+v^{a}-L_{\vec{N}} \omega^{a}\right) \wedge p_{a} \\
& +\int_{\Sigma} B_{a}\left(d \omega_{b}+\omega_{b c} \wedge \omega^{c}\right) \wedge *\left(\omega^{a} \wedge \omega^{b}\right) \\
- & \int_{\Sigma} \frac{N}{2}\left(\Omega_{a b}(\underline{\omega})+\omega_{0 a} \wedge \omega_{0 b}\right) \wedge *\left(\omega^{a} \wedge \omega^{b}\right) \\
= & \delta_{\Sigma} L_{\vec{N}} \omega^{a} \wedge p_{a}+\delta_{\Sigma} w_{b}^{a} \omega^{b} \wedge p_{a} \\
& +\delta_{\Sigma} B_{a}\left(d \omega_{b}+\omega_{b c} \wedge \omega^{c}\right) \wedge *\left(\omega^{a} \wedge \omega^{b}\right) \\
& -\delta_{\Sigma} \frac{N}{2}\left(\Omega_{a b}(\underline{\omega})+\omega_{0 a} \wedge \omega_{0 b}\right) \wedge *\left(\omega^{a} \wedge \omega^{b}\right)
\end{aligned}
$$

But

- $\Omega_{a b}(\underline{\omega}) \wedge \star\left(\omega^{a} \wedge \omega^{b}\right)$

$$
\begin{aligned}
& =q\left(\omega^{a} \wedge \omega^{b}, \Omega_{a b}(\underline{\omega})\right) v o l_{q} \\
& ={ }_{\omega}{ }^{2} a{ }^{a} \omega^{b^{\Omega} a b} \underline{(\omega)}^{v o l} q \\
& ={ }^{2} b^{b^{l}} \omega^{a}{ }^{\Omega} a b \underline{(\omega)}^{\left(\omega 0 l_{q}\right.} \\
& =S(\underline{\omega}) v^{v o l} q^{*}
\end{aligned}
$$

$$
\begin{aligned}
& \text { - } \omega_{0 a} \wedge \omega_{0 b} \wedge *\left(\omega^{a} \wedge \omega^{b}\right)=\omega_{0 a} \wedge p_{a} \\
& \quad=\left(-q\left(p_{a}, * \omega^{b}\right) q\left(p_{b}, * \omega^{a}\right)+\frac{p^{2}}{n-2}\right) v_{l} l_{q}
\end{aligned}
$$

Therefore

$$
\begin{aligned}
-\int_{\Sigma} & \frac{N}{2}\left(\Omega_{a b}(\omega)+\omega_{0 a} \wedge \omega_{0 b}\right) \wedge *\left(\omega^{a} \wedge \omega^{b}\right) \\
& =\int_{\Sigma} \frac{N}{2}\left[q\left(p_{a}, * \omega^{b}\right) q\left(p_{b}, * \omega^{a}\right)-\frac{p^{2}}{n-2}-s(\underline{\omega})\right] v o l_{q}
\end{aligned}
$$

We now shift the theory from $T \underline{Q}$ to $T^{*} \underline{Q}$ and let

$$
H: T^{*} \underline{Q} \rightarrow \underline{R}
$$

be the function defined by the prescription

$$
\begin{aligned}
& H(\vec{\omega}, \vec{p} ; N, \vec{N}, W ; \omega, \vec{B}) \\
& =\int_{\Sigma} L_{\vec{N}} \omega^{a} \wedge p_{a}+\delta_{\Sigma} w_{b}^{a} \omega^{b} \wedge p_{a} \\
& +\int_{\Sigma} \frac{N}{2}\left[q\left(p_{a}, * \omega^{b}\right) q\left(p_{b}, * \omega^{a}\right)-\frac{p^{2}}{n-2}-S(\underline{\omega})\right] v o l_{q} \\
& \quad+\int_{\Sigma} B_{a}\left(d \omega_{b}+\omega_{b c} \wedge \omega^{c}\right) \wedge *\left(\omega^{a} \wedge \omega^{b}\right)
\end{aligned}
$$

[Note: Here the external variable N is unrestricted, i.e., N can be any element of $\left.C^{\infty}(\Sigma).\right]$

Remark: Let $\underline{\omega}=\left[\omega_{b}^{a}\right]$ be the connection l-forms per the metric connection $\nabla^{\text {q }}$ associated with $q$-- then it is clear that

$$
H(\vec{\omega}, \overrightarrow{\mathrm{p}} ; \mathrm{N}, \overrightarrow{\mathrm{~N}}, \mathrm{~W} ; \underline{\omega}, \overrightarrow{\mathrm{B}})
$$

$$
=H(\vec{\omega}, \vec{p} ; N, \vec{N}, W) .
$$

The theory has five constraints, characterized by the conditions

$$
\frac{\delta H}{\delta N}=0, \frac{\delta H}{\delta \vec{N}}=0, \frac{\delta H}{\delta W}=0, \frac{\delta H}{\delta \omega}=0, \frac{\delta H}{\delta \vec{B}}=0 .
$$

Of these, the first three are familiar while the last two are new.
We have

$$
\left[\begin{array}{l}
\frac{\delta H}{\delta N}=\frac{1}{2}\left[q\left(p_{a}, * \omega^{b}\right) q\left(p_{b}, * \omega^{a}\right)-\frac{p^{2}}{n-2}-S(\underline{\omega})\right] v o l_{q} \\
\frac{\delta H}{\delta N^{a}}=-d p_{a}+{ }^{q^{2}} E_{a} d \omega^{b} \wedge p_{b} \\
\frac{\delta H}{\delta W_{b}^{a}}=\omega^{b} \wedge p_{a}-\omega^{a} \wedge p_{b}
\end{array}\right.
$$

Let $\theta^{a}(\underline{\omega})$ be the torsion forms associated with $\nabla(\underline{\omega})$-- then

$$
\frac{\delta H}{\delta \mathrm{~B}_{\mathrm{a}}}=\theta_{\mathrm{b}}(\omega) \wedge *\left(\omega^{\mathrm{a}} \wedge \omega^{\mathrm{b}}\right)
$$

- Define

$$
I_{a}: T^{*} \underline{Q} \rightarrow \Lambda^{n-1} \Sigma
$$

by

$$
I_{a}(\vec{\omega}, \vec{p})=-d p_{a}+{ }_{E_{a}} d \omega^{b} \wedge p_{b}
$$

- Define

$$
A v_{a}^{b}: T^{*} \underline{Q} \rightarrow \Lambda^{n-1} \Sigma
$$

by

$$
A v_{a}^{b}(\vec{\omega}, \vec{p})=\frac{1}{2}\left(\omega^{b} \wedge p_{a}-\omega^{a} \wedge p_{b}\right) .
$$

20. 

## - Define

$$
\mathrm{E}: \mathrm{T}^{*} \underline{\mathrm{Q}} \rightarrow \Lambda^{\mathrm{n}-1} \mathrm{~L}_{\Sigma}
$$

by

$$
E(\vec{\omega}, \vec{p} ; \underline{\omega})=\frac{1}{2}\left[q\left(p_{a}, * \omega^{b}\right) q\left(p_{b}, * \omega^{a}\right)-\frac{p^{2}}{n-2}-S(\underline{\omega})\right] \operatorname{vol} q_{q} .
$$

- Define

$$
\mathrm{T}^{\mathrm{a}}: \mathrm{T}^{*} \underline{\underline{Q}} \rightarrow \Lambda^{\mathrm{n}-\mathrm{l}} \Sigma
$$

by

$$
T^{a}(\vec{\omega}, \vec{p} ; \underline{\omega})=\left(d \omega_{b}+\omega_{b c} \Lambda \omega^{c}\right) \wedge *\left(\omega^{a} \wedge \omega^{b}\right)
$$

Then

$$
\begin{aligned}
& H(\vec{\omega}, \vec{p} ; N, \vec{N}, W ; \underline{\omega}, \vec{B}) \\
& =\int_{\Sigma} N^{a} I_{a}(\vec{\omega}, \vec{p})+\delta_{\Sigma} W_{b^{A}}^{A}{ }_{a}^{b}(\vec{\omega}, \vec{p}) \\
& \quad+\int_{\Sigma} N E(\vec{\omega}, \vec{p} ; \underline{\omega})+\delta_{\Sigma} B_{a} T^{a}(\vec{\omega}, \vec{p} ; \underline{\omega}) .
\end{aligned}
$$

[Note: Accordingly, in contrast to the earlier theory, one of the constraints is not part of H.]

IEMMA We have

$$
\begin{aligned}
\frac{\delta H}{\delta \omega_{a b}}=- & \left(d N+B_{c} \omega^{c}\right) \wedge *\left(\omega^{a} \wedge \omega^{b}\right) \\
& -N \theta^{c}(\underline{\omega}) \wedge *\left(\omega^{a} \wedge \omega^{b} \wedge \omega_{c}\right)
\end{aligned}
$$

[There are two contributions to the variation w.r.t. $\omega_{a b}$. The first is

$$
B_{C}\left(\omega^{b} \wedge *\left(\omega^{\mathrm{c}} \wedge \omega^{\mathrm{a}}\right)-\omega^{\mathrm{a}} \wedge *\left(\omega^{\mathrm{C}} \wedge \omega^{\mathrm{b}}\right)\right)
$$

or still,

$$
B_{C}\left(\omega^{b} \wedge t \omega^{a^{*}}{ }^{c}-\omega^{a} \wedge t \omega^{* \omega^{c}}\right)
$$

or still,

$$
\begin{aligned}
& B_{C}{ }^{(\mathrm{t}} \omega a^{\left.\omega^{\mathrm{b}} \wedge * \omega^{c}-{ }^{\mathrm{t}} \omega^{\mathrm{a}}{ }^{\left(\omega^{\mathrm{b}} \wedge * \omega^{c}\right)}\right)} \\
& \left.+{ }_{\omega} b^{b} \omega^{a} \omega^{a} \omega^{c}\right)-1{ }_{\omega} b^{\left.\omega^{a} \wedge * \omega^{c}\right)}
\end{aligned}
$$

or still,

$$
B_{C}\left(-{ }_{\omega}{ }_{\omega} a^{\left.\left(\omega^{b} \wedge * \omega^{c}\right)+{ }_{\omega}{ }_{\omega} b^{\left.\left(\omega^{a} \wedge * \omega^{c}\right)\right)}\right)}\right.
$$

or still,

$$
B_{C}\left(-{ }_{\omega}{ }_{\omega} a^{q\left(\omega^{b}, \omega^{c}\right) v o l} q^{c}+{ }_{\omega} b^{q\left(\omega^{a}, \omega^{c}\right) v o l}{ }_{q}\right)
$$

or still,

$$
{ }^{B_{C}}\left(q\left(\omega^{a}, \omega^{c}\right) * \omega^{b}-q\left(\omega^{b}, \omega^{c}\right) * \omega^{a}\right)
$$

But

$$
\begin{aligned}
&(-1)^{2+1} \omega^{c} \wedge *\left(\omega^{a} \wedge \omega^{b}\right) \\
&=* l \omega^{c}\left(\omega^{a} \wedge \omega^{b}\right) \\
&=*\left(\imath \omega^{c^{\omega}} \omega^{a} \wedge \omega^{b}-\omega^{a} \wedge l\right. \\
&\left.\omega c^{b}\right) \\
&=*\left(q\left(\omega^{a}, \omega^{c}\right) \omega^{b}-q\left(\omega^{b}, \omega^{c}\right) \omega^{a}\right) \\
&=q\left(\omega^{a}, \omega^{c}\right) * \omega^{b}-q\left(\omega^{b}, \omega^{c}\right) * \omega^{a}
\end{aligned}
$$

The term

$$
-B_{c} \omega^{c} \wedge *\left(\omega^{a} \wedge \omega^{b}\right)
$$

is thus accounted for. What's left comes from consideration of

$$
-\frac{N}{2} S\left(\underline{\omega}^{\operatorname{vol}}{ }_{q}=-\frac{N}{2} \Omega_{c d}(\underline{\omega}) \wedge *\left(\omega^{c} \wedge \omega^{d}\right)\right.
$$

However, on the basis of what was said during our discussion of the Palatini formalism,

$$
\begin{aligned}
& \delta_{a b}\left(\Omega_{c d}(\underline{\omega}) \wedge *\left(\omega^{c} \wedge \omega^{d}\right)\right) \\
& =d\left(\delta \omega_{a b} \wedge *\left(\omega^{a} \wedge \omega^{b}\right)\right)+\delta \omega_{a b} \wedge \theta^{c}(\underline{\omega}) \wedge *\left(\omega^{a} \wedge \omega^{b} \wedge \omega_{c}\right) \\
& -d\left(\delta \omega_{a b} \wedge *\left(\omega^{b} \wedge \omega^{a}\right)\right)-\delta \omega_{a b} \wedge \theta^{c}(\underline{\omega}) \wedge *\left(\omega^{b} \wedge \omega^{a} \wedge \omega_{c}\right) \\
& =2 d\left(\delta \omega_{a b} \wedge *\left(\omega^{a} \wedge \omega^{b}\right)\right)+2 \delta \omega_{a b} \wedge \theta^{c}(\underline{\omega}) \wedge *\left(\omega^{a} \wedge \omega^{b} \wedge \omega_{c}\right) .
\end{aligned}
$$

This explains the occurrence of

$$
-N \theta^{c}(\underline{\omega}) \wedge *\left(\omega^{a} \wedge \omega^{b} \wedge \omega_{C}\right) .
$$

Finally

$$
\begin{aligned}
& d\left(N \delta \omega_{a b} \wedge *\left(\omega^{a} \wedge \omega^{b}\right)\right) \\
& =d N \wedge \delta \omega_{a b} \wedge *\left(\omega^{a} \wedge \omega^{b}\right)+N d\left(\delta \omega_{a b} \wedge *\left(\omega^{a} \wedge \omega^{b}\right)\right) \\
\Rightarrow \quad & \operatorname{Nd}\left(\delta \omega_{a b} \wedge *\left(\omega^{a} \wedge \omega^{b}\right)\right) \\
& =d\left(N \delta \omega_{a b^{\wedge *}} \wedge\left(\omega^{a} \wedge \omega^{b}\right)\right)-d N \wedge \delta \omega_{a b} \wedge *\left(\omega^{a} \wedge \omega^{b}\right) \\
& =d\left(N \delta \omega_{a b^{\wedge *}}{ }^{\wedge}\left(\omega^{a} \wedge \omega^{b}\right)\right)+\delta \omega_{a b^{\prime}} \wedge d N \wedge *\left(\omega^{a} \wedge \omega^{b}\right) .
\end{aligned}
$$

Since

$$
\int_{\Sigma} d\left(N \delta \omega_{a b} \wedge *\left(\omega^{a} \wedge \omega^{b}\right)\right)=0
$$

incorporation of the minus sign leads to

$$
\left.-\mathrm{dN} \wedge *\left(\omega^{a} \wedge \omega^{\mathrm{b}}\right) .\right]
$$

23. 

If $\nabla(\underline{\omega})$ is torsion free, then $\frac{\delta H}{\delta B_{a}}=0$ and if further $d N+B_{c} \omega^{c}=0$, then, in view of the lemma, $\frac{\delta H}{\delta \omega_{a b}}=0$.

There is also a partial converse. Thus assume that $\forall$ a,

$$
\theta^{c}(\underline{\omega}) \wedge *\left(\omega^{a} \omega_{c}\right)=0
$$

and $\forall \mathrm{a} \& \forall \mathrm{~b}$,

$$
\begin{aligned}
& -\left(d N+B_{C} \omega^{c}\right) \wedge *\left(\omega^{a} \wedge \omega^{b}\right)-N \Theta^{c}(\underline{\omega}) \wedge *\left(\omega^{a} \wedge \omega^{b} \Lambda_{C}\right)=0 . \\
& \text { - * }\left(\omega^{a} \wedge \omega^{b}\right) \wedge \omega^{b} \\
& =(-1)^{(n-1)-1} *{ }_{\omega} b^{\left(\omega^{a} \wedge \omega^{b}\right)} \\
& =(-1)^{n} \star\left(1{ }_{\omega} b^{\omega^{a} \wedge \omega^{b}-\omega^{a} \wedge l} \omega^{\left.b^{\omega^{b}}\right)}\right. \\
& =(-1)^{\mathrm{n}} \star\left(q\left(\omega^{\mathrm{a}}, \omega^{\mathrm{b}}\right) \omega^{\mathrm{b}}\right) \\
& =(-1)^{\mathrm{n}} \star \omega^{\mathrm{a}} . \\
& \text { - * }\left(\omega^{a} \wedge \omega^{b} \wedge \omega^{c}\right) \wedge \omega^{b} \\
& =(-1)^{(n-1)-1} * 1{ }_{\omega} b^{\left(\omega^{a} \wedge \omega^{b} \wedge \omega^{c}\right)}
\end{aligned}
$$

$$
\begin{aligned}
& =(-1)^{\mathrm{n}} \star\left(\omega^{\mathrm{a}} \wedge \omega^{\mathrm{c}}+\omega^{\mathrm{a}} \wedge \omega^{c}\right) \\
& =2(-1)^{\mathrm{n}} *\left(\omega^{\mathrm{a}} \wedge \omega^{\mathrm{c}}\right) .
\end{aligned}
$$

Then

$$
\begin{array}{cc}
0=\left[-\left(d N+B_{c} \omega^{c}\right) \wedge *\left(\omega^{a} \wedge \omega^{b}\right)-N \theta^{c}(\underline{\omega}) \wedge *\left(\omega^{a} \wedge \omega^{b} \wedge \omega_{c}\right)\right] \wedge \omega^{b} \\
= & (-1)^{n+1}\left(d N+B_{c} \omega^{c}\right) \wedge * \omega^{a}+2(-1)^{n+1} N \theta^{c}(\underline{\omega}) \wedge *\left(\omega^{a} \wedge \omega_{c}\right) \\
\Rightarrow \quad & \left(d N+B_{c} \omega^{c}\right) \wedge \star \omega^{a}=0 \forall a \\
\Rightarrow \quad & q\left(d N+B_{c} \omega^{c}, \omega^{a}\right)=0 \forall a \\
\Rightarrow \quad & \\
& \\
& \\
& \\
&
\end{array}
$$

So, under the supposition that

$$
N \in C_{>0}^{\infty}(\Sigma) \cup C_{<0}^{\infty}(\Sigma),
$$

it follows that

$$
\Theta^{c}(\underline{\omega}) \wedge *\left(\omega^{a} \wedge \omega^{b} \omega_{c}\right)=0 .
$$

But this means that

$$
\nabla(\underline{\omega}) \operatorname{con}_{\mathrm{q}} \mathrm{~T} \Sigma
$$

is critical, hence $\nabla(\underline{\omega})$ is torsion free. [Note: Bear in mind that $\operatorname{dim} \Sigma>2$.

Definition: The relations

$$
\begin{aligned}
& d \omega_{b}+\omega_{b c} \wedge \omega^{c}=0 \\
& d N+B_{c} \omega^{c}=0
\end{aligned}
$$

are called auxiliary constraints.
[Note: They are simpler to use and nothing of substance is lost in so doing.]

The central theorem in the coframe picture is that $\operatorname{Ein}(\mathrm{g})=0$ provided the constraint equations and the evolution equations are satisfied by the pair $\left(\vec{\omega}_{t}, \overrightarrow{\mathrm{P}}_{\mathrm{t}}\right)$. Is there a similar detection principle at work which will imply that $\nabla=\nabla^{g}$ ? It turns out that the answer is "yes" but no time development of the induced connection is involved: The situation is basically controlled by the imposition of certain constraints.

Let $\nabla$ be a $g$-connection - then, as we know $\theta(\nabla)=0$ if Equations 1 - 4 are satisfied $\forall t$ :

1. $\forall \mathrm{a} \& \forall \mathrm{~b}$ :

$$
\bar{\omega}_{a}^{0}\left(E_{b}\right)=\bar{\omega}_{b}^{0}\left(E_{a}\right) .
$$

2. $\forall a$ :

$$
\mathrm{d} \bar{\omega}^{\mathrm{a}}+\bar{\omega}_{\mathrm{b}}^{\mathrm{a}} \wedge^{-\mathrm{\omega}}=0 .
$$

3. $d N_{t}+\bar{P}_{c} \bar{\omega}^{\mathrm{C}}=0$.
4. $\forall a$ :

$$
\dot{\bar{\omega}}^{\mathrm{a}}={N_{t}}^{-\bar{\omega}}{ }_{0}^{\mathrm{a}}+\overline{\mathrm{Q}}_{\mathrm{b}^{\mathrm{a}}} \overline{\mathrm{~m}}^{\mathrm{b}}+L_{\bar{N}_{t}} \bar{\omega}^{\mathrm{a}}
$$

Consider the one parameter family

$$
t \rightarrow\left(\vec{\omega}_{t}, \overrightarrow{\mathrm{P}}_{\mathrm{t}} ; \mathrm{N}_{\mathrm{t}}, \vec{N}_{\mathrm{t}},\left[\bar{Q}_{\mathrm{b}}^{\mathrm{a}}\right] ;\left[\bar{\omega}_{\mathrm{b}}^{\mathrm{a}}\right],\left[\overline{\mathrm{P}}_{\mathrm{c}}\right]\right)
$$

associated with the pair $(\mathrm{g}, \nabla)$.
Assume: $\forall t$, the pair $\left(\vec{\omega}_{t}, \vec{p}_{t}\right)$ lies in the ADM sector of $T^{*} \underline{Q}$, i.e.,

$$
\bar{\omega}^{\mathrm{a}} \wedge \mathrm{p}_{\mathrm{b}}=\bar{\omega}^{\mathrm{b}} \wedge \mathrm{p}_{\mathrm{a}}
$$

for all a,b. The claim is that Equation $l$ is satisfied. This is obvious if $\mathrm{a}=\mathrm{b}$, so suppose that $\mathrm{a} \neq \mathrm{b}$ - then

$$
\begin{aligned}
& {\left[\begin{array}{l}
\bar{\omega}^{a} \wedge p_{b}=-q_{t}\left(\bar{\omega}_{0 a}, \bar{\omega}^{b}\right) v o l_{q_{t}} \\
\\
\Rightarrow \\
\bar{\omega}^{b} \wedge p_{a}=-q_{t}\left(\bar{\omega}_{0 b}, \bar{\omega}^{a}\right) v o l_{q_{t}}
\end{array}\right.} \\
\Rightarrow \quad & q_{t}\left(\bar{\omega}_{0 a}, \bar{\omega}^{b}\right)=q_{t}\left(\bar{\omega}_{0 b^{\prime}}, \bar{\omega}^{a}\right) \\
& \bar{\omega}_{a}^{0}\left(E_{b}\right)=\bar{\omega}_{b}^{0}\left(E_{a}\right) .
\end{aligned}
$$

Stipulate next that the auxiliary constraints are in force $\forall \mathrm{t}$ :

$$
\left[\begin{array}{l}
d \bar{\omega}_{b}+\bar{\omega}_{b c} \wedge \bar{\omega}^{c}=0 \\
d N_{t}+\bar{P}_{c} \bar{\omega}^{c}=0
\end{array}\right.
$$

thus taking care of Equations 2-3. As for Equation 4, we shall simply assume that it holds at each $t$ (but see the next section on evolution).

Conclusion: Under the stated conditions, $\theta(\nabla)=0 \Rightarrow \nabla=\nabla^{g}$.

Section 51: Evolution in the Palatini Picture The assumptions and notation are those of the standard setup.

Rappel:

$$
\begin{aligned}
& H(\vec{\omega}, \overrightarrow{\mathrm{P}} ; N, \vec{N}, W ; \underline{\omega}, \overrightarrow{\mathrm{B}}) \\
& \quad=\delta_{\Sigma} L_{\vec{N}} \omega^{a} \wedge \mathrm{p}_{a}+\delta_{\Sigma} W_{b}^{a} \omega^{b} \wedge \mathrm{p}_{a} \\
& +\delta_{\Sigma} N E+\delta_{\Sigma} B_{a}\left(d \omega_{b}+\omega_{b c} \wedge \omega^{c}\right) \wedge *\left(\omega^{a} \wedge \omega^{b}\right),
\end{aligned}
$$

where

$$
E(\vec{\omega}, \vec{p} ; \underline{\omega})=\frac{1}{2}\left[q\left(p_{a}, * \omega^{b}\right) q\left(p_{b}, * \omega^{a}\right)-\frac{p^{2}}{n-2}-s(\underline{\omega})\right] \mathrm{vol}_{q} .
$$

There are then two points:

1. Compute $\frac{\delta H}{\delta \mathrm{p}_{\mathrm{a}}}$;
2. Compute $\frac{\delta H}{\delta \omega^{a}}$.

The discussion of $\frac{\delta H}{\delta p_{a}}$ is verbatim the same as in the coframe picture, the result being that

$$
\frac{\delta H}{\delta p_{a}}=L_{\vec{N}} \omega^{a}+w_{b}^{a}{ }^{\omega^{b}}+N\left(q\left(p_{b}, * \omega^{a}\right) \omega^{b}-\frac{p}{n-2} \omega^{a}\right)
$$

Turning to $\frac{\delta H}{\delta \omega^{\text {a }}}$, we have

$$
\begin{aligned}
\frac{\delta H}{\delta \omega^{a}}= & -L_{\vec{N}} p_{a}+w_{a}^{b} p_{b} \\
& +\frac{\delta}{\delta \omega^{a}}\left[\delta_{\Sigma} N E\right]
\end{aligned}
$$

2. 

$$
+\frac{\delta}{\delta \omega^{a}}\left[\int_{\sum} B_{b}\left(d \omega_{c}+\omega_{c d} \wedge \omega^{d}\right) \wedge *\left(\omega^{b} \wedge \omega^{c}\right)\right]
$$

Repeating the earlier analysis word-for-word then leads to

$$
\begin{aligned}
& \frac{\delta}{\delta \omega^{a}}\left[\delta_{\Sigma} N E\right] \\
& \begin{aligned}
= & \frac{\delta}{\delta \omega^{a}}\left[f_{\Sigma} \frac{N}{2} q\left(p_{b}, * \omega^{c}\right) q\left(p_{c}, * \omega^{b}\right) v o l_{q}\right]
\end{aligned} \\
& \\
& +\frac{\delta}{\delta \omega^{a}}\left[\delta_{\Sigma} N\left(-\frac{p^{2}}{2(n-2)}\right) v o l_{q}\right] \\
& \\
& \quad+\frac{\delta}{\delta \omega^{a}}\left[\delta_{\Sigma} N\left(-\frac{1}{2} S(\underline{\omega})\right) v o l_{q}\right] \\
& =
\end{aligned}
$$

But

$$
\begin{aligned}
& \Rightarrow \quad \underline{(\omega)} \operatorname{vol}_{q}=\Omega_{b c}(\underline{\omega}) \wedge *\left(\omega^{b} \wedge \omega^{c}\right) \\
& \Rightarrow \quad \delta_{a}\left(-\frac{1}{2} s(\underline{\omega}) \operatorname{vol}_{q}\right) \\
&=\delta_{a}\left(-\frac{1}{2} \Omega_{b c}(\underline{\omega}) \wedge *\left(\omega^{b} \wedge \omega^{c}\right)\right) \\
&=-\frac{1}{2} \Omega_{b c}(\underline{\omega}) \wedge \delta_{a} *\left(\omega^{b} \wedge \omega^{c}\right)
\end{aligned}
$$

$$
=\delta \omega^{a} \wedge *\left(\operatorname{Ric}_{a}(\underset{\sim}{\omega})-\frac{1}{2} S(\underset{\sim}{\omega}) \omega^{a}\right)
$$

$$
\Rightarrow
$$

$$
\frac{\delta}{\delta \omega^{a}}\left[\delta_{\Sigma} N\left(-\frac{1}{2} S(\underline{\omega})\right) v o l_{q}\right]=N *\left(\operatorname{Ric}_{a}(\underline{\omega})-\frac{1}{2} S(\underline{\omega}) \omega^{a}\right)
$$

[Note: There is no need to deal with $\delta_{a} \Omega_{b c}(\underline{\omega}) \wedge *\left(\omega^{b} \wedge \omega^{c}\right), \underline{\omega}$ being independent of $\vec{\omega}$.

There remains the calculation of

$$
\frac{\delta}{\delta \omega^{a}}\left[\delta_{\Sigma} B_{b}\left(d \omega_{c}+\omega_{c d} \wedge \omega^{d}\right) \wedge *\left(\omega^{b} \wedge \omega^{c}\right)\right]
$$

To this end, write

$$
\begin{aligned}
& \delta_{a}\left[B_{b}\left(d \omega_{c}+\omega_{c d} \wedge \omega^{d}\right) \wedge *\left(\omega^{b} \wedge \omega^{c}\right)\right] \\
& =\delta_{a}\left(B_{b}\left(d \omega_{c}+\omega_{c d} \wedge \omega^{d}\right)\right) \wedge *\left(\omega^{b} \wedge \omega^{c}\right) \\
& +B_{b}\left(d \omega_{c}+\omega_{c d} \wedge \omega^{d}\right) \wedge \delta_{a} *\left(\omega^{b} \wedge \omega^{c}\right) \\
& =B_{b} d \delta \omega_{a} \wedge *\left(\omega^{b} \wedge \omega^{a}\right)+B_{b} \omega_{c a} \wedge \delta \omega^{a} \wedge *\left(\omega^{b} \wedge \omega^{c}\right) \\
& +B_{b}\left(d \omega_{c}+\omega_{c d} \wedge \omega^{d}\right) \wedge \delta \omega^{a} \wedge *\left(\omega^{a} \wedge \omega^{b} \wedge \omega^{c}\right) \\
& =d\left(\delta \omega_{a} \wedge B_{b} \wedge *\left(\omega^{b} \wedge \omega^{a}\right)\right)+\delta \omega_{a} \wedge d\left(B_{b} \wedge *\left(\omega^{b} \wedge \omega^{a}\right)\right) \\
& +\delta \omega^{a} \wedge B_{b} \omega_{a c^{\prime}} \wedge *\left(\omega^{b} \wedge \omega^{c}\right) . \\
& +\delta \omega^{a} \wedge B_{b}\left(d \omega_{c}+\omega_{c d} \wedge \omega^{d}\right) \wedge *\left(\omega^{a} \wedge \omega^{b} \wedge \omega^{c}\right) .
\end{aligned}
$$

Thus

$$
\begin{aligned}
& \frac{\delta}{\delta \omega^{a}}\left[\delta_{\sum} B_{b}\left(d \omega_{c}+\omega_{c d} \wedge \omega^{d}\right) \wedge *\left(\omega^{b} \wedge \omega^{c}\right)\right] \\
& =d\left(B_{b} \wedge *\left(\omega^{b} \wedge \omega^{a}\right)\right)+B_{b} \omega_{a c} \wedge *\left(\omega^{b} \wedge \omega^{c}\right) \\
& \quad+B_{b}\left(d \omega_{c}+\omega_{c d} \wedge \omega^{d}\right) \wedge *\left(\omega^{a} \wedge \omega^{b} \wedge \omega^{c}\right) .
\end{aligned}
$$

Impose now the auxiliary constraints:

$$
\left[\begin{array}{l}
d \omega_{b}+\omega_{b c} \Lambda \omega^{c}=0 \\
d N+B_{c} \omega^{c}=0 .
\end{array}\right.
$$

Then the term prefacing $*\left(\omega^{a} \wedge \omega^{b} \wedge \omega^{c}\right)$ disappears and the claim is that

$$
\begin{aligned}
& d\left(B_{b} \wedge *\left(\omega^{b} \wedge \omega^{a}\right)\right)+B_{b} \omega_{a c} \wedge *\left(\omega^{b} \wedge \omega^{c}\right) \\
& =-*\left(\nabla_{a} d N-\left(\Delta_{q} N\right) \omega^{a}\right) .
\end{aligned}
$$

- $-d *\left(d N \wedge \omega^{a}\right)$

$$
\begin{aligned}
& =-d *\left(-B_{b} \omega^{b} \wedge \omega^{a}\right) \\
& =d *\left(B_{b} \omega^{b} \wedge \omega^{a}\right) \\
& =d\left(B_{b} \wedge *\left(\omega^{b} \wedge \omega^{a}\right)\right) .
\end{aligned}
$$

- $\omega_{C a} \wedge^{\star}\left(d \wedge \wedge \omega^{C}\right)$

$$
\begin{aligned}
& =\omega_{a c} \wedge *\left(-d \wedge \wedge \omega^{c}\right) \\
& =\omega_{a c} \wedge *\left(B_{b} \omega^{b} \wedge \omega^{c}\right) \\
& =B_{b} \omega_{a c} \wedge *\left(\omega^{b} \wedge \omega^{c}\right) .
\end{aligned}
$$

And

$$
\begin{aligned}
-d * & \left(d N \wedge \omega^{a}\right)+\omega_{c a} \wedge *\left(d N \wedge \omega^{C}\right) \\
& =-d *\left(d N \wedge \omega_{a}\right)+\omega^{c} a^{\wedge *\left(d N \wedge \omega_{C}\right)} \\
& =-d^{\nabla}{ }^{q} *\left(d N \wedge \omega_{a}\right) \\
& =-*\left(\nabla_{a} d N-\left(\Delta_{q} N\right) \omega^{a}\right) .
\end{aligned}
$$

Consider the one parameter family

$$
t \rightarrow\left(\vec{\omega}_{t}, \overrightarrow{\mathrm{P}}_{t} ; \mathrm{N}_{\mathrm{t}}, \vec{N}_{\mathrm{t}},\left[\overline{\mathrm{Q}}_{\mathrm{b}}^{\mathrm{a}}\right] ;\left[\bar{\omega}_{b}^{\mathrm{a}}\right],\left[\overrightarrow{\mathrm{P}}_{\mathrm{c}}\right]\right)
$$

associated with the pair $(g, \nabla) \quad\left(\nabla \in \operatorname{con}_{g} T M\right)$.
Assume: The evolution equations

$$
\left[\begin{array}{c}
\quad \dot{\bar{\omega}}^{a}=\frac{\delta H}{\delta p_{a}} \\
\dot{p}_{a}=-\frac{\delta H}{\delta \bar{\omega}^{-a}}
\end{array}\right.
$$

are satisfied by the pair $\left(\vec{\omega}_{t}, \vec{p}_{t}\right)$.

If further the data is subject to the auxiliary constraints

$$
\left[\begin{array}{l}
d \bar{\omega}_{b}+\bar{\omega}_{b c} \bar{\omega}^{c}=0 \\
d N_{t}+\bar{p}_{c} \bar{\omega}^{c}=0
\end{array}\right.
$$

then the evolution equations reduce to those of the coframe picture. This said, suppose finally that $\forall t$, the pair $\left(\vec{\omega}_{t}, \vec{p}_{t}\right)$ lies in the ADM sector of $T^{*} \underline{Q}$. Equations 1-4 are therefore satisfied, hence $\nabla=\nabla^{9}$. Consequently, if the constraint equations of the coframe picture also hold, then $\operatorname{Ein}(g)=0$.

Section 52: Expansion of the Phase Space The assumptions and notation are those of the standard setup.

Rappel:

$$
H(\vec{\omega}, \overrightarrow{\mathrm{p}} ; N, \overrightarrow{\mathrm{~N}}, \omega ; \underline{\omega}, \overrightarrow{\mathrm{B}})
$$

$$
\begin{gathered}
=\int_{\Sigma} L_{\vec{N}} \omega^{a} \wedge p_{a}+\delta_{\Sigma} w_{b}^{a} \omega^{b} \wedge p_{a} \\
+\delta_{\Sigma} N E+\delta_{\Sigma} B_{a}\left(d \omega_{b}+\omega_{b c} \wedge \omega^{c}\right) \wedge *\left(\omega^{a} \wedge \omega^{b}\right),
\end{gathered}
$$

where

$$
E(\vec{\omega}, \vec{p} ; \underline{\omega})=\frac{1}{2}\left[q\left(p_{a}, * \omega^{b}\right) q\left(p_{b} * * \omega^{a}\right)-\frac{p^{2}}{n-2}-S(\underline{\omega})\right] \operatorname{vol}_{q}
$$

Definition:

$$
H_{D}(\vec{N})=\int_{\Sigma} L_{\vec{N}} \omega^{\mathrm{a}} \wedge \mathrm{p}_{\mathrm{a}}
$$

is the integrated diffeomorphism constraint;

$$
H_{\mathrm{R}}(\mathrm{~W})=\int_{\Sigma} \mathrm{w}_{\mathrm{b}}^{\mathrm{a}} \omega^{\mathrm{b}} \wedge \mathrm{p}_{\mathrm{a}}
$$

is the integrated rotational constraint;

$$
H_{H}(N)=\int_{\Sigma} N E
$$

is the integrated hamiltonian constraint.
Therefore

$$
\begin{aligned}
H=H_{D}+H_{R} & +H_{H} \\
& +\delta_{\Sigma} B_{a} \theta_{b}(\underline{\omega}) \wedge *\left(\omega^{a} \wedge \omega^{b}\right) .
\end{aligned}
$$

In the coframe picture, six relations were obtained for the Poisson
2.
brackets of the $H_{D}, H_{R}$, and $H_{H}$. Some of these computations carry over to the present setting and we have

$$
\left[\begin{array}{l}
\left\{H_{D}\left(\vec{N}_{1}\right), H_{D}\left(\vec{N}_{2}\right)\right\}=H_{D}\left(\left[\vec{N}_{1}, \vec{N}_{2}\right]\right) \\
\left\{H_{D}(\overrightarrow{\mathbb{N}}), H_{R}(W)\right\}=H_{R}\left(L_{\vec{N}} W\right) \\
\left\{H_{R}\left(W_{1}\right), H_{R}\left(W_{2}\right)\right\}=H_{R}\left(\left[W_{1}, W_{2}\right]\right) .
\end{array}\right.
$$

But there are differences: This time $\frac{\delta H_{H}(N)}{\delta \omega^{a}}$ is linear in $N$ (as is, of course, $\left.\frac{\delta H_{H}(\mathrm{~N})}{\delta \mathrm{p}_{\mathrm{a}}}\right)$, hence

$$
\left\{H_{H}\left(N_{1}\right), H_{H}\left(N_{2}\right)\right\}=0 .
$$

There are also problems with

$$
\left\{H_{D}(\vec{N}), H_{H}(\mathbb{N})\right\}
$$

and

$$
\left\{H_{R}(W), H_{H}(N)\right\} .
$$

E.g.:

$$
\begin{aligned}
& \left\{H_{R}(W), H_{H}(N)\right\} \\
& =\delta_{\Sigma}-W_{b}^{a}{ }^{\omega}{ }^{\mathrm{b}} \wedge N *\left(\operatorname{Ric}_{a}(\underline{\omega})-\frac{1}{2} S(\omega) \omega^{a}\right) \\
& =-\int_{\Sigma} N W_{b}^{a}{ }^{\omega}{ }^{b} \wedge * \operatorname{Ric} a(\omega) . \\
& =-\delta_{\Sigma} \mathrm{NW}_{\mathrm{b}}^{\mathrm{a}} \mathrm{Ric}_{a b}{ }_{(\underline{\omega}) \text { vol }_{q}} .
\end{aligned}
$$

But, in general, $\operatorname{Ric}_{a b} \underset{\sim}{(\omega)} \neq$ Ric $_{b a}(\underline{\omega})$, so there is no guarantee that the integral vanishes.

To resolve these issues (and others), it will be convenient to enlarge our horizons and promote two of the external variables to configuration status.

$$
\text { - } \underline{\omega}=\left[\omega_{b}^{a}\right] \in \Lambda^{1}(\Sigma ; \underline{s o}(n-1))
$$

is an ( $n-1$ )-by-( $n-1$ ) matrix of l-forms with $\omega_{a b}+\omega_{b a}=0$. Generically, $p_{\underline{\omega}}=$ $\left[p_{\omega_{b}}\right] \in \Lambda^{n-2}(\Sigma ; \underline{s o}(n-1))$ is an $(n-1)$-by-( $\left.n-1\right)$ matrix of $(n-2)$-forms with $p_{\omega_{a b}}+$ $p_{\omega_{b a}}=0$. The prescription

$$
\begin{aligned}
& \Omega\left(\left(\underline{\omega}, \underline{p}_{\underline{\omega}}\right),\left(\underline{\omega}^{\prime}, \underline{p}_{\underline{\omega}}^{\prime}\right)\right) \\
& \quad=\int_{\Sigma}\left(\omega_{a b} \wedge p_{\omega_{a b}^{\prime}}-\omega_{a b}^{\prime} \wedge p_{\omega_{a b}}\right)
\end{aligned}
$$

defines a symplectic structure on

$$
\Lambda^{1}(\Sigma ; \underline{\underline{S O}}(n-1)) \times \Lambda^{n-2}(\Sigma ; \underline{\text { so }}(n-1))
$$

$$
\cdot \vec{B}=\left[B_{a}\right] \in C^{\infty}\left(\Sigma ; \underline{R}^{n-1}\right)
$$

is a 1-by-( $n-1$ ) matrix of $C^{\infty}$ functions on $\Sigma$. Generically, $p_{\vec{B}}=\left[p_{B_{a}}\right] \in \Lambda^{n-1}\left(\Sigma ; \mathbb{R}^{n-1}\right)$ is a l-by- $(\mathrm{n}-1)$ matrix of $(\mathrm{n}-1)$-forms on $\Sigma$. The prescription

$$
\begin{aligned}
& \Omega\left(\left(\vec{B}, p_{\vec{B}}\right), \quad\left(\overrightarrow{B^{\prime}}, p_{\vec{B}}\right)\right) \\
& \quad=\int_{\Sigma}\left(B_{a} \wedge p_{B_{a}^{\prime}}-B_{a}^{\prime} \wedge p_{B_{a}}\right)
\end{aligned}
$$

defines a symplectic structure on

$$
C^{\infty}\left(\Sigma ; \underline{\underline{R}}^{\mathrm{n}-1}\right) \times \Lambda^{\mathrm{n}-1}\left(\Sigma ; \underline{\mathrm{R}}^{\mathrm{n}-1}\right)
$$

Definition: The expanded configuration space is

$$
\mathcal{C}=\underline{Q} \times \Lambda^{1}(\Sigma ; \underline{s O}(\mathrm{n}-1)) \times C^{\infty}\left(\Sigma ; \underline{\mathrm{R}}^{\mathrm{n}-\mathrm{l}}\right)
$$

We shall then operate in

$$
\begin{aligned}
T^{*} C=T^{*} \underline{Q} & \\
& \times \Lambda^{1}(\Sigma ; \underline{\operatorname{so}}(n-1)) \times \Lambda^{n-2}(\Sigma ; \underline{\operatorname{so}}(n-1)) \\
& \times C^{\infty}\left(\Sigma_{;} \underline{R}^{n-1}\right) \times \Lambda^{n-1}\left(\Sigma_{i} \underline{R}^{n-1}\right)
\end{aligned}
$$

equipped with the obvious symplectic structure.
[Note: A typical point in $T^{*} C$ is the pair of triples

$$
\left.\left(\vec{\omega}, \underline{\omega}, \vec{B} ; \vec{p}, \underline{p}_{\underline{\omega}}, p_{\vec{B}}\right) \cdot\right]
$$

N.B. Functions on $T^{*} \underline{Q}$ lift to functions on $T^{*} C$.

In particular: $H_{D}(\overrightarrow{\mathbb{N}})$ and $H_{R}(W)$ are functions on $T^{*} \mathrm{C}$ which are independent of ( $\underline{\omega}_{\underline{\omega}} \underline{\underline{\omega}} ; \vec{B}, p_{\vec{B}}$ ). By contrast, $H_{H}(N)$ is a function on $T^{*} C$ which definitely depends on $\underline{\omega}$ (but not on $\underline{p}_{\underline{\omega}}$ ).

- Given $\vec{\alpha} \in \Lambda^{n-3}\left(\Sigma ; \underline{R}^{\mathrm{n}-1}\right)$, define

$$
H_{T}(\vec{\alpha}): T^{*} C \rightarrow R
$$

by

$$
H_{T}(\vec{\alpha})\left(\vec{\omega}, \underline{\omega}, \vec{B} ; \vec{p}_{p}, \underline{\omega}^{\prime}, \vec{B}\right)
$$

$$
=\int_{\Sigma^{a}} a_{a} \wedge\left(d \omega^{a}+\omega_{b}^{a} \wedge \omega^{b}\right) .
$$

- Given $f \in C^{\infty}(\Sigma)$ and $\beta \in \Lambda^{n-2} \Sigma$, define

$$
H_{f}(\beta): T^{*} C \rightarrow R
$$

by

$$
\begin{aligned}
& H_{f}(\beta)\left(\vec{\omega}, \underline{\omega}, \overrightarrow{\mathrm{B}} ; \overrightarrow{\mathrm{p}}, \underline{\mathrm{p}}_{\underline{\prime}} \mathrm{p}_{\vec{B}}\right) \\
& \quad=\delta_{\Sigma}\left(\mathrm{df}+\mathrm{B}_{\mathrm{a}} \omega^{\mathrm{a}}\right) \wedge \beta .
\end{aligned}
$$

- Given $\underline{\rho} \in \Lambda^{1}(\Sigma$; SO $(n-1))$,
define

$$
H_{1}(\underline{\rho}): T^{*} C \rightarrow \underline{R}
$$

by

$$
\begin{aligned}
H_{1}(\rho) & \left(\vec{\omega}, \underline{\omega}, \vec{B} ; \vec{p}, p_{\underline{\omega}}, p_{\vec{B}}\right) \\
& =\frac{1}{2} \delta_{\Sigma} \rho_{a b} \wedge p_{\omega_{a b}} .
\end{aligned}
$$

$\rho_{\text {Given }} \overrightarrow{\mathrm{R}} \in \mathrm{C}^{\infty}\left(\Sigma_{;} \underline{\mathrm{R}}^{\mathrm{n}-1}\right)$, define

$$
H_{2}(\overrightarrow{\mathrm{R}}): \mathrm{T}^{*} \mathrm{C} \rightarrow \underline{\mathrm{R}}
$$

by

$$
\begin{gathered}
H_{2}(\vec{R})\left(\vec{\omega}, \underline{\omega}, \vec{B} ; \overrightarrow{\mathrm{p}}, \underline{p}_{\underline{\omega}}, \mathrm{p}_{\overrightarrow{\mathrm{B}}}\right) \\
\quad=\int_{\Sigma} \mathrm{R}_{\mathrm{a}} \mathrm{p}_{\mathrm{B}_{\mathrm{a}}}
\end{gathered}
$$

There are four constraint surfaces associated with these functions. Con $_{T \mathrm{~T}}$ : This is the subset of $T^{*} \mathrm{C}$ whose elements are the points $\left(\vec{\omega}, \underline{\omega}, \vec{B} ; \vec{p}, p_{\underline{\omega}}, p_{\vec{B}}\right)$
such that

$$
\mathrm{d} \omega^{a}+\omega_{b}^{a} \wedge \omega^{b}=0 \quad(a=1, \ldots, n-1)
$$

Con $_{f}$ : This is the subset of $T^{*} C$ whose elements are the points

$$
\left(\vec{\omega}, \underline{\omega}, \vec{B} ; \overrightarrow{\mathrm{p}}, \mathrm{p}_{\underline{\omega}}, \mathrm{p}_{\vec{B}}\right)
$$

such that

$$
d f+B_{a} w^{a}=0
$$

Con $_{1}$ : This is the subset of $T * C$ whose elements are the points

$$
\left(\vec{\omega}, \underline{\omega}, \overrightarrow{\mathrm{B}} ; \overrightarrow{\mathrm{p}}, \underline{\mathrm{p}}_{\underline{\omega}}, \mathrm{p}_{\overrightarrow{\mathrm{B}}}\right)
$$

such that

$$
p_{\omega_{a b}}=0 \quad(a, b=1, \ldots, n-1)
$$

$\mathrm{Con}_{2}$ : This is the subset of $\mathrm{T}^{*} \mathrm{C}$ whose elements are the points

$$
\left(\vec{\omega}, \underline{\omega}, \vec{B} ; \overrightarrow{\mathrm{p}}^{\left(\mathrm{p}_{\underline{\omega}^{\prime}}\right.} \mathrm{p}_{\overrightarrow{\mathrm{B}}}\right)
$$

such that

$$
\mathrm{p}_{\mathrm{B}}=0 \quad(\mathrm{a}=1, \ldots, \mathrm{n}-1)
$$

Example:

$$
\left\{H_{R}(W), H_{H}(N)\right\} \mid C o n_{T}
$$

$$
\begin{aligned}
& =-\int_{\Sigma} \mathbb{N W}_{b}^{\mathrm{a}} \mathrm{Ric}_{\mathrm{ab}} \stackrel{(\omega) \mathrm{Vol}_{\mathrm{q}}}{ } \\
& =0 .
\end{aligned}
$$

Indeed, $\nabla(\underline{\omega})=\nabla^{q}$, hence Ric $\underset{a b}{ }(\underline{\omega})=\operatorname{Ric}_{b a}(\underline{\omega})$.
Rappel: Let $f_{1}, f_{2}: T^{*} C \rightarrow \underline{R}-$ then their Poisson bracket $\left\{f_{1}, f_{2}\right\}$ is the function

$$
\left\{f_{1}, f_{2}\right\}: T * C \rightarrow \underline{R}
$$

defined by the rule

$$
\begin{aligned}
& \left\{f_{1}, f_{2}\right\}=\delta_{\Sigma}\left[\frac{\delta f_{2}}{\delta \vec{p}} \wedge \frac{\delta f_{1}}{\delta \vec{\omega}}-\frac{\delta f_{1}}{\delta \vec{p}} \wedge \frac{\delta f_{2}}{\delta \vec{\omega}}\right] \\
& \quad+\delta_{\Sigma}\left[\frac{\delta f_{2}}{\delta p_{\underline{\omega}}} \wedge \frac{\delta f_{1}}{\delta \underline{\omega}}-\frac{\delta f_{2}}{\delta p_{\underline{\omega}}} \wedge \frac{\delta f_{2}}{\delta \underline{\omega}}\right] \\
& \quad+\delta_{\Sigma}\left[\frac{\delta f_{2}}{\delta p_{\vec{B}}} \wedge \frac{\delta f_{1}}{\delta \vec{B}}-\frac{\delta f_{1}}{\delta p_{\vec{B}}} \wedge \frac{\delta f_{2}}{\delta \vec{B}}\right]
\end{aligned}
$$

Example: We have

$$
\left[\begin{array}{l}
\left\{H_{T}(\vec{\alpha}), H_{T}\left(\vec{\alpha}^{\prime}\right)\right\}=0,\left\{H_{f}(\beta), H_{f}\left(\beta^{\prime}\right)\right\}=0 \\
\left\{H_{1}(\underline{p}), H_{1}\left(\underline{\rho}^{\prime}\right)\right\}=0,\left\{H_{2}(\vec{R}), H_{2}\left(\vec{R}^{\prime}\right)\right\}=0 .
\end{array}\right.
$$

Example: We have

$$
\left\{\begin{array}{l}
\left\{H_{T}(\vec{\alpha}), H_{f}(\beta)\right\}=0,\left\{H_{T}(\vec{\alpha}), H_{2}(\vec{R})\right\}=0 \\
\quad\left\{H_{f}(\beta), H_{1}(\rho)\right\}=0,\left\{H_{1}(\underline{\rho}), H_{2}(\vec{R})\right\}=0 .
\end{array}\right.
$$

$$
\begin{aligned}
& \text { - } \delta_{a b}\left(\alpha_{c} \wedge\left(d \omega_{c}+\omega_{c d} \wedge \omega^{d}\right)\right) \\
& =a_{c} \wedge \delta_{a b}\left(\omega_{c d}{ }^{\wedge \omega}{ }^{d}\right) \\
& =\alpha_{a} \wedge \delta \omega_{a b} \wedge \omega^{b}-\alpha_{b} \wedge \delta \omega_{a b} \wedge \omega^{a} \\
& =(-1)^{n-3} \delta \omega_{a b} \wedge\left(\alpha_{a} \wedge \omega^{b}-\alpha_{b} \wedge \omega^{a}\right) . \\
& =\delta \omega_{a b} \wedge\left(\omega^{b} \wedge \alpha_{a}-\omega^{a} \wedge \alpha_{b}\right) \\
& \text { => } \\
& \frac{\delta H_{T}(\vec{\alpha})}{\delta \omega_{a b}}=\omega^{b} \wedge \alpha_{a}-\omega^{a} \wedge \alpha_{b} . \\
& \text { - } \delta_{a b}\left(\frac{1}{2} \rho_{c d^{\wedge}} \wedge p_{\omega_{c d}}\right) \\
& =\frac{1}{2}\left(\rho_{a b} \wedge \delta p_{\omega_{a b}}-\rho_{b a} \wedge \delta p_{\omega_{a b}}\right) \\
& =\rho_{a b} \wedge^{\wedge \delta p_{\omega}}{ }_{a b} \\
& \text { => } \\
& \frac{\delta H_{1}(\rho)}{\delta \mathrm{p}_{\omega_{a b}}}=\rho_{\mathrm{ab}} .
\end{aligned}
$$

Therefore

$$
\left\{H_{T}(\vec{\alpha}), H_{1}(\underline{\rho})\right\}
$$

$$
\begin{aligned}
& =\delta_{\Sigma}\left[\frac{\delta H_{1}(\rho)}{\delta p_{\omega_{a b}}} \wedge \frac{\delta H_{T}(\vec{\alpha})}{\delta \omega_{a b}}-\frac{\delta H_{T}(\vec{\alpha})}{\delta p_{\omega_{a b}}} \wedge \frac{\delta H_{1}(\rho)}{\delta \omega_{a b}}\right] \\
& =\delta_{\Sigma}\left[\frac{\delta H_{1}(\underline{\rho})}{\delta p_{\omega_{a b}}} \wedge \frac{\delta H_{T}(\vec{\alpha})}{\delta \omega_{a b}}\right] \\
& =\int_{\Sigma}\left[\rho_{a b} \wedge\left(\omega^{b} \wedge a_{a}-\omega^{a} \wedge \alpha_{b}\right)\right] \\
& =\int_{\Sigma} \rho_{a b} \omega^{\wedge}{ }^{b} \wedge \alpha_{a}-\delta_{\Sigma} \rho_{a b}{ }^{\wedge \omega^{a} \wedge \alpha_{b}} \\
& =\int_{\Sigma} \rho_{a b} \wedge \omega^{b} \wedge \alpha_{a}+\delta_{\Sigma} \rho_{b a}{ }^{\wedge \omega}{ }^{a} \wedge \alpha_{b} \\
& =2 \int_{\Sigma} \rho_{a b}{ }^{\wedge \omega}{ }^{b} \wedge \alpha_{a} . \\
& \text { - } \delta_{a}\left(\left(d f+B_{b} \omega^{b}\right) \wedge \beta\right) \\
& =\delta_{a}\left(B_{b} \omega^{b}\right)_{\wedge \beta} \\
& =\delta B_{a} \wedge \omega^{a} \wedge \beta \\
& \text { => } \\
& \frac{\delta H_{f}(\beta)}{\delta B_{a}}=\omega^{a} \wedge \beta . \\
& \text { - } \delta_{a}\left(R_{b} \mathrm{p}_{\mathrm{B}}\right) \\
& =R_{a} \delta \mathrm{P}_{\mathrm{B}} \\
& \text { => }
\end{aligned}
$$

$$
\frac{\delta H_{2}(\vec{R})}{\delta p_{B_{a}}}=R_{a}
$$

Therefore

$$
\begin{aligned}
& \left\{H_{f}(\beta), H_{2}(\overrightarrow{\mathrm{R}})\right\} \\
& =\int_{\Sigma}\left[\frac{\delta H_{2}(\vec{R})}{\delta \mathrm{P}_{B_{a}}} \wedge \frac{\delta H_{f}(\beta)}{\delta B_{a}}-\frac{\delta H_{f}(\beta)}{\delta \mathrm{p}_{B_{a}}} \wedge \frac{\delta H_{2}(\vec{R})}{\delta B_{a}}\right] \\
& =\int_{\Sigma}\left[\frac{\delta H_{2}(\vec{R})}{\delta \mathrm{p}_{B_{a}}} \wedge \frac{\delta H_{f}(\beta)}{\delta B_{a}}\right] \\
& =\int_{\Sigma} R_{a} \omega^{a} \wedge \beta . \\
& \text { - } \delta_{a}\left(\alpha_{c} \wedge\left(d \omega^{c}+\omega^{c} d^{\wedge \omega^{d}}\right)\right) \\
& =\delta_{a}\left(\alpha_{c} \wedge d \omega^{c}\right)+\delta_{a}\left(\alpha_{c} \wedge \omega^{c} d^{\wedge} \omega^{d}\right) \\
& =\alpha_{a} \wedge d \delta \omega^{a}+\alpha_{c} \wedge \omega^{c}{ }_{a} \wedge \delta \omega^{a} \\
& =d \delta \omega^{a} \wedge \alpha_{a}+(-1)^{n-2} \delta \omega^{a} \wedge \alpha_{c} \wedge \omega^{c}{ }_{a} \\
& =d \delta \omega^{a} \wedge \alpha_{a}+(-1)^{n}(-1)^{n-3} \delta \omega^{a} \wedge \omega^{c}{ }_{a} \wedge \alpha_{c} \\
& =d \delta \omega^{a} \wedge \alpha_{a}-\delta \omega^{a} \Lambda \omega^{c}{ }_{a} \wedge{ }_{c} \\
& =d\left(\delta \omega^{a} \wedge \alpha_{a}\right)+\delta \omega^{a} \wedge d \alpha_{a}-\delta \omega^{a} \wedge \omega^{c}{ }_{a} \wedge \alpha_{c} \\
& \text { => }
\end{aligned}
$$

$$
\frac{\delta H_{T}(\vec{a})}{\delta \omega^{a}}=d \alpha_{a}-\omega^{c} a^{\wedge \alpha_{c}} .
$$

## Application:

$$
\begin{aligned}
& \int\left\{H_{D}(\vec{N}), H_{T}(\vec{\alpha})\right\}=-\int_{\Sigma} L_{\vec{N}} \omega^{a} \wedge\left(d \alpha_{a}-\omega_{a}^{c}{ }_{a} \wedge \alpha_{c}\right) \\
& \left\{H_{R}(W), H_{T}(\vec{\alpha})\right\}=-\int_{\Sigma} W_{b}{ }^{a} \omega^{b} \wedge\left(d \alpha_{a}-\omega^{c}{ }_{a}{ }^{\wedge} \alpha_{c}\right) \\
& \left\{H_{H}(N), H_{T}(\vec{\alpha})\right\}=-\int_{\Sigma} N\left(q\left(p_{b^{\prime}} * \omega^{a}\right) \omega^{b}-\frac{P}{n-2} \omega^{a}\right) \wedge\left(d \alpha_{a}-\omega^{c}{ }_{a} \wedge \alpha_{c}\right) . \\
& \text { - } \delta_{a}\left(\left(d f+B_{b} \omega^{b}\right) \wedge \beta\right) \\
& =\delta_{a}\left(B_{b} \omega^{b} \wedge \beta\right) \\
& =B_{a} \delta \omega^{a} \wedge \beta \\
& =\delta \omega^{a}{ }^{A} B_{a} B \\
& \text { => } \\
& \frac{\delta H_{f}(\beta)}{\delta \omega^{a}}=B_{a} \beta .
\end{aligned}
$$

Application:

$$
\left\{\begin{array}{l}
\left\{H_{D}(\vec{N}), H_{f}(\beta)\right\}=-\int_{\Sigma} L_{\vec{N}} \omega^{a} \wedge B_{a}{ }^{B} \\
\left\{H_{R}(W), H_{f}(\beta)\right\}=-\int_{\Sigma} W_{b^{a}} \omega^{b} \wedge B_{a} \beta \\
\left\{H_{H}(N), H_{f}(\beta)\right\}=-\int_{\Sigma} N\left(q\left(p_{b}, * \omega^{a}\right) \omega^{b}-\frac{P}{n-2} \omega^{a}\right) \wedge B_{a} \beta .
\end{array}\right.
$$

Inspecting the definitions, we see at once that

$$
\left\{H_{D}(\vec{N}), H_{1}(\underline{\rho})\right\}=0,\left\{H_{R}(W), H_{1}(\underline{\rho})\right\}=0
$$

and

$$
\left\{H_{D}(\vec{N}), H_{2}(\vec{R})\right\}=0,\left\{H_{R}(W), H_{2}(\vec{R})\right\}=0,\left\{H_{H}(N), H_{2}(\vec{R})\right\}=0 .
$$

As regards $\left\{H_{H}(N), H_{1}(\underline{\rho})\right\}$, the situation is not so simple.

LEMMA We have

$$
\frac{\delta H_{H}(N)}{\delta \omega_{a b}}=-d\left(N *\left(\omega^{a} \wedge \omega^{b}\right)\right)-N \omega_{a c} \wedge *\left(\omega^{c} \Lambda \omega^{b}\right)-N \omega_{b c} \wedge *\left(\omega^{a} \wedge \omega^{c}\right) .
$$

[It is a question of explicating

$$
-\frac{N}{2} \delta_{a b}\left(S(\underline{\omega}) \mathrm{vol}_{q}\right)
$$

or still,

$$
-\frac{N}{2} \delta_{a b}\left(\Omega_{c d}(\underline{\omega}) \wedge \star\left(\omega^{c} \wedge \omega^{d}\right)\right)
$$

or still,

$$
-\frac{N}{2} \delta_{a b}\left(d \omega_{c d}+\omega_{c r} \wedge \omega_{r d}\right) \wedge_{*}\left(\omega^{c} \wedge \omega^{d}\right)
$$

or still,

$$
-\frac{N}{2}\left(\delta_{a b}{ }^{d \omega_{c d}}+\delta_{a b} \omega_{c r} \wedge \omega_{r d}+\omega_{c r} \wedge \delta_{a b} \omega_{r d}\right) \wedge *\left(\omega^{c} \wedge \omega^{d}\right)
$$

But

$$
-\frac{N}{2} \delta_{a b}{ }^{d \omega_{c d} \wedge *\left(\omega^{c} \wedge \omega^{d}\right)}
$$

$$
\begin{aligned}
&=-\frac{N}{2} d \delta \omega_{a b} \wedge *\left(\omega^{a} \wedge \omega^{b}\right)+\frac{N}{2} d \delta \omega_{a b} \wedge *\left(\omega^{b} \wedge \omega^{a}\right) \\
&=-N d \delta \omega_{a b} \wedge *\left(\omega^{a} \wedge \omega^{b}\right) \\
&=-d \delta \omega_{a b} \Lambda N *\left(\omega^{a} \wedge \omega^{b}\right) \\
&=-d\left(\delta \omega_{a b} \wedge N *\left(\omega^{a} \wedge \omega^{b}\right)\right)-\delta \omega_{a b} \wedge d\left(N *\left(\omega^{a} \wedge \omega^{b}\right)\right) .
\end{aligned}
$$

And

$$
\begin{aligned}
& \text { - }-\frac{N}{2} \delta_{a b} \omega_{c r} \wedge \omega_{r d} \wedge *\left(\omega^{c} \wedge \omega^{d}\right) \\
& =-\frac{N}{2} \delta \omega_{a b} \wedge \omega_{b d} \wedge *\left(\omega^{a} \wedge \omega^{d}\right)+\frac{N}{2} \delta \omega_{a b} \wedge \omega_{a d}{ }^{\wedge *}\left(\omega^{b} \wedge \omega^{d}\right) \\
& =\frac{N}{2} \delta \omega_{a b^{\wedge}} \wedge\left(\omega_{a d}{ }^{\wedge *}\left(\omega^{b} \wedge \omega^{d}\right)-\omega_{b d^{\wedge}} \wedge\left(\omega^{a} \wedge \omega^{d}\right)\right) . \\
& \text { - }-\frac{N}{2} \omega_{c r} \wedge \delta_{a b}{ }^{\omega}{ }_{r d} \wedge *\left(\omega^{c} \wedge \omega^{d}\right) \\
& =-\frac{N}{2} \omega_{c a}{ }^{\wedge \delta \omega_{a b}}{ }^{\wedge *}\left(\omega^{c} \wedge \omega^{b}\right)+\frac{N}{2} \omega_{c b}{ }^{\wedge \delta \omega_{a b}}{ }^{\wedge *}\left(\omega^{c} \wedge \omega^{a}\right) \\
& =\frac{N}{2} \delta \omega_{a b} \wedge\left(\omega_{c a} \wedge *\left(\omega^{c} \wedge \omega^{b}\right)-\omega_{c b} \wedge *\left(\omega^{c} \wedge \omega^{\mathrm{a}}\right)\right) .
\end{aligned}
$$

To combine these terms, write

$$
\begin{aligned}
& \omega_{a d} \wedge *\left(\omega^{b} \wedge \omega^{d}\right) \\
&=\omega_{a c} \wedge *\left(\omega^{b} \wedge \omega^{c}\right) \\
&=\omega_{c a} \wedge *\left(\omega^{c} \wedge \omega^{b}\right)
\end{aligned}
$$

14. 

and

$$
\begin{aligned}
\omega_{b d} & \wedge *\left(\omega^{a} \wedge \omega^{d}\right) \\
& =\omega_{b c} \wedge *\left(\omega^{a} \wedge \omega^{c}\right) \\
& =\omega_{c b^{\prime}} \wedge *\left(\omega^{c} \wedge \omega^{a}\right) .
\end{aligned}
$$

Then

$$
\begin{aligned}
& -\frac{N}{2}\left(\delta_{a b} \omega_{c r} \wedge \omega_{r d}+\omega_{c r} \wedge \delta_{a b} \omega_{r d}\right) \wedge *\left(\omega^{c} \wedge \omega^{d}\right) \\
& =\delta \omega_{a b} \wedge\left(N \omega_{c a} \wedge *\left(\omega^{c} \wedge \omega^{b}\right)-N \omega_{c b} \wedge *\left(\omega^{c} \wedge \omega^{a}\right)\right) \\
& \left.=\delta \omega_{a b} \wedge\left(-N \omega_{a c} \wedge *\left(\omega^{c} \wedge \omega^{b}\right)-N \omega_{b c} \wedge *\left(\omega^{a} \wedge \omega^{c}\right)\right) .\right]
\end{aligned}
$$

Application:

$$
\begin{aligned}
& \left\{H_{H}(N), H_{1}(\underline{\rho})\right\} \\
= & \int_{\Sigma}\left[\frac{\delta H_{1}(\underline{\rho})}{\delta p_{\omega_{a b}}} \wedge \frac{\delta H_{H}(N)}{\delta \omega_{a b}}-\frac{\delta H_{H}(N)}{\delta p_{\omega_{a b}}} \wedge \frac{\delta H_{1}(\underline{\rho})}{\delta \omega_{a b}}\right] \\
= & \int_{\Sigma}\left[\frac{\delta H_{1}(\underline{\rho})}{\delta p_{\omega_{a b}}} \wedge \frac{\delta H_{H}(N)}{\delta \omega_{a b}}\right] \\
= & \int_{\Sigma} \rho_{a b}\left(-d\left(N *\left(\omega^{a} \wedge \omega^{b}\right)\right)-N \omega^{a} c^{\wedge *}\left(\omega^{c} \wedge \omega^{b}\right)-N \omega_{c}^{b} \wedge *\left(\omega^{a} \wedge \omega^{c}\right)\right) .
\end{aligned}
$$

[note: On Con ${ }_{\text {Tr }}$,

$$
d *\left(\omega^{a} \wedge \omega^{b}\right)=-\omega_{c}^{a} \wedge \star\left(\omega^{c} \wedge \omega^{b}\right)-\omega_{c}^{b} \wedge *\left(\omega^{a} \wedge \omega^{c}\right)
$$

Therefore

$$
\begin{gathered}
-d\left(N *\left(\omega^{a} \wedge \omega^{b}\right)\right)-N \omega^{a} c^{\wedge *\left(\omega^{c} \wedge \omega^{b}\right)-N \omega^{b} c^{\wedge *}\left(\omega^{a} \wedge \omega^{c}\right)} \\
=-d N \wedge *\left(\omega^{a} \wedge \omega^{b}\right)-N d *\left(\omega^{a} \wedge \omega^{b}\right)+N d *\left(\omega^{a} \wedge \omega^{b}\right) \\
= \\
\Rightarrow \quad-d N \wedge *\left(\omega^{a} \wedge \omega^{b}\right) \\
\quad\left\{H_{H}(N), H_{1}(\underline{\rho})\right\} \mid C o n_{T} \\
\left.=-\int_{\Sigma} \rho_{a b^{\prime}} \wedge d N \wedge *\left(\omega^{a} \wedge \omega^{b}\right) .\right]
\end{gathered}
$$

Given $N$, let

$$
H_{T}\left(*\left(d N \wedge \omega_{a}\right)\right)
$$

stand for the function $T^{*} C \rightarrow \underline{R}$ that sends

$$
\left(\vec{\omega}, \underline{\omega}, \vec{B} ; \vec{p}_{\underline{\omega}}, p_{\underline{\omega}}, p_{\vec{B}}\right)
$$

to

$$
\int_{\Sigma} *\left(d N / \omega_{a}\right) \wedge\left(d \omega^{a}+\omega_{b}^{a} \wedge \omega^{b}\right)
$$

[Note: Strictly speaking, this is not consistent with the earlier agreements in that here $\alpha_{a}=*\left(d N \wedge \omega_{a}\right)$ depends on $\vec{\omega}$. However, no difficulties will arise
therefrom. So, e.g.,

$$
\begin{gathered}
\int_{\Sigma} B_{a}\left(d \omega_{b}+\omega_{b c} \wedge \omega^{c}\right) \wedge *\left(\omega^{a} \wedge \omega^{b}\right) \\
\left.=H_{T}\left(B_{C} *\left(\omega^{c} \wedge \omega^{a}\right)\right) .\right]
\end{gathered}
$$

Observation: To begin with,

$$
\begin{aligned}
&(-1)^{n}\left[*\left(d N \wedge \omega_{a}\right) \wedge\left(d \omega^{a}+\omega_{b}^{a} \wedge \omega^{b}\right)\right] \\
&=(-1)^{n} \star\left(d \wedge \wedge \omega_{a}\right) \wedge d \omega^{a} \\
&+(-1)^{n} *\left(d N \wedge \omega_{a}\right) \wedge \omega_{b}^{a} \wedge \omega^{b} \\
&=(-1)^{n}{ }_{\star\left(d N \wedge \omega_{a}\right) \wedge d \omega^{a}} \\
& \quad+(-1)^{n}(-1)^{n-3} \omega_{b}^{a} \wedge \star\left(d N \wedge \omega_{a}\right) \wedge \omega^{b} \\
&=(-1)^{n} \star\left(d N \wedge \omega_{a}\right) \wedge d \omega^{a} \\
& \quad-\omega_{a}^{b} \wedge \star\left(d N \wedge \omega_{b}\right) \wedge \omega^{a} .
\end{aligned}
$$

In addition,

$$
\begin{aligned}
& -d\left[*\left(d N \wedge \omega_{a}\right) \wedge \omega^{a}\right] \\
& =-\left[d *\left(d N \wedge \omega_{a}\right) \wedge \omega^{a}+(-1)^{n-3} *\left(d N \wedge \omega_{a}\right) \wedge d \omega^{a}\right] \\
& =-d_{*}\left(d N \wedge \omega_{a}\right) \wedge \omega^{a}+(-1)^{n} *\left(d N \wedge \omega_{a}\right) \wedge d \omega^{a} .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& (-1)^{n} \int_{\Sigma} *\left(d N \wedge \omega_{a}\right) \wedge\left(d \omega^{a}+\omega_{b}^{a} \wedge \omega^{b}\right) \\
= & \int_{\Sigma}\left[d *\left(d N \wedge \omega_{a}\right)-\omega^{b} a^{\wedge} \wedge\left(d N \wedge \omega_{b}\right)\right] \wedge \omega^{a} \\
& -\int_{\Sigma} d\left[*\left(d N \wedge \omega_{a}\right) \wedge \omega^{a}\right] \\
= & \int_{\Sigma}\left[d *\left(d N \wedge \omega_{a}\right)-\omega_{a}^{b}{ }_{a} \wedge\left(d N \wedge \omega_{b}\right)\right] \wedge \omega^{a} \\
= & \int_{\Sigma} a^{\nabla(\underline{\omega})} *\left(d N \wedge \omega_{a}\right) \wedge \omega^{a} \\
= & \int_{\Sigma} *\left(\nabla_{a}(\underline{\omega}) d N-\left(\Lambda_{c o n}\left(\omega^{a}\right) N\right) \omega^{a}\right) \wedge \omega^{a},
\end{aligned}
$$

where

$$
\begin{aligned}
\Delta_{c o n}(\underline{\omega}) N & =\nabla^{a}(\underline{\omega}) \nabla_{\mathrm{a}}(\underline{\omega}) N \\
& =\nabla(\underline{\omega}) d N\left(E_{a^{\prime}}, E_{a}\right) .
\end{aligned}
$$

Write

$$
\nabla_{\mathrm{a}}(\underline{\omega}) \mathrm{dN}=\nabla(\underline{\omega}) d N\left(\mathrm{E}_{\mathrm{c}^{\prime}} \mathrm{E}_{\mathrm{a}}\right) \omega^{\mathrm{C}} .
$$

Then

$$
\begin{aligned}
& \int_{\Sigma} *\left(\nabla_{a}(\underline{\omega}) d N\right) \wedge \omega^{a} \\
&=\int_{\Sigma} \nabla(\underline{\omega}) d N\left(E_{c}, E_{a}\right) * \omega^{c} \wedge \omega^{a} \\
&=(-1)^{n-2} \int_{\Sigma} \nabla(\underline{\omega}) d N\left(E_{c}, E_{a}\right) \omega^{a} \wedge * \omega^{c} \\
&=(-1)^{n} \int_{\Sigma} \nabla(\underline{\omega}) d N\left(E_{c}, E_{a}\right) q\left(\omega^{a}, \omega^{c}\right) v o l \\
& q
\end{aligned}
$$

$$
=(-1)^{n} \int_{\Sigma}\left(\Delta_{\text {con }}(\omega) N\right) \operatorname{vol}_{\mathrm{q}^{\prime}}
$$

On the other hand,

$$
\begin{aligned}
-\int_{\Sigma} & \left(\Delta_{c o n}(\omega) N\right) * \omega^{a} \wedge \omega^{a} \\
& =-(-1)^{n-2} \int_{\Sigma}\left(\Delta_{c o n}(\underline{\omega}) N\right) \omega^{a} \wedge * \omega \\
& =-(-1)^{n}(n-1) \int_{\Sigma}\left(\Delta_{c o n}(\underline{\omega}) N\right) v o l_{q}
\end{aligned}
$$

Cancelling the $(-1)^{n}$, we thus conclude that

$$
\begin{aligned}
& H_{T}\left(*\left(d N / \omega_{a}\right)\right) \\
&=\int_{\Sigma}\left(\Lambda_{c o n}(\underline{\omega}) N\right) v o l_{q}-(n-1) \int_{\Sigma}\left(\Lambda_{c o n}(\underline{\omega}) N\right) v o l_{q} \\
&=(2-n) \delta_{\Sigma}\left(\Delta_{c o n}(\underline{\omega}) N\right) v o l_{q^{\prime}}
\end{aligned}
$$

which brings us to the point of the computation: In general, the integral

$$
\delta_{\Sigma}\left(\Delta_{c o n}(\omega) N\right){ }^{(\omega)}{ }_{q}
$$

does not vanish, hence $H_{T}$ is nontrivial.
[Note: If $\nabla(\underline{\omega})=\nabla^{q}$, then

$$
\Delta_{\mathrm{con}}(\omega)=\Delta_{\mathrm{q}}
$$

and, of course,

$$
\left.\int_{\Sigma}\left(\Delta_{q} N\right)^{v o l_{q}}=0 .\right]
$$

19. 

LEMMA We have

$$
\begin{gathered}
\rho_{a b} \wedge d N \wedge *\left(\omega^{a} \wedge \omega^{b}\right)+2 \rho_{a b} \wedge \omega^{b} \wedge *\left(d N \wedge \omega^{a}\right) \\
=0 .
\end{gathered}
$$

[Write

$$
\mathrm{dN}=\mathrm{N}_{\mathrm{c}} \omega^{\mathrm{c}} .
$$

Then

$$
\text { - } \begin{aligned}
a b & \wedge d N \wedge *\left(\omega^{a} \wedge \omega^{b}\right) \\
& =\rho_{a b} \wedge N_{c} \omega^{c} \wedge *\left(\omega^{a} \wedge \omega^{b}\right) \\
& =(-1)^{n-3} \rho_{a b} \wedge N_{c} *\left(\omega^{a} \wedge \omega^{b}\right) \wedge \omega^{c} \\
& \left.=(-1)^{n-3} \rho_{a b} \wedge N_{c}(-1)^{n-2} *\left(1{ }_{\omega} c^{\left(\omega^{a}\right.}{ }^{a} \wedge \omega^{b}\right)\right) \\
& =-\rho_{a b} \wedge N_{c} *\left(\delta^{c}{ }_{a} \omega^{b}-\omega^{a} \delta^{c}{ }_{b}\right) \\
& =-\rho_{a b} \wedge N_{a} * \omega^{b}+\rho_{a b} \wedge N_{b}^{*} \omega^{a} \\
& =-\rho_{b a} \wedge N_{b} * \omega^{a}+\rho_{a b} \wedge N_{b} * \omega^{a} \\
& =\rho_{a b} \wedge N_{b} * \omega^{a}+\rho_{a b} \wedge N_{b}^{*} \omega^{a} \\
& =2 \rho_{a b} \wedge N_{b} * \omega^{a} .
\end{aligned}
$$

$$
\begin{aligned}
& \text { - } 2 \rho a b \omega \omega^{b} \wedge *\left(d N \wedge \omega^{a}\right) \\
& =2 \rho_{a b} \wedge N_{c} \omega^{b} \wedge *\left(\omega^{c} \wedge \omega^{a}\right) \\
& =2(-1)^{n-3} \rho_{a b} \wedge N_{c} *\left(\omega^{c} \wedge \omega^{a}\right) \wedge \omega^{b} \\
& =2(-1)^{\mathrm{n}-3} \rho_{a b} \wedge N_{c}(-1)^{\mathrm{n}-2} \star\left({ }_{\omega}{ }_{\omega}{ }^{\left.\left(\omega^{\mathrm{c}} \wedge \omega^{\mathrm{a}}\right)\right)}\right. \\
& =-2 \rho_{a b} \wedge N_{c} *\left(\delta^{b}{ }_{c} \omega^{a}-\omega^{c} \delta^{b}{ }_{a}\right) \\
& =-2 \rho_{a b} \wedge N_{b} * \omega^{a}+2 \rho_{a a^{\prime}} \wedge N_{c} * \omega^{C} \\
& \left.=-2 \rho_{a b} \wedge N_{b} * \omega^{a} .\right]
\end{aligned}
$$

Notation: Put

$$
\tilde{H}_{H}(N)=H_{H}(N)-H_{T}\left(*\left(d N / \omega_{a}\right)\right)
$$

Accordingly,

$$
\begin{aligned}
& \left\{\tilde{H}_{H}(N), H_{1}(\underline{\rho})\right\} \\
& \quad=\left\{H_{H}(N), H_{1}(\underline{\rho})\right\}-\left\{H_{T}\left(*\left(d N \wedge \omega_{a}\right)\right), H_{1}(\underline{\rho})\right\},
\end{aligned}
$$

which, upon restriction to $\mathrm{Con}_{\mathrm{T}}$, equals

$$
-\int_{\Sigma} \rho_{a b} \wedge d N \wedge *\left(\omega^{a} \wedge \omega^{b}\right)-2 \int_{\Sigma} \rho_{a b} \wedge \omega^{b} \wedge *\left(d N \wedge \omega^{a}\right)
$$

I.e.:

$$
\left\{\tilde{H}_{H}(\mathrm{~N}), H_{l}(\rho)\right\} \mid \mathrm{Con}_{\mathrm{T}}=0 .
$$

Remark: Since

$$
\left\{H_{T}\left(*\left(d N \omega \omega_{a}\right)\right), H_{2}(\vec{R})\right\}=0,
$$

it is still the case that

$$
\left\{\tilde{H}_{H}(\mathrm{~N}), \mathrm{H}_{2}(\stackrel{(\mathrm{R}}{\mathrm{R}})\right\}=0 .
$$

N.B. The correction term

$$
H_{T}\left(*\left(d N / \omega_{a}\right)\right)
$$

is identically zero on $\mathrm{Con}_{\mathrm{T}}$.
In terms of $\tilde{H}_{H}$, we have:
I. $\quad\left\{H_{D}(\vec{N}), \tilde{H}_{H}(N)\right\}\left|C o n_{T}=\tilde{H}_{H}\left(L_{\vec{N}} N\right)\right| \operatorname{Con} T_{T} ;$
II. $\left\{H_{R}(W), \tilde{H}_{H}(N)\right\} \mid C o n_{T}=0$;
III. $\left\{\tilde{H}_{H}\left(N_{1}\right), \tilde{H}_{H}\left(N_{2}\right)\right\} \mid$ Con $_{T}$
$=H_{D}\left(N_{1} \operatorname{grad} N_{2}-N_{2} \operatorname{grad} N_{1}\right) \mid \operatorname{Con}_{T}$
$+H_{R}\left(q\left(\mathrm{dN}_{1} \wedge \mathrm{dN}_{2}, \omega^{a}{ }^{\mathrm{A}} \omega_{\mathrm{b}}\right)+\mathrm{q}\left(\mathrm{N}_{1} \mathrm{dN}_{2}-\mathrm{N}_{2} \mathrm{dN}_{1}, \omega_{\mathrm{b}}{ }_{\mathrm{b}}\right)\right) \mid C \mathrm{Con}{ }_{\mathrm{T}}$.

Ad I: Proceeding as in the coframe picture, let

$$
E=E_{k i n}+E_{p o t}
$$

where

$$
E_{k i n}(\vec{\omega}, \vec{p} ; \underline{\omega})=\frac{1}{2}\left[q\left(p_{b}, * \omega{ }^{c}\right) q\left(p_{c^{\prime}} * \omega^{b}\right)-\frac{p^{2}}{n-2}\right] \mathrm{Vol}_{q}
$$

and

$$
\begin{aligned}
E_{\text {pot }}(\vec{\omega}, \vec{p} ; \underline{\omega}) & =-\frac{1}{2} S(\underline{\omega}) \operatorname{vol}_{q} \\
& =-\frac{1}{2} \Omega_{b c}(\underline{\omega}) \wedge *\left(\omega^{\mathrm{b}} \wedge \omega^{c}\right) .
\end{aligned}
$$

Note that $\mathrm{E}_{\text {kin }}$ does not depend on $\underline{\omega}$, while $E_{\text {pot }}$ does not depend on $\overrightarrow{\mathrm{p}}$. This said, in obvious notation,

$$
H_{\mathrm{H}}(\mathrm{~N})=\mathrm{H}_{\mathrm{H}_{\text {kin }}}(\mathrm{N})+\mathrm{H}_{\mathrm{H}_{\mathrm{pot}}}(\mathrm{~N})
$$

and, as before,

$$
\left\{\mathrm{H}_{\mathrm{D}}(\overrightarrow{\mathrm{~N}}), \mathrm{H}_{\mathrm{H}_{\text {kin }}}(\mathrm{N})\right\}=\mathrm{H}_{\mathrm{H}_{\text {kin }}}\left(\mathrm{L}_{\overrightarrow{\mathrm{N}}} \mathrm{~N}\right)
$$

However, $H_{H_{p o t}}(N)$ has to be treated a little bit differently. Thus, in the present setting,

$$
\left.\frac{{ }^{\delta H_{H_{\mathrm{pot}}}}(\mathrm{~N})}{\delta \omega^{\mathrm{a}}}=-\frac{\mathrm{N}}{2}\left(\Omega_{\mathrm{bc}} \stackrel{(\omega)}{\sim}\right) \wedge *\left(\omega^{\mathrm{b}} \wedge \omega^{\mathrm{c}} \wedge \omega_{\mathrm{a}}\right)\right),
$$

so

$$
\begin{aligned}
& \left\{H_{D}(\vec{N}), H_{H_{p o t}}(N)\right\} \\
& \quad=\frac{1}{2} \int_{\Sigma} L_{\vec{N}} \omega^{a} \wedge N\left(\Omega_{b c}(\underline{\omega}) \wedge *\left(\omega^{b} \wedge \omega^{c} \wedge \omega_{a}\right)\right)
\end{aligned}
$$

$$
\begin{aligned}
& \Rightarrow \\
& \qquad \begin{aligned}
&\left\{H_{D}(\overrightarrow{\mathrm{~N}}), H_{H_{\text {pot }}}(\mathrm{N})\right\} \mid \mathrm{Con}_{\mathrm{T}} \\
&=\frac{1}{2} \int_{\mathrm{K}} L_{\overrightarrow{\mathrm{N}}} \omega^{\mathrm{a}} \wedge \mathrm{~N}\left(\Omega_{\mathrm{bc}} \wedge *\left(\omega^{\mathrm{b}} \wedge \omega^{\mathrm{c}} \wedge \omega_{a}\right)\right),
\end{aligned}
\end{aligned}
$$

where $\Omega_{b c}$ is per $\nabla^{q}$. This integral was encountered earlier: It computes to

$$
\begin{aligned}
& H_{H_{\text {pot }}}\left(L_{\vec{N}}^{N}\right) \mid \text { con }_{T} \\
& \quad-\int_{\Sigma} L_{\vec{N}} \omega^{a} \wedge *\left(\nabla_{a} d N-\left(\Delta_{q} N\right) \omega^{a}\right) .
\end{aligned}
$$

But

$$
\begin{aligned}
& -\int_{\Sigma} L_{\vec{N}}^{L_{N}} \omega^{a} \wedge *\left(\nabla_{a} d N-\left(\Delta_{q} N\right) \omega^{a}\right) \\
& =-\int_{\Sigma} L_{\vec{N}}^{L_{N}} \omega^{a} \wedge d^{q} *\left(d N \wedge \omega_{a}\right) \\
& =-\int_{\Sigma} L_{\vec{N}} \omega^{a} \wedge\left(d *\left(d N \wedge \omega_{a}\right)-\omega_{a}^{c} a^{\left.\wedge *\left(d N \wedge \omega_{C}\right)\right)}\right. \\
& =\left\{H_{D}(\vec{N}), H_{T}\left(*\left(d N \wedge \omega_{a}\right)\right)\right\} \mid C o n_{T} \cdot
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& \left\{H_{D}(\vec{N}), \tilde{H}_{H}(N)\right\} \mid \mathrm{Con}_{T} \\
& \quad=\left\{H_{D}(\vec{N}), H_{H}(\mathbb{N})-H_{T}\left(*\left(\mathrm{dN} \wedge \omega_{a}\right)\right)\right\} \mid \mathrm{Con}_{T} \\
& \quad=\left\{H_{D}(\vec{N}), H_{H_{k i n}}(N)+H_{H_{p o t}}(N)\right\} \mid \mathrm{Con}_{T}
\end{aligned}
$$

$$
\begin{aligned}
& -\left\{H_{D}(\vec{N}), H_{T}\left(*\left(d N / \omega_{a}\right)\right)\right\} \mid \mathrm{Con}_{T} \\
& =\left\{H_{D}(\vec{N}), H_{H_{k i n}}(N)\right\} \mid \mathrm{Con}_{T} \\
& +\left\{H_{D}(\vec{N}), H_{H_{\text {pot }}}(\mathrm{N})\right\} \mid \mathrm{Con}_{\mathrm{T}} \\
& -\left\{H_{D}(\vec{N}), H_{T}\left(*\left(d N \wedge \omega_{a}\right)\right)\right\} \mid C o n_{T} \\
& =H_{H_{k i n}}\left(L_{\vec{N}} N\right) \mid \text { Con }_{T} \\
& +H_{H_{p o t}}\left(L_{\vec{N}} N\right)\left|\operatorname{Con}_{T}+\left\{H_{D}(\vec{N}), H_{T}\left(*\left(d N / \omega_{a}\right)\right)\right\}\right| \operatorname{Con}_{T} \\
& -\left\{H_{D}(\overrightarrow{\mathbb{N}}), H_{T}\left(*\left(d N \wedge \omega_{a}\right)\right)\right\} \mid \mathrm{Con}_{T} \\
& =H_{H_{\text {kin }}}\left(L_{\vec{N}} N\right)\left|\mathrm{Con}_{\mathrm{T}}+\mathrm{H}_{\mathrm{H}_{\mathrm{pot}}}\left(\mathrm{~L}_{\vec{N}} \mathrm{~N}\right)\right| \mathrm{Con}_{\mathrm{T}} \\
& =H_{H}\left(L_{\vec{N}} N\right) \mid \mathrm{Con}_{T} \\
& =H_{H} \underset{\vec{N}}{\left(L_{\mathrm{N}} \mathrm{~N}\right)} \mid \mathrm{Con}_{\mathrm{T}} \\
& -H_{T}\left(*\left(\mathrm{dL} \underset{\overrightarrow{\mathrm{~N}}}{\mathrm{~N}} \wedge \omega_{a}\right)\right) \mid \mathrm{Con}_{\mathrm{T}}(\equiv 0!) \\
& =\tilde{H}_{H}\left(L_{\vec{N}} N\right) \mid \operatorname{Con}_{T} .
\end{aligned}
$$

Ad II: In fact,

$$
\left\{H_{R}(W), \tilde{H}_{H}(N)\right\} \mid \operatorname{Con}_{T}
$$

$$
\begin{aligned}
& =\left\{H_{R}(W), H_{H}(N)\right\}\left|\operatorname{Con}_{T}-\left\{H_{R}(W), H_{T}\left(*\left(d N \wedge \omega_{a}\right)\right)\right\}\right| \operatorname{Con}_{T} \\
& =-\left\{H_{R}(W), H_{T}\left(*\left(d N \wedge \omega_{a}\right)\right)\right\} \mid \operatorname{Con}_{T} \\
& =\int_{\Sigma} W_{b}^{a} \omega^{b} \wedge\left(d *\left(d N \wedge \omega_{a}\right)-\omega_{a}^{c} \wedge *\left(d N \wedge \omega_{c}\right)\right) \mid C o n_{T} \\
& =\delta_{\Sigma} W_{b}^{a} \omega^{b}{ }_{\wedge *}\left(\nabla_{a} d N-\left(\Delta_{q} N\right) \omega^{a}\right) \\
& =\int_{\Sigma} W_{b}^{a} \omega^{\omega}{ }_{\wedge * \nabla_{a}} d N-\int_{\Sigma}\left(\Delta_{q} N\right) W_{b}^{a} \omega^{b} \wedge * \omega^{a} \\
& =\int_{\Sigma} W^{a} b^{\omega^{b}} \wedge * \nabla_{a} d N-\int_{\Sigma}\left(\Delta_{q} N\right) W^{a}{ }_{a}{ }^{v o l}{ }_{q} \\
& =\int_{\Sigma} W_{b}^{a} \omega^{b}{ }_{\wedge \star \nabla_{a}} d N \\
& =\int_{\Sigma} W_{b}^{a} H_{N}\left(E_{b}, E_{a}\right){ }^{\text {vol }}{ }_{q} \\
& =0 \text {, }
\end{aligned}
$$

$\mathrm{H}_{\mathrm{N}}$ being symmetric.
Ad III: It has been pointed out at the beginning of this section that here

$$
\left\{H_{H}\left(N_{1}\right), H_{H}\left(N_{2}\right)\right\}=0 .
$$

Therefore

$$
\begin{aligned}
& \left\{\tilde{H}_{H}\left(N_{1}\right), \tilde{H}_{H}\left(N_{2}\right)\right\} \\
= & \left\{H_{H}\left(N_{1}\right)-H_{T}\left(*\left(d N_{1} \wedge \omega_{a}\right)\right), H_{H}\left(N_{2}\right)-H_{T}\left(*\left(d N_{2} \wedge \omega_{a}\right)\right)\right\}
\end{aligned}
$$

$$
\begin{aligned}
=- & \left\{H_{T}\left(*\left(d N_{1} \wedge \omega_{a}\right)\right), H_{H}\left(N_{2}\right)\right\} \\
& -\left\{H_{H}\left(N_{1}\right), H_{T}\left(*\left(d N_{2} \wedge \omega_{a}\right)\right)\right\} \\
= & \left\{H_{H}\left(N_{2}\right), H_{T}\left(*\left(d N_{1} \wedge \omega_{a}\right)\right)\right\} \\
& -\left\{H_{H}\left(N_{1}\right), H_{T}\left(*\left(d N_{2} \wedge \omega_{a}\right)\right)\right\} .
\end{aligned}
$$

Using the explicit fonmulas for these Poisson brackets and then restricting to Con $T_{T}$ leads immediately to the claimed result.

Summary: On Con ${ }_{T}$, the fundamental Poisson bracket relations are the same as those in the coframe picture provided one works with $\tilde{H}_{H}(N)$ rather than $H_{H}(N)$. The next step is to find modifications

$$
\left[\begin{array}{l}
H_{D} \rightarrow \bar{H}_{D} \\
H_{R} \rightarrow \bar{H}_{R} \\
\tilde{H}_{H} \rightarrow \bar{H}_{H}
\end{array}\right.
$$

such that on $\mathrm{Con}_{\mathrm{T}^{\prime}}$,

$$
\begin{aligned}
& \left\{\bar{H}_{D}(\vec{N}), H_{T}(\vec{\alpha})\right\}=0 \\
& \left\{\bar{H}_{R}(W), H_{T}(\vec{\alpha})\right\}=0 \\
& \left\{\bar{H}_{H}(\mathbb{N}), H_{T}(\vec{\alpha})\right\}=0,
\end{aligned} \quad\left\{\begin{array}{l}
\left\{\bar{H}_{D}(\vec{N}), H_{f}(\beta)\right\}=0 \\
\left\{\bar{H}_{R}(W), H_{f}(\beta)\right\}=0 \\
\left\{\bar{H}_{H}(N), H_{f}(\beta)\right\}=0 .
\end{array}\right.
$$

[Note: It will also be clear from the construction that on $\mathrm{Con}_{\text {T }}$,

$$
\left[\begin{array}{l|l}
\left\{\bar{H}_{D}(\vec{N}), H_{1}(\underline{\rho})\right\}=0 & \left\{\bar{H}_{D}(\vec{N}), H_{2}(\vec{R})\right\}=0 \\
\left\{\bar{H}_{R}(W), H_{1}(\underline{\rho})\right\}=0 & \left\{\bar{H}_{R}(W), H_{2}(\vec{R})\right\}=0 \\
\left\{\bar{H}_{H}(N), H_{1}(\underline{\rho})\right\}=0, & \left.\left\{\bar{H}_{H}(N), H_{2}(\vec{R})\right\}=0 .\right]
\end{array}\right.
$$

$\bar{H}_{D}(\vec{N}): ~$
\#1: We have

$$
\begin{aligned}
& \left\{H_{D}(\vec{N}), H_{T}(\vec{\alpha})\right\}=-\int_{\Sigma} L_{\vec{N}} \omega^{a} \wedge\left(d \alpha_{a}-\omega_{a}^{c} \wedge \alpha_{c}\right) . \\
& \text { - } d\left(L_{\vec{N}} \omega^{a} \wedge \alpha_{a}\right) \\
& =d\left(\underset{\vec{N}}{L_{\vec{\prime}}}{ }^{\mathrm{a}}\right) \wedge \alpha_{a}-\underset{\vec{N}}{L_{\vec{N}}} \omega^{\mathrm{a}} \wedge d \alpha_{a} \\
& \text { => } \\
& -\underset{\vec{N}}{L_{1}} \omega^{a} \wedge d \alpha_{a}=d\left(\underset{\vec{N}}{L_{1}}{ }^{a} \wedge \alpha_{a}\right)-\alpha\left(L_{\vec{N}} \omega^{a}\right) \wedge \alpha_{a} . \\
& \text { - }{\underset{\vec{N}}{ }}\left(\omega^{a} \wedge \omega^{c}{ }_{a}{ }^{\alpha}{ }_{c}\right) \\
& =L_{\vec{N}} \omega^{a} \wedge \omega^{c}{ }_{a}^{\wedge \alpha_{c}}+\omega^{a} \wedge L_{\vec{N}} \omega^{c} a^{\wedge \alpha_{c}}+\omega^{a} \wedge \omega^{c}{ }_{a} \wedge L_{\vec{N}}^{\alpha}{ }^{c} \\
& \text { => }
\end{aligned}
$$

$$
\begin{aligned}
& -\omega^{a} \wedge L_{\vec{N}} \omega^{c} a^{\wedge \alpha_{c}}-\omega^{a} \Lambda \omega^{c} a^{\wedge L}{ }_{\vec{N}}^{\alpha} c .
\end{aligned}
$$

Thus

$$
\begin{aligned}
& \left\{H_{D}(\vec{N}), H_{T}(\vec{\alpha})\right\}=-\int_{\Sigma} a\left(L_{\vec{N}} \omega^{a}\right) \wedge \alpha_{a} \\
& -\int_{\Sigma}\left(\omega^{a} \wedge L_{\vec{N}} \omega^{b} a^{\wedge \alpha_{b}}+\omega^{a} \wedge \omega^{b}{ }_{a} \wedge L_{\vec{N}} \alpha_{b}\right) \\
& \left.=-\int_{\Sigma}{ }^{a\left(L L_{\vec{N}}\right.}{ }^{a}\right) \wedge a_{a}-\int_{\Sigma} \omega^{a} \wedge \omega^{b}{ }_{a}{ }^{\wedge L}{ }_{\vec{N}} \alpha_{b} \\
& +\int_{\Sigma} L_{\vec{N}} \omega_{b a}{ }^{\wedge \omega^{a} \Lambda \alpha_{b}} \\
& =-\int_{\Sigma} \mathrm{d}\left(L_{\overrightarrow{\mathrm{N}}} \omega^{\mathrm{a}}\right) \wedge \alpha_{a}-\int_{\Sigma} \omega^{\mathrm{a}} \wedge \omega^{\mathrm{b}}{ }_{a}{ }^{\wedge L}{ }_{\overrightarrow{\mathrm{N}}}{ }^{\alpha}{ }^{b} \\
& +\int_{\Sigma} \stackrel{L}{\vec{N}}^{\omega}{ }_{a b}{ }^{\wedge \omega}{ }^{b} \wedge a_{a} .
\end{aligned}
$$

But

$$
\frac{1}{2}\left\{H_{1}\left(L_{\vec{N}} \omega_{a b}\right), H_{T}(\vec{a})\right\}=-\int_{\Sigma} L_{\vec{N}} \omega_{a b} \wedge \omega^{b} \wedge \alpha_{a} .
$$

Therefore

$$
\begin{aligned}
& \left\{H_{D}(\vec{N}), H_{T}(\vec{\alpha})\right\}+\frac{1}{2}\left\{H_{I}\left(L_{\vec{N}} \omega_{a b}\right), H_{T}(\vec{\alpha})\right\} \\
& \quad=-\int_{\sum} d\left(L_{\vec{N}} \omega^{a}\right) \wedge \alpha_{a}-\int_{\Sigma} \omega^{a} \wedge \omega_{a}^{b} \wedge L_{\vec{N}} \alpha_{b} .
\end{aligned}
$$

Now restrict to $\mathrm{Con}_{\mathrm{T}}$-- then

$$
\mathrm{d} \omega^{\mathrm{b}}=-\omega^{\mathrm{b}}{ }_{a^{n \omega}}{ }^{\mathrm{a}}
$$

=>
29.

$$
\begin{aligned}
& d\left(\underset{\vec{N}}{ } \omega^{a}\right) \wedge \alpha_{a}+\omega^{a} \wedge \omega^{b} a_{\vec{N}} L_{\vec{N}} \\
& =L_{\vec{N}} d \omega^{a} \wedge \alpha_{a}-\omega_{a}^{b} \wedge \omega^{a} \wedge L_{\vec{N}} \alpha_{b} \\
& =\underset{\vec{N}}{L_{C}} d \omega^{a} \wedge \alpha_{a}+d \omega^{b} \wedge L_{\vec{N}} \alpha_{b} \\
& =\underset{\vec{N}}{L_{\vec{N}}}{ }^{\mathrm{d}}{ }^{\mathrm{a}} \wedge \alpha_{a}+d \omega^{\mathrm{a}} \wedge \stackrel{\rightharpoonup}{\mathrm{~N}}^{\alpha}{ }_{a} \\
& =\underset{\vec{N}}{L_{\vec{N}}}\left(d \omega^{a} \wedge \alpha_{a}\right) \\
& \text { => } \\
& \int_{\Sigma}\left(d\left(L_{\vec{N}} \omega^{a}\right) \wedge \alpha_{a}+\omega^{a} \wedge \omega^{b}{ }_{a} \mathcal{L}_{\vec{N}} \alpha_{b}\right) \\
& =0 \text {. }
\end{aligned}
$$

I.e.:

$$
\left.\left\{H_{D}(\vec{N})+\frac{1}{2} H_{1}\left(L_{\vec{N}} \omega_{a b}\right), H_{T}(\vec{\alpha})\right\} \right\rvert\, \operatorname{Con}_{T}=0 .
$$

\#2: We have

$$
\left\{H_{D}(\vec{N}), H_{f}(\beta)\right\}=-\int_{\Sigma} L_{\vec{N}} \omega^{a} \wedge B_{a} \beta .
$$

On the other hand,

$$
\begin{aligned}
& -\left\{H_{2}\left(B_{b} q\left(L_{\vec{N}} \omega^{b}, \omega_{a}\right)\right), H_{f}(\beta)\right\} \\
& \quad=\int_{\Sigma} B_{b} q\left(L_{\vec{N}} \omega^{b}, \omega_{a}\right) \omega^{a} \wedge \beta
\end{aligned}
$$

30. 

$$
\begin{aligned}
& =\int_{\Sigma} q\left(L_{\vec{N}} \omega^{a}, \omega_{b}\right) \omega^{b} \wedge B_{a} \beta \\
& =\int_{\Sigma} L_{\vec{N}} \omega^{a} \wedge B_{a} B .
\end{aligned}
$$

So, with no conditions,

$$
\left\{H_{D}(\vec{N})-H_{2}\left(B_{b} q\left(L_{\vec{N}} w^{b}, \omega_{a}\right)\right), H_{f}(\beta)\right\}=0 .
$$

Notation: Put

$$
\bar{H}_{D}(\vec{N})=H_{D}(\vec{N})+K_{D}(\vec{N}),
$$

where

$$
K_{D}(\vec{N})=\frac{1}{2} H_{1}\left(L_{\vec{N}}{ }^{\omega} a b\right)-H_{2}\left(B_{b} q\left(L_{\vec{N}}^{\omega}, \omega_{a}^{b}\right)\right) .
$$

Then on $\mathrm{Con}_{\mathrm{T}^{\prime}}$

$$
\left\{\bar{H}_{D}(\vec{N}), H_{T}(\vec{\alpha})\right\}=0,\left\{\vec{H}_{D}(\vec{N}), H_{f}(\beta)\right\}=0 .
$$

$$
\bar{H}_{\mathrm{R}}(\mathrm{~W}):
$$

\#1: We have

$$
\left\{H_{R}(W), H_{T}(\vec{\alpha})\right\}=-\delta_{\Sigma} W_{b}^{a}{ }^{b} \wedge\left(d \alpha_{a}-w_{a}^{c}{ }_{a} \alpha_{C}\right)
$$

$$
\text { - } d\left(w^{a}{ }_{b} \wedge \omega^{b} \wedge \alpha_{a}\right)
$$

$$
\begin{aligned}
& =d w_{b}^{a} \omega^{b} \wedge \alpha_{a}+w_{b}^{a} \wedge d\left(\omega^{b} \wedge \alpha_{a}\right) \\
& =d W_{b}^{a} \wedge \omega^{b} \wedge \alpha_{a}+W_{b^{\wedge}}^{a} d \omega^{b} \wedge \alpha_{a}-w_{b}^{a} \wedge \omega^{b} \wedge d \alpha_{a}
\end{aligned}
$$

$$
\Rightarrow
$$

$$
\begin{aligned}
& -W_{b}^{a} \wedge \omega^{b} \wedge d \alpha_{a} \\
& =d\left(W_{b}^{a} \wedge \omega^{b} \wedge \alpha_{a}\right) \\
& -d W_{b}^{a} \wedge \omega^{b} \alpha_{a}-W_{b}^{a}{ }_{b} \wedge d \omega^{b}{ }^{\text {a }} \alpha_{a} . \\
& \text { - }-W_{b}^{a} \wedge \alpha \omega^{b} \wedge \alpha_{a} \\
& =-\omega_{b}^{a} \wedge\left(\theta^{b}(\underline{\omega})-\omega^{b} \wedge \omega^{c}\right) \wedge \alpha_{a} \\
& =-W_{b}^{a} \wedge^{b}(\underline{\omega}) \wedge \alpha_{a}+W_{a b} \omega^{b} c^{\wedge} \omega^{c} \wedge \alpha_{a} \\
& =-\tilde{W}_{b}^{a} \wedge \theta^{b}(\underline{\omega}) \wedge \alpha_{a}+\omega^{b} c^{b} W_{a b}{ }^{\wedge \omega}{ }^{c} \wedge \alpha_{a} \\
& =-W^{a}{ }_{b} \wedge \theta^{b}(\underline{\omega}) \wedge \alpha_{a}-\omega_{b}^{c}{ }_{b} \wedge W_{a b} \wedge \omega^{c} \wedge \alpha_{a} \\
& =-W^{a}{ }_{b} \wedge \theta^{b}(\underline{\omega}) \wedge \alpha_{a}-\omega^{b}{ }_{c} \wedge W_{a c} \wedge \omega^{b} \wedge \alpha_{a} \\
& =-W_{b}^{a} \wedge \theta^{b}(\underline{\omega}) \wedge \alpha_{a}+\omega_{b}^{C} \wedge W_{a c} \wedge \omega^{b} \wedge \alpha_{a} . \\
& \bullet^{2}{ }_{b} \wedge \omega^{b} \wedge \omega^{c}{ }_{a} \wedge \alpha_{c} \\
& =-W_{a b} \wedge \omega^{c}{ }_{a} \wedge \omega^{b} \wedge \alpha_{c} \\
& =\omega^{a} \wedge \omega_{a b} \wedge \omega^{b}{ }^{\text {}}{ }_{c} \\
& =\omega^{c}{ }_{a} \wedge W_{c b} \wedge \omega^{b} \wedge \alpha_{a} .
\end{aligned}
$$

$$
\begin{aligned}
&--d W_{b}^{a} \wedge \omega^{b} \wedge \alpha_{a} \\
&-W_{b}^{a} \wedge d \omega^{b} \wedge \alpha_{a}+W_{b}^{a}{ }_{b} \omega^{b} \wedge \omega^{c}{ }_{a} \wedge \alpha_{c} \\
&=-W_{b}^{a} \wedge \theta^{b}(\underline{\omega}) \wedge \alpha_{a} \\
&+\left(-d W_{a b}+\omega^{c}{ }_{a} \wedge W_{c b}+\omega_{b}^{c} \wedge W_{a c}\right) \wedge \omega^{b} \wedge \alpha_{a} \\
&=-W^{a}{ }_{b} \wedge \theta^{b}(\underline{\omega}) \wedge \alpha_{a}-d^{\nabla(\underline{\omega})^{W}} W_{a b} \wedge \omega^{b} \wedge \alpha_{a} .
\end{aligned}
$$

Thus

$$
\begin{aligned}
& \left\{H_{R}(W), H_{T}(\vec{\alpha})\right\} \\
& =-\int_{\Sigma} W_{b}^{a} \wedge \theta^{b}(\underline{\omega}) \wedge \alpha_{a}-\int_{\Sigma} d^{\nabla(\omega)} W_{a b} \wedge \omega^{b} \wedge \alpha_{a} .
\end{aligned}
$$

But

$$
-\frac{1}{2}\left\{H_{1}\left(d^{\nabla(\underline{\omega})} W_{a b}\right), H_{T}(\vec{\alpha})\right\}=\delta_{\Sigma} d^{\nabla(\underline{\omega})} W_{a b} \wedge \omega^{\mathrm{b}} \wedge \alpha_{a} .
$$

Therefore

$$
\begin{aligned}
& \left\{H_{R}(W), H_{T}(\vec{\alpha})\right\}-\frac{1}{2}\left\{H_{1}\left(d^{\nabla(\omega)} W_{a b}\right), H_{T}(\vec{\alpha})\right\} \\
& =-\delta_{\Sigma} W^{a}{ }_{b} \wedge \theta^{b}(\underline{\omega}) \wedge \alpha_{a} .
\end{aligned}
$$

Now restrict to $\mathrm{Con}_{\mathrm{T}}$ - then $\theta^{\mathrm{b}}(\underline{\omega})=0$, hence

$$
\left.\left\{H_{R}(W)-\frac{1}{2} H_{1}\left(d^{\nabla(\underline{\omega})} W_{a b}\right), H_{T}(\vec{\alpha})\right\} \right\rvert\, \operatorname{con}_{T}=0 .
$$

\#2: We have

$$
\left\{H_{R}(W), H_{f}(B)\right\}=-\int_{\Sigma} W_{b}^{a} \omega^{b} \wedge B_{a} \beta
$$

$$
\begin{aligned}
& =-\int_{\Sigma} W_{a b} B^{a} \omega^{b} \wedge B \\
& =-\int_{\Sigma} W_{b a} B^{b} \omega^{a} \wedge \beta \\
& =\int_{\Sigma} W_{a b} B^{b} \omega^{a} \wedge \beta_{n}
\end{aligned}
$$

On the other hand,

$$
\left\{H_{2}\left(W_{a b} B^{b}\right), H_{f}(B)\right\}=-\delta_{\Sigma} W_{a b} B^{b} \omega^{a} \wedge B .
$$

So, with no conditions,

$$
\left\{H_{R}(W)+H_{2}\left(W_{a b} B^{b}\right), H_{f}(B)\right\}=0 .
$$

Notation: Put

$$
\bar{H}_{R}(W)=H_{R}(W)+K_{R}(W),
$$

where

$$
K_{R}(W)=-\frac{1}{2} H_{1}\left(d^{\nabla(\underline{\omega})} W_{a b}\right)+H_{2}\left(W_{a b} B^{b}\right) .
$$

Then on $\mathrm{Con}_{\mathrm{T}}$,

$$
\left\{\bar{H}_{R}(W), H_{T}(\vec{\alpha})\right\}=0,\left\{\bar{H}_{R}(W), H_{f}(\beta)\right\}=0
$$

$$
\vec{H}_{H}(\mathrm{~N}):
$$

\#l: We have

$$
\begin{aligned}
\left\{\tilde{H}_{H}(N), H_{T}(\vec{\alpha})\right\} & =\left\{H_{H}(N), H_{T}(\vec{\alpha})\right\}-\left\{H_{T}\left(*\left(d N \wedge \omega_{a}\right)\right), H_{T}(\vec{\alpha})\right\} \\
& =\left\{H_{H}(N), H_{T}(\vec{\alpha})\right\}
\end{aligned}
$$

$$
=-\int_{\Sigma} N\left(q\left(p_{b}, * \omega^{a}\right) \omega^{b}-\frac{p}{n-2} \omega^{a}\right) \wedge\left(d \alpha_{a}-\omega^{c} \wedge \alpha_{c}\right)
$$

Let

$$
\begin{aligned}
\zeta^{a} & =N\left(q\left(p_{b}, * \omega^{a}\right) \omega^{b}-\frac{p}{n-2} \omega^{a}\right) \\
\cdot d\left(\zeta^{a} \wedge \alpha_{a}\right) & =d \zeta^{a} \wedge \alpha_{a}-\zeta^{a} \wedge d \alpha_{a}
\end{aligned}
$$

$$
\Rightarrow
$$

$$
-\zeta^{a} \wedge d \alpha_{a}=d\left(\zeta^{a} \wedge \alpha_{a}\right)-d \zeta^{a} \wedge \alpha_{a}
$$

$$
\cdot \zeta^{a} \wedge \omega_{a}^{c} \wedge_{c}
$$

$$
=-\omega_{a}^{c} \wedge \zeta^{a} \wedge \alpha_{c}
$$

$$
\begin{aligned}
& =-\omega^{a}{ }_{c} \wedge \zeta^{c} \wedge \alpha_{a} \\
& =\omega^{c}{ }_{a} \wedge \zeta c_{c} \wedge \alpha_{a}
\end{aligned}
$$

Thus

$$
\begin{aligned}
\left\{H_{H}(N),\right. & \left.H_{T}(\vec{\alpha})\right\} \\
& =\int_{\Sigma}\left(-d \zeta_{a}+\omega^{c} a^{\wedge \zeta} c\right) \wedge \alpha_{a} \\
& =-\int_{\Sigma} d^{\nabla(\underline{\omega})} \zeta_{a} \wedge \alpha_{a}
\end{aligned}
$$

The combination

$$
z_{a b}(\underline{\omega})=\frac{1}{2}\left(l_{E_{a}} d^{\nabla(\underline{\omega})} \zeta_{b}-{ }_{l_{E_{b}}} d^{\nabla(\underline{\omega})} \zeta_{a}\right)+\frac{1}{2} \omega^{c}{ }^{l_{E_{b}}}{ }_{E_{a}} d^{\nabla(\underline{\omega})} \zeta_{c}
$$

is antisymmetric and
35.

$$
-\frac{1}{2}\left\{H_{1}\left(Z_{a b}(\omega)\right), H_{T}(\vec{\alpha})\right\}=\int_{\Sigma} Z_{a b}(\underline{\omega}) \wedge \omega^{b} \wedge \alpha_{a} .
$$

But

$$
\delta_{\Sigma} \mathrm{Z}_{\mathrm{ab}}(\omega) \wedge \omega^{\mathrm{b}} \wedge \alpha_{a}=\delta_{\Sigma} d^{\nabla(\omega)} \zeta_{a} \wedge \alpha_{a}
$$

To see this, write

$$
d^{\nabla(\omega)} \zeta_{a}=\frac{1}{2} c_{u v}^{a} \omega^{u} \omega^{v}\left(c_{u v}^{a}=-C_{v u}^{a}\right)
$$

and recall that

$$
\begin{aligned}
& C^{a}{ }_{u v}={ }^{l_{E}}{ }_{V}{ }^{l_{E}}{ }_{u} d^{\nabla(\underline{\omega})} \zeta_{a} . \\
& \text { - }{ }_{E_{a}} d^{\nabla(\underline{\omega})} \zeta_{b} \\
& =\frac{1}{2} C^{b} \operatorname{uv}^{2} E_{a}\left(\omega^{u} \wedge \omega^{v}\right) \\
& =\frac{1}{2} C^{b}{ }_{u v}\left(\delta^{u} a^{\omega}{ }^{v}-\omega^{u} \delta^{v}{ }_{a}\right) \\
& =\frac{1}{2} c^{b} a v^{\omega^{v}}-\frac{1}{2} c^{b}{ }_{u a} \omega^{u} . \\
& \text { - }-{ }^{2} E_{b} d^{\nabla(\underline{\omega})} \zeta a \\
& =-\frac{1}{2} C^{a}{ }_{u v}{ }^{\mathrm{l}} \mathrm{E}_{\mathrm{b}}\left(\omega^{\mathrm{u}} \wedge \omega^{\mathrm{v}}\right) \\
& =-\frac{1}{2} C_{u v}^{a}\left(\delta_{b}^{u} \omega^{v}-\omega^{u} \delta_{b}^{v}\right) \\
& =\frac{1}{2} c^{a}{ }_{u b} \omega^{u}-\frac{1}{2} c^{a}{ }_{b v}{ }^{\left(\omega^{v}\right.}
\end{aligned}
$$

$$
\begin{aligned}
& \frac{1}{2}\left(l_{E_{a}}{ }^{d}{ }^{\nabla(\omega)} \zeta_{b}-{ }^{l_{E}}{ }_{b} d^{\nabla(\omega)} \zeta_{a}{ }^{2} \wedge \omega^{b}\right. \\
& =\frac{1}{4}\left(c^{b}{ }_{a v} \omega^{\nu} \wedge \omega^{b}-C_{u a}^{b}{ }^{\omega} \wedge \omega^{u}{ }^{b}\right. \\
& \left.+c^{\mathrm{a}}{ }_{u b^{\omega}}{ }^{\mathrm{u}} \wedge \omega \omega^{\mathrm{b}}-\mathrm{c}_{\mathrm{bv}}{ }^{\mathrm{a}}{ }^{\mathrm{v}} \wedge \omega^{\mathrm{b}}\right) \\
& =\frac{1}{4}\left(c^{b}{ }_{a u} \omega^{u} \wedge \omega^{b}+c^{b}{ }_{a u}{ }^{\omega}{ }^{\mathrm{u}} \wedge \omega^{b}\right. \\
& \left.+c^{a}{ }_{v b} \omega^{\mathrm{v}}{ }^{\prime} \omega^{\mathrm{b}}+\mathrm{C}^{\mathrm{a}}{ }_{\mathrm{vb}}{ }^{\mathrm{v}}{ }^{\mathrm{N}}{ }^{\mathrm{b}}{ }^{\mathrm{b}}\right) \\
& =\frac{1}{2} c^{b}{ }_{a u} \omega^{u} \wedge \omega^{b}+\frac{1}{2} c^{a}{ }_{v b}{ }^{v}{ }^{v} \wedge \omega^{b} \\
& =\frac{1}{2} c_{a b}^{u} \omega^{b} \wedge \omega^{u}+\frac{1}{2} c^{a}{ }_{u b}{ }^{\mathrm{u}}{ }^{\mathrm{a}} \mathrm{~N} \mathrm{\omega}^{\mathrm{b}} \\
& =\frac{1}{2} c^{c}{ }_{a b} \omega^{b} \wedge \omega^{c}+\frac{1}{2} c^{a}{ }_{u v}{ }^{\omega}{ }^{u} \wedge \omega^{v} \\
& =-\frac{1}{2} c^{c}{ }_{a b} \omega^{C} \wedge \omega^{b}+d^{\nabla(\omega)} \zeta_{a} .
\end{aligned}
$$

However

$$
\begin{gathered}
\frac{1}{2} \omega^{c}{ }^{c}{ }_{E_{b}}{ }^{2} E_{a}{ }^{d}{ }^{\nabla(\omega)}{ }_{\zeta} c^{\wedge \omega}{ }^{b} \\
\quad=\frac{1}{2} \omega^{c} c^{c}{ }_{a b}{ }^{\wedge \omega} \omega^{b} \\
= \\
\frac{1}{2} c^{c}{ }_{a b} \omega^{c} \wedge \omega^{b} .
\end{gathered}
$$

Therefore

$$
z_{a b}(\underline{\omega}) \wedge \omega^{b}=-\frac{1}{2} c_{a b}^{c}{ }^{\omega}{ }^{c} \Lambda \omega^{b}+d^{\nabla(\omega)} \zeta_{a}
$$

$$
\begin{aligned}
& \quad+\frac{1}{2} c_{a b}^{c} \omega^{\omega^{c} \Lambda \omega^{b}} \\
& =d^{\nabla(\omega)} \zeta_{a} .
\end{aligned}
$$

Consequently,

$$
\left\{H_{H}(\mathbb{N})-\frac{1}{2} H_{1}\left(Z_{a b}(\underline{\omega})\right), H_{T}(\vec{\alpha})\right\}=0
$$

on the nose.
\#2: We have

$$
\begin{aligned}
& \left\{\tilde{H}_{H}(N), H_{f}(\beta)\right\}=\left\{H_{H}(N), H_{f}(\beta)\right\}-\left\{H_{T}\left(*\left(d N / \omega_{a}\right)\right), H_{f}(\beta)\right\} \\
& =\left\{H_{H}(N), H_{f}(\beta)\right\} \\
& =-\int_{\Sigma} N\left(q\left(p_{b}, * \omega^{a}\right) \omega^{b}-\frac{P}{n-2} \omega^{a}\right) \wedge B_{a} \beta \\
& =-\int_{\Sigma} B_{a} N\left(q\left(p_{b}, * \omega^{a}\right) \omega^{b} \wedge \beta-\frac{P}{n-2} \omega^{a} \wedge \beta\right)
\end{aligned}
$$

On the other hand,

$$
\begin{aligned}
& -\left\{H_{2}\left(B_{b} N\left(q\left(p_{a}, * \omega^{b}\right)-\frac{p}{n-2} n_{a}^{b}\right)\right), H_{f}(\beta)\right\} \\
& =\int_{\Sigma} B_{b} N\left(q\left(p_{a}, * \omega^{b}\right)-\frac{P}{n-2} \eta_{a}^{b}\right) \omega^{a} \wedge \beta \\
& =\int_{\Sigma} B_{b} N\left(q\left(p_{a}, * \omega^{b}\right) \omega^{a} \wedge \beta-\frac{p}{n-2} n^{b} \omega^{\omega} \omega^{a} \wedge \beta\right) \\
& =\int_{\Sigma} B_{a} N\left(q\left(p_{b}, * \omega^{a}\right) \omega^{b} \wedge \beta-\frac{p}{n-2} n_{b^{a}}^{a} \omega^{b} \wedge \beta\right)
\end{aligned}
$$

$$
=\int_{\Sigma} B_{a} N\left(q\left(p_{b}, * \omega^{a}\right) \omega^{b} \wedge \beta-\frac{p}{n-2} \omega^{a} \wedge \beta\right)
$$

So, with no conditions,

$$
\left\{H_{H}(N)-H_{2}\left(B_{b} N\left(q\left(p_{a}, * \omega^{b}\right)-\frac{p}{n-2} n^{b}\right)\right), H_{f}(\beta)\right\}=0 .
$$

Notation: Put

$$
\bar{H}_{H}(\mathrm{~N})=\tilde{H}_{\mathrm{H}}(\mathrm{~N})+K_{\mathrm{H}}(\mathrm{~N}),
$$

where

$$
K_{H}(N)=-\frac{1}{2} H_{1}\left(Z_{a b}(\underline{\omega})\right)-H_{2}\left(B_{b} N\left(q\left(p_{a}, * \omega^{b}\right)-\frac{p}{n-2} n_{a}^{b}\right)\right)
$$

Then on $\mathrm{Con}_{\mathrm{T}^{\prime}}$

$$
\left\{\bar{H}_{H}(N), H_{T}\left(\vec{\alpha}^{\alpha}\right)\right\}=0,\left\{\bar{H}_{H}(N), H_{f}(\beta)\right\}=0 .
$$

Remark: Since

$$
\begin{aligned}
\left\{\bar{H}_{H}(\mathrm{~N}), \mathrm{H}_{1}(\underline{\rho})\right\} & =\left\{\tilde{H}_{H}(\mathrm{~N}), H_{1}(\underline{\rho})\right\}+\left\{\mathrm{K}_{\mathrm{H}}(\mathrm{~N}), \mathrm{H}_{1}(\underline{\rho})\right\} \\
& =\left\{\tilde{H}_{H}(\mathrm{~N}), \mathrm{H}_{1}(\underline{\rho})\right\},
\end{aligned}
$$

it follows that

$$
\begin{aligned}
\left\{\bar{H}_{H}(\mathrm{~N}), H_{1}(\underline{\rho})\right\} \mid \mathrm{Con}_{T} & =\left\{\tilde{H}_{H}(\mathrm{~N}), H_{1}(\underline{\rho})\right\} \mid \mathrm{Con}_{T} \\
& =0
\end{aligned}
$$

THEOREM On COn ${ }_{T}$, we have

1. $\left\{\bar{H}_{D}\left(\vec{N}_{1}\right), \bar{H}_{D}\left(\vec{N}_{2}\right)\right\}=\bar{H}_{D}\left(\left[\vec{N}_{1}, \vec{N}_{2}\right]\right)$;
2. 
3. $\left\{\bar{H}_{D}(\overrightarrow{\mathrm{~N}}), \bar{H}_{\mathrm{R}}(\mathrm{W})\right\}=\bar{H}_{\mathrm{R}}\left(\mathrm{L}_{\overrightarrow{\mathrm{N}}} \mathrm{W}\right)$;
4. $\left\{\bar{H}_{D}(\vec{N}), \bar{H}_{H}(N)\right\}=\bar{H}_{H}\left(L_{\vec{N}} N\right)$;
5. $\left\{\bar{H}_{R}\left(W_{1}\right), \bar{H}_{R}\left(W_{2}\right)\right\}=\bar{H}_{R}\left(\left[W_{1}, W_{2}\right]\right)$;
6. $\left\{\bar{H}_{\mathrm{R}}(\mathrm{W}), \bar{H}_{\mathrm{H}}(\mathrm{N})\right\}=0$;
7. $\left\{\vec{H}_{H}\left(N_{1}\right), \bar{H}_{H}\left(N_{2}\right)\right\}$

$$
\begin{aligned}
= & \bar{H}_{D}\left(N_{1} \operatorname{grad} N_{2}-N_{2} \operatorname{grad} N_{1}\right) \\
& +\bar{H}_{R}\left(q\left(d N_{1} \wedge d N_{2}, \omega^{a} \Lambda \omega_{b}\right)+q\left(N_{1} d N_{2}-N_{2} d N_{1}, \omega_{b}^{a}\right)\right) .
\end{aligned}
$$

Notation: $\operatorname{Con}_{\underline{Q}}$ is the subset of $T^{*} \mathrm{C}$ whose elements are the points

$$
\left(\vec{\omega}, \underline{\omega}, \overrightarrow{\mathrm{B}} ; \overrightarrow{\mathrm{p}}, \underline{\mathrm{p}}_{\underline{\omega}}, \mathrm{p}_{\overrightarrow{\mathrm{B}}}\right)
$$

such that simultaneously

$$
\frac{\delta H}{\delta N}=0, \frac{\delta H}{\delta \vec{N}}=0, \frac{\delta H}{\delta W}=0 .
$$

Definition: The physical phase space of the theory (a.k.a. the constraint surface of the theory) is the subset Con Pal of $\mathrm{T}^{*} \mathrm{C}$ defined by

$$
\mathrm{Con}_{\mathrm{Pal}}=\mathrm{Con}_{\underline{Q}} \mathrm{nCon}_{\mathrm{T}} \mathrm{nCon}_{1} \mathrm{nCon}_{2}
$$

A constraint is a function $\phi: T^{*} \mathcal{C} \rightarrow \underline{R}$ such that $\left.\phi\right|_{\mathrm{Con}_{\mathrm{Pal}}}=0$.
Example: $H_{T}(\vec{\alpha}), H_{1}(\underline{\rho})$, and $H_{2}(\vec{R})$ are obviously constraints, thus, by construction, so are $\bar{H}_{D}(\vec{N}), \bar{H}_{R}(W)$, and $\bar{H}_{H}(N)$.

Definition: A function $\phi: T^{*} C \rightarrow \underline{R}$ is said to be first class if

$$
\{\phi, \Phi\} \mid \mathrm{Con}_{\mathrm{Pal}}=0
$$

where

$$
\Phi=\bar{H}_{\mathrm{D}}(\overrightarrow{\mathrm{~N}}), \bar{H}_{\mathrm{R}}(\mathrm{~W}), \bar{H}_{\mathrm{H}}(\mathrm{~N})
$$

or

$$
\Phi=H_{T}(\vec{\alpha}), H_{1}(\varrho), H_{2}(\vec{R}) .
$$

[Note: Here the parameters

$$
\vec{N}, W, N, \vec{\alpha}, \underline{\rho}, \vec{R}
$$

are arbitrary.]
Example: $\bar{H}_{D}(\bar{N}), \bar{H}_{R}(W)$, and $\bar{H}_{H}(N)$ are first class.
A function that is not first class is called second class. E.g.: $H_{D}$,
$H_{R^{\prime}}$ and $H_{H}$ are second class, as is $H$.
The fact that $H$ is second class can be partially remedied. To this end, let

$$
\bar{H}=H+K_{D}(\bar{N})+K_{R}(W)+K_{H}(N) .
$$

Then

$$
\begin{gathered}
\bar{H}=\bar{H}_{D}(\vec{N})+\bar{H}_{R}(\mathrm{~W})+H_{T}\left(B_{C} *\left(\omega^{c} \Lambda \omega^{a}\right)\right) \\
+H_{H}(\mathrm{~N})+K_{H}(\mathrm{~N})
\end{gathered}
$$

$$
\begin{aligned}
=\bar{H}_{D}(N) & +\bar{H}_{R}(W)+H_{T}\left(B_{C} *\left(\omega^{c} \wedge \omega^{a}\right)\right) \\
& +\tilde{H}_{H}(N)+H_{T}\left(*(d N) \wedge \omega_{a}\right)+K_{H}(N) \\
=\bar{H}_{D}(\vec{N}) & +\bar{H}_{R}(W)+\bar{H}_{H}(N) \\
& +H_{T}\left(B B_{C} *\left(\omega^{c} \wedge \omega^{a}\right)\right)+H_{T}\left(*\left(d N \wedge \omega_{a}\right)\right) .
\end{aligned}
$$

Thanks to this last representation of $\bar{H}$, on $\mathrm{Con}_{\mathrm{Pal}}$, we have:

$$
\left[\begin{array}{l}
\left\{\bar{H}_{i}, \bar{H}_{D}\right\}=0,\left\{\bar{H}^{\prime}, \bar{H}_{R}\right\}=0,\left\{\bar{H}^{\prime}, \bar{H}_{H}\right\}=0 \\
\left\{\bar{H}_{,}, H_{T}(\vec{\alpha})\right\}=0,\left\{\bar{H}, H_{2}(\overline{\mathrm{R}})\right\}=0 .
\end{array}\right.
$$

Still, this does not say that $\bar{H}$ is first class since $\left\{\bar{H}_{1} H_{1}(\underline{\rho})\right\}$ has yet to be considered and therein lies the rub.

Notation: Let

$$
\mathrm{Con}_{\mathrm{Pal}}(\mathrm{~N})=\mathrm{Con}_{\mathrm{Pal}}{ }^{\mathrm{nCon}} \mathrm{~N}^{-}
$$

[Note: $\mathrm{Con}_{T \mathrm{~T}} \mathrm{COH}_{\mathrm{N}}$ is the subset of $T^{*} \mathrm{C}$ consisting of those points

$$
\left(\vec{\omega}, \underline{\omega}, \overrightarrow{\mathrm{B}} ; \overrightarrow{\mathrm{P}}_{r} \mathrm{p}_{\underline{\omega}}, \mathrm{p}_{\overrightarrow{\mathrm{B}}}\right)
$$

such that the auxiliary constraints

$$
\left[\begin{array}{l}
d \omega^{a}+\omega_{b}^{a}{ }_{b} \omega^{b}=0 \\
d N+B_{c} \omega^{c}=0
\end{array}\right.
$$

are in force.]
42.

We then claim that on $\mathrm{Con}_{\mathrm{Pal}}(\mathrm{N})$,

$$
\left\{\bar{H}, H_{1}(\underline{\rho})\right\}=0 .
$$

In fact,

$$
\begin{aligned}
& \left\{\bar{H}_{1} H_{1}(\underline{\rho})\right\} \mid C o n_{\mathrm{Pal}}(N) \\
= & \left\{H_{T}\left(B_{C} *\left(\omega^{c} \wedge \omega^{a}\right)\right)+H_{T}\left(*\left(d N \wedge \omega_{a}\right)\right), H_{1}(\underline{p})\right\} \mid C o n_{\mathrm{Pal}}(N) \\
= & 2 \int_{\Sigma} \rho_{a b} \wedge \omega^{b} \wedge\left(B_{C} *\left(\omega^{c} \wedge \omega^{a}\right)+*\left(d N \wedge \omega_{a}\right)\right) \mid C o n_{P a l}(N) \\
= & 2 \int_{\Sigma} \rho_{a b} \wedge \omega^{b} \wedge\left(B_{C} *\left(\omega^{c} \wedge \omega^{a}\right)+*\left(-B_{C} \omega^{c} \wedge \omega_{a}\right)\right) \\
= & 0 .
\end{aligned}
$$

So, while $\bar{H}$ is not, strictly speaking, first class, it is at least first class in a restricted sense.
[Note: For the record, observe too that

$$
\left.\left\{\bar{H}_{1} H_{f}(\beta)\right\} \mid \mathrm{Con}_{\mathrm{Pal}}=0 .\right]
$$

Remark: The correction terms $K_{D}(\vec{N}), K_{R}(W)$, and $K_{H}(N)$ involve $H_{1}$ and $H_{2}$, hence they vanish on $\mathrm{Con}_{1} \cap \mathrm{Con}_{2}$. Nevertheless, working with $\bar{H}$ is not the same as working with $H$.

Section 53: Extension of the Scalars Let M be a connected $C^{\infty}$ manifold of dimension $n$,

$$
D(\mathrm{M})=\stackrel{\infty}{\mathrm{p}, \mathrm{q}=0}{ }_{\mathrm{q}}^{\infty} D_{\mathrm{q}}^{\mathrm{p}}(\mathrm{M})
$$

its tensor algebra.
Notation: Put

$$
D(M ; \underline{C})=\underset{p, q=0}{\infty} D_{\mathrm{q}}^{\mathrm{p}}(\mathrm{M} ; \underline{\mathrm{C}})
$$

the complexified tensor algebra.
[Note: Here, $D_{0}^{0}(\mathrm{M} ; \underline{\mathrm{C}})=\mathrm{C}^{\infty}(\mathrm{M} ; \underline{\mathrm{C}}), D_{0}^{1}(\mathrm{M} ; \underline{\mathrm{C}})=D^{1}(\mathrm{M} ; \underline{\mathrm{C}})$, the derivations of $C^{\infty}(M ; \mathbb{C})$ (a.k.a, the complex vector fields on $M$ ), and $D_{1}^{0}(M ; \underline{C})=D_{1}(M ; \underline{C})$, the linear forms on $D^{l}(M ; C)$ (viewed as a module over $\left.\left.C^{\infty}(M ; C)\right).\right]$

The operation of conjugation in $C^{\infty}(M ; C)$ induces a similar operation in each $\nabla_{q}^{p}(M ; \underline{C})$.
$\bar{X}$ : Given $X \in \mathcal{D}^{1}(M ; \underline{C})$, define $\bar{X} \in \mathcal{D}^{1}(M ; \underline{C})$ by

$$
\overline{\mathrm{X}} \mathrm{f}=\overline{(\overline{\mathrm{Xf}})} .
$$

$\bar{\omega}$ : Given $\omega \in \mathcal{D}_{1}(M ; \underline{C})$, define $\bar{\omega} \in D_{1}(M ; \underline{C})$ by

$$
\bar{\omega}(\mathrm{X})=\overline{\omega(\bar{X})} .
$$

In general, the conjugation $\mathrm{T} \rightarrow \overline{\mathrm{T}}$ is defined by

$$
\begin{aligned}
& \overline{\mathrm{T}}\left(\omega_{1}, \ldots, \omega_{\mathrm{p}}, \mathrm{x}_{1}, \ldots, \mathrm{X}_{\mathrm{q}}\right) \\
& \quad=\mathrm{T}\left(\bar{\omega}_{1}, \ldots, \bar{\omega}_{\mathrm{p}}, \overline{\mathrm{x}}_{1}, \ldots, \overline{\mathrm{X}}_{\mathrm{q}}\right)^{-} .
\end{aligned}
$$

Remark: There is an arrow of inclusion

$$
D_{q}^{p}(\mathbb{M}) \rightarrow D_{q}^{p}(M ; C)
$$

For example, each $X \in \mathcal{D}^{l}(M)$ can be regarded as a complex vector field via the prescription

$$
X f=X\left(\frac{1}{2}(f+\bar{f})\right)+\sqrt{-1} X\left(\frac{1}{2 \sqrt{-1}}(f-\bar{f})\right)
$$

A complex metric is an element of $D_{2}^{0}(\mathrm{M} ; \underline{\mathrm{C}})$ which is symmetric and nondegenerate.

Notation: $\underline{M}_{\underline{C}}$ is the set of complex metrics on $M$.
[Note: There is an arrow of inclusion $\underline{M} \rightarrow \underline{M}_{C}$.]
Example: Suppose that $M$ is parallelizable. Let $\left\{E_{1}, \ldots, E_{n}\right\}$ be a complex frame. Given $X, Y \in D^{1}(M ; \underline{C})$, put

$$
g(X, Y)=\left.\left.n_{i j} X^{i} Y^{j}\right|_{-} \quad\right|^{x=X^{i} E_{i}}
$$

Then $g$ is a complex metric on $M$.
[Note: In terms of the associated coframe $\left\{\omega^{1}, \ldots \omega^{n}\right\}$,

$$
\left.g=-\omega^{l} \otimes \omega^{l}-\cdots-\omega^{k} \otimes \omega^{k}+\omega^{k+1} \otimes \omega^{k+1}+\cdots+\omega^{n} \otimes \omega^{n} \cdot\right]
$$

Let $g \in \underline{M}_{C}$-- then a connection $\nabla$ on TM1 $\otimes \underline{C}$ is said to be a $\underline{g-c o n n e c t i o n ~ i f ~}$ $\nabla \mathrm{g}=0$. As in the real case, among all g-connections there is exactly one with zero torsion, the metric connection.
[Note: Likewise, other entities associated with $g$ still make sense (e.g. Ein(g)), a point that will be taken for granted in the sequel.]

Section 54: Selfdual Algebra In this section we shall develop the machinery that will be needed for complex general relativity in dimension 4.

Rappel: Let $V$ be a vector space over R - then a complex structure on V is an $\underline{R}$-linear map $J: V \rightarrow V$ such that $J^{2}=-I$, where $I=i d_{V}$ is the identity map.

LEMMA The arrow

$$
J: \underline{\text { so }}(1,3) \rightarrow \text { so }(1,3)
$$

defined by

$$
(J A)_{i j}=\frac{1}{2} \varepsilon_{i j}{ }^{k l_{A}}{ }_{k \ell}
$$

is a complex structure on so $(1,3)$.

Before we give the proof, it is necessary to explain the index convention on the Levi-Civita symbol. Thus, as usual, $\varepsilon^{i j k l}$ is the upper Levi-Civita symbol $\left(\varepsilon^{0123}=1\right)$. Indices are then lowered by means of

$$
\eta=\left[\begin{array}{rrrr}
-1 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 \\
0 & 0 & 1 & 0 \\
0 & 0 & 0 & 1
\end{array}\right]
$$

So

$$
\begin{aligned}
\varepsilon_{i j k \ell} & =n_{i r} \eta_{j s} \eta_{k u} n_{\ell v} \varepsilon^{r s u v} \\
& =\varepsilon_{i} \varepsilon_{j} \varepsilon_{k} \varepsilon_{\ell} \varepsilon^{i j k \ell}
\end{aligned}
$$

is not the lower Levi-Civita symbol $\left(\underline{\varepsilon}_{0123}=-1\right)$.

$$
2 .
$$

FACI We have
$A$ matrix $A=\left[A_{j}^{i}{ }_{j}\right] \in s o(1,3)$ is characterized by the condition

$$
A_{j}^{i}=-\varepsilon_{i} \varepsilon_{j} A_{i}^{j} \quad \text { (no sum) }
$$

Thus to check that $J A \in \operatorname{so}(1,3)$, one must compare

$$
(\mathrm{JA})^{i}{ }_{j}
$$

with

$$
-\varepsilon_{i} \varepsilon_{j}(J A)_{i}^{j}
$$

But

$$
(J A)_{j}^{i}=\varepsilon_{i}\left(\frac{1}{2} \varepsilon_{i j}{ }^{k \ell_{A_{k \ell}}}\right)
$$

while

$$
-\varepsilon_{i} \varepsilon_{j}(J A)_{i}^{j}=-\varepsilon_{i} \varepsilon_{j} \varepsilon_{j}\left(\frac{1}{2} \varepsilon_{j i}^{k \ell_{A_{k \ell}}}\right)
$$

And

$$
\begin{aligned}
-\varepsilon_{i} \varepsilon_{j} \varepsilon_{j} \varepsilon_{j i}^{k \ell} & =-\varepsilon_{i} \varepsilon_{j i}^{k \ell} \\
& =-\varepsilon_{i} \varepsilon_{j} \varepsilon_{i} \varepsilon^{j i k \ell} \\
& =\varepsilon_{i} \varepsilon_{i} \varepsilon_{j} \varepsilon^{i j k \ell} \\
& =\varepsilon_{i} \varepsilon_{i j}^{k \ell}
\end{aligned}
$$

Moving on, write

$$
\begin{aligned}
& J(J \mathrm{~A})_{i j}=\frac{1}{2} \varepsilon_{i j}{ }^{k \ell}(\mathrm{JA})_{k \ell} \\
& =\frac{1}{2} \varepsilon_{i j}{ }^{\mathrm{k} \ell}\left(\frac{1}{2} \varepsilon_{\mathrm{k} \ell}{ }^{\mathrm{uv}} \mathrm{~A}_{\mathrm{uv}}\right) \\
& =\frac{1}{4} \varepsilon_{i} \varepsilon_{j} \varepsilon_{u} \varepsilon_{v} \varepsilon^{i j k \ell} \varepsilon_{k \ell u v}{ }^{A} u v \\
& =-\frac{1}{4} \varepsilon_{i} \varepsilon_{j} \varepsilon_{u} \varepsilon_{v} \delta^{i j k \ell} k \ell u v^{A} u v \\
& =-\frac{1}{4} \varepsilon_{i} \varepsilon_{j} \varepsilon_{u} \varepsilon_{v} \delta^{i j k l} u v k \ell^{A} u v \\
& =-\frac{1}{4} \varepsilon_{i} \varepsilon_{j} \varepsilon_{u} \varepsilon_{v} \frac{(4-2)!}{(4-4)!} \delta^{i j}{ }_{u v}{ }^{A} u v \\
& =-\frac{1}{2} \varepsilon_{i} \varepsilon_{j} \varepsilon_{u} \varepsilon_{v}\left(\left|\begin{array}{cc}
i & i^{i} \\
\delta u & \delta v \\
\delta_{u}^{j} & \delta^{j} \\
\end{array}\right|\right){ }_{v v} \\
& =-\frac{1}{2} \varepsilon_{i} \varepsilon_{j}{ }^{\varepsilon} u^{\varepsilon} v\left(\delta^{i}{ }_{u} \delta^{j}{ }_{v}-\delta^{i} v \delta^{j}{ }_{u}\right) A_{u v} \\
& =-\frac{1}{2} \varepsilon_{i} \varepsilon_{j} \varepsilon_{u} \varepsilon^{\varepsilon} \delta^{i} u^{i} \delta^{j} v^{A} u v \\
& +\frac{1}{2} \varepsilon_{i} \varepsilon_{j} \varepsilon u^{\varepsilon} v^{d^{i}} v^{\delta^{j}} u^{A}{ }_{u v} \\
& =-\frac{1}{2} \varepsilon_{i} \varepsilon_{j} \varepsilon_{i} \varepsilon_{j} A_{i j}+\frac{1}{2} \varepsilon_{i} \varepsilon_{j} \varepsilon_{j} \varepsilon_{i} A_{j i}
\end{aligned}
$$

$$
\begin{aligned}
& =-\frac{1}{2} A_{i j}+\frac{1}{2} A_{j i} \\
& =-A_{i j} .
\end{aligned}
$$

Therefore

$$
\mathrm{J}^{2}=-\mathrm{I}
$$

as contended.
N.B. One can, of course, view $J$ as an endomorphism of $g \ell(4, \underline{R})$ but then $J$ is no longer a complex structure.

Pass now to the complexification $\underline{s O}(1,3) \otimes \underline{C}(\equiv \underline{S O}(1,3) \underline{C})$ and extend $J$ by linearity -- then there is a direct sum decomposition
where

$$
\underline{\text { so }}(1,3)_{\underline{C}}^{ \pm}=\{\mathrm{A} \in \underline{\text { so }}(1,3) \underline{\mathrm{C}}: J \mathrm{~A}= \pm \sqrt{-1} \mathrm{~A}\} .
$$

[Note: The elements of $\underline{\text { so }}(1,3)_{\underline{C}}^{+}\left(\underline{(s o n}(1,3) \underline{C_{0}}\right)$ are said to be selfdual (antiselfdual).]

```
IEMMA \(\forall \mathrm{A}, \mathrm{B} \in \underline{\mathrm{SO}}(1,3) \underline{\mathrm{C}}^{\prime}\)
    \([\mathrm{JA}, \mathrm{B}]=\mathrm{J}[\mathrm{A}, \mathrm{B}]=[\mathrm{A}, \mathrm{JB}]\).
```

    Application: \(\quad \forall A, B \in \underline{S O}(1,3) \underline{\mathrm{C}}^{\prime}\)
        \([\mathrm{JA}, \mathrm{JB}]=-[\mathrm{A}, \mathrm{B}]\).
    [In fact,

$$
\begin{aligned}
{[J A, J B] } & =J[A, J B] \\
& =J J[A, B]=-[A, B] .]
\end{aligned}
$$

Let

$$
\mathrm{P}^{ \pm}: \underline{\operatorname{so}(1,3)} \underline{\underline{C}}{ }_{\underline{s o}(1,3)}^{\underline{\mathrm{C}}}
$$

be the projections, so that

$$
P^{ \pm}=\frac{1}{2}(I \mp \sqrt{-1} J) .
$$

Then

$$
\mathrm{P}^{ \pm}[\mathrm{A}, \mathrm{~B}]=\left[\mathrm{P}^{ \pm} \mathrm{A}, \mathrm{~B}\right]=\left[\mathrm{A}, \mathrm{P}^{ \pm} \mathrm{B}\right]=\left[\mathrm{P}^{ \pm} \mathrm{A}, \mathrm{P}^{ \pm} \mathrm{B}\right] .
$$

Therefore so $(1,3)_{\underline{\mathrm{C}}}^{ \pm}$are ideals in so $(1,3) \underline{\mathrm{C}}^{\cdot}$
Remark: $\underline{\mathrm{SO}}(1,3) \underline{\mathrm{C}}(\approx \underline{\mathrm{SO}}(4, \underline{\mathrm{C}}))$ is connected and there is a covering map

$$
\underline{\mathrm{SL}}(2, \underline{\mathrm{C}}) \times \underline{\mathrm{SL}}(2, \underline{\mathrm{C}}) \rightarrow \underline{\mathrm{SO}}(1,3) \underline{\mathrm{C}}
$$

which is universal, the product

$$
\underline{S L}(2, \underline{C}) \times \underline{S L}(2, \underline{C})
$$

being simply connected.
[Note: It is not difficult to see that

$$
\left.\underline{\operatorname{so}}(1,3)_{\underline{\mathrm{C}}}^{ \pm} \approx \underline{s \ell}(2, \underline{\mathrm{C}}) \approx \operatorname{so}(3, \underline{\mathrm{C}}) .\right]
$$

Let $M$ be a connected $C^{\infty}$ manifold of dimension 4, Fix a semiriemannian structure $g \in \mathbb{M}, 3^{\circ}$

Assume: The orthonormal frame bundle LM ( g ) is trivial.
Suppose that $E=\left\{E_{1}, \ldots, E_{n}\right\}$ is an orthonormal frame. Let $\nabla \in c o n n_{g} T M$ and put

$$
\omega_{\nabla}=\left[\omega_{j}^{i}\right] .
$$

Then

$$
\begin{aligned}
& \left.\omega_{j}^{i}=-\varepsilon_{i} \varepsilon_{j} \omega^{j}{ }_{i} \quad \text { (no sum }\right) \\
\Rightarrow \quad & \\
& \omega_{\nabla} \in \Lambda^{l}(M ; \underline{s o}(1,3)) .
\end{aligned}
$$

LEMMA We have

$$
J \omega_{\nabla} \wedge J \omega_{\nabla}=-\omega_{\nabla} \wedge \omega_{\nabla}
$$

[Write

$$
\begin{aligned}
& \left(J \omega_{\nabla} \wedge J \omega_{\nabla}\right)_{j}^{i}=\left(J \omega_{\nabla}\right)_{k}^{i}{ }_{k} \wedge\left(J \omega_{\nabla}\right)_{j}^{k} \\
& \quad=\varepsilon_{i}\left(\frac{1}{2} \varepsilon_{i k} r s_{\omega_{r s}}\right) \wedge \varepsilon_{k}\left(\frac{1}{2} \varepsilon_{k j}{ }^{\left.u v_{v_{u v}}\right)}\right. \\
& \quad=\frac{1}{4} \varepsilon_{i} \varepsilon_{k} \varepsilon_{i k}{ }^{r s} \varepsilon_{k j} u v_{\omega_{r s}} \wedge \omega_{u v} \\
& \quad=\frac{1}{4} \varepsilon_{u} \varepsilon_{v} \varepsilon^{i k r s} \underline{\varepsilon}_{k j u v} \omega_{r s} \wedge \omega_{u v} \\
& \quad=-\frac{1}{4} \varepsilon_{u} \varepsilon_{v} \delta^{i k r s}{ }_{k j u v v_{r s} \omega_{u v}} \\
& \quad=\frac{1}{4} \varepsilon_{u} \varepsilon_{v} \delta^{i r s k}{ }_{j u v k} \omega_{r s} \wedge \omega_{u v}
\end{aligned}
$$

$$
\begin{aligned}
& =\frac{1}{4} \varepsilon_{u} \varepsilon_{v} \frac{(4-3)!}{(4-4)!} \delta^{i r s}{ }_{j u v}{ }^{\omega} r s^{\Lambda \omega}{ }_{u v} \\
& =\frac{1}{4} \varepsilon_{u} \varepsilon_{v} \delta^{i r s}{ }_{j u v}{ }^{\omega} r s^{\Lambda \omega}{ }_{u v} .
\end{aligned}
$$

But

$$
\begin{aligned}
& \delta^{i r s}{ }_{j u v}=\left|\begin{array}{ccc}
\delta^{i}{ }_{j} & \delta^{i}{ }_{u} & \delta^{i}{ }_{v} \\
\delta^{r}{ }_{j} & \delta^{r}{ }_{u} & \delta^{r}{ }_{v} \\
\delta^{s}{ }_{j} & \delta^{s}{ }_{u} & \delta^{s}{ }_{v}
\end{array}\right|
\end{aligned}
$$

And

1. $\frac{1}{4} \varepsilon_{u} \varepsilon_{v} \delta^{i}{ }_{j} \delta^{r} u^{\delta} \delta^{s} v^{\omega} r s{ }^{\wedge \omega_{u v}}$

$$
\begin{aligned}
& =\frac{1}{4} \varepsilon_{u} \varepsilon_{v} \delta^{i}{ }_{j} \omega_{u v} \wedge \omega_{u v} \\
& =0
\end{aligned}
$$

2. $-\frac{1}{4} \varepsilon_{u} \varepsilon_{v} \delta^{i}{ }_{j} \delta^{r}{ }_{v} \delta^{s} u^{\omega}{ }_{r s} \wedge \omega_{u v}$

$$
\begin{aligned}
& =-\frac{1}{4} \varepsilon_{u} \varepsilon_{v}{ }^{\delta}{ }_{j}{ }_{j}{ }_{v u u^{\wedge}} \omega_{u v} \\
& =\frac{1}{4} \varepsilon_{u} \varepsilon_{v} \delta^{i}{ }_{j} \omega_{u v} \wedge \omega_{u v}
\end{aligned}
$$

$=0$.
3. $-\frac{1}{4} \varepsilon_{u} \varepsilon_{v} \delta^{i}{ }_{u} \delta^{r}{ }_{j} \delta^{s}{ }^{s}{ }^{\omega}{ }_{r s}{ }^{\wedge} \omega_{u v}$

$$
\begin{aligned}
& =-\frac{1}{4} \varepsilon_{i} \varepsilon_{v} \omega_{j v} \wedge \omega_{i v} \\
& =\frac{1}{4} \varepsilon_{i} \varepsilon_{v} \omega_{v j} \wedge \omega_{i v^{*}}
\end{aligned}
$$

4. $\frac{1}{4} \varepsilon_{u} \varepsilon_{v} \delta^{i}{ }_{u} \delta^{r}{ }^{r} \delta^{s}{ }_{j}{ }^{\omega}{ }_{r s}{ }^{\wedge \omega_{u v}}$

$$
=\frac{1}{4} \varepsilon_{i} \varepsilon_{v^{\omega}}{ }_{v j} \wedge \omega_{i v}
$$

5. $\frac{1}{4} \varepsilon_{u} \varepsilon_{v} \delta^{i}{ }_{v} \delta^{r}{ }_{j}{ }^{s}{ }^{s} u^{\omega} r s^{\wedge}{ }^{\omega}{ }_{u v}$

$$
=\frac{1}{4} \varepsilon_{u} \varepsilon_{i} \omega_{j u}{ }^{\wedge \omega_{u i}}
$$

6. $-\frac{1}{4} \varepsilon_{u} \varepsilon_{v} \delta^{i} v^{\delta}{ }^{r} u \delta^{s}{ }_{j}{ }^{\omega}{ }_{r s}{ }^{\wedge \omega_{u v}}$

$$
\begin{aligned}
& =-\frac{1}{4} \varepsilon_{u} \varepsilon_{i} \omega_{u j} \wedge \omega_{u i} \\
& =\frac{1}{4} \varepsilon_{u} \varepsilon_{i} \omega_{j u} \wedge \omega_{u i} .
\end{aligned}
$$

So

$$
\begin{aligned}
3+4 & =\frac{1}{2} \varepsilon_{i} \varepsilon_{v}{ }^{\omega} v j \\
& \wedge \omega_{i v} \\
& =-\frac{1}{2} \varepsilon_{i} \varepsilon_{v} \omega_{i v} \wedge \omega_{v j}
\end{aligned}
$$

9. 

$$
=-\frac{1}{2} \omega^{i} v^{\mathrm{i}} \wedge \omega_{j}^{\mathrm{V}}
$$

while

$$
\begin{aligned}
5+6 & =\frac{1}{2} \varepsilon_{u} \varepsilon_{i}{ }_{j u}{ }^{\wedge \omega_{u i}} \\
& =-\frac{1}{2} \varepsilon_{i} \varepsilon_{u}{ }_{u}{ }_{u i} \wedge \omega_{j u} \\
& =-\frac{1}{2} \varepsilon_{i} \varepsilon_{u}\left(-\omega_{i u}\right) \wedge\left(-\omega_{u j}\right) \\
& =-\frac{1}{2} \omega^{i}{ }_{u} \wedge \omega_{j}^{u}{ }_{j} .
\end{aligned}
$$

Therefore

$$
\left.(3+4)+(5+6)=-\left(\omega_{\nabla} \wedge \omega_{\nabla}\right)_{j}^{i} \cdot\right]
$$

Variant

$$
\begin{aligned}
J \omega_{\nabla} \wedge J \omega_{\nabla} & =\frac{1}{2}\left[J \omega_{\nabla}, J \omega_{\nabla}\right] \\
& =-\frac{1}{2}\left[\omega_{\nabla}, \omega_{\nabla}\right] \\
& =-\omega_{\nabla} \wedge \omega_{\nabla} .
\end{aligned}
$$

LEMMA We have

$$
J\left(\omega_{\nabla} \wedge \omega_{\nabla}\right)=\frac{1}{2}\left(J \omega_{\nabla} \wedge \omega_{\nabla}+\omega_{\nabla} \wedge J \omega_{\nabla}\right)
$$

[Write

$$
J\left(\omega_{\nabla} \wedge \omega_{\nabla}\right)_{i j}=-\left(J\left(J \omega_{\nabla} \wedge J \omega_{\nabla}\right)\right)_{i j}
$$

$$
\begin{aligned}
& =-\frac{1}{2} \varepsilon_{i j}{ }^{k \ell}\left(J \omega_{\nabla} \wedge J \omega_{\nabla}\right)_{k \ell} \\
& =-\frac{l}{2} \varepsilon_{i j}{ }^{k \ell \ell}\left(J \omega_{\nabla}\right)_{k r} \wedge\left(J \omega_{\nabla}\right)^{r} \ell \\
& =-\frac{1}{2} \varepsilon_{i j}{ }^{k \ell}\left(\frac{1}{2} \varepsilon_{k r}{ }^{s t} \omega_{s t}\right) \wedge\left(\frac{1}{2} \varepsilon^{r} \ell^{u v} \omega_{u v}\right) \\
& =-\frac{1}{8} \varepsilon_{i j}{ }^{k \ell} \varepsilon^{r}{ }_{\ell}{ }^{u v} \varepsilon_{k r}{ }^{s t} \omega_{s t}{ }^{\wedge \omega_{u v}} \\
& =-\frac{1}{8} \varepsilon_{i} \varepsilon_{j} \varepsilon_{r} \varepsilon_{u} \varepsilon_{v} \varepsilon^{i j k \ell} \varepsilon_{r l u v} \varepsilon_{k r}{ }^{s t} \omega_{s t}{ }^{\Lambda \omega_{u v}} \\
& =\frac{1}{8} \varepsilon_{i} \varepsilon_{j} \varepsilon_{r} \varepsilon_{u} \varepsilon_{v} \delta^{i j k \ell}{ }_{r \ell u v} \varepsilon_{k r}{ }^{s t}{ }_{\omega}{ }_{s t}{ }^{\wedge \omega}{ }_{u v} \\
& =\frac{1}{8} \varepsilon_{i} \varepsilon_{j} \varepsilon_{r} \varepsilon_{u} \varepsilon_{v} \delta^{i j k} \ell{ }_{r u v} \ell^{\varepsilon}{ }_{k r}{ }^{s t} \omega_{\text {st }}{ }^{\wedge \omega_{u v}} \\
& =\frac{1}{8} \varepsilon_{i} \varepsilon_{j} \varepsilon_{r} \varepsilon_{u} \varepsilon_{v} \frac{(4-3)!}{(4-4)!} \delta^{i j k}{ }_{r u v} \varepsilon_{k r}{ }^{s t} \omega_{s t} \wedge \omega_{u v} \\
& =\frac{1}{8} \varepsilon_{i} \varepsilon_{j} \varepsilon_{r} \varepsilon_{u} \varepsilon_{v} \delta^{i j k}{ }_{r u v} \varepsilon_{k r}{ }^{s t} \omega_{s t}{ }^{\wedge \omega_{u v}} .
\end{aligned}
$$

But

$$
\begin{aligned}
& \delta^{i j k}{ }_{r u v}=\left|\begin{array}{ccc}
\delta^{i}{ }_{r} & \delta^{i}{ }_{u} & \delta^{i}{ }_{v} \\
\delta^{j}{ }_{r} & \delta^{j}{ }_{u} & \delta^{j}{ }_{v} \\
\delta^{k}{ }_{r} & \delta^{k} & \delta_{u}^{k}{ }_{v}
\end{array}\right| \\
& =\delta_{r}^{i}{ }_{r} \delta^{j}{ }_{u}{ }^{\delta}{ }^{k}{ }_{v}-\delta^{i}{ }_{r}{ }^{\delta}{ }^{j}{ }_{v} \delta^{k}{ }_{u}-\delta^{i}{ }_{u} \delta^{j}{ }_{r}{ }^{\delta}{ }^{k}{ }_{v}
\end{aligned}
$$

$$
+\delta^{i}{ }_{u} \delta^{j} v^{j}{ }_{r}^{k}+\delta^{i}{ }_{v} \delta_{r}^{j} \delta^{k}{ }_{u}-\delta^{i} \delta^{j}{ }_{u} \delta^{k}{ }_{r}
$$

And

1. $\frac{1}{8} \varepsilon_{i} \varepsilon_{j} \varepsilon_{r} \varepsilon_{u} \varepsilon_{v} \delta^{i}{ }_{r} \delta^{j}{ }_{u} \delta^{k}{ }_{v} \varepsilon_{k r}{ }^{s t} \omega_{s t} \wedge \omega_{u v}$

$$
\begin{aligned}
& =\frac{1}{8} \varepsilon_{i} \varepsilon_{j} \varepsilon_{i} \varepsilon_{j} \varepsilon_{v} \varepsilon_{v i}{ }^{s t} \omega_{s t} \wedge \omega_{j v} \\
& =\frac{1}{8} \varepsilon_{v} \varepsilon_{v i} s t^{s t}{ }^{\wedge} \omega_{j v}
\end{aligned}
$$

2. $-\frac{1}{8} \varepsilon_{i} \varepsilon_{j} \varepsilon_{r} \varepsilon_{u} \varepsilon_{v} \delta^{i}{ }_{r} \delta^{j}{ }_{v} \delta^{k}{ }_{u} \varepsilon_{k r}{ }^{s t} \omega_{s t}{ }^{\wedge \omega_{u v}}$

$$
\begin{aligned}
& =-\frac{1}{8} \varepsilon_{i} \varepsilon_{j} \varepsilon_{i} \varepsilon_{u} \varepsilon_{j} \varepsilon_{u i}{ }^{s t} \omega_{s t} \wedge \omega_{u j} \\
& =-\frac{1}{8} \varepsilon_{u}{ }_{u}{ }_{u i}{ }^{s t} \omega_{s t} \wedge \omega_{u j}
\end{aligned}
$$

3. $-\frac{1}{8} \varepsilon_{i} \varepsilon_{j} \varepsilon_{r} \varepsilon_{u} \varepsilon_{v} \delta^{i}{ }_{u} \delta^{j}{ }_{r} \delta^{k}{ }_{v} \varepsilon_{k r}{ }^{s t} \omega_{s t}{ }^{\wedge} \omega_{u v}$

$$
\begin{aligned}
& =-\frac{1}{8} \varepsilon_{i} \varepsilon_{j} \varepsilon_{j} \varepsilon_{i} \varepsilon_{v} \varepsilon_{v j}{ }^{s t^{\prime}} \omega_{s t} \wedge \omega_{i v} \\
& =-\frac{1}{8} \varepsilon_{v} \varepsilon_{v j} s t^{s t}{ }_{s \omega_{i v}}
\end{aligned}
$$

4. $\frac{1}{8} \varepsilon_{i} \varepsilon_{j} \varepsilon_{r} \varepsilon_{u}{ }^{\varepsilon}{ }_{v} \delta^{i} u^{i} \delta^{j}{ }_{v} \delta^{k}{ }_{r}{ }^{\varepsilon}{ }_{k r}{ }^{s t} \omega{ }_{s t} \wedge \omega_{u v}$

$$
\begin{aligned}
& =\frac{1}{8} \varepsilon_{i} \varepsilon_{j} \varepsilon_{r} \varepsilon_{i} \varepsilon_{j} \varepsilon_{r r}{ }^{s t} \omega_{s t} \wedge \omega_{i j} \\
& =0
\end{aligned}
$$

$$
\text { 5. } \begin{gathered}
\frac{1}{8} \varepsilon_{i} \varepsilon_{j} \varepsilon_{r} \varepsilon_{u} \varepsilon_{v} \delta^{i}{ }_{v} \delta^{j}{ }_{r} \delta^{k}{ }_{u} \varepsilon_{k r}{ }^{s t} \omega_{s t} \wedge \omega_{u v} \\
\\
=\frac{1}{8} \varepsilon_{i} \varepsilon_{j} \varepsilon_{j} \varepsilon_{u} \varepsilon_{i} \varepsilon_{u j}{ }^{s t_{\omega}}{ }_{s t} \wedge \omega_{u i} \\
\\
=\frac{1}{8} \varepsilon_{u} \varepsilon_{u j}{ }^{s t_{\omega}{ }_{s t} \wedge \omega}{ }_{u i} .
\end{gathered}
$$

6. $-\frac{1}{8} \varepsilon_{i} \varepsilon_{j} \varepsilon_{r} \varepsilon_{u} \varepsilon_{v}^{\varepsilon} \delta^{i}{ }_{v} \delta{ }^{j}{ }_{u} \delta^{k} r^{\varepsilon} \varepsilon_{k r}{ }^{s t_{\omega}}{ }_{s t}{ }^{\wedge \omega}{ }_{u v}$

$$
\begin{aligned}
& =-\frac{1}{8} \varepsilon_{i} \varepsilon_{j} \varepsilon_{r} \varepsilon_{j} \varepsilon_{i} \varepsilon_{r r} s t_{\omega_{s t}}{ }^{\wedge \omega_{j i}} \\
& =0
\end{aligned}
$$

So

$$
\begin{aligned}
1+2 & =\frac{1}{8} \varepsilon_{v} \varepsilon_{v i} s t_{\omega_{s t}} \wedge \omega_{j v}-\frac{1}{8} \varepsilon_{u} \varepsilon_{u i} s t_{\omega_{s t}} \wedge \omega_{u j} \\
& =-\frac{1}{8} \varepsilon_{k} \varepsilon_{k i} s t_{\omega_{s t}} \wedge \omega_{k j}-\frac{1}{8} \varepsilon_{k} \varepsilon_{k i} s t_{\omega}{ }_{s t} \wedge \omega_{k j} \\
& =\frac{1}{4} \varepsilon_{k} \varepsilon_{i k} s t_{\omega_{s t}} \wedge \omega_{k j} \\
& =\frac{1}{2}\left(\frac{1}{2} \varepsilon_{i k} s t_{\omega}{ }_{s t} \wedge \varepsilon_{k} \omega_{k j}\right) \\
& =\frac{1}{2}\left(\left(J \omega_{\nabla}\right){ }_{i k} \wedge \omega_{j}^{k}\right) \\
& =\frac{1}{2}\left(J \omega_{\nabla} \wedge \omega_{\nabla}\right)_{i j}
\end{aligned}
$$

while

$$
3+5=-\frac{1}{8} \varepsilon_{v} \varepsilon_{v j}{ }^{s t} \omega_{s t} \wedge \omega_{i v}+\frac{1}{8} \varepsilon_{u} \varepsilon_{u j}{ }^{s t} \omega_{s t} \wedge \omega_{u i}
$$

$$
\begin{aligned}
& =\frac{1}{8} \varepsilon_{k} \varepsilon_{k j}{ }^{s t} \omega_{i k} \wedge \omega_{s t}+\frac{1}{8} \varepsilon_{k} \varepsilon_{k j}{ }^{s t} \omega_{i k} \wedge \omega_{s t} \\
& =\frac{1}{4} \varepsilon_{k} \varepsilon_{k j}{ }^{s t} \omega_{i k} \wedge \omega_{s t} \\
& =\frac{1}{2}\left(\omega_{i k} \wedge \frac{1}{2} \varepsilon_{k} \varepsilon_{k j}{ }^{s t} \omega_{s t}\right) \\
& =\frac{1}{2}\left(\omega_{i k} \wedge \frac{1}{2} \varepsilon_{j}^{k t_{j}} \omega_{s t}\right) \\
& =\frac{1}{2}\left(\omega_{i k} \wedge\left(J \omega_{\nabla}\right)_{j}^{k}\right) \\
& =\frac{1}{2}\left(\omega_{\nabla} \wedge J \omega_{\nabla}\right)_{i j} \cdot
\end{aligned}
$$

Therefore

$$
\left.(1+2)+(3+5)=\frac{1}{2}\left(J \omega_{\nabla} \wedge \omega_{\nabla}+\omega_{\nabla} \wedge J \omega_{\nabla}\right)_{i j} \cdot\right]
$$

Variant

$$
\begin{aligned}
& J\left(\omega_{\nabla} \wedge \omega_{\nabla}\right)=J\left(\frac{1}{2}\left[\omega_{\nabla}, \omega_{\nabla}\right]\right) \\
& =\frac{1}{2} J\left(\left[\omega_{\nabla}, \omega_{\nabla}\right]\right) \\
& =\frac{1}{2}\left(\frac{1}{2}\left[J \omega_{\nabla}, \omega_{\nabla}\right]+\frac{1}{2}\left[\omega_{\nabla}, J \omega_{\nabla}\right]\right) \\
& =\frac{1}{2}\left(\frac{1}{2}\left(J \omega_{\nabla} \wedge \omega_{\nabla}+\omega_{\nabla} \wedge J \omega_{\nabla}\right)+\frac{1}{2}\left(\omega_{\nabla} \wedge J \omega_{\nabla}+J \omega_{\nabla} \wedge \omega_{\nabla}\right)\right) \\
& =\frac{1}{2}\left(J \omega_{\nabla} \wedge \omega_{\nabla}+\omega_{\nabla} \wedge J \omega_{\nabla}\right) .
\end{aligned}
$$

14. 

Returning to our g-connection $\nabla$, write

$$
\omega_{\nabla}=\omega_{\nabla}^{+}+\omega_{\nabla^{\prime}}^{-}
$$

where

$$
\left.\right|_{-\quad \omega_{\nabla}^{+}=\mathrm{P}^{+} \omega_{\nabla}=\frac{1}{2}\left(\omega_{\nabla}-\sqrt{-1} J \omega_{\nabla}\right)} ^{\omega_{\nabla}^{-}=\mathrm{P}^{-} \omega_{\nabla}=\frac{1}{2}\left(\omega_{\nabla}+\sqrt{-1} J \omega_{\nabla}\right)} .
$$

Decompose $\Omega_{\nabla}$ analogously, thus

$$
\Omega_{\nabla}=\Omega_{\nabla}^{+}+\Omega_{\nabla}^{-}
$$

Then

$$
\begin{aligned}
& \Omega_{\nabla}^{+}=\frac{1}{2}\left(\Omega_{\nabla}-\sqrt{-1} J \Omega_{\nabla}\right) \\
= & \frac{1}{2}\left(d \omega_{\nabla}+\omega_{\nabla} \wedge \omega_{\nabla}-\sqrt{-1} J\left(d \omega_{\nabla}+\omega_{\nabla} \wedge \omega_{\nabla}\right)\right) \\
= & \frac{1}{2}\left(d \omega_{\nabla}+\omega_{\nabla} \wedge \omega_{\nabla}-\sqrt{-1}\left(d J \omega_{\nabla}+J\left(\omega_{\nabla} \wedge \omega_{\nabla}\right)\right)\right. \\
= & \frac{1}{2}\left(\mathrm{~d}\left(\omega_{\nabla}-\sqrt{-1} J \omega_{\nabla}\right)+\omega_{\nabla} \wedge \omega_{\nabla}-\sqrt{-I} J\left(\omega_{\nabla} \wedge \omega_{\nabla}\right)\right) \\
= & \frac{1}{2}\left(\mathrm{~d}\left(\omega_{\nabla}-\sqrt{-1} J \omega_{\nabla}\right)+\frac{1}{2} \omega_{\nabla} \wedge \omega_{\nabla}-\frac{1}{2} J \omega_{\nabla} \wedge J \omega_{\nabla}\right. \\
& \left.-\frac{\sqrt{-1}}{2}\left(J \omega_{\nabla} \wedge \omega_{\nabla}+\omega_{\nabla} \wedge J \omega_{\nabla}\right)\right) \\
= & \frac{1}{2}\left(\mathrm{~d}\left(\omega_{\nabla}-\sqrt{-1} J \omega_{\nabla}\right)+\frac{1}{2}\left(\omega_{\nabla}-\sqrt{-1} J \omega_{\nabla}\right) \wedge\left(\omega_{\nabla}-\sqrt{-1} J \omega_{\nabla}\right)\right)
\end{aligned}
$$

15. 

$$
\begin{gathered}
\left.=\mathrm{d}\left(\frac{1}{2}\left(\omega_{\nabla}-\sqrt{-1} J \omega_{\nabla}\right)\right)+\frac{1}{2}\left(\omega_{\nabla}-\sqrt{-1} J \omega_{\nabla}\right) \wedge \frac{1}{2}\left(\omega_{\nabla}-\sqrt{-1} J \omega_{\nabla}\right)\right) \\
=d \omega_{\nabla}^{+}+\omega_{\nabla}^{+} \wedge \omega_{\nabla}^{+} .
\end{gathered}
$$

## Similarly

$$
\Omega_{\nabla}^{-}=d \omega_{\nabla}^{-}+\omega_{\nabla}^{-} \wedge \omega_{\nabla}^{-} .
$$

Remark: To interpret these relations, define complex g-connections $\nabla^{ \pm}$by

$$
\nabla_{X}^{ \pm} E_{j}=\left(\omega^{ \pm}\right)_{j}^{i}(X) E_{i} .
$$

Then

$$
\left[\begin{array}{c}
\Omega_{\nabla^{+}}=\Omega_{\nabla}^{+} \\
\Omega_{\nabla^{-}}=\Omega_{\nabla}^{-}
\end{array}\right.
$$

LEMMA We have

$$
\begin{aligned}
& \Omega_{i j}^{+}(\nabla) \wedge \theta^{i j}\left(=\Omega_{i j}\left(\nabla^{+}\right) \wedge \theta^{i j}\right) \\
& =\frac{1}{2}\left(\Omega_{i j}(\nabla) \wedge *\left(\omega^{i} \wedge \omega^{j}\right)-\sqrt{-1} \Omega_{i j}(\nabla) \wedge\left(\omega^{i} \wedge \omega^{j}\right)\right)
\end{aligned}
$$

[In fact,

$$
\begin{aligned}
& \left(J \Omega_{\nabla}\right)_{i j} \wedge *\left(\omega^{i} \wedge \omega^{j}\right) \\
& =\frac{1}{4} \varepsilon_{i j}{ }^{k \ell} \Omega_{k \ell}(\nabla) \wedge \varepsilon_{i} \varepsilon_{j} \varepsilon_{i j u v^{\prime}} \omega^{u} \wedge \omega^{v} \\
& =\frac{1}{4} \varepsilon^{i j k \ell} \varepsilon_{i j u v} \Omega_{k \ell}(\nabla) \wedge \omega^{u} \wedge \omega^{v}
\end{aligned}
$$

$$
\begin{aligned}
& =\frac{1}{4} \varepsilon^{k \ell i j} \varepsilon_{u v i j}{ }^{\Omega} k \ell(\nabla) \wedge \omega^{\mathrm{u}} \Lambda \omega^{\mathrm{V}} \\
& =\frac{1}{4} \delta^{k \ell l i j}{ }_{u v i j} \Omega_{k l}(\nabla) \wedge \omega^{u} \wedge \omega^{v} \\
& =\frac{1}{4} \frac{(4-2)!}{(4-4)!} \delta^{\mathrm{k} \ell}{ }_{u v} \Omega_{k \ell}(\nabla) \wedge \omega^{\mathrm{u}} \cap \omega^{\mathrm{v}} \\
& =\frac{1}{2}\left|\begin{array}{cc}
\delta^{k} & \delta^{k} \\
& \\
& \\
\delta^{l} & \delta^{\ell}
\end{array}\right| \quad \Omega_{k \ell}(\nabla) \wedge \omega^{u} \Lambda \omega^{v} \\
& =\frac{1}{2}\left(\delta^{\mathrm{k}}{ }_{\mathrm{u}} \delta^{\ell}{ }_{\mathrm{v}}-\delta^{\mathrm{k}}{ }_{\mathrm{v}} \delta^{\ell}{ }_{\mathrm{u}}\right) \Omega_{\mathrm{kl}}(\nabla) \wedge \omega^{\mathrm{u}} \mathrm{~N} \mathrm{\omega}^{\mathrm{v}} \\
& =\frac{1}{2} \delta^{k} u^{\ell} \delta^{\ell} \Omega_{k \ell}(\nabla) \wedge \omega^{u} \Lambda \omega^{v} \\
& -\frac{1}{2} \delta^{k} v^{\delta}{ }^{\ell} u^{\Omega}{ }_{k} \ell(\nabla) \wedge \omega^{u} \Lambda \omega^{v} \\
& =\frac{1}{2} \Omega_{k \ell}(\nabla) \wedge \omega^{k} \wedge \omega^{\ell}-\frac{1}{2} \Omega_{k \ell}(\nabla) \wedge \omega^{\ell} \wedge \omega^{k} \\
& \left.=\Omega_{k \ell}(\nabla) \wedge \omega^{k} \Lambda \omega^{\ell}=\Omega_{i j}(\nabla) \wedge \omega^{i} \Lambda \omega^{j} .\right]
\end{aligned}
$$

[Note: It is to be emphasized that here, $\varepsilon_{i j u v}$ is the genuine lower Levi-Civita symbol and not its hybrid cousin used earlier.]

Rappel:

$$
d \theta^{i}(\nabla)+\omega_{j}^{i} \wedge \Theta^{j}(\nabla)=\Omega_{j}^{i}(\nabla) \wedge \omega^{j}
$$

Therefore

$$
\begin{aligned}
& \Omega_{i j}^{+}(\nabla) \wedge \theta^{i j}=\frac{1}{2} \Omega_{i j}(\nabla) \wedge \theta^{i j} \\
& \quad+\frac{\sqrt{-1}}{2}\left(d \theta_{i}(\nabla)+\omega_{i j} \wedge \theta^{j}(\nabla)\right) \wedge \omega^{i} .
\end{aligned}
$$

Now specialize and take $\nabla=\nabla^{9}$ - then the conclusion is that

$$
\Omega_{i j}^{+}{ }_{i \theta^{\wedge j}}^{i j}=\frac{1}{2} \Omega_{i j} \wedge \theta^{i j} .
$$

Remark: The preceding considerations also imply that

$$
\Omega_{i j}^{-} \wedge \theta^{i j}=\frac{1}{2} \Omega_{i j} \wedge \theta^{i j}
$$

Section 55: The Selfdual Lagrangian The assumptions and notation are those of the standard setup, subject now to the stipulation that $\mathrm{n}=4$, hence $\operatorname{dim} \Sigma=3$.

Consider

$$
\theta^{i j}{ }_{\wedge \Omega^{+}}^{i j}\left(=\frac{1}{2} \theta^{i j}{ }_{\wedge \Omega_{i j}}\right) .
$$

Write

$$
\theta^{\mathrm{ij}}{ }_{\wedge \Omega^{+}}{ }_{\mathrm{ij}}=2 \theta^{0 \mathrm{a}}{ }_{\wedge \Omega^{+}}{ }_{0 \mathrm{a}}+\theta^{\mathrm{bc}}{ }_{\wedge \Omega^{+}}{ }_{\mathrm{bc}}{ }^{-}
$$

Since $\Omega^{+}$is selfdual, we have

$$
\begin{aligned}
\sqrt{-1} \Omega_{0 \mathrm{a}}^{+} & =\frac{1}{2} \varepsilon_{0 \mathrm{a}}^{\mathrm{k} \ell_{\Omega}{ }_{\mathrm{k} \ell}} \\
& =\frac{1}{2} \varepsilon_{0 \mathrm{ak} \ell^{\Omega^{+\mathrm{k} \ell}}} .
\end{aligned}
$$

But

$$
\begin{aligned}
& \varepsilon_{0 \mathrm{aa} 0 \ell}=\underline{\varepsilon}_{0 \mathrm{ako}}=0 \\
\Rightarrow \quad & \\
& \sqrt{-1} \Omega_{0 \mathrm{a}}^{+}=\frac{1}{2} \varepsilon_{0 \mathrm{abc}} \Omega^{\Omega^{+\mathrm{bc}},}
\end{aligned}
$$

where

$$
\underline{\varepsilon}_{0 a b c}=\varepsilon_{0} \varepsilon^{0 a b c}=-\varepsilon^{0 a b c}=-\varepsilon_{a b c}\left(\varepsilon_{123}=1\right)
$$

Therefore

$$
\theta^{i j_{\Lambda \Omega^{+}}}{ }_{i j}=\sqrt{-1} \varepsilon_{a b c}{ }^{\Omega^{+b c}} \wedge \theta^{0 a}+\theta^{b c_{\Lambda \Omega}^{+}}{ }_{b c}
$$

Observation:

$$
0={ }^{l_{E}}{ }_{0}\left(\Omega^{+b c}{ }_{\wedge * \omega}\right)
$$

$$
\begin{aligned}
& ={ }_{l_{0}} \Omega^{\Omega^{+b c}} \Lambda * \omega^{a}+\Omega^{+b c} \wedge l_{E_{0}}{ }^{* \omega^{a}} \\
& \text { => } \\
& { }^{\imath} E_{0} \Omega^{+b c}{ }_{\wedge * \omega}{ }^{a}=-\Omega^{+b c} \wedge l_{E_{0}} * \omega^{a} \\
& =-\Omega^{+b c}{ }_{\wedge} \omega_{0}{ }_{0}^{* \omega^{a}} \\
& =\Omega^{+\mathrm{bc}} \wedge \tau{ }_{\omega} 0^{* \omega^{\mathrm{a}}} \\
& =\Omega^{+\mathrm{b}} \mathrm{c}_{\wedge *}\left(\omega^{\mathrm{a}} \wedge \omega^{0}\right) \\
& =-\Omega^{+b c} \wedge *\left(\omega^{0} \wedge \omega^{a}\right) \\
& =-\Omega^{+\mathrm{bc}}{ }_{\wedge \theta} 0 \mathrm{a} .
\end{aligned}
$$

Consequently,

$$
\theta^{i j}{ }_{\wedge \Omega}{ }_{i j}=-\sqrt{-I} \varepsilon_{a b c} E_{0} \Omega^{+b c} c_{\Lambda * \omega^{a}}+\theta^{b c}{ }_{\Lambda \Omega}{ }^{+} \mathrm{bc}^{\prime}
$$

thus, on formal grounds,

$$
\begin{aligned}
& \delta_{M} \theta^{i j}{ }_{\wedge \Omega^{+}}{ }_{i j} \\
& =\int_{\underline{\mathrm{R}}} d t \delta_{\Sigma} \mathrm{i}_{\mathrm{t}}^{\left.{ }_{\mathrm{t}}{ }^{l} \partial / \partial \mathrm{t}^{[-\sqrt{-1}} \varepsilon_{\mathrm{abc}}{ }^{l} \mathrm{E}_{0}^{\Omega}{ }^{\Omega^{+\mathrm{bc}}} \wedge * \omega^{\mathrm{a}}+\theta^{\mathrm{bc}} \wedge \Omega^{+} \mathrm{bc}^{]}\right] .}
\end{aligned}
$$

To explicate the integral over $\Sigma$, note first that

On the other hand, the calculation of

$$
i_{t^{1}}^{\lambda^{2} / \partial t}\left[-\sqrt{-1} \varepsilon_{a b c} E_{0}^{\Omega^{\Omega^{+b c}}}{ }_{\wedge * \omega}{ }^{a}\right]
$$

is trickier and hinges on a preliminary remark.
Define an element

$$
\Phi \in \Lambda^{0}\left(\mathrm{M} ; \mathrm{T}_{0}^{2}(\mathrm{M}) \otimes \underline{\mathrm{C}}\right) \quad\left(=D_{0}^{2}(\mathrm{M} ; \underline{\mathrm{C}})\right)
$$

by

$$
\Phi^{i j}=\Phi\left(\omega^{i}, \omega^{j}\right)=\omega^{+i j}\left(N E_{0}\right)
$$

Then $\left(\nabla^{+}=\left(\nabla^{g}\right)^{+}\right)$

$$
\begin{aligned}
& d^{\nabla^{+}}{ }_{\Phi} \mathrm{bc}=\mathrm{d} \Phi^{\mathrm{bc}}+\omega^{+\mathrm{b}}{ }_{k} \wedge \Phi^{\mathrm{kc}}+\omega^{+\mathrm{c}}{ }_{k} \wedge \Phi^{\mathrm{bk}} \\
& \text { => } \\
& \mathrm{d} \Phi^{\mathrm{bc}}-\mathrm{a}^{\nabla^{+}}{ }_{\Phi} \mathrm{bc}=-\omega^{+\mathrm{b}}{ }_{\mathrm{k}} \wedge \Phi^{\mathrm{kc}}-\omega^{+\mathrm{c}}{ }_{\mathrm{k}} \wedge \Phi^{\mathrm{bk}} \\
& =-\Phi^{\mathrm{bk}} \omega_{\mathrm{k}} \mathrm{c}_{\mathrm{k}}-\Phi^{\mathrm{kc}} \omega_{\mathrm{k}}{ }^{\mathrm{b}} \\
& =-\Phi_{\mathrm{k}} \omega^{+\mathrm{ck}}-\Phi^{\mathrm{kc}} \omega^{+\mathrm{b}}{ }_{\mathrm{k}} \\
& =\Phi_{\mathrm{k}}^{\mathrm{b}} \omega^{+\mathrm{kc}}-\Phi^{\mathrm{kc}}{ }_{\omega}{ }^{+\mathrm{b}}{ }_{\mathrm{k}} .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& { }^{N 1} \underline{E}_{0} \Omega^{\Omega^{+b c}}=N \underline{E}_{0}\left(d \omega^{+b c}+\omega^{+b}{ }_{k} \Lambda \omega^{+k c}\right) \\
& ={ }^{l} \mathrm{NE}_{0}\left(\mathrm{~d} \omega^{+b c}+\omega^{+b}{ }_{k} \wedge \omega^{+k c}\right) \\
& ={ }^{l_{N E}}{ }_{0} d \omega^{+b c}+{ }^{l_{N E}}{ }_{0}\left(\omega_{k}^{+b}{ }_{k} \wedge \omega^{+\mathrm{kc}}\right) .
\end{aligned}
$$

But

$$
\begin{aligned}
& { }^{1} \mathrm{NE}_{0}\left(\omega^{+b}{ }_{\mathrm{k}}{ }^{+\omega^{+k c}}\right) \\
& =\left({ }^{\mathrm{NE}_{0}} \omega^{\omega+\mathrm{b}} \mathrm{k}\right) \wedge \omega^{+k c}-\omega^{+\mathrm{b}}{ }_{\mathrm{k}} \wedge\left(\mathrm{l}_{\mathrm{NE}_{0}} \omega^{+\mathrm{kc}}\right) \\
& =\omega^{+\mathrm{b}} \mathrm{k}^{\left(\mathrm{NE}_{0}\right) \omega^{+\mathrm{kc}}-\omega^{+\mathrm{kc}}\left(\mathrm{NE}_{0}\right) \omega^{+\mathrm{b}} \mathrm{k} .{ }^{2} .} \\
& =\Phi_{k}{ }^{\omega}{ }^{+k c}-\Phi^{k c} \omega^{+b}{ }_{k} \\
& \text { => } \\
& \mathrm{Nu}_{\mathrm{E}_{0}} \Omega^{+\mathrm{bc}}=\mathrm{l}_{\mathrm{NE}_{0}} \mathrm{~d} \omega^{+\mathrm{bc}}+\mathrm{d} \Phi^{\mathrm{bc}}-\mathrm{d}^{\nabla^{+}}{ }_{\Phi} \mathrm{bc} \\
& ={ }^{\imath_{N E}}{ }_{0} d \omega^{+b c}+d \imath_{N E_{0}} \omega^{+b c}-d^{\nabla^{+}}{ }_{\imath_{N E}} \omega_{0}^{+b c} \\
& =L_{\mathrm{NE}_{0}} \omega^{+\mathrm{bc}}-\mathrm{d}^{\nabla^{+}}{ }_{\mathrm{NE}_{0}} \omega^{+\mathrm{bc}} \\
& =L_{\partial / \partial t^{\omega}}{ }^{+b c}-\underset{\vec{N}}{L_{N}} \omega^{+b c}-d^{\nabla^{+}}{ }^{l_{N E}}{ }_{0} \omega^{+b c} .
\end{aligned}
$$

Let $u, v=1,2,3$ and write

$$
* \omega^{\mathrm{a}}=\frac{1}{2} \varepsilon_{\mathrm{aOuv}} \omega^{0} \Lambda \omega^{\mathrm{u}} \Lambda \omega^{v}
$$

or still

$$
\star \omega^{\mathrm{a}}=-\frac{1}{2} \varepsilon_{0 \text { auv }} \omega^{0} \wedge \omega^{\mathrm{u}} \wedge \omega^{\mathrm{v}}
$$

Then

$$
\begin{aligned}
& =-i_{t}^{*}{ }^{\star} \partial / \partial t\left[-\sqrt{-1} \varepsilon_{a b c} * \omega^{a} \wedge \varepsilon_{0} \Omega_{0}^{+b c}\right] \\
& \left.=-i_{t}^{*}{ }_{1} \partial / \partial t{ }^{[\sqrt{-1}} \frac{1}{2} \varepsilon_{a b c} \varepsilon_{0 a u v} \omega^{0} \Lambda \omega^{u} \Lambda \omega{ }^{v} \wedge l_{v_{0}} \Omega^{+b c}\right] \\
& \left.=-i_{t}^{*}\left[\sqrt{-1} \frac{1}{2} \varepsilon_{a b c} \varepsilon_{0 a u v}{ }^{\left(\imath_{\partial}\right.} \partial / \partial t^{\omega}{ }^{0}\right) \wedge \omega^{u} \Lambda \omega^{v} \wedge l_{v_{0}} \Omega^{+b c}\right] \\
& \left.\left.-\sqrt{-1} \frac{1}{2} \varepsilon_{a b c} \varepsilon^{\varepsilon_{0 a u v}}{ }^{\omega}{ }^{0} \wedge \mathrm{l} \partial / \partial t^{\left(\omega^{u} \Lambda \omega^{v} \wedge l^{v}\right.} E_{0} \Omega^{+b c}\right)\right] \\
& =-\sqrt{-1} \frac{1}{2} \varepsilon_{a b c} \varepsilon^{\varepsilon} 0 a u v^{\omega^{u}} \Lambda \bar{\omega}^{-v} \Lambda N_{t} i_{t}^{*} E_{0} \Omega^{+\mathrm{bc} c} \\
& =-\sqrt{-1} \frac{1}{2} \varepsilon_{a b c} \varepsilon_{0 a u v}{ }^{-\mathrm{u}} \Lambda \bar{\omega}^{\mathrm{v}} \wedge i_{\mathrm{t}}^{*}\left(\mathrm{Nl} \mathrm{E}_{0} \Omega^{\text {+bc }}\right) .
\end{aligned}
$$

But

$$
\begin{aligned}
\varepsilon_{a b c} \varepsilon_{0 a u v} & =\varepsilon_{a b c}{ }^{\varepsilon} \text { auv } \\
& =\varepsilon_{b c a} \varepsilon_{u v a} \\
& =\delta^{b c}{ }_{u v} \\
& =\left(\delta^{b} u^{\delta} v_{v}-\delta^{b} v^{\delta}{ }^{c} u^{\prime}\right) \\
\Rightarrow \quad & \frac{1}{2} \varepsilon_{a b c}{ }^{\varepsilon} 0 a u v^{-u} \bar{\omega}^{u} \Lambda \bar{\omega}^{-v}=\bar{\omega}^{b} \Lambda \bar{\omega}^{c} .
\end{aligned}
$$

So finally

$$
\left.i_{t}^{*}{ }^{\star} \partial / \partial t^{[-\sqrt{-1}} \varepsilon_{a b c} E_{0} E^{\Omega^{+b c}} \wedge * \omega{ }^{a}\right]
$$

$$
\left.=-\sqrt{-I}{\stackrel{\left(\bar{\omega}^{+}\right.}{b c}}_{+}-L_{\bar{N}_{t}} \bar{\omega}_{b c}^{+}-i_{t_{t} d^{\prime} \nabla^{+}}{ }^{l} N_{0} \omega_{0}^{+}{ }_{b c}\right) \wedge\left(\bar{\omega}^{b} \wedge \bar{\omega}^{c}\right)
$$

or still,

Remark: We could just as well have worked with

$$
\theta^{i j}{ }_{\wedge \Omega}{ }_{i j}{ }^{\prime}
$$

the upshot being that there would be a sign change, viz.

$$
\begin{aligned}
& \int_{M} \theta^{i j}{ }_{\wedge \Omega}{ }_{i j} \\
& \left.=\int_{\underline{R}} d t \delta_{\Sigma} i_{t}^{*}{ }^{1} \partial / \partial t^{[\sqrt{-1}} \varepsilon_{a b c}{ }^{l} E_{0} \Omega^{-\mathrm{bc}} \wedge * \omega^{\mathrm{a}}+\theta^{\mathrm{bc}}{ }_{\wedge \Omega^{-}}{ }_{\mathrm{bc}}\right] .
\end{aligned}
$$

This seemingly technical point has its uses and will come up again later on.
To make further progress, it will be necessary to take a closer look at $\Omega^{+}{ }_{a b}$ :

$$
\begin{aligned}
& \Omega_{a b}^{+}=d \omega_{a b}^{+}+\omega_{a k^{+}}^{\wedge \omega^{+k}}{ }_{b} \\
& =d \omega_{a b}^{+}+\omega_{a c}^{+} \wedge \omega^{+c}{ }_{b}+\omega^{+}{ }_{a 0^{\wedge} \omega^{+0}}^{b} \\
& =d \omega_{a b}^{+}+\omega_{a c^{+}} \wedge \omega^{+c}{ }_{b}+\omega_{0 a^{+}}{ }^{+} \omega_{0 b}^{+}
\end{aligned}
$$

LEMMA We have

$$
\omega_{0 a}^{+}{ }^{\wedge} \omega_{0 b}^{+}=\omega^{+}{ }_{a c} \wedge \omega^{+c}{ }_{b}
$$

[Let $u, v=1,2,3-$ then, since $\omega^{+}$is selfdual,

$$
\begin{aligned}
& \int^{-} \omega^{+}{ }_{\mathrm{ac}}=-\sqrt{-I} \varepsilon{ }_{\mathrm{ac}}{ }^{0 u^{+}}{ }^{+}{ }_{\mathrm{Ou}} \\
& \omega_{b}^{+c}=-\sqrt{-I} \varepsilon_{b}^{c} O v_{\omega}^{+}{ }_{O v} \\
& \text { => } \\
& \omega^{+}{ }_{a c} \Lambda \omega^{+c}{ }_{b}=-\varepsilon{ }_{a c}{ }^{0 u_{\varepsilon}^{c}}{ }_{b} 0 v_{\omega}{ }^{+}{ }_{0 u^{\prime}} \Lambda \omega^{+}{ }_{O v^{*}}
\end{aligned}
$$

But

$$
\begin{aligned}
& \varepsilon \mathrm{ac}^{0 u_{c} \mathrm{c} 0 \mathrm{ov}}=\varepsilon_{\mathrm{b}}^{\mathrm{acO} u_{\varepsilon} \mathrm{cbOv}} \\
& =\varepsilon^{0 \mathrm{acu}} \varepsilon^{0 c b v} \\
& =-\varepsilon^{0 a u c} \varepsilon_{0 b v c} \\
& =-\delta_{\mathrm{bv}}^{\mathrm{au}} \\
& =-\left(\delta_{b}^{a} \delta^{u}{ }_{v}-\delta^{a}{ }_{v} \delta^{u}{ }_{b}\right) \\
& \text { => }
\end{aligned}
$$

$$
\begin{aligned}
& =\delta^{\mathrm{a}}{ }_{\mathrm{b}} \omega^{+}{ }_{0 c}{ }^{\wedge \omega^{+}}{ }_{0 c}-\omega^{+}{ }_{0 b} \wedge \omega^{+}{ }_{0 a} \\
& \left.=\omega^{+}{ }_{0 \mathrm{a}}{ }^{\Lambda \omega^{+}}{ }_{0 \mathrm{~b}}{ }^{\cdot}\right]
\end{aligned}
$$

Application:

$$
\Omega_{a b}^{+}=d \omega_{a b}^{+}+2 \omega_{a c}^{+} \omega_{b}^{+c}
$$

LEMMA We have

$$
2 i_{t}^{\star \omega^{+a}}{ }_{b}^{+a}=\bar{\omega}_{b}^{a}-\sqrt{-1} \varepsilon_{a b c} \bar{\omega}_{0 c}
$$

[By definition,

$$
2 \omega^{+}=\omega-\sqrt{-1} J \omega .
$$

Thus

$$
\begin{aligned}
2 \omega_{j}^{+i} & =\omega_{j}^{i}-\frac{\sqrt{-1}}{2} \varepsilon_{j k}^{i} \ell \omega_{\ell}^{k} \\
\Rightarrow \quad & 2 \omega_{c}^{+0} \\
& =\omega_{c}^{0}-\frac{\sqrt{-1}}{2} \varepsilon_{c k}^{0} \ell^{\ell} \omega_{\ell} .
\end{aligned}
$$

On the other hand, $\omega^{+}$is selfdual, hence

$$
2 \omega^{+a b}=-\sqrt{-1} \varepsilon_{0 c^{a b}}^{2 \omega^{+0 c}}
$$

or still,

$$
\left.2 \omega^{+a}{ }_{b}=-\sqrt{-1} \varepsilon_{b 0 c^{a}}^{\left[\omega^{0}\right.}{ }_{c}^{0}-\frac{\sqrt{-1}}{2} \varepsilon_{c k}^{0} \ell_{\omega^{k}}^{k}\right]
$$

But

$$
\begin{aligned}
-\sqrt{-1} \varepsilon_{b 0 c}^{a}{ }^{\omega}{ }_{c}^{0} & =\sqrt{-1} \varepsilon^{a}{ }_{b 0 c}{ }^{\omega} 0 c \\
& =\sqrt{-1} \varepsilon_{0} \varepsilon^{a b 0}{ }_{\omega_{0 c}} \\
& =\sqrt{-1} \varepsilon_{0} \varepsilon^{0 a b c}{ }_{\omega_{0 c}} \\
& =-\sqrt{-1} \varepsilon_{a b c}{ }^{\omega} 0 c
\end{aligned}
$$

9. 

And, in addition,

$$
\begin{aligned}
& -\frac{1}{2} \varepsilon^{\mathrm{a}}{ }_{\mathrm{bOc}}{ }^{\varepsilon}{ }_{\mathrm{ck}}{ }^{\ell} \omega^{k}{ }_{\ell} \\
& =\frac{1}{2} \varepsilon_{a b c} \varepsilon_{k} \varepsilon^{0 c k \ell} \omega_{\ell}^{k} \\
& =\frac{1}{2} \varepsilon_{\mathrm{k}} \varepsilon_{\mathrm{abc}} \varepsilon^{\varepsilon} \mathrm{ck} \ell^{\omega^{k}} \ell \\
& =\frac{1}{2} \varepsilon_{k} \varepsilon_{a b c} \varepsilon_{k l c}{ }^{\omega^{k}} \ell \\
& =\frac{1}{2} \varepsilon_{k} \delta^{a b} k \ell^{\omega} \ell \\
& =\frac{1}{2} \varepsilon_{k}\left(\delta^{a}{ }_{k} \delta^{b}{ }_{\ell}-\delta^{a} \ell^{\delta^{b}}{ }_{k}\right) \omega_{\ell}^{k} \\
& =\frac{1}{2}\left(\omega_{b}^{a}-\omega_{a}^{b}\right) \\
& \left.=\omega_{b}{ }^{\mathrm{a}} .\right]
\end{aligned}
$$

[Note: By the same token,

$$
\left.2 i_{t}^{\star} \omega_{b}^{-a}=\bar{\omega}_{b}^{a}+\sqrt{-1} \varepsilon_{a b c} \bar{\omega}_{0 c} \cdot\right]
$$

Put

$$
A_{b}^{a}=2 i_{t}^{* \omega}+a{ }_{b}
$$

10. 

Then

$$
\left[A_{b}^{a}\right] \in \Lambda^{1}(\Sigma ; \underline{\underline{O}}(3, \underline{C}))
$$

and the prescription

$$
\nabla_{X} Y=\left\langle X, d Y^{a}+A_{b}^{a} Y^{b}\right\rangle E_{a}
$$

defines a complex $\bar{g}$-connection $A$. Denoting by $F$ the associated curvature, we have

$$
\begin{aligned}
F_{a b} & =d A_{a b}+A_{a c} \Lambda A_{b}^{C} \\
& =2 i_{t}^{*}\left(d \omega_{a b}^{+}+2 \omega_{a c}^{+} \wedge \omega^{+c_{b}}\right) \\
& =2 i_{t}^{*} \Omega^{+} \\
& =2 \bar{\Omega}_{a b}^{+}
\end{aligned}
$$

[Note: The proof of the preceding lemma is applicable to $\Omega^{+a}{ }_{b}$, so

$$
\left.\mathrm{F}_{\mathrm{ab}}=2 \mathrm{i}_{\mathrm{t}^{\star} \Omega^{+}}^{\mathrm{ab}}{ }^{+} \bar{\Omega}_{\mathrm{ab}}-\sqrt{-1} \varepsilon_{\mathrm{abc}} \bar{\Omega}_{0 \mathrm{c}} \cdot\right]
$$

Now write

$$
\begin{aligned}
i_{t}^{*} d^{\nabla^{+}} \imath_{N E_{0}} \omega^{+}{ }_{a b} & =d^{A} i_{t}^{\star} \imath_{N E_{0}} \omega^{+}{ }_{a b} \\
& =\frac{1}{2} d^{A} z_{a b}
\end{aligned}
$$

where

$$
z_{a b}=2 N_{t} i^{*} l^{\prime} E_{0} \omega^{+}{ }_{a b}
$$

[Note: Accordingly,

$$
Z_{a b}=N_{t} i_{t}^{*}\left(\omega_{a b}\left(E_{0}\right)-\sqrt{-1} \varepsilon_{a b c}{ }_{0 c}\left(E_{0}\right)\right)
$$

$$
\left.=-\bar{Q}_{a b}-\sqrt{-1} \varepsilon_{a b c} \overline{\mathrm{P}}_{c} \cdot\right]
$$

Details The equality

$$
i_{t}^{* \alpha} \nabla^{\nabla^{+}}{ }_{l_{N E}} \omega^{+}{ }_{a b}=d^{A} i_{t}^{*} l_{N E_{0}} \omega^{+}
$$

is not obvious. By definition,

$$
d^{\nabla^{+}} \Phi_{a b}=d \Phi_{a b}+\omega_{a i^{+}}^{\wedge \Phi_{b}^{i}}+\omega_{b i^{\wedge}}{ }_{a}^{i}
$$

thus

$$
\begin{aligned}
& i_{t}^{*} \mathrm{a}^{\nabla^{+}}{ }^{{ }^{+}}{ } E_{0} \omega^{+}{ }_{a b} \\
& =d i_{t}^{*} \Phi_{a b}+i_{t}^{* \omega^{+}}{ }_{a i}{ }^{\wedge i_{t}^{*} \Phi_{b}^{i}}+i_{t}^{*} \omega_{b i}{ }^{\wedge} i_{t}^{* \Phi}{ }_{a}^{i} \\
& =d N_{t} i_{t}^{\star} \omega^{+}{ }_{a b}\left(E_{0}\right)+i_{t}^{\star}{ }^{+}{ }_{a i} \wedge N_{t} i_{t}^{*} \omega^{+i}{ }_{b}\left(E_{0}\right)+i_{t}^{\star \omega}{ }^{+}{ }_{b i} N_{t} i_{t}^{\star \omega}{ }^{+}{ }_{a}^{i}\left(E_{0}\right),
\end{aligned}
$$

whereas

$$
\begin{gathered}
a^{A} i_{t}^{*} 1_{N E_{0}} \omega^{+} a b \\
=d N_{t} i_{t}^{*} \omega^{+}{ }_{a b}\left(E_{0}\right)+A_{a c} N N_{t} i_{t}^{*} \omega^{+c}{ }_{b}\left(E_{0}\right)+A_{b c} N N_{t} i_{t}^{*} \omega_{a}^{+c}\left(E_{0}\right)
\end{gathered}
$$

Write
12.

Then

$$
\begin{aligned}
& i_{t}^{*} \omega^{+} a c^{\wedge i_{t}^{*} \omega}{ }_{b}^{+c}\left(E_{0}\right)=\frac{1}{2} A A_{a c} \wedge i_{t}^{*} \omega^{+c}{ }_{b}\left(E_{0}\right) \\
& i_{t}^{*} \omega^{+}{ }_{b c} \wedge i_{t}^{* \omega}{ }_{a}^{+c}\left(E_{0}\right)=\frac{1}{2} A_{b c} \wedge i_{t}^{*} \omega^{+}{ }_{a}^{c}\left(E_{0}\right)
\end{aligned}
$$

Let $u, v=1,2,3$ and $r, s=1,2,3$ :

$$
\begin{aligned}
& \int^{-} \sqrt{-1} \omega^{+}{ }_{\mathrm{a} 0}=\frac{1}{2} \varepsilon_{\mathrm{auv}} \omega^{+u v} \\
& \sqrt{-1} \omega_{b}^{+0}=\frac{1}{2} \varepsilon_{b r s} \omega^{+r s} \\
& \text { => } \\
& \omega^{+}{ }_{a 0}{ }^{\wedge \omega}{ }^{+0}{ }_{b}\left(E_{0}\right)=\frac{1}{\sqrt{-1}}\left(\sqrt{-1} \omega^{+}{ }_{a 0}\right) \wedge \frac{1}{\sqrt{-1}}\left(\sqrt{-1} \omega^{+0}{ }_{b}\left(E_{0}\right)\right) \\
& =-\frac{1}{4} \delta^{\text {au }}{ }_{\mathrm{brs}}{ }^{\omega+u v_{\Lambda \omega}}{ }^{+r s}\left(E_{0}\right) .
\end{aligned}
$$

But

$$
\begin{aligned}
& \delta^{a u v{ }_{b r s}}=\left|\begin{array}{ccc}
\delta^{a}{ }_{b} & \delta^{a}{ }_{r} & \delta^{a}{ }_{s} \\
\delta_{b}^{u} & \delta_{r}^{u} & \delta^{u}{ }_{s} \\
\delta_{b}^{v} & \delta_{r}^{v} & \delta^{v}{ }_{s}
\end{array}\right| \\
& =\delta_{b}^{a} \delta^{\delta^{u}}{ }_{r} \delta^{v}{ }_{s}-\delta^{a}{ }_{b} \delta^{u}{ }_{s} \delta^{v}{ }_{r}-\delta^{a}{ }_{r} \delta^{u}{ }_{b} \delta^{v}{ }_{s} \\
& +\delta^{\mathrm{a}}{ }_{r} \delta^{\mathrm{u}}{ }_{s} \delta^{\mathrm{v}}{ }_{b}+\delta^{\mathrm{a}}{ }_{s} \delta^{\mathrm{u}}{ }_{b} \delta^{\mathrm{v}}{ }_{r}-\delta^{\mathrm{a}}{ }_{s} \delta^{\mathrm{u}}{ }_{r} \delta^{\mathrm{v}}{ }_{b} .
\end{aligned}
$$

13. 

And

1. $\delta^{a}{ }_{b} \delta^{u}{ }_{r} \delta^{v}{ }_{s}{ }^{\omega+u v}{ }_{\wedge \omega}+r s{ }_{\left(E_{0}\right)}$

$$
=\delta_{b}^{a}{ }^{\omega}{ }^{+u v} \omega^{+u v}\left(E_{0}\right)
$$

2. $-\delta^{a}{ }_{b} \delta^{u}{ }_{s} \delta^{v} r^{\omega}{ }^{+u v} \wedge \omega{ }^{+r s}\left(E_{0}\right)$

$$
=-\delta_{b}^{a}{ }^{\omega+u v_{\Lambda \omega}+v u}\left(E_{0}\right)
$$

3. $-\delta^{\mathrm{a}}{ }_{r} \delta^{\mathrm{u}}{ }_{b} \delta^{\mathrm{v}}{ }_{s}{ }^{\omega}{ }^{+u v}{ }_{\Lambda \omega}+r s{ }_{\left(E_{0}\right)}$

$$
\begin{aligned}
& =-\omega^{+b v_{\wedge \omega}}+a v_{\left(E_{0}\right)} \\
& =-\omega_{b v^{+} \wedge \omega_{a}^{+}}^{+v_{0}}\left(E_{0}\right) \\
& =-\omega_{b c}^{+} \wedge \omega_{a}^{+}\left(E_{0}\right) .
\end{aligned}
$$

4. $\delta^{a}{ }_{r} \delta^{u}{ }_{s} \delta^{v}{ }_{b}{ }^{\omega+u v}{ }_{\Lambda \omega}+r s{ }_{\left(E_{0}\right)}$

$$
\begin{aligned}
& =\omega^{+u b^{\prime}} \omega^{+a u}\left(E_{0}\right) \\
& =-\omega_{b u}^{+} \wedge \omega_{a}^{+u}\left(E_{0}\right) \\
& =-\omega_{b c}^{+} \wedge \omega_{a}^{+c}\left(E_{0}\right)
\end{aligned}
$$

$$
\begin{aligned}
& \text { 5. } \delta^{a}{ }_{s} \delta^{u} b^{u} \delta_{r}{ }^{v}{ }^{+u v} \wedge \omega^{+r s}\left(E_{0}\right) \\
& =\omega^{+b v} \wedge \omega^{+v a}\left(E_{0}\right) \\
& =-\omega_{b v}^{+} \wedge \omega_{a}^{+} v_{0}\left(E_{0}\right) \\
& =-\omega_{b c}^{+} \wedge \omega^{+}{ }_{a}^{c}\left(E_{0}\right) . \\
& \text { 6. }-\delta^{a}{ }_{s} \delta^{u} r^{\delta^{v}}{ }_{b} \omega^{+u v} \wedge \omega^{+r s}\left(E_{0}\right) \\
& \left.=-\omega^{+u b_{\Lambda \omega}}+{ }_{0}{ }^{+u a}\right) \\
& =-\omega_{b u}^{+} \wedge \omega_{a}^{+u}\left(E_{0}\right) \\
& =-\omega_{b c^{+}}^{\wedge \omega^{+}} a^{C}\left(E_{0}\right) .
\end{aligned}
$$

So

$$
\begin{gathered}
-\frac{1}{4}(1+2)-\frac{1}{4}(3+4+5+6) \\
=-\frac{1}{4} \delta_{b}^{a} \omega^{+u v_{\wedge \omega}}{ }^{\left.+u v_{\left(E_{0}\right.}\right)+\frac{1}{4} \delta_{b}^{a} \omega^{+u v_{\wedge \omega}}+{ }^{\left.+v u_{\left(E_{0}\right)}\right)}} \begin{array}{c}
+\omega_{b c}^{+} \wedge \omega_{a}^{c}\left(E_{0}\right)
\end{array}
\end{gathered}
$$

Applying $i_{t}^{*}$ to

$$
\omega^{+} b c^{\wedge \omega^{+}} a^{c}\left(E_{0}\right)
$$

then gives

$$
\frac{1}{2} A_{b c} \wedge i_{t}^{*}+c\left(E_{0}\right)
$$

15. 

There remains the contribution from

$$
\omega_{b 0}{ }_{\mathrm{b} 0^{\wedge \omega}}{ }_{\mathrm{a}}^{0}\left(\mathrm{E}_{0}\right)
$$

or still,

$$
-\omega_{b 0}^{+}{ }^{\wedge \omega}{ }_{a}^{+0}\left(E_{0}\right)
$$

or still,

$$
\frac{1}{4} \delta^{\text {buv }} \operatorname{ars}^{\omega+u v}{ }_{\Lambda \omega}^{+r s}\left(E_{0}\right)
$$

Reverse the roles of $a$ and $b$ in the above to get:

$$
\begin{aligned}
& \frac{1}{4} \delta_{a}^{b} \omega^{+u v}{ }_{\wedge \omega}+u v_{\left(E_{0}\right)}-\frac{1}{4} \delta_{a}^{b} \omega^{+u v_{\wedge \omega}}+\mathrm{vu}{ }_{\left(E_{0}\right)} \\
& \quad+\omega_{a c}^{+} \wedge \omega_{b}^{+c}\left(E_{0}\right)
\end{aligned}
$$

The first line cancels with
while the second, upon application of $i_{t}^{*}$, leads to

$$
\frac{1}{2} A_{a c} \wedge i_{t}^{\star} \omega^{+c}\left(E_{0}\right)
$$

Summary: We have

$$
\begin{gathered}
\int_{M} \theta^{i j j_{\Lambda \Omega}}{ }_{i j} \\
=\frac{1}{2} \int_{\underline{R}} d t \delta_{\Sigma}-\sqrt{-1}\left[\dot{A}_{a b}-L_{\stackrel{N}{N}_{t}} A_{a b}-d^{A} Z_{a b}\right] \wedge\left(\bar{\omega}^{a} \wedge \bar{\omega}^{b}\right) \\
+N_{t} F_{a b} \wedge *\left(\bar{\omega}^{a} \wedge \bar{\omega}^{-b}\right)
\end{gathered}
$$

[Note: For the record,

$$
\begin{gathered}
\int_{M} \theta^{i j} \wedge_{\Omega}{ }_{i j} \\
=\frac{1}{2} \int_{\underline{R}} d t \int_{\Sigma} \sqrt{-I}\left[\dot{A}_{a b}-L_{\vec{N}_{t}}^{A}{ }_{a b}-d^{A} Z_{a b}\right] \wedge\left(\bar{\omega}^{a} \wedge \bar{\omega}^{b}\right) \\
+N_{t} F_{a b} \wedge \star\left(\bar{\omega}^{a} \wedge \bar{\omega}^{-b}\right)
\end{gathered}
$$

Here

$$
\left[\begin{array}{l}
A_{a b}=\bar{\omega}_{a b}+\sqrt{-1} \varepsilon_{a b c} \bar{\omega}_{0 c} \\
z_{a b}=-\bar{Q}_{a b}+\sqrt{-1} \varepsilon_{a b c} \bar{P}_{c}
\end{array}\right.
$$

and

$$
\left.\mathrm{F}_{\mathrm{ab}}=\mathrm{dA}_{a b}+\mathrm{A}_{\mathrm{ac}} \wedge A_{\mathrm{b}}^{\mathrm{c}}=2 \bar{\Omega}_{\mathrm{ab}}^{-}\right]
$$

The preceding expression for

$$
\delta_{M} \theta^{i j}{ }_{\Lambda \Omega^{+}}{ }_{i j}
$$

is not convenient for manipulation (no boundary terms have arisen thus far).

LEMMA We have

$$
\begin{array}{r}
\frac{1}{2} \int_{\Sigma}-\sqrt{-1}\left[\dot{A}_{a b}-L_{\vec{N}_{t}}^{A} a b\right. \\
\left.=-\frac{\sqrt{-1}}{2} \frac{d}{d t} \delta_{\Sigma} Z_{a b}\right] \wedge\left(A_{a b} \wedge\left(\bar{\omega}^{a} \wedge \bar{\omega}^{-\mathrm{b}} \wedge \bar{\omega}^{-b}\right)+\frac{\sqrt{-1}}{2} \delta_{\Sigma} L_{\vec{N}_{t}}\left(A_{a b} \wedge\left(\omega^{-a} \wedge \bar{\omega}^{-b}\right)\right)\right.
\end{array}
$$

$$
\begin{aligned}
& +\frac{\sqrt{-I}}{2} \int_{\Sigma} d\left(Z_{a b}\left(\left(^{a} \wedge \bar{\omega}^{b}\right)\right)\right. \\
+\sqrt{-I} \int_{\Sigma}{ }_{a b b} \dot{\bar{\omega}}^{a} \wedge \bar{\omega}^{b} & -\sqrt{-I} \delta_{\Sigma} A_{a b} \wedge L_{\overrightarrow{N_{t}}} \bar{\omega}^{a} \wedge \bar{\omega}^{b} \\
& -\sqrt{-I} \delta_{\Sigma} z_{a b} a^{A} \frac{\omega}{\omega} \wedge \bar{\omega}^{b}
\end{aligned}
$$

[Note:

$$
\begin{aligned}
& \left.\right|^{-} d^{A}{ }^{A} a=d \bar{\omega}^{a}+A^{a} c^{-\omega^{C}} \\
& d^{A-b}=\bar{\omega}^{-b}+A^{b} d^{\wedge} \bar{\omega}^{d} \\
& \text { => } \\
& d^{A} Z_{a b} \wedge^{-a} \wedge \bar{\omega}^{b} \\
& =\left(d z_{a b}-A_{a}^{c} Z_{c b}-A_{b}^{d} Z_{a d}\right) \wedge \omega^{a} \wedge \bar{\omega}{ }^{b} \\
& =d z_{a b} \wedge \bar{\omega}^{\mathrm{a}} \wedge \bar{\omega}^{\mathrm{b}}-z_{c b}\left(A^{\mathrm{c}}{ }_{a} \wedge \bar{\omega}^{\mathrm{a}}\right) \wedge \bar{\omega}^{\mathrm{b}}+z_{a d}\left(A^{\mathrm{d}}{ }_{b} \wedge \omega^{-\mathrm{b}}\right) \wedge \bar{\omega}^{\mathrm{a}} \\
& =d z_{a b} \wedge \omega^{-a} \wedge \bar{\omega}^{b}-z_{c b}\left(d^{A} \bar{\omega}^{c}-d \bar{\omega}^{c}\right) \wedge \bar{\omega}^{b}+z_{a d}\left(d^{A} \bar{\omega}^{-d}-d \omega^{-d}\right) \wedge \bar{\omega}^{a} \\
& =d z_{a b} \wedge \bar{\omega}^{-a} \wedge \omega^{b}-z_{a b}\left(d^{A} \omega^{-a}-d \bar{\omega}^{-a}\right) \wedge \omega^{-b}+z_{a b}\left(d^{A-b}-d \omega^{-b}\right) \wedge \omega^{-a} \\
& =d z_{a b} \wedge \Lambda^{-a} \wedge \omega^{b}+z_{a b} d \omega^{a} \wedge \omega^{b}-z_{a b} \omega^{a} \wedge d \omega^{b} \\
& -z_{a b} d^{A} \bar{\omega}^{a} \wedge \bar{\omega}^{b}+z_{a b}{ }^{d^{A}} \bar{\omega}^{b} \wedge \bar{\omega}^{a}
\end{aligned}
$$

18. 

$$
\begin{aligned}
& =d\left(z_{a b}\left(\bar{\omega}^{a} \wedge \bar{\omega}^{b}\right)\right)-z_{a b} d^{A}-\bar{\omega} \Lambda \bar{\omega}^{b}+z_{b a} d^{A}-\bar{\omega} \wedge \wedge \bar{\omega}^{b} \\
& \left.=d\left(z_{a b}\left(\bar{\omega}^{a} \Lambda \bar{\omega}^{b}\right)\right)-2 z_{a b} d^{A}-\bar{\omega} \Lambda \bar{\omega}^{b} \cdot\right]
\end{aligned}
$$

With the understanding that the expression

$$
-\frac{\sqrt{-1}}{2} \frac{d}{d t} \int_{\Sigma} A_{a b} \wedge\left(\bar{\omega}^{\mathrm{a}} \wedge \bar{\omega}^{\mathrm{b}}\right)
$$

is to be ignored, it follows that

$$
\int_{M} \theta^{i j} j_{\wedge \Omega^{+}}{ }_{i j}
$$

equals

$$
\begin{aligned}
& \int_{\underline{R}} d t \int_{\Sigma}\left[\sqrt{-1} A_{a b} \wedge \dot{\bar{\omega}} \wedge \omega^{-b}+\sqrt{-1} A_{a b} \wedge{\underset{\sim}{N}}_{t} \bar{\omega}^{-\mathrm{a}} \Lambda \bar{\omega}^{\mathrm{b}}\right. \\
& \left.-\sqrt{-1} Z_{a b}{ }^{a}{ }^{A}-\bar{\omega} \Lambda \omega^{-b}+\frac{1}{2} N_{t} F_{a b} \wedge *\left(\bar{\omega}^{a} \Lambda \bar{\omega}^{-b}\right)\right] .
\end{aligned}
$$

Claim: There is a simplification, viz.

$$
\mathrm{z}_{a b} \mathrm{~d}^{\mathrm{A}-\bar{\omega}^{\mathrm{a}} \Lambda \bar{\omega}^{\mathrm{b}}}=0
$$

To see this, write

$$
\begin{aligned}
& Z_{a b} d^{A} \bar{\omega}^{a} \Lambda \bar{\omega}^{b} \\
& =z_{a b}\left(d \bar{\omega}^{a}+A_{c}^{a} \wedge \bar{\omega}^{c}\right) \wedge \bar{\omega}^{b} \\
& =z_{a b}\left(d \bar{\omega}^{a}+\left(\bar{\omega}_{c}^{a}-\sqrt{-1} \varepsilon_{a c d^{\bar{\omega}}} 0 d\right) \wedge \bar{\omega}^{c}\right) \wedge \bar{\omega}^{b} \\
& =z_{a b}\left(d \bar{\omega}^{a}+\bar{\omega}_{c}^{a} \wedge \bar{\omega}^{c}\right) \wedge \bar{\omega}^{b}-\sqrt{-1} z_{a b} \varepsilon^{\varepsilon} a c d^{\bar{\omega}} 0 d^{\wedge \bar{\omega}^{c} \wedge \bar{\omega}^{b}}
\end{aligned}
$$

19. 

$$
\begin{aligned}
& =z_{a b} \theta^{a}(\bar{\nabla}) \wedge \bar{\omega}^{b}-\sqrt{-I} z_{a b}{ }_{a c d^{\bar{\omega}} O d^{\wedge} \bar{\omega}^{c} \wedge \omega^{b}} \\
& =-\sqrt{-1} Z_{a b} \varepsilon_{\mathrm{dac}^{\bar{\omega}}} 0 \mathrm{a}^{\wedge \omega^{c}} \wedge \omega^{-\mathrm{b}} \\
& =-\sqrt{-1} \mathrm{Z}_{\mathrm{ab}} \varepsilon_{\mathrm{cad}}{ }^{\bar{\omega}} 0 c^{\wedge \bar{\omega}^{\mathrm{d}} \wedge \bar{\omega}^{\mathrm{b}} .}
\end{aligned}
$$

[Note:

$$
\begin{aligned}
& \left.\theta^{\mathrm{a}}(\bar{\nabla})=0\left(\bar{\nabla}=\nabla^{\bar{g}}=\nabla^{\mathrm{q}}\right) .\right] \\
& \text { - } \varepsilon \operatorname{cad}^{\bar{\omega}} 0 c^{\wedge \bar{\omega}^{d} \wedge \bar{\omega}^{b}} \\
& =\bar{\omega}_{0 c} \wedge \varepsilon_{c a d} \bar{\omega}^{-\mathrm{d}} \wedge \bar{\omega}^{\mathrm{b}} \\
& =\bar{\omega}_{0 c} \wedge \star\left(\bar{\omega}^{c} \wedge \bar{\omega}^{\mathrm{a}}\right) \wedge \bar{\omega}^{-\mathrm{b}} \\
& =-\bar{\omega}_{0 c} \Lambda \bar{\omega}^{b} \wedge *\left(\bar{\omega}^{c} \wedge \bar{\omega}^{a}\right) \\
& =\bar{\omega}^{\mathrm{b}} \wedge \bar{\omega}_{0 c} \wedge \star\left(\bar{\omega}^{c} \wedge \bar{\omega}^{\mathrm{a}}\right) \\
& =-\bar{\omega}^{-\mathrm{b}} \wedge *\left(\bar{\omega}^{\mathrm{c}} \wedge \bar{\omega}^{-\mathrm{a}}\right) \wedge \bar{\omega}_{0 c} \\
& =-(-1)^{I(3-1)-\bar{\omega}}{ }^{\mathrm{b}} \wedge *\left(l_{\bar{\omega}_{0 c}}\left(\bar{\omega}^{\mathrm{c}} \wedge \bar{\omega}^{\mathrm{a}}\right)\right) \\
& =-\bar{\omega}^{\mathrm{b}} \wedge \star\left(\left(\frac{1}{\bar{\omega}_{0 c}} \bar{\omega}^{-\mathrm{c}}\right) \bar{\omega}^{-\mathrm{a}}-\left(\bar{\omega}_{0 c} \bar{\omega}^{\mathrm{a}}\right) \bar{\omega}^{\mathrm{c}}\right) \\
& =-\bar{\omega}^{-\mathrm{b}} \wedge\left(\left(\frac{1}{\bar{\omega}_{0 c}} \bar{\omega}^{-\mathrm{c}}\right) * \bar{\omega}^{-\mathrm{a}}-\left(\bar{l}_{\bar{\omega}_{0 c}} \bar{\omega}^{-\mathrm{a}}\right) \star \bar{\omega}^{-\mathrm{c}}\right)
\end{aligned}
$$

$$
\begin{aligned}
& =-\bar{\omega}^{\mathrm{b}} \wedge\left(q_{t}\left(\bar{\omega}_{0 c}, \bar{\omega}^{-\mathrm{c}}\right) \star \bar{\omega}^{\mathrm{a}}-q_{t}\left(\bar{\omega}_{0 c^{\prime}} \bar{\omega}^{\mathrm{a}}\right) \star \bar{\omega}^{\mathrm{c}}\right) \\
& =-\left(q_{t}\left(\bar{\omega}_{0 c}, \bar{\omega}^{\mathrm{c}}\right) \bar{\omega}^{\mathrm{b}} \wedge \star \bar{\omega}^{\mathrm{a}}-q_{t}\left(\bar{\omega}_{0 c}, \bar{\omega}^{\mathrm{a}}\right) \bar{\omega}^{\mathrm{b}} \wedge * \bar{\omega}^{\mathrm{c}}\right) \\
& =\left(q_{t}\left(\bar{\omega}_{0 c}, \bar{\omega}^{\mathrm{a}}\right) q_{t}\left(\bar{\omega}^{\mathrm{b}}, \bar{\omega}^{\mathrm{c}}\right)-q_{t}\left(\bar{\omega}_{0 c}, \bar{\omega}^{\mathrm{c}}\right) q_{t}\left(\bar{\omega}^{\mathrm{b}}, \bar{\omega}^{\mathrm{a}}\right)\right) \mathrm{vol}_{q_{t}} \\
& =\left(q_{t}\left(\bar{\omega}_{0 c}, \bar{\omega}^{\mathrm{a}}\right) \delta_{b c}-q_{t}\left(\bar{\omega}_{0 c}, \bar{\omega}^{c}\right) \delta_{a b}\right) v o l_{q_{t}} \\
& =\left(q_{t}\left(\bar{\omega}_{0 b}, \bar{\omega}^{\mathrm{a}}\right)-q_{t}\left(\bar{\omega}_{0 c}, \bar{\omega}^{\mathrm{c}}\right) \delta_{a b}\right){ }^{\mathrm{Vol}}{ }_{q_{t}} .
\end{aligned}
$$

Therefore

$$
\begin{gathered}
z_{a b} \varepsilon_{c a d} \bar{\omega}_{0 c} \Lambda \bar{\omega}^{-\mathrm{d}} \wedge \Lambda^{-\mathrm{b}} \\
=z_{a b}\left(q_{t}\left(\bar{\omega}_{0 b}, \bar{\omega}^{\mathrm{a}}\right)-q_{t}\left(\bar{\omega}_{0 c}, \bar{\omega}^{c}\right) \delta_{a b}\right) \mathrm{vol}_{q_{t}} .
\end{gathered}
$$

Bearing in mind that $z_{a b}=-z_{b a}$, take $a \neq b$ and consider

$$
\begin{aligned}
& 2 z_{a b} q_{t}\left(\bar{\omega}_{0 b}, \bar{\omega}^{a}\right) \\
& =z_{a b} q_{t}\left(\bar{\omega}_{0 b}, \bar{\omega}^{a}\right)+z_{a b} q_{t}\left(\bar{\omega}_{0 b}, \bar{\omega}^{a}\right) \\
& =z_{a b} q_{t}\left(\bar{\omega}_{0 b}, \bar{\omega}^{a}\right)+z_{b a} q_{t}\left(\bar{\omega}_{0 a}, \bar{\omega}^{b}\right) \\
& =z_{a b}\left(q_{t}\left(\bar{\omega}_{0 b}, \bar{\omega}^{a}\right)-q_{t}\left(\bar{\omega}_{0 a}, \bar{\omega}^{b}\right)\right)
\end{aligned}
$$

Write

$$
\left.\right|_{-} ^{\bar{\omega}_{0 a}=-\kappa_{a c}{ }^{-{ }^{c}}} \begin{aligned}
& \bar{\omega}_{0 b}=-\kappa_{b d}{ }^{-d}
\end{aligned}
$$

Then

$$
\begin{aligned}
& \bar{I}^{-} q_{t}\left(\bar{\omega}_{0 b}, \bar{\omega}^{a}\right)=-\kappa_{b a} \\
& -q_{t}\left(\bar{\omega}_{0 a}, \bar{\omega}^{b}\right)=-\kappa_{a b} \\
& \text { => } \\
& q_{t}\left(\bar{\omega}_{0 b}, \bar{\omega}^{a}\right)-q_{t}\left(\bar{\omega}_{0 a}, \bar{\omega}^{b}\right) \\
& =-\kappa_{b a}+\kappa_{a b} \\
& =-\kappa_{a b}+\kappa_{a b}=0 .
\end{aligned}
$$

To recapitulate: Modulo the boundary term,

$$
\int_{M} \theta^{i j}{ }_{\wedge \Omega}{ }_{i j}
$$

equals

$$
\begin{gathered}
\int_{\underline{R}} d t \int_{\Sigma}\left[\sqrt{-I} A_{a b} \wedge \dot{\bar{\omega}} \wedge \bar{\omega}^{b}-\sqrt{-I} A_{a b} \wedge L_{\vec{N}_{t}} \bar{\omega}^{a} \wedge \bar{\omega}^{b}\right. \\
\left.+\frac{1}{2} N_{t} F_{a b} \wedge *\left(\bar{\omega}^{\mathrm{a}} \wedge \bar{\omega}^{b}\right)\right]
\end{gathered}
$$

[Note: Analogously,

$$
\int_{\mathrm{M}} \theta^{i j}{ }_{\wedge \Omega}{ }_{i j}
$$

equals

$$
\begin{aligned}
& \int_{R} d t \int_{\Sigma}\left[-\sqrt{-I} A_{a b} \wedge \dot{\bar{\omega}} \wedge \bar{\omega}^{b}+\sqrt{-I} A_{a b} \wedge L_{\vec{N}_{t}} \bar{\omega}^{-a} \wedge \omega^{b}\right. \\
& \left.\left.+\frac{1}{2} N_{t} F_{a b} \wedge^{*}\left(\bar{\omega}^{a} \wedge \bar{\omega}^{-b}\right)\right] .\right]
\end{aligned}
$$

The theory (be it selfdual or antiselfdual) carries three external variables, namely
and

$$
w=\left[w_{b}^{a}\right],
$$

where $W_{b}^{a} \in C^{\infty}(\Sigma)$ and $w_{b}^{a}=-W_{a}^{b}$.

Given $(\vec{\omega}, \overrightarrow{\mathrm{V}} ; \mathrm{N}, \overrightarrow{\mathrm{N}}, \mathrm{W})$, put

$$
N \omega_{0}^{a}=v^{a}-w_{b}^{a} \omega^{b}-L_{\vec{N}} \omega^{a} .
$$

Definition:

SD: Let

$$
\left\{\begin{array}{l}
A_{a b}=\omega_{a b}-\sqrt{-1} \varepsilon_{a b c}{ }^{\omega} 0 c \\
F_{a b}=d A_{a b}+A_{a c} \wedge A_{b}^{c} .
\end{array}\right.
$$

Then the selfdual lagrangian is the function

$$
\mathrm{L}^{+}: \mathrm{TQ} \rightarrow \Lambda^{3} \Sigma \otimes \underline{\mathrm{C}}
$$

defined by the rule

$$
\begin{aligned}
& L^{+}(\vec{\omega}, \vec{v} ; N, N, N) \\
= & \sqrt{-I} A_{a b} \wedge v^{a} \wedge \omega^{b}-\sqrt{-I} A_{a b} \wedge L_{\vec{N}} \omega^{a} \wedge \omega^{b}
\end{aligned}
$$

$$
+\frac{1}{2} N F_{a b} \wedge \star\left(\omega^{\mathrm{a}} \wedge \omega^{\mathrm{b}}\right) .
$$

ASD: Let

$$
\left[\begin{array}{l}
A_{a b}=\omega_{a b}+\sqrt{-I} \varepsilon_{a b c} \omega_{0 c} \\
F_{a b}=d A_{a b}+A_{a c} \wedge A_{b}^{C} .
\end{array}\right.
$$

Then the antiselfdual lagrangian is the function

$$
L^{-}: T \underline{Q} \rightarrow \Lambda^{3} \Sigma \otimes \underline{C}
$$

defined by the rule

$$
\begin{aligned}
& L^{-}(\vec{\omega}, \vec{v} ; N, \vec{N}, W) \\
& =-\sqrt{-I} A_{a b} \wedge v^{a} \wedge \omega^{b}+\sqrt{-I} A_{a b} \wedge L_{\vec{N}} \omega^{a} \wedge \omega^{b} \\
& \\
& +\frac{1}{2} N F_{a b} \wedge *\left(\omega^{a} \wedge \omega^{b}\right) .
\end{aligned}
$$

[Note: The $\omega_{b}^{a}$ are the connection l-forms of the metric connection $\nabla^{q}$ associated with $q$ and, of course, the Hodge star is taken per q.]
$T 0$ initiate the transition from $T \underline{Q}$ to $T^{*} \underline{Q}$, the usual procedure at this point would be to calculate the functional derivative

$$
\frac{\delta L^{ \pm}}{\delta \vec{v}}
$$

While possible, this is not totally straightforward and introduces certain technical complications which ultimately are irrelevant. Therefore it will be best to simply sidestep the issue and proceed directly to $T^{*} \underline{Q}$, where one can take advantage of its underlying symplectic structure.
section-56: Two Canonical Pransformations The are those of the standard_setup but with the restriction that $n=4$.

Rappel:

$$
\begin{aligned}
& H(\underset{\vec{\omega}, \vec{p}}{\vec{~}} ; N, \vec{N}, W) \\
& =\int_{\Sigma} \mathcal{L}_{\vec{N}} \omega^{a} \wedge p_{a}+\delta_{\Sigma} W_{b}^{a} \omega^{b} \wedge p_{a}+\delta_{\Sigma} N E,
\end{aligned}
$$

where

$$
E(\vec{\omega}, \vec{p})=\frac{1}{2}\left[q\left(p_{a}, * \omega^{b}\right) q\left(p_{b^{\prime}} * \omega^{a}\right)-\frac{p^{2}}{2}-S(q)\right] \operatorname{vol}_{q} .
$$

Let $\underline{Q}_{C}$ be the set of ordered complex coframes on $\Sigma-$ then each $\vec{\omega} \in \underline{Q}_{C}$ gives rise to a complex metric $q$, viz.

$$
\mathrm{q}=\omega^{1} \otimes \omega^{1}+\omega^{2} \otimes \omega^{2}+\omega^{3} \otimes \omega^{3}
$$

and we write

$$
\operatorname{vol}_{\mathrm{q}}=\omega^{1} \wedge \omega^{2} \wedge \omega^{3}
$$

Put

$$
\mathrm{T}^{*} \underline{\mathrm{Q}}_{\underline{C}}={\underline{\mathrm{Q}_{\underline{C}}}}_{\underline{C}} \times \Lambda^{2}\left(\Sigma ; \mathrm{T}_{1}^{0}(\Sigma) \otimes \underline{\mathrm{C}}\right)
$$

[Note: Elements of $T^{*} \underline{Q}_{\underline{C}}$ are again denoted by $(\vec{\omega}, \overrightarrow{\mathrm{p}})$.]
Then the hamiltonian of complex general relativity is the function $H$ above formally extended to $T^{*}{ }_{-1}$ by allowing $(\vec{\omega}, \vec{p})$ to be complex.

Remark: The external variables $N, \vec{N}, \hat{W}_{b}$ are, at the beginning, real. However, in the formalities to follow, one can allow them to be complex. This does not change the earlier theory, which goes through unaltered. Still, at the end of the day, we shall return to the path $t \rightarrow\left(\vec{\omega}_{t}, \overrightarrow{\mathrm{P}}_{t}\right)$ in the ADM sector of $\mathrm{T}^{*} \underline{Q}$ and,
of course, in this situation, the external variables $N_{t}, \vec{N}_{t}, \bar{Q}_{b}^{\mathrm{a}}$ are real. Define

$$
T: T^{*} \underline{\underline{Q}}_{\underline{C}} \rightarrow T^{*} \underline{\underline{Q}}_{\underline{C}}
$$

by

$$
T(\vec{\omega}, \vec{p})=(\vec{\omega}, \vec{p}-\sqrt{-1} d \vec{\omega})
$$

Then $T$ is bijective.
[Note: Explicitly,

$$
\mathrm{T}^{-1}: \mathrm{T}^{*} \underline{\mathrm{Q}}_{\underline{\mathrm{C}}} \rightarrow \mathrm{~T}^{*} \underline{\mathrm{Q}}_{\underline{\mathrm{C}}}
$$

is given by

$$
\left.T^{-1}(\vec{\omega}, \overrightarrow{\mathrm{p}})=(\vec{\omega}, \overrightarrow{\mathrm{p}}+\sqrt{-1} \mathrm{~d} \vec{\omega}) .\right]
$$

LEMMA $T$ is a canonical transformation.
[It is a question of verifying that

$$
\Omega\left(\mathrm{DT}(\vec{\omega}, \overrightarrow{\mathrm{p}})(\alpha, \beta), \mathrm{DT}(\vec{\omega}, \overrightarrow{\mathrm{p}})\left(\alpha^{\prime}, \beta^{\prime}\right)\right)=\Omega\left((\alpha, \beta),\left(\alpha^{\prime}, \beta^{\prime}\right)\right)
$$

for all

$$
\left[\begin{array}{l}
\quad \alpha, \alpha^{\prime} \in \Lambda^{1}\left(\Sigma ; \mathrm{T}_{0}^{1}(\Sigma) \otimes \underline{C}\right) \\
\quad \beta, \beta^{\prime} \in \Lambda^{2}\left(\Sigma ; \mathrm{T}_{1}^{0}(\Sigma) \otimes \underline{C}\right)
\end{array}\right.
$$

From the definitions

$$
\left[\begin{array}{l}
\quad \operatorname{DT}(\vec{\omega}, \vec{p})(\alpha, \beta)=(\alpha, \beta-\sqrt{-1} d \alpha) \\
\operatorname{DT}(\vec{\omega}, \vec{p})\left(\alpha^{\prime}, \beta^{\prime}\right)=\left(\alpha^{\prime}, \beta^{\prime}-\sqrt{-I} d \alpha^{\prime}\right)
\end{array}\right.
$$

And

$$
\begin{aligned}
& \Omega\left((\alpha, \beta-\sqrt{-1} d \alpha),\left(\alpha^{\prime}, \beta^{\prime}-\sqrt{-1} d \alpha^{\prime}\right)\right) \\
& \begin{array}{r}
=\int_{\Sigma}\left(\alpha \wedge\left(\beta^{\prime}-\sqrt{-1} d \alpha^{\prime}\right)-\alpha^{\prime} \wedge(\beta-\sqrt{-1} d \alpha)\right) \\
= \\
\quad \delta_{\Sigma}\left(\alpha \wedge \beta^{\prime}-\alpha^{\prime} \wedge \beta\right) \\
\end{array} \begin{array}{l}
=\sqrt{-1} \delta_{\Sigma}\left(\alpha^{\prime} \wedge \alpha \alpha-\alpha \wedge d \alpha^{\prime}\right) \\
=\Omega\left((\alpha, \beta),\left(\alpha^{\prime}, \beta^{\prime}\right)\right)+\sqrt{-1} \delta_{\Sigma} \alpha\left(\alpha \wedge \alpha^{\prime}\right) \\
\left.=\Omega\left((\alpha, \beta),\left(\alpha^{\prime}, \beta^{\prime}\right)\right) .\right]
\end{array}
\end{aligned}
$$

Let

$$
\overrightarrow{\mathrm{P}}=\overrightarrow{\mathrm{p}}-\sqrt{-1} \mathrm{~d} \vec{\omega} .
$$

So, schematically,

4.

With this in mind, put

$$
H_{T}=H \circ T^{-1} .
$$

Then

$$
H_{T}(\vec{\omega}, \vec{P})=H(\vec{\omega}, \vec{P}+\sqrt{-1} d \vec{\omega})
$$

and we shall now examine each of the terms figuring in the RHS.
The first of these is

$$
\delta_{\Sigma} L_{\vec{N}} \omega^{\mathrm{a}} \wedge \mathrm{P}_{\mathrm{a}}+\sqrt{-1} \int_{\Sigma} \stackrel{L}{\vec{N}}^{\omega^{\mathrm{a}}} \wedge d \omega^{\mathrm{a}}
$$

Claim:

$$
\delta_{\Sigma} L_{\vec{N}} \omega^{\mathrm{a}} \Lambda d \omega^{\mathrm{a}}=0
$$

[In fact,

$$
\begin{aligned}
& \underset{\vec{N}}{d\left(L^{a} \wedge \omega^{a}\right)}=\underset{\vec{N}}{d L_{N}} \omega^{a} \Lambda \omega^{a}-\underset{\vec{N}}{L_{N}}{ }^{a} \wedge d \omega^{a} \\
& \text { => } \\
& 0=\int_{\Sigma} d\left(\underset{\vec{N}}{ } \omega^{\mathrm{a}} \Lambda \omega^{\mathrm{a}}\right)=\delta_{\Sigma} \underset{\overrightarrow{\mathrm{N}}}{\mathrm{~d} L^{\mathrm{a}}}{ }^{\mathrm{a}} \omega^{\mathrm{a}}-\int_{\Sigma} L_{\overrightarrow{\mathrm{N}}} \omega^{\mathrm{a}} \wedge d \omega^{\mathrm{a}} \\
& \text { => }
\end{aligned}
$$

$$
\begin{aligned}
& \text { => } \\
& \int_{\Sigma} L_{\vec{N},} d \omega^{a} \wedge \omega^{a}=\int_{\Sigma}{\underset{\vec{N}}{ }} \omega^{a} \wedge d \omega^{a} .
\end{aligned}
$$

But

$$
0=\int_{\Sigma} L_{\vec{N}}\left(\omega^{a} \wedge d \omega^{a}\right)
$$

$$
\begin{aligned}
& =\int_{\Sigma} L_{\vec{N}} \omega^{a} \wedge d \omega^{a}+\int_{\Sigma} \omega^{a} \wedge L_{\vec{N}} d \omega^{a} \\
& =\int_{\Sigma} L_{\vec{N}} \omega^{a} \wedge d \omega^{a}+\int_{\Sigma} L_{\vec{N}} d \omega^{a} \wedge \omega^{a} .
\end{aligned}
$$

Therefore

$$
2 \delta_{\Sigma} L_{\overrightarrow{\mathbf{N}}} \omega^{\mathrm{a}} \wedge d \omega^{a}=0
$$

$$
\begin{aligned}
& \Rightarrow \\
& \quad \int_{\Sigma} L_{\vec{N}} \omega^{a} \wedge d \omega^{a}=0,
\end{aligned}
$$

as claimed.]

The second term is

$$
\delta_{\Sigma} W_{b}^{a} \omega^{b} \wedge\left(P_{a}+\sqrt{-1} d \omega_{a}\right)
$$

which will be left as is.
It remains to consider

$$
E(\vec{\omega}, \overrightarrow{\mathrm{P}}+\sqrt{-1} d \vec{\omega})
$$

To begin with

$$
\begin{aligned}
& \quad q\left(P_{a}+\sqrt{-1} d \omega_{a}, * \omega^{b}\right) q\left(P_{b}+\sqrt{-1} d \omega_{b^{\prime}} * \omega^{a}\right) \\
& =q\left(P_{a}, * \omega^{b}\right) q\left(P_{b^{\prime}} * \omega^{a}\right) \\
& +q\left(P_{a}, * \omega^{b}\right) q\left(\sqrt{-1} d \omega_{b}, * \omega^{a}\right)+q\left(P_{b^{\prime}} * \omega^{a}\right) q\left(\sqrt{-1} d \omega_{a}, * \omega^{b}\right) \\
& \quad-q\left(d \omega_{a}, * \omega^{b}\right) q\left(d \omega_{b^{\prime}}, * \omega^{a}\right)
\end{aligned}
$$

$$
\begin{aligned}
&=q\left(P_{a^{\prime}} * \omega^{b}\right) q\left(P_{b^{\prime}} \star \omega^{a}\right) \\
&+2 \sqrt{-1} q\left(P_{a}, * \omega^{b}\right) q\left(d \omega^{b}, \star \omega^{a}\right) \\
&-q\left(d \omega^{a}, \star \omega^{b}\right) q\left(d \omega^{b}, \star \omega^{a}\right)
\end{aligned}
$$

Next

$$
\begin{aligned}
&- \frac{1}{2} q\left(P_{a}+\sqrt{-1} d \omega_{a}, * \omega^{a}\right)^{2} \\
&=-\frac{1}{2} q\left(P_{a}+\sqrt{-1} d \omega_{a^{\prime}} * \omega^{a}\right) q\left(P_{b}+\sqrt{-1} d \omega_{b^{\prime}} * \omega^{b}\right) \\
&=-\frac{1}{2} q\left(P_{a^{\prime}} * \omega^{a}\right) q\left(P_{b^{\prime}} * \omega^{b}\right) \\
&-\frac{\sqrt{-1}}{2}\left[q\left(P_{a}, * \omega^{a}\right) q\left(d \omega^{b}, * \omega^{b}\right)+q\left(P_{b^{\prime}} * \omega^{b}\right) q\left(d \omega^{a}, * \omega^{a}\right)\right] \\
&-\frac{1}{2}(\sqrt{-1})^{2} q\left(d \omega^{a}, * \omega^{a}\right) q\left(d \omega^{b}, * \omega^{b}\right) \\
&=-\frac{p^{2}}{2}-\sqrt{-1} P q\left(d \omega^{a}, * \omega^{a}\right) \\
&+\frac{1}{2} q\left(d \omega^{a}, * \omega^{a}\right) q\left(d \omega^{b}, * \omega^{b}\right),
\end{aligned}
$$

where

$$
p=q\left(p_{a}, * w^{a}\right)
$$

Rappel: We have

$$
S(q) v^{v o l_{q}}=-2 d\left(\omega^{a} \wedge_{* d} d \omega^{a}\right)
$$

$$
+\frac{1}{2}\left(d \omega^{\mathrm{a}} \wedge \omega^{\mathrm{a}}\right) \wedge *\left(\mathrm{~d} \omega^{\mathrm{b}} \wedge \omega^{\mathrm{b}}\right)-\left(\mathrm{d} \omega^{\mathrm{a}} \wedge \omega^{\mathrm{b}}\right) \wedge *\left(\mathrm{~d} \omega^{\mathrm{b}} \wedge \omega^{\mathrm{a}}\right)
$$

Claim:

1. The sum of

$$
-q\left(d \omega^{a}, * \omega^{b}\right) q\left(d \omega^{b}, * \omega^{a}\right) v o l_{q}
$$

and

$$
\left(d \omega^{\mathrm{a}} \wedge \omega^{\mathrm{b}}\right) \wedge *\left(d \omega^{\mathrm{b}} \wedge \omega^{\mathrm{a}}\right)
$$

is zero.
2. The sum of

$$
\frac{1}{2} q\left(d \omega^{a}, * \omega^{a}\right) q\left(d \omega^{b}, * \omega^{b}\right) v o l_{q}
$$

and

$$
-\frac{1}{2}\left(d \omega^{\mathrm{a}} \wedge \omega^{\mathrm{a}}\right) \wedge *\left(\mathrm{~d} \omega^{\mathrm{b}} \wedge \omega^{\mathrm{b}}\right)
$$

is zero.
[Consider, e.g., l. Write

$$
\left.\right|_{-} ^{d \omega^{a} \Lambda \omega^{b}=q\left(d \omega^{a} \Lambda \omega^{b}, v o l_{q}\right) v o l_{q}} \begin{aligned}
& d \omega^{b} \Lambda \omega^{a}=q\left(d \omega^{b} \Lambda \omega^{a}, v o l_{q}\right) v o l_{q}
\end{aligned}
$$

Then

$$
\begin{aligned}
& \left(d \omega^{a} \wedge \omega^{b}\right) \wedge \star\left(d \omega^{b} \wedge \omega^{a}\right) \\
& =q\left(d \omega^{a} \wedge \omega^{b}, d \omega^{b}{ }^{a} \omega^{a}\right) v o l_{q} \\
& =q\left(d \omega^{a} \Lambda \omega^{b}, v o l_{q}\right) q\left(d \omega^{b} \wedge \omega^{a}, v o l_{q}\right) v o l_{q}
\end{aligned}
$$

On the other hand,

$$
\begin{aligned}
& q\left(d \omega^{a}, * \omega^{b}\right) q\left(d \omega^{b}, * \omega^{a}\right) v o l_{q} \\
= & q\left(d \omega^{a}, l \omega^{b^{v o l}} q\right) q\left(d \omega^{b},{ }_{\omega} a^{\mathrm{vol}_{q}}\right) \operatorname{vol}_{q} \\
= & q\left(\omega^{b} \wedge d \omega^{a}, \operatorname{vol}_{q}\right) q\left(\omega^{a} \wedge d \omega^{b}, \operatorname{vol}_{q}\right) \operatorname{vol}_{q} \\
= & \left.q\left(d \omega^{a} \wedge \omega^{b}, \operatorname{vol}_{q}\right) q\left(d \omega^{b} \wedge \omega^{a}, \operatorname{vol}_{q}\right) \operatorname{vol}_{q} \cdot\right]
\end{aligned}
$$

Summary: We have

$$
\begin{aligned}
& H_{T}(\vec{\omega}, \vec{P} ; N, \vec{N}, W) \\
& =\int_{\Sigma} L_{\vec{N}} \omega^{a} \wedge \mathrm{P}_{\mathrm{a}}+\int_{\Sigma} \mathrm{w}_{b^{\mathrm{a}}}{ }^{\mathrm{b}} \wedge\left(\mathrm{P}_{\mathrm{a}}+\sqrt{-I} \mathrm{~d} \omega_{\mathrm{a}}\right) \\
& +\int_{\Sigma} N d\left(\omega^{a} \wedge * d \omega^{a}\right) \\
& +\int_{\Sigma} \frac{N}{2}\left[q\left(P_{a}, * \omega^{b}\right) q\left(P_{b}, * \omega^{a}\right)\right. \\
& \left.+2 \sqrt{-I} q\left(P_{a}, * \omega^{b}\right) q\left(d \omega^{b}, * \omega^{a}\right)-\frac{P^{2}}{2}-\sqrt{-I} \operatorname{Pq}\left(d \omega^{a}, * \omega^{a}\right)\right] \operatorname{vol} q_{q} .
\end{aligned}
$$

[Note:

$$
\begin{gathered}
\Rightarrow \quad d\left(N \wedge \omega^{a} \wedge * d \omega^{a}\right)=d N \wedge \omega^{a} \wedge * d \omega^{a}+N d\left(\omega^{a} \wedge * d \omega^{a}\right) \\
\Rightarrow \quad \int_{\Sigma} N d\left(\omega^{a} \wedge * d \omega^{a}\right)=-\int_{\Sigma} d N \wedge \omega^{a} \wedge * d \omega^{a} \\
=-\int_{\Sigma} q\left(d N, \omega^{c}\right) \omega^{c} \wedge \omega^{a} \wedge * d \omega^{a}
\end{gathered}
$$

$$
\left.=-\int_{\Sigma} q\left(d N, \omega^{c}\right) q\left(\omega^{c} \Lambda \omega^{a}, d \omega^{a}\right) \operatorname{vol}_{q} .\right]
$$

N.B. Write the constraint equations and the evolution equations in terms of $H_{T}$. Suppose that they are satisfied by the pair $\left(\vec{\omega}_{t}, \vec{P}_{t}\right)-$ then $\operatorname{Ein}(g)=0$.

At first glance, it appears that little has been gained by the foregoing procedure. However, the next step is to follow the canonical transformation $(\vec{\omega}, \vec{p}) \rightarrow(\vec{\omega}, \vec{P})$ by yet another and then the situation will simplify considerably.

Given $(\vec{\omega}, \vec{P})$, let

$$
A_{a b}=-\sqrt{-1}\left[q\left(P_{c}, \omega^{a} \Lambda \omega^{b}\right) \omega^{c}-\frac{p}{2} *\left(\omega^{a} \Lambda \omega^{b}\right)\right]
$$

where

$$
P=q\left(P_{c}, * \omega^{c}\right)
$$

Reality Check on $\left(\vec{\omega}_{t}, \vec{P}_{t}\right)$, this definition of $A_{a b}$ agrees with the one used in the last section, viz. (choosing the plus sign)

$$
\bar{\omega}_{a b}+\sqrt{-1} \varepsilon_{a b c} \bar{\omega}_{0 c} .
$$

Thus start by writing

$$
\begin{aligned}
& -\sqrt{-1}\left[q_{t}\left(P_{c}, \bar{\omega}^{\mathrm{a}} \Lambda \bar{\omega}^{\mathrm{b}}\right) \bar{\omega}^{\mathrm{c}}-\frac{\mathrm{P}}{2} *\left(\bar{\omega}^{\mathrm{a}} \wedge \bar{\omega}^{\mathrm{b}}\right)\right] \\
& =-\sqrt{-1}\left[q_{t}\left(p_{c}-\sqrt{-1} d \bar{\omega}_{c}, \bar{\omega}^{a} \Lambda \bar{\omega}^{b}\right) \bar{\omega}^{c}\right. \\
& \left.-\frac{1}{2} q_{t}\left(p_{c}-\sqrt{-1} d \bar{\omega}_{c}, * \bar{\omega}^{c}\right) *\left(\bar{\omega}^{-a} \Lambda \bar{\omega}^{-b}\right)\right] \\
& =-\sqrt{-1}\left[q_{t}\left(p_{c}, \bar{\omega}^{\mathrm{a}} \wedge \bar{\omega}^{\mathrm{b}}\right) \bar{\omega}^{c}-\sqrt{-1} q_{t}\left(d \bar{\omega}_{c}, \bar{\omega}^{\mathrm{a}} \wedge \bar{\omega}^{\mathrm{b}}\right) \bar{\omega}^{\mathrm{c}}\right. \\
& \left.-\frac{1}{2} q_{t}\left(p_{c}, * \bar{\omega}^{-c}\right) *\left(\bar{\omega}^{\mathrm{a}} \Lambda \bar{\omega}^{\mathrm{b}}\right)+\frac{\sqrt{-1}}{2} q_{t}\left(d \bar{\omega}_{c^{\prime}} * \bar{\omega}^{\mathrm{c}}\right) *\left(\bar{\omega}^{\mathrm{a}} \Lambda \bar{\omega}^{\mathrm{b}}\right)\right]
\end{aligned}
$$

$$
\begin{aligned}
= & -q_{t}\left(d_{\bar{\omega}_{c}}, \bar{\omega}^{\mathrm{a}} \wedge \bar{\omega}^{\mathrm{b}}\right) \bar{\omega}^{-\mathrm{c}}+\frac{1}{2} q_{t}\left(\mathrm{~d} \bar{\omega}_{c}, * \bar{\omega}^{\mathrm{c}}\right) *\left(\bar{\omega}^{\mathrm{a}} \wedge \bar{\omega}^{\mathrm{b}}\right) \\
& -\sqrt{-1} q_{t}\left(p_{c}, \bar{\omega}^{\mathrm{a}} \wedge \bar{\omega}^{-\mathrm{b}}\right) \bar{\omega}^{\mathrm{c}}+\frac{\sqrt{-1}}{2} q_{t}\left(p_{c^{\prime}} * \bar{\omega}^{-\mathrm{c}}\right) *\left(\bar{\omega}^{\mathrm{a}} \wedge \bar{\omega}^{-\mathrm{b}}\right) .
\end{aligned}
$$

1. The $\bar{\omega}_{\mathrm{b}}^{\mathrm{a}}$ are the connection l-forms per the metric connection $\bar{\nabla}$ $\left(=\nabla^{q}\right)$, hence

$$
\begin{aligned}
& \bar{\omega}_{a b}=\frac{1}{2}\left(q_{t}\left(d \bar{\omega}^{-a}, \bar{\omega}^{b} \wedge \bar{\omega}^{c}\right) \bar{\omega}^{-c}-q_{t}\left(d \bar{\omega}^{-b}, \bar{\omega}^{a} \wedge \bar{\omega}^{c}\right) \bar{\omega}^{-c}\right. \\
& \left.\quad-q_{t}\left(\bar{\omega}_{c}, \bar{\omega}^{a} \wedge \bar{\omega}^{b}\right) \bar{\omega}^{c}\right) \\
& \Rightarrow \\
& \quad-q_{t}\left(d \bar{\omega}_{c},,^{-a} \wedge \bar{\omega}^{b}\right) \bar{\omega}^{c} \\
& =2 \bar{\omega}_{a b}-q_{t}\left(d \bar{\omega}^{a}, \bar{\omega}^{b} \wedge \bar{\omega}^{c}\right) \bar{\omega}^{c}+q_{t}\left(d \bar{\omega}^{b}, \bar{\omega}^{a} \wedge \bar{\omega}^{c}\right) \bar{\omega}^{c} .
\end{aligned}
$$

On the other hand,

$$
\begin{aligned}
& \bar{\omega}_{a b}={ }_{l_{E}} d \bar{\omega}^{a}-{ }_{l_{E}} d \bar{\omega}^{-b}-\frac{1}{2}{ }^{l_{E_{b}}}{ }^{l_{E}}\left(d \bar{\omega}_{C} \wedge \bar{\omega}^{c}\right) . \\
& { }^{-}{ }^{{ }^{l}} E_{b} d \bar{\omega}^{a}=c_{b c}^{a}{ }^{-c}=q_{t}\left(d \bar{\omega}^{a}, \bar{\omega}^{b} \wedge \bar{\omega}^{-c}\right) \bar{\omega}^{c} \\
& { }^{l} E_{a} d \bar{\omega}^{b}=c_{a c}^{b}{ }^{-c}=q_{t}\left(d \bar{\omega}^{b}, \bar{\omega}^{a} \wedge \bar{\omega}^{c}\right) \bar{\omega}^{c} . \\
& \text { - } q_{t}\left(\mathrm{~d}_{\mathrm{c}},{ }^{\prime-\bar{\omega}}\right)^{\mathrm{C}} \mathrm{vol}_{\mathrm{q}_{t}} \\
& =d \bar{\omega}_{c} \wedge * * \bar{\omega}^{c}
\end{aligned}
$$

$$
\begin{aligned}
& =d \bar{\omega}_{c} \wedge(-1)^{1(3-1)} \bar{\omega}^{c} \\
& =\partial \bar{\omega}_{C} \Lambda \bar{\omega}^{C} \\
& \text { => } \\
& { }^{\imath} E_{b}{ }^{l} E_{a}\left(d \bar{\omega} c^{\wedge \bar{\omega}}\right) \\
& =q_{t}\left(d \bar{\omega}_{c}, * \bar{\omega}^{c}\right)^{\imath} E_{b}{ }^{l} E_{a}{ }^{\text {vol }} q_{t} \\
& =q_{t}\left(d \bar{\omega}_{c^{\prime}} * \bar{\omega}^{-\mathrm{C}}\right)^{2} \bar{\omega}^{b^{2}} \bar{\omega}^{\mathrm{a}}{ }^{\mathrm{vol}} q_{t} \\
& =q_{t}\left(d \bar{\omega}_{c}, * \bar{\omega}^{c}\right)^{\imath} \bar{\omega}^{\mathrm{a}} \wedge \bar{\omega}^{b^{v o l}} q_{t} \\
& =q_{t}\left(d \bar{\omega}_{c}, * \bar{\omega}^{\mathrm{c}}\right) *\left(\bar{\omega}^{\mathrm{a}} \wedge \bar{\omega}^{\mathrm{b}}\right) .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& -q_{t}\left(d \bar{\omega}_{c}, \bar{\omega}^{a} \wedge \bar{\omega}^{b}\right) \bar{\omega}^{c}+\frac{1}{2} q_{t}\left(d \bar{\omega}_{c}, * \bar{\omega}^{c}\right) *\left(\bar{\omega}^{a} \wedge \bar{\omega}^{b}\right) \\
& =2 \bar{\omega}_{a b}-q_{t}\left(d \bar{\omega}^{a}, \bar{\omega}^{b} \wedge \bar{\omega}^{c}\right) \bar{\omega}^{c}+q_{t}\left(d^{b}, \bar{\omega}^{a} \wedge \bar{\omega}^{c}\right) \bar{\omega}^{c} \\
& -\bar{\omega}_{a b}+q_{t}\left(d \bar{\omega}^{a}, \bar{\omega}^{b} \wedge \bar{\omega}^{c}\right) \bar{\omega}^{c}-q_{t}\left(d \bar{\omega}^{b}, \bar{\omega}^{a} \wedge \bar{\omega}^{c}\right) \bar{\omega}^{c} \\
& =\bar{\omega}_{a b} .
\end{aligned}
$$

2. We have

$$
\sqrt{-I} \varepsilon_{a b c} \bar{\omega}_{0 c}=-\sqrt{-I} \varepsilon_{a b c} q_{t}\left(p_{d}, * \bar{\omega}^{c}\right) \bar{\omega}^{-d}+\frac{\sqrt{-1}}{2} q_{t}\left(p_{d}, * \bar{\omega}^{-d}\right) \varepsilon_{a b c} \bar{\omega}^{-c}
$$

$$
=-\sqrt{-1} \varepsilon_{a b c} q_{t}\left(p_{d^{\prime}} * \bar{\omega}^{-c}\right) \bar{\omega}^{-d}+\frac{\sqrt{-1}}{2} q_{t}\left(p_{c^{\prime}} * \bar{\omega}^{c}\right) *\left(\bar{\omega}^{-\mathrm{a}} \wedge \bar{\omega}^{-b}\right)
$$

And

$$
\begin{aligned}
& \varepsilon_{a b c} q_{t}\left(p_{d}, * \bar{\omega}^{c}\right) \omega^{-d} \\
& =\varepsilon_{a b c} q_{t}\left(p_{d^{\prime}} \frac{1}{2} \varepsilon_{\operatorname{cuv}^{-}} \bar{\omega}^{-\mathrm{u}} \wedge \bar{\omega}^{-v}\right) \omega^{-\mathrm{d}} \\
& =\frac{1}{2} \varepsilon_{a b c}{ }^{c_{C u v}} q_{t}\left(p_{d}, \bar{\omega}^{\mathrm{u}} \wedge \omega^{-}\right) \omega^{-\mathrm{d}} \\
& =\frac{1}{2} \varepsilon_{a b c} \varepsilon_{u v c} q_{t}\left(p_{d}, \bar{\omega}^{\mathrm{u}} \Lambda \bar{\omega}^{-\mathrm{v}}\right) \bar{\omega}^{-\mathrm{d}} \\
& =\frac{1}{2} \delta^{\mathrm{ab}}{ }_{u v} \mathrm{q}_{\mathrm{t}}\left(\mathrm{p}_{\mathrm{c}},{ }^{-\mathrm{u}} \wedge \bar{\omega}^{-\mathrm{v}}\right) \bar{\omega}^{\mathrm{c}} \\
& =\frac{1}{2}\left(\delta_{u}^{a} \delta_{v}^{b}-\delta_{v}^{a} \delta_{u}^{b}\right) q_{t}\left(p_{c}, \bar{\omega}^{u} \wedge \bar{\omega}^{v}\right) \bar{\omega}^{c} \\
& =\frac{1}{2} q_{t}\left(p_{C}, \bar{\omega}^{a} \wedge \bar{\omega}^{b}\right) \bar{\omega}^{c}-\frac{1}{2} q_{t}\left(p_{c}, \bar{\omega}^{\mathrm{b}} \wedge \bar{\omega}^{\mathrm{a}}\right) \bar{\omega}^{\mathrm{c}} \\
& =q_{t}\left(p_{c}, \bar{\omega}^{\mathrm{a}} \Lambda \bar{\omega}^{\mathrm{b}}\right) \bar{\omega}^{c} .
\end{aligned}
$$

Put

$$
A_{c}=\frac{\sqrt{-1}}{2} \varepsilon_{c u v} A_{u v}
$$

Then

$$
A_{a b}=-\sqrt{-1} \varepsilon_{a b c} A_{c}
$$

Indeed

$$
\begin{aligned}
-\sqrt{-I} \varepsilon_{a b c} A_{c} & =-\sqrt{-I} \varepsilon_{a b c}\left(\frac{\sqrt{-I}}{2} \varepsilon_{c u v}\right) A_{u v} \\
& =\frac{1}{2} \varepsilon_{a b c} \varepsilon_{u v c} A_{u v} \\
& =\frac{1}{2} \delta^{a b} u v^{A} u v \\
& =\frac{1}{2}\left(A_{a b}-A_{b a}\right) \\
& =A_{a b}
\end{aligned}
$$

IEMMA We have

$$
\left[\begin{array}{l}
A_{a}=q\left(P_{b^{\prime}} * \omega_{a}\right) \omega^{b}-\frac{P}{2} \omega_{a} \\
-\quad P_{a}=A_{b} \wedge *\left(\omega^{b} \wedge_{\omega_{a}}\right)
\end{array}\right.
$$

[Re $A_{a}: \quad$ Write

$$
\begin{gathered}
A_{a}=\frac{\sqrt{-I}}{2} \varepsilon_{a b c}{ }^{A} b c \\
=\frac{\sqrt{-I}}{2} \varepsilon_{a b c}\left[-\sqrt{-I} q\left(P_{d}, \omega^{b} \wedge \omega^{c}\right) \omega^{d}+\frac{\sqrt{-I}}{2} P *\left(\omega^{b} \wedge \omega^{c}\right)\right] \\
=q\left(P_{d^{\prime}}, \frac{1}{2} \varepsilon_{a b c} \omega^{b} \wedge \omega^{c}\right) \omega^{d}-\left(\frac{P}{2}\right) \frac{1}{2} \varepsilon_{a b c} *\left(\omega^{b} \wedge \omega^{c}\right) \\
=q\left(P_{b}, * \omega_{a}\right) \omega^{b}-\left(\frac{P}{2}\right) \frac{1}{2} \varepsilon_{a b c} *\left(\omega^{b} \wedge \omega^{c}\right) .
\end{gathered}
$$

14. 

Then

$$
\begin{array}{rl}
\frac{1}{2} \varepsilon_{a b c} & *\left(\omega^{b} \wedge \omega^{c}\right)=\frac{1}{2} \varepsilon_{a b c} \varepsilon_{b c d^{\omega}}{ }^{d} \\
& =\frac{1}{2} \varepsilon_{a b c} \varepsilon_{d b c} \omega^{d} \\
& =\frac{1}{2}\left(2 \delta^{a}{ }_{d} \omega^{d}\right) \\
& =\omega_{a} .
\end{array}
$$

Re $P_{a}$ : First

$$
\begin{aligned}
& { }_{\omega}^{1} b\left(A_{b} \wedge * \omega^{a}\right)={ }_{\omega}^{1} b^{A}{ }_{b} \wedge * \omega^{a}-A_{b} \wedge_{1}{ }_{\omega} b^{* \omega}{ }^{a} \\
& =1_{\omega} b^{A} b^{\wedge} \wedge * \omega^{a}-A_{b} \wedge *\left(\omega^{a} \wedge \omega^{b}\right) \\
& =1_{\omega^{b}}{ }^{A} b^{\prime} \wedge \omega^{a}+A_{b} \wedge *\left(\omega^{b} \wedge \omega^{a}\right) \\
& \text { => } \\
& A_{b} \wedge *\left(\omega^{b} \wedge \omega^{a}\right)={ }_{\omega}^{1} b^{\left(A_{b} \wedge * \omega^{a}\right)-1}{ }_{\omega} b^{A} b^{A} \wedge * \omega^{a} \\
& =1_{\omega} b^{q\left(A_{b}, \omega^{a}\right) v o l} q_{q}-q\left(A_{b}, \omega^{b}\right) * \omega^{a} \\
& =q\left(A_{b}, \omega^{a}\right) * \omega^{b}-q\left(A_{b}, \omega^{b}\right) * \omega^{a} .
\end{aligned}
$$

But

$$
A_{b}=q\left(P_{c}, * \omega_{b}\right) \omega^{C}-\frac{P}{2} \omega_{b}
$$

$$
\begin{aligned}
& \text { => } \\
& \Gamma^{-} q\left(A_{b}, \omega^{a}\right)=q\left(P_{a}, * \omega_{b}\right)-\frac{P}{2} \delta^{a}{ }_{b} \\
& q\left(A_{b}, \omega^{b}\right)=q\left(P_{b}, * \omega_{b}\right)-\left(\frac{3}{2} P\right) \\
& \text { => } \\
& A_{b} \wedge *\left(\omega^{b} \wedge \omega_{a}\right) \\
& =q\left(P_{a^{\prime}} * \omega_{b}\right) * \omega^{b}-\left(\frac{P}{2} \delta_{b}^{a}\right) * \omega^{b} \\
& -q\left(P_{b^{\prime}} * \omega_{b}\right) * \omega_{a}+\left(\frac{3}{2} P\right) * \omega_{a} \\
& =P_{a}+\left(-\frac{1}{2} P-P+\frac{3}{2} P\right) * \omega_{a} \\
& \left.=P_{a} \cdot\right]
\end{aligned}
$$

Notation: Given $(\vec{\omega}, \vec{P})$, let

$$
\left[\begin{array}{l}
Q^{a}=-* \omega^{a} \\
A_{a}=q\left(P_{b}, * \omega_{a}\right) \omega^{b}-\frac{P}{2} \omega_{a}
\end{array}\right.
$$

and put

$$
\left\{_{-} \quad \begin{array}{l}
Q \\
\quad \\
\vec{A}=\left(Q_{1}, Q^{2}, Q^{3}\right) \\
\left.A_{2}, A_{3}\right)
\end{array}\right.
$$

Set

$$
\mathrm{T}^{\star} * \underline{\underline{Q}}_{\underline{C}}=\star \underline{\underline{Q}}_{\underline{C}} \times \Lambda^{1}\left(\Sigma ; \mathrm{T}_{1}^{0}(\Sigma) \otimes \underline{\mathrm{C}}\right)
$$

16. 

and equip it with the evident symplectic structure.
Define

$$
\mathrm{S}: \mathrm{T}^{*} \underline{\mathrm{Q}}_{\underline{\mathrm{C}}} \rightarrow \mathrm{~T}^{*} \underline{\underline{\mathrm{Q}}} \underline{\underline{\mathrm{C}}}
$$

by

$$
S(\vec{\omega}, \overrightarrow{\mathrm{P}})=(\vec{Q}, \overrightarrow{\mathrm{~A}}) .
$$

SUBLEMMA S is bijective.
[It is obvious that $S$ is injective. To establish that $S$ is surjective, fix $(\vec{Q}, \vec{\alpha}) \in T^{*} * \underline{\underline{Q}}_{\underline{C}}$ and let

$$
\mathrm{P}_{\mathrm{a}}=\alpha_{\mathrm{b}} \wedge \star\left(\omega^{\mathrm{b}} \wedge \omega_{\mathrm{a}}\right)
$$

Then we claim that

$$
S(\vec{\omega}, \vec{P})=(\vec{Q}, \vec{\alpha}) .
$$

To see this, consider

$$
q\left(\alpha_{c} \wedge *\left(\omega^{c} \wedge \omega_{b}\right), * \omega_{a}\right) \omega^{b}-\frac{P}{2} \omega_{a} .
$$

- $\alpha_{c} \wedge *\left(\omega^{c} \wedge \omega_{b}\right)$

$$
\begin{aligned}
&= q\left(\alpha_{c}, \omega_{b}\right) * \omega^{c}-q\left(\alpha_{c}, \omega^{c}\right) * \omega_{b} \\
& \Rightarrow \quad \\
& q\left(\alpha_{c} \wedge *\left(\omega^{c} \wedge \omega_{b}\right), * \omega_{a}\right) \omega^{b} \\
&= q\left(\alpha_{c}, \omega_{b}\right) q\left(* \omega^{c}, * \omega_{a}\right) \omega^{b}-q\left(\alpha_{c}, \omega^{c}\right) q\left(* \omega_{b}, * \omega^{a}\right) \omega^{b} \\
&=q\left(\alpha_{a}, \omega^{b}\right) \omega^{b}-q\left(\alpha_{c}, \omega^{c}\right) \omega^{a} .
\end{aligned}
$$

$$
\begin{aligned}
& -\frac{P}{2} \omega_{a} \\
& \quad=-\frac{1}{2} q\left({\left.P_{c}, * \omega^{c}\right) \omega_{a}} \begin{array}{rl} 
& =-\frac{1}{2} q\left(\alpha_{d} \wedge *\left(\omega^{d} \wedge \omega_{c}\right), * \omega^{c}\right) \omega_{a} \\
& =-\frac{1}{2} q\left(q\left(\alpha_{d}, \omega_{c}\right) * \omega^{d}-q\left(\alpha_{d^{\prime}} \omega^{d}\right) * \omega_{c^{\prime}} * \omega^{c}\right) \omega_{a} \\
& =-\frac{1}{2} q\left(\alpha_{d}, \omega^{\alpha}\right) \omega_{a}+\frac{3}{2} q\left(\alpha_{d^{\prime}} \omega^{d}\right) \omega_{a} \\
& =q\left(\alpha_{c}, \omega^{c}\right) \omega_{a} .
\end{array}\right.
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& q\left(\alpha_{c} \wedge_{*}\left(\omega^{c} \wedge \omega_{b}\right), \star \omega_{a}\right) \omega^{b}-\frac{p}{2} \omega_{a} \\
& \quad=q\left(\alpha_{a}, \omega^{b}\right) \omega^{b}-q\left(\alpha_{c}, \omega^{c}\right) \omega^{a}+q\left(\alpha_{c}, \omega^{c}\right) \omega_{a} \\
& \quad=q\left(\alpha_{a}, \omega^{b}\right) \omega^{b} \\
& \left.\quad=\alpha_{a} \cdot\right]
\end{aligned}
$$

LEMMA $S$ is a canonical transformation.

It suffices to show that

$$
\left\{\int_{\Sigma} Q^{a} \wedge \alpha_{a}, \int_{\Sigma} A_{b} \wedge \beta^{b}\right\}=\int_{\Sigma} \alpha_{c} \wedge \beta^{c}
$$

18. 

for all

$$
\left[\begin{array}{l}
\alpha \in \Lambda^{1}\left(\Sigma ; \mathrm{T}_{1}^{0}(\Sigma) \otimes \underline{C}\right) \\
\beta \in \Lambda^{2}\left(\Sigma ; \mathrm{T}_{0}^{1}(\Sigma) \otimes \underline{C}\right)
\end{array}\right.
$$

Here the Poisson bracket on the left equals

$$
\int_{\Sigma}\left[\frac{\delta}{\delta \vec{P}}\left(\int_{\Sigma} A_{b} \wedge \beta^{b}\right) \wedge \frac{\delta}{\delta \vec{\omega}}\left(\int_{\Sigma} Q^{a} \wedge \alpha_{a}\right)-\frac{\delta}{\delta \vec{P}}\left(\int_{\Sigma} Q^{a} \wedge \alpha_{a}\right) \wedge \frac{\delta}{\delta \vec{\omega}}\left(\int_{\Sigma} A_{b} \wedge \beta^{b}\right)\right]
$$

or still,

$$
\int_{\Sigma}\left[\frac{\delta}{\delta \mathrm{P}_{c}}\left(\delta_{\Sigma} A_{b} \wedge \beta^{\mathrm{b}}\right) \wedge \frac{\delta}{\delta \omega^{c}}\left(\delta_{\Sigma} Q^{\mathrm{a}} \wedge \alpha_{a}\right)-\frac{\delta}{\delta \mathrm{P}_{c}}\left(\int_{\Sigma} Q^{\mathrm{a}} \wedge \alpha_{a}\right) \wedge \frac{\delta}{\delta \omega^{c}}\left(\delta_{\Sigma} A_{b} \wedge \beta^{b}\right)\right]
$$

But from the definitions, it is clear that

$$
\frac{\delta}{\delta \mathrm{P}_{\mathrm{C}}}\left(\int_{\Sigma} Q^{\mathrm{a}} \wedge \alpha_{\mathrm{a}}\right)=0
$$

which leaves

$$
\int_{\Sigma}\left[\frac{\delta}{\delta P_{c}}\left(\int_{\Sigma} A_{b} \wedge \beta^{b}\right) \wedge \frac{\delta}{\delta \omega}{ }^{c}\left(\int_{\Sigma} Q^{a} \wedge \alpha_{a}\right)\right]
$$

- $\delta_{C}\left(Q^{a} \wedge \alpha_{a}\right)$

$$
\begin{aligned}
& =\delta_{c} Q^{a} \wedge \alpha_{a} \\
& =\delta_{c}\left(-\star \omega^{a}\right) \wedge \alpha_{a} \\
& =-\delta \omega^{c} \wedge \tau \omega^{c^{*} \omega^{a} \wedge \alpha_{a}} \\
& =-\delta \omega^{c} \wedge *\left(\omega^{a} \wedge \omega^{c}\right) \wedge \alpha_{a}
\end{aligned}
$$

$$
\begin{aligned}
& \text { => } \\
& \frac{\delta}{\delta \omega^{c}}\left(\int_{\Sigma} Q^{a} \wedge \alpha_{a}\right)=-*\left(\omega^{a} \wedge \omega^{c}\right) \wedge \alpha_{a} . \\
& \text { - } \delta_{C}\left(A_{b} \wedge \beta^{b}\right) \\
& =\delta_{C} A_{b} \wedge \beta^{b} \\
& =\delta_{c}\left(q\left(P_{d^{\prime}} * \omega_{b}\right) \omega^{d}-\frac{P}{2} \omega_{b}\right) \wedge \beta^{b} \\
& =q\left(\delta P_{c^{\prime}} * \omega_{b}\right) \omega^{c} \wedge \beta^{b}-\frac{1}{2} q\left(\delta P_{c}, * \omega^{c}\right) \omega_{b} \wedge \beta^{b}
\end{aligned}
$$

$$
\begin{aligned}
& =*\left(\omega_{b} \wedge \delta \mathrm{P}_{c}\right) \wedge \omega^{\mathrm{c}} \wedge \beta^{\mathrm{b}}-\frac{1}{2} *\left(\omega^{\mathrm{c}} \wedge \delta \mathrm{P}_{c}\right) \wedge \omega_{b} \wedge \beta^{\mathrm{b}} \\
& =\omega^{c} \wedge \beta^{b} \wedge *\left(\omega_{b} \wedge \delta P_{c}\right)-\frac{1}{2} \omega_{b} \wedge \beta^{b} \wedge_{*}\left(\omega^{c} \wedge \delta P_{c}\right) \\
& =\omega_{b} \wedge \delta P_{c} \wedge_{*}\left(\omega^{c} \wedge \beta^{b}\right)-\frac{1}{2} \omega^{c} \wedge \delta P_{c} \wedge *\left(\omega_{b} \wedge \beta^{b}\right) \\
& =\delta P_{c} \wedge q\left(\beta^{b}, * \omega^{c}\right) \omega_{b}-\frac{1}{2} \delta P_{c} \wedge q\left(\beta^{b}, * \omega_{b}\right) \omega^{c} \\
& \Rightarrow \\
& \frac{\delta}{\delta \mathrm{P}_{c}}\left(\int_{\Sigma} A_{b} \wedge B^{b}\right) \\
& =q\left(\beta^{b}, * \omega^{c}\right) \omega_{b}-\frac{1}{2} q\left(\beta^{b}, * \omega_{b}\right) \omega^{c} .
\end{aligned}
$$

Matters therefore reduce to consideration of

$$
\int_{\Sigma}\left(q\left(\beta^{b}, * \omega^{c}\right) \omega_{b}-\frac{1}{2} q\left(\beta^{b}, * \omega_{b}\right) \omega^{c}\right) \wedge-*\left(\omega^{a} \wedge \omega^{c}\right) \wedge \alpha_{a}
$$

or still,

$$
\delta_{\Sigma} \alpha_{a} \wedge *\left(\omega^{c} \wedge \omega^{a}\right) \wedge \gamma_{c},
$$

where

$$
\gamma_{c}=\frac{1}{2} q\left(\beta^{b}, * \omega_{b}\right) \omega^{c}-q\left(\beta^{b}, * \omega^{c}\right) \omega_{b} .
$$

To finish, one then has to prove that

$$
*\left(\omega^{c} \wedge \omega^{a}\right) \wedge \gamma_{C}=\beta^{a} .
$$

On purely algebraic grounds (cf. infra), there are unique complex l-forms $X_{c}$ that satisfy the equation

$$
*\left(\omega^{c} \wedge \omega^{a}\right) \wedge x_{c}=\beta^{a} .
$$

To compute them, begin by wedging both sides with $\omega^{\mathrm{b}}$ :

$$
\omega^{b} \wedge_{*}\left(\omega^{c} \wedge \omega^{a}\right) \wedge x_{c}=\omega^{b} \wedge B^{a}
$$

- We have

$$
\begin{aligned}
& 0=\imath_{\omega^{a}}\left(\omega^{b} \wedge * \omega^{c} \wedge X_{c}\right)
\end{aligned}
$$

$$
\begin{aligned}
& =\delta_{a b} * \omega^{c} \wedge X_{c}-\omega^{b} \wedge z \omega^{a * \omega^{c} \wedge X_{c}-\omega^{b} \wedge * \omega{ }^{c} \wedge z} \omega^{a} X_{c}
\end{aligned}
$$

$$
\begin{aligned}
& \text { => } \\
& \omega^{b} \wedge *\left(\omega^{\mathrm{c}} \Lambda \omega^{\mathrm{a}}\right) \wedge \mathrm{x}_{\mathrm{c}} \\
& =\omega^{\mathrm{b}} \wedge_{\omega^{\mathrm{a}}}{ }^{* \omega^{c} \wedge X_{c}} \\
& =\delta_{a b} * \omega^{c} \wedge X_{c}-{ }^{2}{ }_{\omega}{ }^{2} X_{c} \wedge \omega^{b} \wedge * \omega^{c} \\
& =\delta_{a b}{ }^{* \omega}{ }^{c} \wedge X_{c}-\left(r_{\omega}{ }^{a^{x_{c}}}\right) q\left(\omega^{b}, \omega^{c}\right) v o l_{q} \\
& \left.=\delta_{a b} * \omega^{c} \Lambda_{c}-\left(2{ }_{\omega} a_{b}\right)\right)^{v o l}{ }_{q} \\
& =\delta_{a b} * \omega^{c} \wedge X_{c}-{ }_{\omega}{ }_{\omega}^{a}\left(X_{b} \wedge \operatorname{vol}_{q}\right)-X_{b} \wedge \imath{ }_{\omega} a^{\operatorname{vol}} q \\
& =\delta_{a b}{ }^{* \omega}{ }^{C} \wedge X_{c}-X_{b} \wedge{ }_{\omega} a^{{ }^{\text {vol }}}{ }_{q} \\
& =\delta_{a b} * \omega^{c} \wedge X_{c}-X_{b} \wedge * \omega^{a} \\
& =\delta_{a b} * \omega^{c} \wedge X_{c}-* \omega^{a} \wedge X_{b} .
\end{aligned}
$$

Accordingly,

$$
-* \omega^{a} \wedge x_{b}+\delta_{a b} * \omega^{c} \wedge x_{c}=\omega^{b} \wedge \beta^{a}
$$

or still,

$$
-q\left(x_{b}, \omega^{a}\right)+\delta_{a b} q\left(x_{c}, \omega^{c}\right)=q\left(\omega^{b}, \star \beta^{a}\right)
$$

Put

$$
x=\sum_{c=1}^{3} q\left(x_{c}, \omega^{c}\right) .
$$

Then

$$
\begin{aligned}
& \Gamma^{-} x-q\left(X_{1}, \omega^{1}\right)=q\left(\omega^{1}, * \beta^{1}\right) \\
& x-q\left(x_{2}, \omega^{2}\right)=q\left(\omega^{2}, * \beta^{2}\right) \\
& x-q\left(X_{3}, \omega^{3}\right)=q\left(\omega^{3}, \star \beta^{3}\right) \\
& \text { => } \\
& 3 x-x=\sum_{c=1}^{3} q\left(\omega^{c}, * \beta^{c}\right) \\
& \text { => } \\
& X=\frac{1}{2} q\left(\omega^{C}, * B^{C}\right) \\
& \text { => } \\
& q\left(X_{b}, \omega^{a}\right)=\frac{1}{2} \delta_{a b} q\left(\omega^{c}, * \beta^{c}\right)-q\left(\omega^{b}, * \beta^{a}\right) .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
x_{c} & =q\left(x_{c^{\prime}} \omega^{a}\right) \omega^{a} \\
& =\frac{1}{2} \delta_{a c} q\left(\omega^{b}, * \beta^{b}\right) \omega^{a}-q\left(\omega^{c}, * \beta^{a}\right) \omega^{a} \\
& =\frac{1}{2} q\left(\beta^{b}, * \omega_{b}\right) \omega^{c}-q\left(\beta^{b}, * \omega^{c}\right) \omega^{b} \\
& =\gamma_{c^{\prime}}
\end{aligned}
$$

which implies that

$$
*\left(\omega^{c} \wedge \omega^{a}\right) \wedge \gamma_{C}=\beta^{a} .
$$

Details The first thing to note is that by linear algebra, one can assume without loss of generality that

$$
\beta^{a}=0(a=1,2,3),
$$

the point being to show that the only solution to

$$
*\left(\omega^{\mathrm{c}} \wedge \omega^{\mathrm{a}}\right) \wedge \mathrm{X}_{\mathrm{C}}=0
$$

is the zero solution. This said, consider the system

$$
\left[\begin{array}{rl}
-\omega^{3} \wedge x_{2}+\omega^{2} \wedge x_{3} & =0 \\
\omega^{3} \wedge x_{1}-\omega^{1} \wedge x_{3} & =0 \\
-\omega^{2} \wedge x_{1}+\omega^{1} \wedge x_{2} & =0
\end{array}\right.
$$

Write

$$
\left[\begin{array}{l}
x_{1}=x_{11} \omega^{1}+x_{12} \omega^{2}+x_{13} \omega^{3} \\
x_{2}=x_{21} \omega^{1}+x_{22} \omega^{2}+x_{23} \omega^{3} \\
x_{3}=x_{31} \omega^{1}+x_{32} \omega^{2}+x_{33} \omega^{3}
\end{array}\right.
$$

Then

$$
\text { 1. }-\mathrm{x}_{21} \omega^{3} \Lambda \omega^{1}-\mathrm{x}_{22} \omega^{3} \Lambda \omega^{2}+\mathrm{x}_{31} \omega^{2} \Lambda \omega^{1}+\mathrm{x}_{33} \omega^{2} \Lambda \omega^{3}=0
$$

2. $X_{11} \omega^{3} \Lambda \omega^{1}+X_{12} \omega^{3} \Lambda \omega^{2}-X_{32} \omega^{1} \Lambda \omega^{2}-X_{33} \omega^{1} \Lambda \omega^{3}=0$.
3. $-\mathrm{X}_{11} \omega^{2} \Lambda \omega^{1}-\mathrm{X}_{13} \omega^{2} \Lambda \omega^{3}+\mathrm{X}_{22} \omega^{1} \Lambda \omega^{2}+\mathrm{X}_{23} \omega^{1} \wedge \omega^{3}=0$.
4. 

So

$$
\left[\begin{array}{l}
\omega^{2} \wedge 1 \Rightarrow x_{21}=0 \\
\omega^{3} \wedge 1 \Rightarrow x_{31}=0,
\end{array}\left|\begin{array}{l}
\omega^{1} \wedge 2=0 \Rightarrow x_{12}=0 \\
\omega^{3} \wedge 2=0 \Rightarrow x_{32}=0,
\end{array}\right|_{\omega^{1} \wedge 3 \Rightarrow x_{13}=0} \omega^{2} \wedge 3 \Rightarrow x_{23}=0\right.
$$

Thus

$$
\begin{aligned}
& \left.\right|_{x_{1}}=x_{11} \omega^{1}+\begin{aligned}
x_{2} & =x_{22^{\omega}}{ }^{2} \\
x_{3} & =x_{33} \omega^{3}
\end{aligned} \\
& \text { => } \\
& \left.\right|^{-}-\omega^{3} \wedge \mathrm{X}_{22 \omega^{2}+\omega^{2} \wedge \mathrm{X}_{33} \omega^{3}=000{ }^{3}=0} \\
& \omega^{3} \wedge x_{11} \omega^{1}-\omega^{1} \wedge x_{33} \omega^{3}=0 \\
& -\omega^{2} \wedge x_{11} \omega^{1}+\omega^{1} \wedge x_{22} \omega^{2}=0 \\
& \text { => } \\
& \begin{array}{r}
x_{22}+x_{33}=0 \\
x_{11}+x_{33}=0 \\
x_{11}+x_{22}=0
\end{array} \\
& \text { => }
\end{aligned}
$$

25. 

$$
\begin{aligned}
& {\left[\begin{array}{l}
x_{22}=-x_{33} \\
x_{22}
\end{array}=+x_{33}\right.} \\
& \Rightarrow \\
& x_{33}=0
\end{aligned} \quad \Rightarrow x_{11}=0 .
$$

Interpretation of $\vec{A}$ Each triple

$$
\vec{A}=\left(A_{1}, A_{2}, A_{3}\right)
$$

determines an $\underline{s \ell}(2, \underline{C})$-valued l-form on $\Sigma$. To explain this precisely, we need some preparation.

Rappel: Let

$$
\left.\left.\sigma_{1}=\left[\begin{array}{cc}
0 & 1 \\
1 & 0
\end{array}\right], \quad \sigma_{2}=\left\lvert\, \begin{array}{cc}
0 & -\sqrt{-1} \\
\sqrt{-1} & 0
\end{array}\right.\right], \quad \sigma_{3}=\left\lvert\, \begin{array}{cc}
1 & 0 \\
0 & -1
\end{array}\right.\right]
$$

Then

$$
\left[\sigma_{a}, \sigma_{b}\right]=2 \sqrt{-1} \varepsilon_{a b c} \sigma_{c} .
$$

Let

$$
T_{1}=-\frac{1}{2} \sqrt{-1} \sigma_{1}, T_{2}=-\frac{1}{2} \sqrt{-1} \sigma_{2}, T_{3}=-\frac{1}{2} \sqrt{-1} \sigma_{3} .
$$

Then

$$
\begin{aligned}
{\left[T_{a}, T_{b}\right] } & =-\frac{1}{4} 2 \sqrt{-1} \varepsilon_{a b c}{ }_{c} \\
& =\varepsilon_{a b c}\left(-\frac{1}{2} \sqrt{-1}\right) \sigma_{c} \\
& =\varepsilon_{a b c} T_{c}
\end{aligned}
$$

Thus the set $\left\{\mathrm{T}_{1}, \mathrm{~T}_{2}, \mathrm{~T}_{3}\right\}$ is a basis for $\underline{\text { su }}$ (2) (with structure constants $\varepsilon_{a b c}$ ) which is orthonormal per the scalar product

$$
\langle\mathrm{A}, \mathrm{~B}\rangle=-2 \underline{\operatorname{tr}}(\mathrm{AB}) .
$$

Pass now to $\underline{s \ell}(2, \underline{C})$, the complexification of $\underline{s u}(2)$. Let $\tau_{a}=\frac{1}{2} \sigma_{a}$ - then the $\tau_{a}$ are a basis for $\underline{s \ell(2, \underline{C})}$ (viewed as a complex Lie algebra), the structure constants being $\sqrt{-1} \varepsilon_{a b c}$ :

$$
\begin{aligned}
{\left[\tau_{a}, \tau_{b}\right] } & =\frac{1}{4}\left[\sigma_{a}, \sigma_{b}\right] \\
& =\frac{\sqrt{-1}}{2} \varepsilon_{a b c}{ }_{c} \\
& =\sqrt{-1} \varepsilon_{a b c} c_{c}
\end{aligned}
$$

Given $\vec{A}$, the combination

$$
A_{1} \tau_{1}+A_{2} \tau_{2}+A_{3} \tau_{3}
$$

$$
\begin{aligned}
\overrightarrow{\mathrm{F}}=\mathrm{d} \overrightarrow{\mathrm{~A}} & +\overrightarrow{\mathrm{A}} \wedge \overrightarrow{\mathrm{~A}} \\
& =\mathrm{d} \overrightarrow{\mathrm{~A}}+\frac{1}{2}[\overrightarrow{\mathrm{~A}}, \overrightarrow{\mathrm{~A}}]
\end{aligned}
$$

where

$$
\begin{aligned}
{[\vec{A}, \vec{A}] } & =\left[A_{a} \tau_{a}, A_{b} \tau_{b}\right] \\
& =\left(A_{a} \wedge A_{b}\right)\left[\tau_{a}, \tau_{b}\right] \\
& =\sqrt{-1} \varepsilon_{a b c}\left(A_{a} \wedge A_{b}\right) \tau_{c}
\end{aligned}
$$

Therefore

$$
F_{c}=d A_{c}+\frac{\sqrt{-I}}{2} \varepsilon_{a b c} A_{a} \wedge A_{b}
$$

which is in agreement with the earlier definition of $\vec{F}$ as

$$
d \vec{A}+\frac{\sqrt{-1}}{2} \vec{A} \stackrel{\times}{\wedge} \vec{A}
$$

Section 57: Ashtekar's Hamiltonian The assumptions and notation are those of the standard setup but with the restriction that $n=4$.

As was established in the last section, there are canonical transformations $T$ and $S$ :

$$
T^{*} \underline{Q}_{\underline{C}} \xrightarrow{T} T^{*} \underline{Q}_{\underline{C}} \xrightarrow{S} T^{*} * \underline{Q}_{\underline{C}}
$$

Consequently,

$$
H_{S} \circ T=H \circ(S \circ T)^{-1}=H \circ T^{-1} \circ S^{-1}=H_{T} \circ S^{-1} .
$$

Here

$$
H_{S} \circ T(\vec{Q}, \vec{A})=H_{T}(\vec{\omega}, \vec{P}),
$$

where

$$
P_{a}=A_{b} \wedge *\left(\omega^{b} \wedge \omega_{a}\right)
$$

However, before we trace the effect of this change of variable, it will be best to review and reinforce our notation,

Recall that

$$
\left[\begin{array}{l}
Q^{a}=-* \omega^{a} \\
A_{a}=q\left(P_{b}, * \omega_{a}\right) \omega^{b}-\frac{P}{2} \omega_{a}
\end{array}\right.
$$

and

$$
\left[\begin{array}{l}
\vec{Q}=\left(Q^{1}, Q^{2}, Q^{3}\right) \\
\vec{A}=\left(A_{1}, A_{2}, A_{3}\right) .
\end{array}\right.
$$

2. 

Therefore

$$
\begin{aligned}
& d^{A} Q^{a}=d Q^{a}+A_{b}^{a}{ }_{b}^{\wedge} Q^{b} \\
&=d Q^{a}-\sqrt{-1} \varepsilon_{b c^{a}}{ }^{c} \wedge Q^{b} \\
& \Rightarrow \quad
\end{aligned}
$$

$$
d^{A} \bar{Z}=d \vec{Z}+\sqrt{-1} \vec{A} \times \stackrel{\times}{\widehat{Q}} .
$$

Next put

$$
\overrightarrow{\mathrm{F}}=\left(\mathrm{F}_{1}, \mathrm{~F}_{2}, \mathrm{~F}_{3}\right),
$$

where

$$
F_{a}=d A_{a}+\frac{\sqrt{-1}}{2} \varepsilon_{a b c} A_{b} \Lambda A_{c} .
$$

Then

$$
\vec{F}=d \vec{A}+\frac{\sqrt{-1}}{2} \vec{A} \times \vec{A} .
$$

Finally let

$$
z=\left[z_{b}^{a}\right] \quad\left(z_{b}^{a} \in C^{\infty}(\Sigma ; \underline{C})\right)
$$

subject to $z_{b}^{a}=-z_{a}^{b}$ and write

$$
\left.\right|_{-} ^{\mathrm{z}_{\mathrm{a}}=\frac{\sqrt{-1}}{2} \varepsilon_{a b c} \mathrm{z}_{\mathrm{bc}}} \begin{aligned}
& \overrightarrow{\mathrm{z}}=\left(\mathrm{z}_{1}, \mathrm{z}_{2}, \mathrm{z}_{3}\right)
\end{aligned}
$$

Remark: There is an issue of consistency present in the definition of $\vec{F}$. Thus a priori,

$$
\mathrm{F}_{\mathrm{a}}=\frac{\sqrt{-I}}{2} \varepsilon_{\mathrm{abc}} \mathrm{~F}_{\mathrm{bc}}
$$

or still,

$$
F_{a}=\frac{\sqrt{-I}}{2} \varepsilon_{a b c}\left(d A_{b c}+A_{b d} \wedge A_{c}^{d}\right),
$$

the implied assumption being that this reduces to

$$
d A_{a}+\frac{\sqrt{-1}}{2} \varepsilon_{a b c} A_{b} \wedge A_{c} .
$$

- $\frac{\sqrt{-1}}{2} \varepsilon_{a b c}{ }^{d A} b c$

$$
\begin{aligned}
& =d\left(\frac{\sqrt{-1}}{2} \varepsilon_{a b c} A_{b c}\right) \\
& =d A_{a} .
\end{aligned}
$$

- $\frac{\sqrt{-1}}{2} \varepsilon_{a b c} A_{b d^{\prime}} A^{d}{ }_{c}$

$$
\begin{aligned}
& =\frac{\sqrt{-1}}{2} \varepsilon_{a b c}\left(-\sqrt{-1} \varepsilon_{b d u} A_{u} \wedge-\sqrt{-1} \varepsilon_{d c v} A_{v}\right) \\
& =-\frac{\sqrt{-1}}{2} \varepsilon_{a b c} \varepsilon_{b d u} \varepsilon_{d c v^{A}} u^{\wedge} A_{v} \\
& =\frac{\sqrt{-1}}{2} \varepsilon_{a b c} \varepsilon_{b u d} \varepsilon_{c v d} A_{u} \wedge A_{v} \\
& =\frac{\sqrt{-1}}{2} \varepsilon_{a b c} \delta^{b u} c v^{A} u^{\wedge A} v \\
& =\frac{\sqrt{-1}}{2} \varepsilon_{a b c}\left(\delta^{b} c^{\delta^{u}} v^{0}-\delta^{b} v^{\delta^{u}} c^{A} u^{\prime} \wedge A_{v}\right. \\
& =\frac{\sqrt{-1}}{2} \varepsilon_{a b c}\left(\delta^{b} c^{A} \wedge A_{u}-A_{c} \wedge A_{b}\right)
\end{aligned}
$$

4. 

$$
=\frac{\sqrt{-I}}{2} \varepsilon_{a b c} A_{b} \wedge A_{c}
$$

FACT We have

$$
d(\vec{Z} \dot{\Lambda} \vec{Q})=d^{A} \vec{Z} \dot{\wedge} \vec{Q}+\vec{Z} \dot{\wedge} d^{A} \bar{Q} .
$$

[For

$$
\begin{aligned}
d^{A} Z \dot{Z} \dot{Q} & =d^{A} Z_{a} \wedge Q^{a} \\
& =\left(d Z_{a}-A^{b} a^{\wedge} Z_{b}\right) \wedge Q^{a} \\
& =d Z_{a} \wedge Q^{a}+A_{b}^{a} \wedge Z_{b} \wedge Q^{a}
\end{aligned}
$$

and

$$
\begin{aligned}
\vec{Z} \wedge d^{A} \vec{Q} & =Z_{a} \wedge \alpha^{A} Q^{a} \\
& =Z_{a} \wedge\left(d Q^{a}+A_{b}^{a}{ }_{b} Q^{b}\right) \\
& =Z_{a} \wedge d Q^{a}+Z_{a} \wedge A^{a}{ }_{b} \wedge Q^{b}
\end{aligned}
$$

$$
\Rightarrow
$$

$$
\begin{aligned}
& d^{A} \vec{Z} \dot{\wedge} \vec{Q}+\vec{Z} \dot{\wedge} d^{A} \vec{Q} \\
&= d Z_{a} \wedge Q^{a}+Z_{a} \wedge A Q^{a} \\
& \quad+A_{b}^{a} \wedge Z_{b} \wedge Q^{a}+A_{b}^{a} \wedge Z_{a} \wedge Q^{b} \\
&= d\left(Z_{a} \wedge Q^{a}\right)
\end{aligned}
$$

$$
\begin{aligned}
& \quad+A_{b}^{a} \wedge Z_{b} \wedge Q^{a}+A_{a}^{b} \wedge Z_{b} \wedge Q^{a} \\
& =d(\vec{Z} \dot{\wedge} \vec{Q}) \\
& \\
& \quad+A_{b}^{a} \wedge Z_{b} \wedge Q^{a}-A_{b}^{a} \wedge Z_{b} \wedge Q^{a} \\
& = \\
& d(\vec{Z} \dot{Q} \vec{Q}) .]
\end{aligned}
$$

Rappel:

$$
\begin{aligned}
& H_{T}(\vec{\omega}, \vec{P} ; N, \vec{N}, W) \\
& =\delta_{\Sigma} L_{\vec{N}} \omega^{a} \wedge P_{a}+\delta_{\Sigma} w_{b}^{a} \omega^{b} \wedge\left(P_{a}+\sqrt{-1} d \omega_{a}\right) \\
& \\
& \quad+\delta_{\Sigma}-q\left(d N, \omega^{c}\right) q\left(\omega^{c} \wedge \omega^{a}, d \omega^{a}\right) v o l_{q} \\
& \\
& \quad+\delta_{\Sigma} \frac{N}{2}\left[q\left(P_{a}, * \omega^{b}\right) q\left(P_{b^{\prime}} * \omega^{a}\right)\right. \\
& \left.\quad+2 \sqrt{-1} q\left(P_{a^{\prime}} * \omega^{b}\right) q\left(d \omega^{b}, * \omega^{a}\right)-\frac{P^{2}}{2}-\sqrt{-1} P q\left(d \omega^{a}, * \omega^{a}\right)\right] v o l_{q} .
\end{aligned}
$$

We shall now make the change of variable $P_{a} \rightarrow A_{b} \wedge *\left(\omega^{b} \wedge \omega_{a}\right)$ in $H_{T}$ and consider the various terms obtained thereby.

First

$$
\begin{aligned}
& \int_{\Sigma} \mathcal{L}_{\vec{N}} \omega^{a} \wedge P_{a} \\
& =\int_{\Sigma} L_{\vec{N}} \omega^{a} \wedge A_{b} \wedge *\left(\omega^{b} \wedge \omega_{a}\right) \\
& =\int_{\Sigma}-\underset{\vec{N}}{L_{\vec{N}}} \omega^{\mathrm{a}} \wedge *\left(\omega^{\mathrm{b}} \wedge \omega_{a}\right) \wedge A_{b}
\end{aligned}
$$

$$
=\delta_{\Sigma} *\left(\omega^{b} \wedge \omega_{a}\right) \wedge L_{\vec{N}} \omega^{a} \wedge A_{b},
$$

which we claim is equal to

$$
\int_{\Sigma} L_{\vec{N}} \vec{Q} i \overrightarrow{\mathrm{~A}} .
$$

To see this, write

$$
\star \omega{ }^{b}=\frac{1}{2} \varepsilon_{b c d^{\omega}}{ }^{c} \wedge \omega
$$

Then

$$
\begin{aligned}
\quad L_{\vec{N}} * \omega^{b} & =\varepsilon_{b c d} L_{\vec{N}} \omega^{c} \Lambda \omega^{d} \\
\Rightarrow \quad & \vec{L}_{\vec{N}} Q^{b}=-\varepsilon_{b c d} L_{\vec{N}} \omega^{c} \Lambda \omega^{d} .
\end{aligned}
$$

On the other hand,

$$
\begin{aligned}
*\left(\omega^{\mathrm{b}} \wedge \omega^{\mathrm{a}}\right) & \wedge L_{\overrightarrow{\mathbf{N}}} \omega^{\mathrm{a}} \\
\quad & =\varepsilon_{b a c} \omega^{c} \wedge L_{\vec{N}} \omega^{\mathrm{a}} \\
& =-\varepsilon_{b a c} \stackrel{L}{\vec{N}}^{\omega^{a}} \wedge \omega^{c} \\
& =-\varepsilon_{b c d^{\prime} L_{\vec{N}}} \omega^{c} \Lambda \omega^{d} .
\end{aligned}
$$

Next

$$
\begin{aligned}
& \int_{\Sigma} W_{b}^{a}{ }^{\omega}{ }^{b} \wedge\left(P_{a}+\sqrt{-1} d \omega_{a}\right) \\
= & \int_{\Sigma} W_{b}^{a}{ }^{\omega}{ }^{b} \wedge\left(A_{c} \wedge *\left(\omega^{c} \wedge \omega_{a}\right)+\sqrt{-1} d \omega_{a}\right)
\end{aligned}
$$

Put

$$
z_{a b}=-W_{a b}+\sqrt{-1} \varepsilon_{a b c} W_{c^{\prime}}
$$

where

$$
W_{C}=-q\left(d N, w^{C}\right) .
$$

The discussion then breaks into two parts:

1. $\delta_{\Sigma}-Z_{a b}{ }_{c}{ }_{c} \wedge *\left(\omega^{c} \wedge \omega^{a}\right) \wedge \omega^{b}$.
2. $\int_{\Sigma}-\sqrt{-1} z_{a b} d \omega^{a} \wedge \omega^{b}$.
[Note: We shall hold

$$
\sqrt{-1} \int_{\Sigma} \varepsilon_{a b c} W_{c}\left(\mathrm{P}_{a}+\sqrt{-1} d \omega_{a}\right) \wedge \omega^{b}
$$

in abeyance for the time being.]

LEMMA

$$
1+2=\int_{\Sigma} \vec{Z} \dot{\wedge} d^{A} \vec{Q}
$$

[Note: Here, of course,

$$
\left.\vec{z} \dot{\wedge} d^{A} \vec{Q}=z_{a} \wedge d^{A} Q^{a} .\right]
$$

- Write

$$
\begin{aligned}
& \left.-\mathrm{z}_{a b}{ }^{\mathrm{A}} c^{\wedge *} \omega^{\mathrm{c}} \omega^{\mathrm{N}} \omega^{\mathrm{a}}\right) \wedge \omega^{\mathrm{b}} \\
& \quad=-\mathrm{z}_{a b}{ }^{\mathrm{A}}{ }^{\wedge} \wedge \varepsilon_{c a u} \omega^{\mathrm{u}} \wedge \omega^{\mathrm{b}}
\end{aligned}
$$

$$
\begin{aligned}
& =-(-\sqrt{-1}) \varepsilon_{a b v} v_{v}{ }^{A} c_{c} \wedge \varepsilon_{c a u} w^{u} \wedge \omega^{b} \\
& =\sqrt{-1} \varepsilon_{C a u} \varepsilon_{a b v}{ }^{Z} v^{A} c_{c} \Lambda \omega^{u} \Lambda \omega^{b} \\
& =\sqrt{-1} \varepsilon_{c u a} \varepsilon_{v b a} Z_{v} A_{c} \Lambda \omega \omega^{u} \Lambda \omega^{b} \\
& =\sqrt{-1} \delta^{c u}{ }_{v b} \mathrm{Z}_{\mathrm{A}} \mathrm{~A}_{\mathrm{A}} \wedge \omega^{\mathrm{u}} \wedge \omega^{\mathrm{b}} \\
& =\sqrt{-1}\left(\delta_{v}^{c} \delta^{u}{ }_{b}-\delta^{c}{ }_{b} \delta^{u}{ }_{v}\right) Z_{v}{ }_{c} \wedge \omega^{u} \wedge \omega^{b} \\
& =\sqrt{-1} z_{c} A_{c} \Lambda \omega^{b} \Lambda \omega^{b}-\sqrt{-1} z_{u} A_{b} \Lambda \omega^{u} \Lambda \omega^{b} \\
& =-\sqrt{-1} Z_{u} A_{b} \wedge \omega^{u} \wedge \omega^{b} \\
& =-\sqrt{-1} Z_{u} A_{c} \Lambda \omega{ }^{u} \Lambda \omega{ }^{\text {c }} \\
& =\sqrt{-\mathrm{I}} \mathrm{Z}_{\mathbf{u}} \mathrm{A}_{\mathrm{c}} \wedge \omega^{\mathrm{C}} \Lambda \omega^{\mathrm{u}} \\
& =\sqrt{-1} Z_{a}{ }_{A}{ }_{c} \wedge \omega^{C}{ }^{\wedge} \omega^{\mathrm{a}} \text {. }
\end{aligned}
$$

- Write

$$
\begin{aligned}
& -\sqrt{-1} Z_{a} \varepsilon_{a b c}{ }^{A} c^{\wedge} Q^{b} \\
& =-\sqrt{-1} z_{a} \varepsilon_{a b c}{ }^{A} c^{\wedge} \wedge\left(-\frac{1}{2} \varepsilon_{b u v}{ }^{\omega}{ }^{\mathrm{u}} \wedge \omega^{\mathrm{V}}\right) \\
& =\frac{\sqrt{-1}}{2} \varepsilon_{a b c} \varepsilon_{b u v}{ }^{2}{ }_{a}{ }^{A} c_{c} \wedge \omega^{\mathrm{u}} \wedge \omega^{v} \text {. } \\
& =\frac{\sqrt{-1}}{2} \varepsilon_{a c b}{ }^{\varepsilon} v u b^{Z} a^{A} c \Lambda \omega \omega^{u} \Lambda \omega^{v}
\end{aligned}
$$

9. 

$$
\begin{aligned}
& =\frac{\sqrt{-1}}{2} \delta^{\mathrm{ac}} \mathrm{vu}^{\mathrm{Z}} \mathrm{a}_{\mathrm{A}}{ }_{\mathrm{A}} \wedge \omega^{\mathrm{u}} \wedge \omega^{\mathrm{v}} \\
& =\frac{\sqrt{-1}}{2}\left(\delta^{\mathrm{a}}{ }_{v} \delta^{\mathrm{c}} \mathrm{u}^{-}-\delta^{\mathrm{a}}{ }_{u} \delta^{\mathrm{c}}{ }_{v}\right) \mathrm{Z}_{\mathrm{a}}{ }^{A} c \Lambda \omega^{u}{ }^{\mathrm{u}} \omega^{v} \\
& =\frac{\sqrt{-1}}{2}\left(Z_{a}{ }^{A} c \Lambda \omega^{c} \Lambda \omega{ }^{a}-Z_{a}{ }^{A} c \Lambda \omega^{a}{ }^{a} \omega^{c}\right) \\
& =\frac{\sqrt{-1}}{2}\left(Z_{a}{ }^{A} c \Lambda \omega^{C} \Lambda \omega^{a}+Z_{a}{ }^{A} c \wedge \omega^{c} \Lambda \omega^{a}\right) \\
& =\sqrt{-1} \mathrm{Z}_{\mathrm{a}}{ }^{\mathrm{A}} \mathrm{c}{ }^{\omega}{ }^{\mathrm{C}} \Lambda \omega^{\mathrm{a}} \text {. }
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& \int_{\Sigma}-\mathrm{Z}_{\mathrm{ab}}{ }^{\mathrm{A}} c \wedge *\left(\omega^{\mathrm{c}} \wedge \omega^{\mathrm{a}}\right) \wedge \omega^{\mathrm{b}} \\
&=\delta_{\Sigma}-\sqrt{-1} \mathrm{Z}_{\mathrm{a}} \varepsilon_{a b c}{ }^{A} c^{\wedge} \wedge Q^{\mathrm{b}}
\end{aligned}
$$

As for the other term,

$$
\begin{aligned}
& -\sqrt{-1} z_{a b} d \omega{ }^{a} \wedge \omega^{b} \\
& =-\sqrt{-1}(-\sqrt{-1}) \varepsilon_{a b c}{ }^{Z} c^{d} \omega^{a} \Lambda \omega^{b} \\
& =-\varepsilon_{a b c}{ }^{Z} c_{c} \partial \omega{ }^{a} \Lambda \omega^{b} \\
& =-\varepsilon_{c b a}{ }^{Z}{ }{ }^{d} \omega^{C}{ }^{\mathrm{C}} \omega^{b} \\
& =-\varepsilon_{b c a}{ }^{Z}{ }_{a}{ }^{d} \omega^{b}{ }_{\Lambda \omega}{ }^{c} \\
& =-\varepsilon_{a b c}{ }^{Z} a \omega^{b} \Lambda \omega^{c},
\end{aligned}
$$

which we claim is the same as

$$
z_{a} d Q^{a}=-z_{a} d \star \omega^{a} .
$$

Thus write

$$
\star \omega \omega^{a}=\frac{1}{2} \varepsilon_{a b c} \omega^{b} \Lambda \omega^{c} .
$$

Then

$$
\begin{aligned}
d * \omega^{a} & =\frac{1}{2} \varepsilon_{a b c}\left(d \omega^{b} \wedge \omega^{c}-\omega^{b} \wedge d \omega^{c}\right) \\
& =\frac{1}{2} \varepsilon_{a b c} d \omega^{b} \wedge \omega^{c}-\frac{1}{2} \varepsilon_{a b c} d \omega^{c} \Lambda \omega^{b} .
\end{aligned}
$$

But

$$
\begin{aligned}
-\frac{1}{2} \varepsilon_{a b c} d \omega^{c} \wedge \omega^{b} & =-\frac{1}{2} \varepsilon_{a c b} d \omega^{b} \Lambda \omega^{c} \\
& =\frac{1}{2} \varepsilon_{a b c} \partial \omega^{b} \wedge \omega^{c} .
\end{aligned}
$$

Therefore

$$
\mathrm{d} \star \omega^{\mathrm{a}}=\varepsilon_{\mathrm{abc}} \mathrm{~d}^{\mathrm{b}} \wedge \omega^{c}
$$

and the claim follows.
So, in recapitulation:

$$
1+2=\rho_{\Sigma} \vec{Z} \dot{\wedge} d^{A} \vec{Q}
$$

Remark: The expression

$$
-\bar{Q}_{a b}+\sqrt{-1} \varepsilon_{a b c} \bar{P}_{c} \quad\left(\bar{P}_{c}=-q_{t}\left(d N_{t}, \bar{\omega}^{c}\right)\right)
$$

appeared earlier during the course of the lagrangian analysis.

$$
\begin{aligned}
& \int_{\Sigma} \frac{N}{2}\left[q\left(P_{a^{\prime}} * \omega^{b}\right) q\left(P_{b^{\prime}} * \omega^{a}\right)\right. \\
+ & \left.2 \sqrt{-I} q\left(P_{a^{\prime}}, \omega^{b}\right) q\left(d \omega^{b}, * \omega^{a}\right)-\frac{p^{2}}{2}-\sqrt{-1} \operatorname{Pq}\left(d \omega^{a}, * \omega^{a}\right)\right] v o l_{q} \\
= & \int_{\Sigma}-\sqrt{-I} N \vec{F} \wedge * \bar{Z}+\sqrt{-1} \int_{\Sigma} q\left(d N, \omega^{a}\right) p_{b} \wedge *\left(\omega^{a} \wedge \omega^{b}\right) .
\end{aligned}
$$

[From the definitions,

$$
\begin{aligned}
- & \sqrt{-1} N F^{\prime} \dot{\Lambda} \star \underline{Q} \\
& =-\sqrt{-1} N F_{a^{\prime}} \wedge Q^{a} \\
& =-\sqrt{-1} N F_{a} \wedge *\left(-* \omega^{a}\right) \\
& =\sqrt{-1} N F_{a} \wedge \omega^{a} \\
& =\sqrt{-1} N\left(d A_{a}+\frac{\sqrt{-1}}{2} \varepsilon_{a b c} A_{b} \wedge A_{c}\right) \wedge \omega^{a} \\
& =\sqrt{-1} N d A_{a} \wedge \omega^{a}-\frac{N}{2} \varepsilon_{a b c} A_{b} \wedge A_{c} \wedge \omega^{a} .
\end{aligned}
$$

And

$$
\begin{aligned}
& -\frac{N}{2} \varepsilon_{a b c} A_{b} \wedge{ }_{c} \wedge \omega^{a} \\
=- & \frac{N}{2} \varepsilon_{a b c}\left(q\left(P_{u^{\prime}} * \omega^{b}\right) \omega^{u}-\frac{P}{2} \omega^{b}\right) \wedge\left(q\left(P_{v^{\prime}} * \omega^{c}\right) \omega^{v}-\frac{P}{2} \omega^{c}\right) \wedge \omega^{a} \\
= & -\frac{N}{2} \varepsilon_{a b c}\left[q\left(P_{u^{\prime}} * \omega^{b}\right) q\left(P_{v^{\prime}} * \omega^{c}\right) \omega^{u} \Lambda \omega^{v}\right.
\end{aligned}
$$

$$
\begin{aligned}
& -\frac{P}{2} q\left(P_{u^{\prime}} * \omega^{b}\right) \omega^{u} \wedge \omega^{c}-\frac{P}{2} q\left(P_{v^{\prime}} * \omega^{c}\right) \omega^{b} \wedge \omega^{v} \\
& \left.+\frac{p^{2}}{4} \omega^{b} \wedge \omega^{c}\right] \wedge \omega^{a} . \\
& \text { - }-\varepsilon_{a b c} q\left(P_{u^{\prime}} * \omega^{b}\right) q\left(P_{v^{\prime}} * \omega^{c}\right) \omega^{u} \Lambda \omega^{v} \Lambda \omega^{a} \\
& =-q\left(P_{u^{\prime}} * \omega^{b}\right) q\left(P_{v^{\prime}} * \omega^{C}\right) \omega^{u} \Lambda \omega^{v} \wedge \varepsilon_{b c a} \omega^{a} \\
& =-q\left(P_{u^{\prime}} * \omega^{b}\right) q\left(P_{v^{\prime}} * \omega^{c}\right) \omega^{u} \Lambda \omega^{v} \wedge *\left(\omega^{b} \wedge \omega^{c}\right) \\
& =-q\left(P_{u^{\prime}} * \omega^{b}\right) q\left(P_{v^{\prime}} * \omega^{c}\right) q\left(\omega^{u} \Lambda \omega^{v}, \omega^{b} \wedge \omega^{c}\right) \operatorname{vol}_{q} \\
& =-q\left(P_{u^{\prime}} * \omega^{b}\right) q\left(P_{v^{\prime}} * \omega^{c}\right) q\left(l_{\omega_{b}}\left(\omega^{u} \lambda \omega^{v}\right), \omega_{c}\right) \operatorname{vol}_{q} \\
& =-q\left(P_{u^{\prime}} * \omega^{b}\right) q\left(P_{v^{\prime}} * \omega^{c}\right) q\left(\delta^{u}{ }_{b} \omega^{v}-\omega^{u} \delta^{v}{ }_{b^{\prime}} \omega_{C}\right) V^{V O l}{ }_{q} \\
& =-q\left(P_{u^{\prime}} * \omega^{b}\right) q\left(P_{v^{\prime}} * \omega^{c}\right)\left(\delta_{b}^{u}{ }_{b} \delta_{c}^{v}-\delta^{v}{ }_{b} \delta^{u}{ }_{c}\right) V_{q} \\
& =-q\left(P_{u^{\prime}} * \omega^{b}\right) q\left(P_{v^{\prime}} * \omega^{c}\right) \delta_{b}^{u} \delta^{v} c^{v o l}{ }_{q} \\
& +q\left(P_{u^{\prime}} \omega^{\mathrm{b}}\right) q\left(\mathrm{P}_{\mathrm{v}^{\prime}} \omega^{\mathrm{c}}\right) \delta^{\mathrm{v}}{ }_{\mathrm{b}} \delta^{\mathrm{u}} \mathrm{c}^{\mathrm{vol}}{ }_{q} \\
& =\left(q\left(P_{c}, * \omega^{b}\right) q\left(P_{b}, * \omega^{c}\right)-P^{2}\right) \operatorname{Vol}_{q} \\
& =\left(q\left(P_{a}, * \omega{ }^{b}\right) q\left(P_{b}, * \omega{ }^{a}\right)-P^{2}\right) \text { vol }_{q} .
\end{aligned}
$$

- $\varepsilon_{a b c} \frac{P}{2} q\left(P_{u^{\prime}} * \omega^{b}\right) \omega^{u} \wedge \omega^{c} \wedge \omega^{a}$

$$
\begin{aligned}
& =\operatorname{Pq}\left(P_{u^{\prime}} * \omega^{b}\right) \omega^{u} \wedge \frac{1}{2} \varepsilon_{b a c} \omega^{a} \wedge \omega^{c} \\
& +\operatorname{Pq}\left(\mathrm{P}_{\mathrm{v}^{\prime}} * \omega^{\mathrm{C}}\right) \omega^{\mathrm{V}} \wedge \frac{1}{2} \varepsilon_{c a b} \omega^{\mathrm{a}} \wedge \omega^{\mathrm{b}} \\
& =\operatorname{Pq}\left(\mathrm{P}_{\mathrm{u}^{\prime}} * \omega^{\mathrm{b}}\right) \omega^{\mathrm{u}} \wedge * \omega^{\mathrm{b}}+\operatorname{Pq}\left(\mathrm{P}_{\mathrm{v}^{\prime}} * \omega^{\mathrm{C}}\right) \omega^{\mathrm{V}} \wedge * \omega^{\mathrm{C}} \\
& =P q\left(P_{u^{\prime}} * \omega^{b}\right) \delta^{u}{ }_{b}{ }^{\mathrm{VOl}} \mathrm{q}_{\mathrm{q}}+\mathrm{Pq}\left(\mathrm{P}_{\mathrm{v}^{\prime}} * \omega^{\mathrm{c}}\right) \delta^{\mathrm{V}}{ }_{\mathrm{c}} \mathrm{vol}_{\mathrm{q}} \\
& =\left(P^{2}+P^{2}\right) \operatorname{vol}_{q} .
\end{aligned}
$$

- $-\varepsilon_{a b c} \frac{\mathrm{p}^{2}}{4} \omega^{b} \wedge \omega^{c} \wedge \omega^{a}$

$$
\begin{aligned}
& =-\frac{p^{2}}{4} \varepsilon_{a b c} \omega^{a^{a}} \omega^{b} \wedge \omega \omega^{c} \\
& =-\frac{p^{2}}{4} 6 \mathrm{vol}_{q} \\
& =-\frac{3}{2} \mathrm{P}^{2} \mathrm{vol}_{\mathrm{q}} .
\end{aligned}
$$

Therefore

$$
\int_{\Sigma}-\frac{N}{2} \varepsilon_{a b c} A_{b} \wedge A_{c} \wedge \omega^{a}
$$

$$
=s_{\Sigma} \frac{N}{2}\left[q\left(P_{a}, * \omega^{b}\right) q\left(P_{b^{\prime}} * \omega^{a}\right)-\frac{p^{2}}{2}\right] \operatorname{vol}_{q}
$$

Next

$$
\begin{aligned}
& 0=\int_{\Sigma} d\left(N A_{a} \wedge \omega^{a}\right) \\
&=\int_{\Sigma} d N \wedge A_{a} \wedge \omega^{a}+\delta_{\Sigma} N d\left(A_{a} \wedge \omega^{a}\right) \\
&=\int_{\Sigma} d N \wedge A_{a} \wedge \omega^{a}+\delta_{\Sigma} N\left(d A_{a} \wedge \omega^{a}-A_{a} \wedge d \omega^{a}\right) \\
& \Rightarrow \quad \int_{\Sigma}{ }^{a} d A_{a} \wedge \omega^{a}=\delta_{\Sigma} N A_{a} \wedge d \omega^{a}-\int_{\Sigma} d N \wedge A_{a} \wedge \omega^{a} .
\end{aligned}
$$

- $N A_{a} \wedge d \omega^{a}$

$$
\begin{aligned}
& =N\left(q\left(P_{b}, * \omega_{a}\right) \omega^{b}-\frac{P}{2} \omega_{a}\right) \wedge d \omega^{a} \\
& =N\left(q\left(P_{b}, * \omega_{a}\right) \omega^{b} \wedge d \omega^{a}-\frac{P}{2} \omega_{a} \wedge d \omega^{a}\right)
\end{aligned}
$$

$$
=N\left(q\left(\mathrm{P}_{\mathrm{b}^{\prime}} * \omega_{a}\right) \mathrm{q}\left(\omega^{\mathrm{b}} \wedge d \omega^{\mathrm{a}}, \mathrm{vol}{ }_{q}\right)\right.
$$

$$
\left.-\frac{P}{2} q\left(\omega_{a} \wedge d \omega^{a}, \operatorname{vol}_{q}\right)\right) v o l_{q}
$$

$$
=N\left(q\left(P_{b}, * \omega_{a}\right) q\left(d \omega^{a},{ }_{\omega} b^{v o l} q\right)\right.
$$

$$
\left.-\frac{\mathrm{P}}{2} q\left(\mathrm{~d} \omega^{\mathrm{a}}, \mathrm{l}_{\omega} \mathrm{a}^{\mathrm{vol}} \mathrm{q}\right)\right) \mathrm{vol}_{\mathrm{q}}
$$

$$
=N\left(q\left(P_{b}, * \omega_{a}\right) q\left(d \omega^{a}, * \omega^{b}\right)-\frac{p}{2} q\left(d \omega^{a}, * \omega^{a}\right)\right) \operatorname{vol}_{q}
$$

$$
\begin{aligned}
&=N\left(q\left(P_{a, * \omega^{b}}^{b}\right) q\left(d \omega^{b}, \star \omega^{a}\right)-\frac{p}{2} q\left(d \omega^{a}, \star \omega^{a}\right)\right) v o l_{q} \\
&--d N \wedge A_{a} \wedge \omega^{a} \\
&=-q\left(d N, \omega^{c}\right) \omega^{c} \wedge A_{a} \wedge \omega^{a}
\end{aligned}
$$

But

$$
\begin{aligned}
& q\left(d N, \omega^{a}\right) P_{b} \wedge *\left(\omega^{a} \wedge \omega^{b}\right) \\
& =\mathrm{q}\left(d N, \omega^{\mathrm{a}}\right) \mathrm{A}_{\mathrm{c}} \wedge *\left(\omega^{\mathrm{c}} \wedge \omega^{\mathrm{b}}\right) \wedge *\left(\omega^{\mathrm{a}} \wedge \omega^{\mathrm{b}}\right) \\
& =q\left(d N, \omega^{a}\right) A_{c} \wedge \varepsilon_{c b u}{ }^{\omega}{ }^{u} \wedge \varepsilon_{a b v}{ }^{\omega}{ }^{v} \\
& =q\left(d N, \omega^{a}\right) A_{c} \wedge \varepsilon_{c b u}{ }^{\varepsilon} a b v v^{\omega}{ }^{u} \wedge \omega^{v} \\
& =q\left(d N, \omega^{a}\right) A_{C} \wedge \varepsilon_{c u b} \varepsilon_{a v b} \omega^{u} \wedge \omega^{v} \\
& =q\left(d N, \omega^{a}\right) A_{c} \wedge \delta^{C u} \operatorname{av}^{\omega}{ }^{\mathrm{u}} \wedge \omega^{v} \\
& =q\left(d N, \omega^{a}\right) A_{c} \wedge\left(\delta^{c}{ }_{a} \delta^{u}{ }_{v}-\delta^{c}{ }_{v} \delta^{u}{ }_{a}\right) \omega^{u} \wedge \omega^{v} \\
& =-q\left(d N, \omega^{a}\right) A_{c} \wedge \delta^{c} v^{\delta}{ }^{\mathrm{u}} a^{\omega^{u}}{ }^{\mathrm{u}}{ }^{\mathrm{v}} \\
& =-q\left(d N, \omega^{a}\right) A_{c} \Lambda \omega^{a} \Lambda \omega^{c} \\
& =q\left(d N, \omega^{a}\right) \omega^{a}{ }_{\wedge A_{c}} \wedge \omega^{c} \\
& =q\left(d N, \omega^{c}\right) \omega^{c} \wedge A_{a} \wedge \omega^{a}
\end{aligned}
$$

16. 

=>

$$
\begin{aligned}
& -d \mathbb{N} \wedge A_{a} \wedge \omega^{a} \\
& \quad=-q\left(d N, \omega^{a}\right) P_{b} \wedge *\left(\omega^{a} \wedge \omega^{b}\right) .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& \int_{\Sigma} \sqrt{-1} N d A_{a} \wedge \omega^{a} \\
= & \int_{\Sigma} \frac{N}{2}\left[2 \sqrt{-I} q\left(P_{a}, \star \omega^{b}\right) q\left(d \omega^{b}, \star \omega^{a}\right)-\sqrt{-I} \operatorname{Pq}\left(d \omega^{a}, * \omega^{a}\right)\right] v 0 l_{q} \\
& \left.\quad-\sqrt{-I} \int_{\Sigma} q\left(d N, \omega^{a}\right) P_{b} \wedge \star\left(\omega^{a} \wedge \omega^{b}\right) \cdot\right]
\end{aligned}
$$

Earlier we had set aside

$$
\sqrt{-1} \int_{\Sigma} \varepsilon_{a b c} W_{c}\left(P_{a}+\sqrt{-1} d \omega_{a}\right) \wedge \omega^{b}
$$

where

$$
W_{C}=-q\left(d N, \omega^{C}\right)
$$

Since

$$
\begin{aligned}
\sqrt{-1} q(d N & \left., \omega^{a}\right) P_{b} \wedge *\left(\omega^{a} \wedge \omega^{b}\right) \\
& =\sqrt{-I} \varepsilon_{a b c}{ }^{q\left(d N, \omega^{a}\right) P_{b} \wedge \omega^{c}} \\
& =\sqrt{-I} \varepsilon_{c b a}{ }^{q\left(d N, \omega^{c}\right) P_{b} \wedge \omega^{a}} \\
& =\sqrt{-I} \varepsilon_{c a b} q\left(d N, \omega^{c}\right) P_{a} \wedge \omega^{b}
\end{aligned}
$$

$$
=\sqrt{-1} \varepsilon_{a b c} q^{\left(d N, \omega^{c}\right)} \mathrm{P}_{\mathrm{a}} \Lambda \omega^{\mathrm{b}}
$$

it follows that

$$
\sqrt{-1} \int_{\Sigma} \varepsilon_{\mathrm{abc}} \mathrm{~W}_{\mathrm{c}} \mathrm{P}_{\mathrm{a}} \Lambda \omega^{\mathrm{b}}
$$

cancels with

$$
\sqrt{-1} \int_{\Sigma} q\left(d N, \omega^{a}\right) P_{b} \wedge *\left(\omega^{a} \Lambda \omega^{b}\right)
$$

What remains, viz.

$$
-\int_{\Sigma} \varepsilon_{a b c}{ }^{W}{ }_{c} d \omega^{a} \lambda \omega^{b}
$$

cancels with

$$
\begin{aligned}
\delta_{\Sigma} & -q\left(d N, \omega^{c}\right) q\left(\omega^{c} \Lambda \omega^{a}, d \omega^{a}\right) v o l_{q} \\
& =\delta_{\Sigma} W_{C} q\left(\omega^{c} \wedge \omega^{a}, d \omega^{a}\right) v o l_{q^{\prime}} .
\end{aligned}
$$

Indeed

$$
\begin{aligned}
& -\int_{\Sigma} \varepsilon_{a b c} W_{C} d \omega^{a} \Lambda \omega^{b} \\
& \quad=\int_{\Sigma} W_{C} d \omega^{a} \Lambda \varepsilon_{a c b^{b}} \omega^{b} \\
& \quad=\int_{\Sigma} W_{C} d \omega^{a}{ }^{a} *\left(\omega^{a} \wedge \omega^{c}\right) \\
& \quad=\int_{\Sigma} W_{C} q\left(\omega^{a} \Lambda \omega^{c}, d \omega^{a}\right) v o l_{q} \\
& \quad=-\int_{\Sigma} W_{C} q\left(\omega^{c} \Lambda \omega^{a}, d \omega^{a}\right) v o l_{q}
\end{aligned}
$$

Definition: The Ashtekar hamiltonian is the function

$$
H: \mathrm{T}^{*} * \underline{\underline{Q}}_{\underline{\mathrm{C}}} \rightarrow \underline{\mathrm{C}}
$$

defined by the prescription

$$
\begin{aligned}
& H(\vec{Q}, \vec{A} ; N, \vec{N}, \vec{Z}) \\
& \quad=\int_{\Sigma} L_{\vec{N}} \vec{Q} \dot{\lambda} \vec{A}+\int_{\Sigma} \vec{Z} \dot{\wedge} d^{A} \vec{Q}+\int_{\Sigma}-\sqrt{-I} \overrightarrow{N F} \dot{\wedge} *
\end{aligned}
$$

The constraints of the theory are encoded in the demand that

$$
\frac{\delta H}{\delta N}=0, \frac{\delta H}{\delta \vec{N}}=0, \frac{\delta H}{\delta \vec{Z}}=0 .
$$

We shall deal with the first and second of these later on. As for the third, it is clear that

$$
\frac{\delta H}{\delta \vec{Z}}=d^{A} \vec{Q}
$$

Rappel: The ADM sector of $T^{*} \underline{\underline{Q}}_{\underline{C}}$ consists of the pairs $(\vec{\omega}, \overrightarrow{\mathrm{p}})$ for which

$$
\omega^{a} \wedge p_{b}=\omega^{b} \wedge p_{a}
$$

The image of the $A D M$ sector of $T^{*} \underline{Q}_{\underline{C}}$ under $T$ is the set of pairs $(\vec{\omega}, \vec{P})$ such that

$$
\omega^{\mathrm{b}} \wedge \mathrm{P}_{a}-\omega^{\mathrm{a}} \wedge \mathrm{P}_{\mathrm{b}}+\sqrt{-1} \mathrm{~d}\left(\omega^{\mathrm{a}} \wedge \omega^{\mathrm{b}}\right)=0
$$

E.g.:

$$
\begin{gathered}
\omega^{a} \wedge p_{b}=\omega^{b} \wedge p_{a} \\
\Rightarrow \\
\omega^{b} \wedge\left(p_{a}-\sqrt{-1} d \omega_{a}\right)-\omega^{a} \wedge\left(p_{b}-\sqrt{-1} d \omega_{b}\right)+\sqrt{-1} d\left(\omega^{a} \wedge \omega^{b}\right) \\
=\omega^{b} \wedge p_{a}-\omega^{a} \wedge p_{b}+\sqrt{-1}\left(-d \omega^{a} \Lambda \omega^{b}+\omega^{a} \wedge d \omega^{b}\right)+\sqrt{-1} d\left(\omega^{a} \Lambda \omega^{b}\right)
\end{gathered}
$$

19. 

$$
\begin{gathered}
=\sqrt{-1}\left(-d \omega^{a} \wedge \omega^{b}+\omega^{a} \wedge d \omega^{b}\right)+\sqrt{-1}\left(d \omega^{a} \wedge \omega^{b}-\omega^{a} \wedge d \omega^{b}\right) \\
=0 .
\end{gathered}
$$

The image of the $A D M$ sector of $T^{*} \underline{Q}_{\underline{C}}$ under $S \circ T$ is the set of pairs $(\vec{Q}, \vec{A})$ such that

$$
d^{A_{Q} \vec{Q}}=0 .
$$

E.g.:

$$
\begin{aligned}
& \omega^{c} \wedge P_{b}-\omega^{b} \wedge P_{c}+\sqrt{-1} d\left(\omega^{b} \Lambda \omega^{c}\right)=0 \\
& \text { => } \\
& d^{A} Q^{a}=d Q^{a}-\sqrt{-1} \varepsilon_{a b c} A^{C} \wedge Q^{b} \\
& =-d * \omega^{a}-\sqrt{-1} \varepsilon_{a b c}\left(q\left(P_{d}, * \omega_{c}\right) \omega^{d}-\frac{P}{2} \omega_{c}\right) \wedge-* \omega^{b} \\
& =-\varepsilon_{a b c} d \omega^{b} \Lambda \omega^{c} \\
& \left.+\sqrt{-1} \varepsilon_{a b c}{ }^{q\left(P_{d}\right.}{ }^{*}{ }^{* \omega}{ }_{c}\right) q\left(\omega^{d}, \omega^{b}\right) \operatorname{vol}_{q} \\
& -\sqrt{-1} \varepsilon_{a b c} \frac{\mathrm{P}}{2} \mathrm{q}\left(\omega^{\mathrm{c}}, \omega^{\mathrm{b}}\right) \operatorname{vol}_{\mathrm{q}} \\

& \left.+\sqrt{-1} \varepsilon_{a b c} q^{\left(P_{b}, * \omega_{c}\right)}\right)^{\operatorname{vol}}{ }_{q}-\sqrt{-1} \varepsilon_{a b b} \frac{P}{2} \operatorname{vol}_{q} \\
& =-\varepsilon_{a b c} d \omega^{b} \Lambda \omega^{c}+\sqrt{-1} \varepsilon_{a b c} q^{\left(P_{b}, * \omega_{c}\right)}{ }^{\text {vol }}{ }_{q}
\end{aligned}
$$

$$
\begin{aligned}
& =-\varepsilon_{a b c} d \omega^{b} \wedge \omega^{c}+\sqrt{-1} \varepsilon_{a b c} \omega^{c} \wedge P_{b} \\
& =-\varepsilon_{a b c} d \omega^{b} \wedge \omega^{c}+\frac{\sqrt{-1}}{2} \varepsilon_{a b c} \omega^{c} \wedge P_{b}+\frac{\sqrt{-1}}{2} \varepsilon_{a b c} \omega^{\omega} \wedge P_{b} \\
& =-\varepsilon_{a b c} d \omega^{b} \wedge \omega^{c}+\frac{\sqrt{-1}}{2} \varepsilon_{a b c} \omega^{c} \wedge P_{b}+\frac{\sqrt{-1}}{2} \varepsilon_{a c b} \omega^{b} \wedge P_{c} \\
& =-\varepsilon_{a b c} d \omega^{b} \Lambda \omega^{c}+\frac{\sqrt{-1}}{2} \varepsilon_{a b c} \omega^{c} \wedge P_{b}-\frac{\sqrt{-1}}{2} \varepsilon_{a b c} \omega^{b} \wedge P_{c} \\
& =-\varepsilon_{a b c} d \omega^{b} \Lambda \omega^{c}+\frac{\sqrt{-1}}{2} \varepsilon_{a b c}\left(-\sqrt{-1} d\left(\omega^{b} \Lambda \omega^{c}\right)\right) \\
& =-\varepsilon_{a b c} d \omega^{b} \Lambda \omega^{c}+\frac{1}{2} \varepsilon_{a b c} d\left(\omega^{b} \Lambda \omega^{c}\right) \\
& =-\varepsilon_{a b c} d \omega^{b} \Lambda \omega^{c}+\frac{1}{2} \varepsilon_{a b c}\left(d \omega^{b} \Lambda \omega^{c}-\omega^{b} \Lambda d \omega^{c}\right) \\
& =-\varepsilon_{a b c} d \omega^{b} \Lambda \omega^{c}+\frac{1}{2} \varepsilon_{a b c} d \omega^{b} \Lambda \omega^{c}-\frac{1}{2} \varepsilon_{a c b} \omega^{c} \Lambda d \omega^{b} \\
& =-\varepsilon_{a b c} d \omega^{b} \Lambda \omega^{c}+\frac{1}{2} \varepsilon_{a b c} d \omega^{b} \Lambda \omega^{c}+\frac{1}{2} \varepsilon_{a b c} d \omega^{b} \Lambda \omega^{c} \\
& =0 \text {. }
\end{aligned}
$$

We have

The path $t \rightarrow\left(\vec{\omega}_{t} \vec{P}_{t}\right)$ lies in the ADM sector of $T^{*} Q$ and $\operatorname{Ein}(g)=0$ provided the constraint equations and the evolution equations are satisfied by the pair $\left(\vec{\omega}_{t}, \vec{p}_{t}\right)$. The path $t \rightarrow T\left(\vec{\omega}_{t}, \vec{p}_{t}\right) \quad\left(=\left(\vec{\omega}_{t}, \vec{p}_{t}\right)\right)$ lies in the image under $T$ of the

ADM sector of $\mathrm{T}^{*} \underline{\underline{Q}}_{\underline{C}}$ and, since $T$ is canonical, $\operatorname{Ein}(g)=0$ provided the constraint equations are satisfied by the pair $\left(\vec{\omega}_{t}, \overrightarrow{\mathrm{P}}_{t}\right)$. Finally, the path $t \rightarrow S \circ T\left(\vec{\omega}_{t}, \overrightarrow{\mathrm{p}}_{t}\right)$ $\left(=\left(\vec{Q}_{t}, \vec{A}_{t}\right)\right)$ lies in the image under $S \circ T$ of the $A D M$ sector of $T^{*} \underline{\underline{Q}}_{\underline{C}}$ and, since $S \circ T$ is canonical, $\operatorname{Ein}(g)=0$ provided the constraint equations and the evolution equations are satisfied by the pair ( $\vec{Q}_{t}, \vec{A}_{t}$ ).
N.B. The constraint equations and the evolution equations per ( $\vec{Q}_{t}, \overrightarrow{\mathrm{~A}}_{t}$ ) are explicated in the ensuing sections.

Section 58: Evolution in the Ashtekar Picture The assumptions and notation are those of the standard setup but with the restriction that $n=4$.

Let

$$
\begin{gathered}
H=H(\vec{Q}, \vec{A} ; N, \vec{N}, \vec{Z}) \\
=\int_{\Sigma} L_{\vec{N}} \vec{Q} \dot{\wedge} \dot{A}+\int_{\Sigma} \vec{Z} \dot{\perp} d^{A} \vec{Q}+\int_{\Sigma}-\sqrt{-1} \overrightarrow{N F} \dot{\wedge} * \vec{Q} .
\end{gathered}
$$

Objective: Compute the functional derivatives

$$
\left.\right|_{-} \frac{\delta H}{\delta \vec{A}}
$$

and hence determine the equations of motion

$$
\left.\right|_{-\quad} ^{-\vec{Q}}=\frac{\delta H}{\delta \vec{A}}, \begin{aligned}
-\vec{A} & =-\frac{\delta H}{\delta \vec{Q}}
\end{aligned}
$$

Calculation of $\frac{\delta H}{\delta \vec{A}}$ :

1. Consider

$$
\delta_{a}\left(L_{\vec{N}} \vec{Q} \dot{A} \vec{A}\right)
$$

Thus

$$
\begin{aligned}
\delta_{a}\left(L_{\vec{N}} Q^{b} \wedge A_{b}\right) & =\underset{\vec{N}}{L_{\vec{N}}} Q^{b} \wedge \delta_{a} A_{b} \\
& =\underset{\vec{N}}{L_{\vec{N}}} Q^{a} \wedge \delta A_{a} .
\end{aligned}
$$

2. 

Therefore

$$
\frac{\delta}{\delta \mathbb{A}_{\mathrm{a}}}\left[\int_{\Sigma} \stackrel{L}{\mathrm{~N}}^{\vec{Q}} \dot{\mathrm{~A}}\right]=\mathrm{L}_{\overrightarrow{\mathrm{N}}} \mathrm{Q}^{\mathrm{a}}
$$

2. Consider

$$
\delta_{a}\left(\vec{Z} \dot{\wedge} d^{A} \vec{Q}\right)
$$

Thus

$$
\begin{aligned}
\delta_{a}\left(Z_{b} \wedge d^{A} Q^{b}\right) & =\delta_{a}\left(Z_{b} \wedge\left(d Q^{b}-\sqrt{-1} \varepsilon^{b} d^{A} A^{d} \wedge Q^{c}\right)\right) \\
& =-\sqrt{-1} Z_{b} \wedge \delta_{a}\left(\varepsilon^{b}{ }_{c d^{A}} A^{d}\right) \wedge Q^{c} \\
& =-\sqrt{-1} Z_{b} \wedge \varepsilon^{b} c a a_{a} \delta A^{c} Q^{c} \\
& =-\sqrt{-1} \varepsilon_{b c a} Z_{b} \wedge Q^{c} \wedge \delta A_{a} \\
& =-\sqrt{-1} \varepsilon_{a b c}{ }^{Z_{b}}{ }^{\wedge} Q^{c} \wedge \delta A_{a} \\
& =-\sqrt{-1}\left(\vec{Z} \stackrel{\times}{ } \wedge^{Q}\right) a^{\wedge} \wedge A_{a} .
\end{aligned}
$$

Therefore

$$
\frac{\delta}{\delta A_{a}}\left[\int_{\Sigma} \vec{Z} \dot{\wedge} d^{A} \vec{Q}\right]=-\sqrt{-1}(\vec{Z} \stackrel{\times}{\wedge} \vec{Q})_{a}
$$

3. Consider

$$
\delta_{a}(-\sqrt{-1} \stackrel{\rightharpoonup}{F} \dot{\wedge} * \vec{Q})
$$

3. 

Thus

$$
\begin{aligned}
\delta_{a}(- & \left.\sqrt{-1} N F_{b} \wedge * Q^{b}\right) \\
& =-\sqrt{-1}\left(N * Q^{b} \wedge_{a}\left(d A_{b}+\frac{\sqrt{-1}}{2}\left(\vec{A}^{\times} \wedge \vec{A}\right)_{b}\right)\right. \\
& =-\sqrt{-1}\left(N * Q^{a} \wedge d \delta A_{a}+\frac{\sqrt{-1}}{2} N * Q^{b} \wedge \delta_{a}\left(\vec{A}^{\times} \stackrel{\rightharpoonup}{A}\right)_{b}\right) .
\end{aligned}
$$

- $d\left(N * Q^{a} \wedge \delta A_{a}\right)$

$$
=d\left(N * Q^{a}\right) \wedge \delta A_{a}-N * Q^{a} \wedge d \delta A_{a}
$$

=>

$$
N * Q^{\mathrm{a}} \wedge \mathrm{~d} \delta \mathrm{~A}_{\mathrm{a}}
$$

$$
=-d\left(\mathbb{N} * Q^{a} \wedge \delta A_{a}\right)+d\left(N * Q Q^{a}\right) \wedge \delta A_{a} .
$$

- $\frac{\sqrt{-1}}{2} \delta_{a}\left(\vec{A} \stackrel{\times}{\wedge} \vec{A}_{b}\right.$

$$
\begin{aligned}
& =\frac{\sqrt{-1}}{2} \delta_{a}\left(\varepsilon_{b c d} A_{c} \wedge A_{d}\right) \\
& =\frac{\sqrt{-1}}{2}\left(\varepsilon_{b a d} \delta A_{a} \wedge A_{d}+\varepsilon_{b c a} A_{c} \wedge \delta A_{a}\right) \\
& =\frac{\sqrt{-1}}{2}\left(-\varepsilon_{b a d} A_{d} \wedge \delta A_{a}+\varepsilon_{b c a} A_{c} \wedge \delta A_{a}\right) \\
& =\frac{\sqrt{-1}}{2}\left(-\varepsilon_{b a d} A_{d}+\varepsilon_{b c a} A_{c}\right) \wedge \delta A_{a} \\
& =\frac{\sqrt{-1}}{2}\left(\varepsilon_{b d a} A_{d}+\varepsilon_{b c a} A_{c}\right) \wedge \delta A_{a}
\end{aligned}
$$

4. 

$$
\begin{aligned}
& =\frac{\sqrt{-1}}{2}\left(\varepsilon_{b c a}{ }^{A} c+\varepsilon_{b c a}{ }^{A}{ }_{c}\right) \wedge \delta A_{a} \\
& =\sqrt{-1} \varepsilon_{b c a} A_{c} \wedge \delta A_{a} \\
& \text { => } \\
& \frac{\sqrt{-1}}{2} N * Q^{b_{\wedge}}{ }_{a}(\vec{A} \stackrel{\times}{\wedge} \vec{A})_{b} \\
& =N * Q^{b} \wedge \sqrt{-1} \varepsilon_{b c a} A_{c} \wedge \delta A_{a} \\
& =-\sqrt{-1} \varepsilon_{b c a}{ }^{A} c N N \star Q^{b} \wedge \delta A_{a} \\
& =-\sqrt{-1} \varepsilon_{b c^{A}}{ }^{\mathrm{C}} \Lambda N * Q^{\mathrm{b}} \wedge \delta \mathrm{~A}_{\mathrm{a}} .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& \frac{\delta}{\delta A_{a}}\left[\delta_{\Sigma}-\sqrt{-1} N \vec{N} \dot{\wedge} * \vec{Q}\right] \\
& =-\sqrt{-1}\left(d\left(N * Q^{a}\right)-\sqrt{-1} \varepsilon_{b c}^{a} A^{C} \wedge\left(N * Q^{b}\right)\right) \\
& =-\sqrt{-1} d^{A}\left(N * Q^{a}\right) .
\end{aligned}
$$

Combining 1,2 , and 3 then gives

$$
\frac{\delta H}{\delta \vec{A}}=\underset{\vec{N}}{L_{\vec{Q}}}-\sqrt{-1} \vec{Z} \stackrel{\times}{\wedge} \vec{Q}-\sqrt{-1} d^{A}(N * \vec{Q})
$$

Calculation of $\frac{\delta H}{\delta \vec{Q}}$ :

1. Consider

$$
\delta_{a}\left(L_{\vec{N}} \vec{Q} \dot{A}\right)
$$

Thus

$$
\begin{aligned}
\delta_{a}\left(L_{\vec{N}} Q^{b} \wedge A_{b}\right) & =\delta_{a} L_{\vec{N}} Q^{b} \wedge A_{b} \\
& =L_{\vec{N}} \delta Q^{a} \wedge A_{a} \\
& =-\delta Q^{a} \wedge L_{\vec{N}} A_{a}+L_{\vec{N}}\left(\delta Q^{a} \wedge A_{a}\right)
\end{aligned}
$$

Therefore

$$
\frac{\delta}{\delta Q^{a}}\left[\int_{\Sigma} L_{\vec{N}} \vec{Q} \dot{A}\right]=-L_{\vec{N}}^{A} a .
$$

2. Consider

$$
\delta_{a}\left(\vec{Z} \wedge d^{A} \mathbb{Q}\right)
$$

Thus

$$
\begin{aligned}
\delta_{a}\left(Z_{b} \wedge d^{A} Q^{b}\right)= & \delta_{a}\left(d^{A} Q^{b} \wedge Z_{b}\right) \\
= & \delta_{a}\left(\left(d Q^{b}-\sqrt{-1} \varepsilon^{b} c d^{A}{ }^{d} \wedge Q^{c}\right) \wedge Z_{b}\right) \\
= & d \delta Q^{a} \wedge Z_{a}-\sqrt{-1} \varepsilon^{b} a c^{A}{ }^{c} \wedge \delta Q^{a} \wedge Z_{b} \\
= & -\delta Q^{a} \wedge d Z_{a}-\delta Q^{a} \wedge \sqrt{-1} \varepsilon^{b} a A^{A} A^{c} \wedge Z_{b} \\
& +d\left(\delta Q^{a} \wedge Z_{a}\right)
\end{aligned}
$$

6. 

$$
\begin{aligned}
=\delta Q^{a} \wedge\left(-d Z_{a}-\right. & \left.\sqrt{-1} \varepsilon^{b} a c^{A^{c}} \wedge Z_{b}\right) \\
& +d\left(\delta Q^{a} \wedge Z_{a}\right) \\
=\delta Q^{a} \wedge\left(-d Z_{a}+\right. & \left.\sqrt{-1} \varepsilon_{a b c} A^{c} \wedge Z_{b}\right) \\
& +d\left(\delta Q^{a} \wedge Z_{a}\right)
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& \frac{\delta}{\delta Q^{a}}\left[\delta_{\Sigma} \vec{Z} \dot{\wedge} d^{A} \vec{Q}\right] \\
& \quad=-\left(d Z_{a}-\sqrt{-1} \varepsilon_{a b c}{ }^{A^{c} \wedge Z_{b}}\right) \\
& \quad=-d^{A} Z_{a} .
\end{aligned}
$$

3. Consider

$$
\delta_{a}(-\sqrt{-1} N \vec{F} \dot{\Lambda} * \vec{Q}) .
$$

Thus

$$
\begin{aligned}
\delta_{a}\left(-\sqrt{-1} N \vec{F}_{b} \wedge * Q^{b}\right) & =\delta_{a}\left(-\sqrt{-1} N F_{b} \wedge-\omega^{b}\right) \\
& =\sqrt{-1} \delta_{a}\left(\omega^{b} \wedge N F_{b}\right)
\end{aligned}
$$

IEMMA We have

$$
-\frac{\delta}{\delta Q^{a}}\left[\delta_{\Sigma} \omega^{b} \wedge N F_{b}\right] \quad\left(=\frac{\delta}{\delta \star \omega^{a}}\left[\delta_{\Sigma} \omega^{b} \wedge N F_{b}\right]\right)
$$

$$
=\frac{1}{2} q\left(N F_{c^{\prime}} * \omega^{c}\right) \omega^{a}-q\left(\omega^{a}, * N F_{b}\right) \omega^{b}
$$

[Let $\beta_{a}=N F_{a}$ and

$$
\gamma_{a}=\frac{1}{2} q\left(\beta_{c}, * \omega^{c}\right) \omega^{a}-q\left(\omega^{a}, * \beta_{b}\right) \omega^{b}
$$

Then (see the end of Section 56)

$$
\begin{aligned}
& \beta_{a}=*\left(\omega^{b} \wedge \omega^{a}\right) \wedge \gamma_{b} \\
& \Rightarrow \quad \omega^{a} \wedge \beta_{a}=\omega^{a} \wedge *\left(\omega^{b} \wedge \omega^{a}\right) \wedge \gamma_{b} \\
&=\omega^{a} \wedge \varepsilon_{b a c} \omega^{c} \wedge \gamma_{b} \\
&=\varepsilon_{b a c}\left(\omega^{a} \wedge \omega^{c}\right) \wedge \gamma_{b} \\
&=2 * \omega^{b} \wedge \gamma_{b} \\
& \Rightarrow \quad \frac{\delta}{\delta * \omega^{a}}\left[\delta_{\Sigma} \omega^{b} \wedge \beta_{b}\right] \\
&=\frac{\delta}{\delta * \omega^{a}}\left[\delta_{\Sigma} 2 * \omega^{b} \wedge \gamma_{b}\right]
\end{aligned}
$$

Now take $\delta_{a}$ per $* \omega^{a}$ and not $-* \omega^{a}\left(=Q^{a}\right)-$ then

$$
\begin{aligned}
2 \delta_{a}\left(* \omega^{b} \wedge \gamma_{b}\right) & =2 \delta_{a} * \omega^{b} \wedge \gamma_{b}+2 * \omega^{b} \wedge \delta_{a} \gamma_{b} \\
& =2 \delta * \omega^{a} \wedge \gamma_{a}+2 * \omega^{b} \wedge \delta_{a} \gamma_{b}
\end{aligned}
$$

But

$$
\begin{gathered}
0=\delta_{a} \beta_{c}=\delta_{a}\left(*\left(\omega^{b} \wedge \omega^{c}\right) \wedge \gamma_{b}\right) \\
=\delta_{a}\left(*\left(\omega^{b} \wedge \omega^{c}\right)\right) \wedge \gamma_{b}+*\left(\omega^{b} \wedge \omega^{c}\right) \wedge \delta_{a} \gamma_{b}
\end{gathered}
$$

Therefore

$$
\begin{aligned}
2 * \omega^{b} \wedge \delta_{a} \gamma_{b} & =\omega^{c} \wedge *\left(\omega^{b} \wedge \omega^{c}\right) \wedge \delta_{a} \gamma_{b} \\
& =-\omega^{c} \wedge \delta_{a}\left(*\left(\omega^{b} \wedge \omega^{c}\right)\right) \wedge \gamma_{b} \\
& =-\omega^{c} \wedge \varepsilon_{b c d} \delta_{a} \omega^{d} \wedge \gamma_{b} \\
& =\delta_{a} \omega^{d} \wedge \varepsilon_{b c d^{2}} \omega^{c} \wedge \gamma_{b} \\
& =-\delta_{a} \omega^{d} \wedge \varepsilon_{b d d} \omega^{c} \wedge \gamma_{b} \\
& =-\delta_{a} \omega^{d} \wedge *\left(\omega^{b} \wedge \omega^{d}\right) \wedge \gamma_{b} \\
& =-\delta_{a} \omega^{d} \wedge \beta_{d} \\
& =-\delta_{a} \omega^{b} \wedge \beta_{b}
\end{aligned}
$$

$$
\begin{aligned}
& \Rightarrow \\
& 2 \delta_{a}\left(* \omega^{b} \wedge \gamma_{b}\right)=2 \delta * \omega^{a} \wedge \gamma_{a}-\delta_{a} \omega^{b} \wedge \beta_{b} \\
&=2 \delta * \omega^{a} \wedge \gamma_{a}-\delta_{a} \omega^{b} \wedge \beta_{b}-\omega^{b} \wedge \delta_{a} \beta_{b} \\
&=2 \delta * \omega^{a} \wedge \gamma_{a}-\delta_{a}\left(\omega^{b} \wedge \beta_{b}\right)
\end{aligned}
$$

$$
\begin{aligned}
& \left.\Rightarrow \quad \begin{array}{rl}
\quad \delta_{a}\left(\omega^{b} \wedge \beta_{b}\right) & =2 \delta_{a}\left(* \omega^{b} \wedge \gamma_{b}\right) \\
& =2 \delta * \omega^{a} \wedge \gamma_{a}-\delta_{a}\left(\omega^{b} \wedge \beta_{b}\right) \\
\Rightarrow \quad & \delta_{a}\left(\omega^{b} \wedge \beta_{b}\right)
\end{array}\right)=\delta * \omega^{a} \wedge \gamma_{a} \\
& \Rightarrow \quad \frac{\delta}{\delta * \omega^{a}}\left[\delta_{\Sigma} \omega^{b} \wedge \beta_{b}\right]=\gamma_{a} .
\end{aligned}
$$

I.e.:

$$
\begin{aligned}
\frac{\delta}{\delta * \omega}{ }^{\mathrm{a}} & {\left[\delta_{\Sigma} \omega^{\mathrm{b}} \wedge N F_{b}\right] } \\
& \left.=\frac{1}{2} q\left(N F_{c^{\prime}}, * \omega^{c}\right) \omega^{a}-q\left(\omega^{a}, * N F_{b}\right) \omega^{b} \cdot\right]
\end{aligned}
$$

Notation: Put

$$
\mathrm{F}=\mathrm{q}\left(\mathrm{~F}_{\mathrm{uv}^{\prime}} \omega^{\mathrm{u}} \Lambda \omega^{\mathrm{v}}\right)
$$

Then

$$
\begin{aligned}
& \frac{1}{2} q\left(\mathrm{NF}_{\mathrm{C}^{\prime}} * \omega^{\mathrm{C}}\right) \omega^{\mathrm{a}} \\
& \quad=-\frac{1}{2} \mathrm{q}\left(\mathrm{NF}_{\mathrm{C}^{\prime}} * \omega^{\mathrm{C}}\right) * Q^{a} \\
& \quad=-\frac{1}{2} \mathrm{Nq}\left(\frac{\sqrt{-1}}{2} \varepsilon_{C u v^{\prime}} \mathrm{F}_{u v^{\prime}} * \omega^{\mathrm{C}}\right) * Q^{a}
\end{aligned}
$$

10. 

$$
\begin{aligned}
& =-\frac{\sqrt{-1}}{4} N q^{\left(F_{u v^{\prime}} \varepsilon_{C u v} * \omega^{c}\right) * Q^{a}} \\
& =-\frac{\sqrt{-1}}{4} N q^{a}\left(F_{u v^{\prime}} \varepsilon_{u v c} * \omega^{c}\right) * Q^{a} \\
& =-\frac{\sqrt{-1}}{4} N q\left(F_{u v^{\prime}} \omega^{u} \wedge \omega^{v}\right) * Q^{a} \\
& =-\frac{\sqrt{-1}}{4} N F * Q^{a} .
\end{aligned}
$$

Notation: Put

$$
(\overrightarrow{\operatorname{Ric}} F)_{a}={ }_{\omega}^{1}{ }^{b_{b a}} F_{b a}
$$

Then

$$
\begin{aligned}
& (\overrightarrow{\text { Ric }} F)_{a}=-\sqrt{-1} \varepsilon_{c_{b a}^{l}}{ }_{\omega}{ }^{\mathrm{F}_{\mathrm{C}}} \\
& =\sqrt{-1} \varepsilon_{a b c}{ }_{\omega}{ }_{\omega}{ }^{\mathrm{F}} \mathrm{c}_{\mathrm{c}} \\
& \text { => } \\
& \sqrt{-1}(\overrightarrow{R i c} F)_{a}=-\varepsilon_{a b c}{ }_{\omega}{ }_{\omega}{ }^{F}{ }_{c} \\
& =-\varepsilon_{a b c} q\left(\omega^{u},{ }_{\omega}{ }_{\omega}{ }^{F} c_{c}\right) \omega^{u} \\
& =-\varepsilon_{a b c} q\left(\omega^{b} \wedge \omega^{\mathrm{u}}, \mathrm{~F}_{\mathrm{c}}\right) \omega^{\mathrm{u}} \\
& =-\varepsilon_{a b c}{ }^{\varepsilon_{b u v}}{ }^{q}\left(* \omega^{\mathrm{V}}, \mathrm{~F}_{\mathrm{c}}\right) \omega^{\mathrm{u}} \\
& =\varepsilon_{a c b} \varepsilon_{u v b} q\left(*_{\omega}{ }^{v}, F_{c}\right) \omega^{u}
\end{aligned}
$$

## 11.

$$
\begin{aligned}
& =\delta^{\mathrm{ac}}{ }_{u v} \mathrm{q}\left(* \omega^{\mathrm{v}}, \mathrm{~F}_{\mathrm{c}}\right) \omega^{\mathrm{u}} \\
& =\left(\delta^{\mathrm{a}}{ }_{u} \delta^{\mathrm{c}}{ }_{v}-\delta^{\mathrm{a}}{ }_{v} \delta^{\mathrm{c}}{ }_{u}\right) q\left(* \omega^{\mathrm{V}},{ }_{\mathrm{F}}{ }_{\mathrm{C}}\right) \omega^{\mathrm{u}} \\
& =q\left(* \omega^{c}, F_{c}\right) \omega^{a}-q\left(\omega^{a}, * F_{c}\right) \omega^{c} \\
& \text { => } \\
& \sqrt{-1} N(\overrightarrow{\text { Rim }})_{a} \\
& =q\left(N F_{c}, * \omega^{C}\right) \omega^{a}-q\left(\omega^{a}, * N F_{b}\right) \omega^{b} \\
& \text { => } \\
& \sqrt{-\mathrm{I}} \mathrm{~N}(\overrightarrow{\mathrm{Ric}} \mathrm{~F})_{a}-\frac{1}{2} q\left(\mathrm{NF}_{c}, * \omega^{C}\right) \omega^{a} \\
& =\frac{1}{2} q\left(N F_{c^{\prime}} * \omega^{C}\right) \omega^{a}-q\left(\omega^{a}, \star N F_{b}\right) \omega^{b} \\
& \text { => } \\
& \frac{\delta}{\delta * \omega^{a}}\left[\delta_{\Sigma} \omega^{b} \wedge N F_{b}\right] \\
& =\sqrt{-1} N(\overrightarrow{R i c} F)_{a}+\frac{\sqrt{-1}}{4} N F * Q^{a} \\
& \text { => } \\
& \frac{\delta}{\delta Q^{a}}\left[\delta_{\Sigma}-\sqrt{-1} \overrightarrow{N F} \dot{\wedge} \times \vec{Q}\right]=N(\overrightarrow{\operatorname{Ric} F})_{a}+\frac{1}{4} N F * Q^{a} .
\end{aligned}
$$

Combining 1, 2, and 3 then gives

$$
\frac{\delta H}{\delta \vec{Q}}=-L_{\vec{N}}^{\vec{A}}-d^{A} \vec{Z}+N(\overrightarrow{R i c} F)+\frac{1}{4} N F+\vec{Q} .
$$

Definition: The relations
are the Ashtekar equations of motion.
Reality Check Along the path $t \rightarrow\left(\vec{\omega}_{t}, \vec{p}_{t}\right)$, we have

$$
\dot{\bar{\omega}} \mathrm{a}=\mathrm{N}_{\mathrm{t}} \bar{\omega}_{0}^{\mathrm{a}}+\overline{\mathrm{Q}}_{\mathrm{b}^{\mathrm{\omega}}}^{\mathrm{a}}+\mathrm{L}_{\vec{N}_{\mathrm{t}}} \bar{\omega}^{\mathrm{a}}
$$

Write

$$
\star \bar{\omega}^{-\mathrm{a}}=\frac{1}{2} \varepsilon_{\mathrm{abc}} \bar{\omega}^{-\mathrm{b}} \wedge \bar{\omega}^{\mathrm{c}}
$$

Then

$$
\begin{aligned}
& \frac{d}{d t} * \bar{\omega}^{\mathrm{a}}=\frac{1}{2} \varepsilon_{a b c} \dot{\bar{\omega}}^{\mathrm{b}} \wedge \bar{\omega}^{\mathrm{c}}+\frac{1}{2} \varepsilon_{a b c}{ }^{\bar{\omega} \mathrm{b}} \wedge \dot{\bar{\omega}} \mathrm{c} \\
& =\frac{1}{2} \varepsilon_{a b c} c^{\dot{\omega} \mathrm{b}} \Lambda \bar{\omega}^{\mathrm{c}}+\frac{1}{2} \varepsilon_{\mathrm{acb}} \bar{\omega}^{-\mathrm{c}} \wedge \dot{\bar{\omega}} \mathrm{~b} \\
& =\frac{1}{2} \varepsilon_{a b c} \dot{\overline{\bar{\omega}}}^{\omega} \Lambda \bar{\omega}^{c}-\frac{1}{2} \varepsilon_{a b c}{ }^{-c} \Lambda \dot{\bar{\omega}} b \\
& =\frac{1}{2} \varepsilon a b c^{\dot{\bar{\omega}} \mathrm{b}} \bar{\omega}^{-\mathrm{c}}+\frac{1}{2} \varepsilon_{a b c} \dot{\bar{\omega}}^{\dot{\mathrm{b}}} \Lambda \bar{\omega}^{\mathrm{c}} \\
& =\varepsilon_{a b c} \dot{\bar{\omega}}^{\ddot{b}} \wedge \bar{\omega}^{-c} \\
& =\varepsilon_{a b c}\left(N_{t} \bar{\omega}_{0}^{\mathrm{b}}+\bar{Q}_{d^{-b}} a^{-\mathrm{d}}+L_{\vec{N}_{t}} \bar{\omega}^{-\mathrm{b}}\right) \wedge \bar{\omega}^{\mathrm{c}} .
\end{aligned}
$$

On the other hand,

$$
\begin{aligned}
& \text { => } \\
& \frac{\mathrm{d}}{\mathrm{dt}}-*_{\bar{\omega}}{ }^{\mathrm{a}}=L_{\bar{N}_{\mathrm{N}}}-* \bar{\omega}_{\mathrm{a}}-\sqrt{-1} \varepsilon_{a b c}{ }_{\mathrm{z}_{\mathrm{b}} \wedge}-* \bar{\omega}^{\mathrm{c}} \\
& -\sqrt{-1}\left(-\alpha\left(N_{t}{ }^{-a}\right)-\sqrt{-1} \varepsilon_{b c}^{a} A^{C} \wedge-\left(N_{t} \bar{\omega}^{-b}\right)\right) \\
& \text { => } \\
& \frac{\mathrm{d}}{\mathrm{dt}} * \omega^{-\mathrm{a}}=L_{\overrightarrow{\mathrm{N}}_{\mathrm{t}}} * \bar{\omega}_{\mathrm{a}}+\sqrt{-1} \varepsilon_{\mathrm{abc}} \mathrm{z}_{\mathrm{b}} \wedge-* \bar{\omega}^{\mathrm{c}} \\
& +\sqrt{-1}\left(-d\left(N_{t} \bar{\omega}^{-a}\right)-\sqrt{-1} \varepsilon{ }^{a}{ }_{b c} A^{C} \wedge-\left(N_{t} \bar{\omega}^{b}\right)\right) .
\end{aligned}
$$

And this expression for $\frac{\mathrm{d}}{\mathrm{dt}} * \bar{\omega}^{\mathrm{a}}$ had better agree with the one given above (in particular, the imaginary terms must vanish, our data being real).

- $L_{\vec{N}_{t}} * \bar{\omega}_{a}$

$$
\begin{aligned}
& =\frac{1}{2} \varepsilon_{a b c} \stackrel{\rightharpoonup}{N}_{t} \bar{\omega}^{\mathrm{b}} \wedge \bar{\omega}^{c}+\frac{1}{2} \varepsilon_{a b c} \bar{\omega}^{\bar{b} \wedge L_{\vec{N}_{t}}} \bar{\omega}^{c} \\
& =\frac{1}{2} \varepsilon_{a b c^{L} \vec{N}_{t}} \bar{\omega}^{\mathrm{b}} \wedge \bar{\omega}^{\mathrm{c}}+\frac{1}{2} \varepsilon_{a c b} \bar{\omega}^{\mathrm{c}} \wedge{\stackrel{\rightharpoonup}{{ }_{N}^{N}}}_{t} \bar{\omega}^{\mathrm{b}} \\
& =\frac{1}{2} \varepsilon_{a b c} L_{\overrightarrow{N_{t}}} \bar{\omega}^{\mathrm{b}} \wedge \bar{\omega}^{-c}-\frac{1}{2} \varepsilon_{a b c} \bar{\omega}^{\mathrm{c}} \wedge L_{\overrightarrow{N_{\mathrm{N}}}} \bar{\omega}^{\mathrm{b}} \\
& =\frac{1}{2} \varepsilon_{a b c}{\stackrel{\rightharpoonup}{N_{t}}}^{\omega} \bar{\omega}^{\mathrm{b}} \wedge \bar{\omega}^{c}+\frac{1}{2} \varepsilon_{a b c} \stackrel{\rightharpoonup}{N}_{t} \bar{\omega}^{\mathrm{b}} \wedge \bar{\omega}^{\mathrm{c}}
\end{aligned}
$$

$$
=\varepsilon_{a b c^{L} \vec{N}_{t}}^{\bar{\omega}^{-b} \wedge \widehat{\omega}^{-c}}
$$

The Lie derivative terms thus match up. To compare the rotational terms, recall that

$$
\begin{aligned}
& \mathrm{Z}_{\mathrm{ab}}=-\overline{\mathrm{Q}}_{\mathrm{ab}}+\sqrt{-1} \varepsilon_{\mathrm{abc}} \overline{\mathrm{P}}_{\mathrm{c}} \\
& \text { => } \\
& z_{a}=\frac{\sqrt{-1}}{2} \varepsilon_{a u v}{ }^{Z} u v \\
& =\frac{\sqrt{-1}}{2} \varepsilon_{\mathrm{auv}}\left(-\overline{\mathrm{Q}}_{\mathrm{uv}}+\sqrt{-1} \varepsilon_{\mathrm{uvc}} \overline{\mathrm{P}}_{\mathrm{c}}\right) \\
& =-\frac{\sqrt{-1}}{2} \varepsilon_{\text {auv }} \bar{Q}_{u v}-\frac{1}{2} \varepsilon_{\text {auv }} \varepsilon_{u v c} \overline{\bar{P}}_{c}
\end{aligned}
$$

$$
\begin{aligned}
& =-\frac{\sqrt{-1}}{2} \varepsilon_{a u v} \overline{\bar{Q}}_{\mathrm{uv}}-\frac{1}{2}\left(2 \delta^{\mathrm{a}}{ }_{c} \overline{\mathrm{P}}_{\mathrm{c}}\right. \\
& =-\frac{\sqrt{-1}}{2} \varepsilon_{a u v} \bar{Q}_{u v}-\overline{\mathrm{P}}_{\mathrm{a}} \\
& =-\frac{\sqrt{-I}}{2} \varepsilon_{a u v} \bar{Q}_{u v}+q_{t}\left(\mathrm{dN}_{t}, \bar{\omega}^{\mathrm{a}}\right) \\
& \text { => } \\
& -\sqrt{-1} \varepsilon_{a b c}{ }^{Z} b^{\wedge} \wedge \bar{w}^{c} \\
& =-\sqrt{-1} \varepsilon_{a b c}\left(-\frac{\sqrt{-I}}{2} \varepsilon_{b u v} \bar{Q}_{u v}+q_{t}\left(N_{t}, \bar{\omega}^{-b}\right)\right) \wedge * \bar{\omega}^{\mathrm{c}} .
\end{aligned}
$$

15. 

$$
\begin{aligned}
& \text { - }-\sqrt{-1} \varepsilon_{a b c}\left(-\frac{\sqrt{-1}}{2}\right) \varepsilon_{b u v} \bar{\rho}_{u v} \wedge * \omega^{-c} \\
& =-\frac{1}{2} \varepsilon_{a b c} \varepsilon_{b u v^{\bar{Q}}} \overline{u v} \wedge *{ }^{-c}{ }^{-} \\
& =\frac{1}{2} \varepsilon_{a c b} \varepsilon_{u v b} \overline{\mathscr{R}}_{u v} \wedge * \bar{\omega}^{c} \\
& =\frac{1}{2} \delta^{\mathrm{ac}}{ }_{u v} \overline{\bar{Q}}_{u v} \wedge \star \bar{\omega}^{\mathrm{c}} \\
& =\frac{1}{2}\left(\delta_{u}{ }_{u} \delta^{c}{ }_{v}-\delta^{\mathrm{a}}{ }_{v} \delta^{c}{ }_{u}\right) \overline{\hat{Q}}_{u v} \wedge * \omega^{c} \\
& =\frac{1}{2}\left(\bar{Q}_{a c} \wedge * \bar{\omega}^{\mathrm{C}}-\bar{Q}_{\mathrm{ca}} \wedge * \bar{\omega}^{\mathrm{C}}\right) \\
& =\frac{1}{2}\left(\bar{Q}_{a c} \wedge * \bar{\omega}^{c}+\bar{Q}_{a c} \wedge * \bar{\omega}^{C}\right) \\
& =\bar{Q}_{\mathrm{ac}}{ }^{\wedge \star \bar{\omega}^{\mathrm{C}}} . \\
& \text { - } \varepsilon_{a b c} \overline{0}^{b} d^{-\bar{\omega}} \wedge \bar{\omega}^{c} \\
& =\varepsilon_{a b c} \overline{\bar{Q}}_{b d}{ }^{-\bar{\omega}} \wedge \bar{\omega}^{c} \\
& =\varepsilon_{a b c} \varepsilon_{d c u} \overline{ }_{b d}{ }^{\wedge * \omega^{u}} \\
& =-\varepsilon_{\mathrm{abc}} \varepsilon_{\mathrm{duc}} \overline{\overline{ }}_{\mathrm{bd}}{ }^{\wedge \star \bar{\omega}}{ }^{-\mathrm{u}} \\
& =-\delta^{a b} d u \bar{Q}_{b d^{\wedge}} \wedge \bar{\omega}^{-u}
\end{aligned}
$$

$$
\begin{aligned}
& =-\left(\delta^{a}{ }_{d} \delta^{b} u{ }^{b}-\delta_{u}^{a} \delta^{b}{ }_{d} \bar{Q}_{b d} \wedge \star \bar{w}^{-u}\right. \\
& =-\bar{Q}_{b a} \wedge * \bar{w}^{b}+\bar{Q}_{b b} \wedge \star \bar{w}^{a} \\
& =-\bar{Q}_{b a} \wedge{ }^{*} \vec{\omega}^{\mathrm{b}} \\
& =-\bar{Q}_{c a} \wedge * \bar{\omega}^{C} \\
& =\bar{Q}_{\mathrm{ac}} \wedge \star \bar{\omega}^{\mathrm{c}} .
\end{aligned}
$$

The rotational terms are thereby accounted for. Next

$$
\begin{aligned}
& -\sqrt{-1} \sqrt{-1} \varepsilon_{b c}^{a} A^{c} \Lambda-\left(N_{t}{ }^{-b}\right)=-\varepsilon_{a b c}\left(\frac{\sqrt{-1}}{2} \varepsilon_{C u v} \bar{\omega}_{u v}+\frac{\sqrt{-1}}{2} \varepsilon_{c u v} \sqrt{-1} \varepsilon_{d u v} \bar{\omega}_{O d}\right) \wedge N_{t} \bar{\omega}^{-\mathrm{b}}
\end{aligned}
$$

$$
\begin{aligned}
& =-\frac{\sqrt{-1}}{2} \varepsilon_{a b c} \varepsilon_{u v c} \bar{\omega}_{u v} \wedge N_{t}{ }^{-\mathrm{b}}+\varepsilon_{a b c} \bar{\omega}_{0 c} \wedge N_{t} \bar{\omega}^{\mathrm{b}} \\
& =-\frac{\sqrt{-1}}{2} \delta{ }^{a b} \operatorname{uv}^{\bar{\omega}}{ }_{u v} \wedge N_{t} \bar{\omega}^{b}+\varepsilon_{a c b} N_{t} \bar{\omega}_{0 b} \wedge \bar{\omega}^{-c} \\
& =-\frac{\sqrt{-1}}{2}\left(\delta_{u}^{a} \delta^{b}{ }_{v}-\delta_{v}^{a} \delta_{u}^{b}\right) \bar{\omega}_{u v} \wedge N_{t} \bar{\omega}^{b}-\varepsilon_{a b c} N_{t} \bar{\omega}_{0 b} \Lambda \bar{\omega}^{c} \\
& =-\frac{\sqrt{-1}}{2}\left(\bar{\omega}_{a b}-\bar{\omega}_{b a}\right) \wedge N_{t}{ }^{-\omega^{b}}+\varepsilon_{a b c} N_{t} \bar{\omega}_{b 0} \wedge \bar{\omega}^{c} \\
& =-\sqrt{-1} N_{t} \bar{\omega}_{b}^{\mathrm{a}}{ }_{\mathrm{n}} \bar{\omega}^{\mathrm{b}}+\varepsilon_{a b c} \mathrm{~N}_{\mathrm{t}} \bar{\omega}_{0}^{\mathrm{b}}{ }_{0} \bar{\omega}^{\mathrm{c}} .
\end{aligned}
$$

In view of this, all that remains is to show that the imaginary terms add up to zero:

$$
-\sqrt{-I}\left(\varepsilon_{a b c} q_{t}\left(d N_{t}, \bar{\omega}^{b}\right) \wedge * \bar{\omega}^{c}+d\left(N_{t} \bar{\omega}^{a}\right)+N_{t} \bar{\omega}^{-a} b^{\wedge} \bar{\omega}^{b}\right)=0
$$

1. $\varepsilon_{a b c} q_{t}\left(d N_{t}{ }^{\prime \prime}{ }^{\bar{b}}\right) \wedge * \bar{\omega} \bar{\omega}^{c}$

$$
\begin{aligned}
& =\frac{1}{2} \varepsilon_{a b c} \varepsilon_{c u v} q_{t}\left(d N_{t}, \bar{\omega}^{b}\right) \wedge \bar{\omega}^{u} \wedge \bar{\omega}^{v} \\
& =\frac{1}{2} \varepsilon_{a b c} \varepsilon_{u v c} q_{t}\left(d N_{t}, \bar{\omega}^{b}\right) \wedge \bar{\omega}^{-u} \wedge \bar{\omega}^{-v} \\
& =\frac{1}{2} \delta^{a b}{ }_{u v} q_{t}\left(d N_{t},^{\prime \omega^{b}}\right) \wedge \bar{\omega}^{u} \wedge \bar{\omega}^{-v} \\
& =\frac{1}{2}\left(\delta^{a} u^{\delta} v_{v}-\delta^{a} v^{\delta}{ }_{u}\right) q_{t}\left(d N_{t^{\prime}} \bar{\omega}^{b}\right) \wedge \bar{\omega}^{u} \wedge \bar{\omega}^{v} \\
& =\frac{1}{2} q_{t}\left(d N_{t^{\prime}} \bar{\omega}^{b}\right) \wedge\left(\bar{\omega}^{a} \wedge \bar{\omega}^{-b}-\bar{\omega}^{b} \wedge \bar{\omega}^{-a}\right) \\
& =q_{t}\left(d N_{t}, \bar{\omega}^{b}\right) \bar{\omega}^{a} \wedge \bar{\omega}^{b} .
\end{aligned}
$$

2. $d\left(N_{t} \bar{\omega}^{a}\right)=d N_{t} \wedge \omega^{-a}+N_{t} \wedge d \bar{\omega}^{a}$

$$
\begin{aligned}
& =q_{t}\left(d N_{t}, \bar{\omega}^{b}\right) \bar{\omega}^{b} \wedge \bar{\omega}^{a}+N_{t} \wedge-\bar{\omega}_{b}^{a} \wedge \bar{\omega}^{b} \\
& =-q_{t}\left(d N_{t}, \bar{\omega}^{b}\right) \bar{\omega}^{a} \wedge \bar{\omega}^{b}-N_{t} \bar{\omega}_{b}^{a} \wedge \bar{\omega}^{b} .
\end{aligned}
$$

3. $N_{t}{ }^{-\omega^{a}} b^{\wedge \omega}$.

## Therefore

$$
1+2+3=0
$$

The evolution equation for

$$
\frac{d}{d t} \vec{A}_{t}
$$

is, of course, complex (even though $\left(\vec{\omega}_{t}, \vec{p}_{t}\right)$ is real), hence breaks up into real and imaginary parts. As will be shown below, its real part admits a simple interpretation (but its imaginary part appears to be less amenable to explicit recognition).

Let $\mu, \nu$ be indices that run between 1 and 3 and work locally.
Rappel: We have

$$
\begin{aligned}
& \dot{\kappa}_{\mu \nu}=L_{\vec{N}_{t}} \kappa_{\mu \nu}+2 N_{t}\left(\kappa_{t} * k_{t}\right)_{\mu \nu} \\
& -N_{t} K_{t} \kappa_{\mu \nu}-N_{t} \operatorname{Ric}\left(q_{t}\right)_{\mu \nu}+\bar{\nabla}_{\mu} \bar{\nabla}_{\nu} N_{t} \\
& \quad+\frac{1}{4} N_{t}\left(S\left(q_{t}\right)-\left[\kappa_{t}, \kappa_{t}\right]_{q_{t}}+K_{t}^{2}\right)\left(q_{t}\right)_{\mu \nu}
\end{aligned}
$$

[Note: As usual, $k_{\mu \nu}=\left(k_{t}\right)_{\mu \nu}{ }^{.}$]
Write

$$
\begin{aligned}
\bar{\omega}_{0 a} & =-\kappa_{a b} \bar{\omega}^{b} \\
& =-\kappa_{t}\left(E_{a}, E_{b}\right) \bar{\omega}^{b} \\
& =-\kappa_{t}\left(e^{\mu} \frac{\partial}{\partial x^{\mu}}, e_{b}^{\nu} \frac{\partial}{\partial x^{\nu}}\right) \bar{\omega}^{b} \\
& =-e_{a}^{\mu} e^{\nu} b^{k_{\mu}} \bar{\omega}^{\bar{\omega}} \\
& =-e_{a}^{\mu} e^{\nu}{ }_{b} e^{b}{ }_{\nu}{ }^{\prime} \kappa_{\mu \nu} d x^{\nu^{\prime}} \\
& =-e_{a}^{\mu} \delta^{\nu}{ }_{\nu} \kappa_{\mu \nu} d x^{\nu^{\prime}}
\end{aligned}
$$

19. 

$$
\begin{aligned}
& =-e^{\mu}{ }_{a}{ }_{\mu \nu} d x^{\nu} \\
& =-\kappa_{\mu \nu} e^{\mu} a^{d x} .
\end{aligned}
$$

Then

$$
\dot{\bar{\omega}}_{0 a}=-\left(\kappa_{\mu \nu} e^{\mu}{ }_{a}\right) \cdot d x,
$$

where

$$
\left(e_{a}^{\mu}\right)^{\cdot}=-e_{b}^{\mu} \dot{e}_{\mu^{\prime}}^{b} e^{\mu^{\prime}}{ }_{a}
$$

LEMMA We have

$$
\begin{aligned}
\dot{\bar{\omega}}_{0 a}= & L_{\vec{N}_{t}} \omega_{0 a}-d^{\nabla} \bar{q}_{q_{t}}\left(d N_{t}, \bar{\omega}_{a}\right)+\bar{Q}_{a c} \bar{\omega}_{0 c} \\
& +N_{t}\left(\operatorname{Ric}\left(q_{t}\right)_{a b}-\left(\kappa_{t} \star K_{t}\right){ }_{a b}+K_{t} \kappa_{a b}\right) \bar{\omega}^{b} \\
- & \frac{1}{4} N_{t}\left(S\left(q_{t}\right)-\left[\kappa_{t}, \kappa_{t}\right]_{q_{t}}+K_{t}^{2}\right) \bar{\omega}^{a}
\end{aligned}
$$

The point now is that the equation for $\dot{\bar{\omega}}_{0 a}$ is the negative of the real part of the equation for $\dot{\mathrm{A}}_{\mathrm{a}}$.

To verify this, start from the fact that

$$
A_{a}\left(=\left(\vec{A}_{t}\right)_{a}\right)=\frac{\sqrt{-1}}{2} \varepsilon_{a b c} \bar{\omega}_{b c}-\bar{\omega}_{0 a}
$$

$$
-d^{\nabla}{ }^{q_{t}} q_{t}\left(d N_{t}, \bar{\omega}_{a}\right)+\bar{Q}_{a c} \bar{\omega}_{0 c}
$$

comes from, write

$$
\begin{gathered}
d z_{a}-\sqrt{-1} \varepsilon_{a b c} A^{C} \wedge z_{b} \\
=-\frac{\sqrt{-1}}{2} \varepsilon_{a u v} d \bar{Q}_{q v}+d q_{t}\left(d N_{t}, \bar{\omega}_{a}\right) \\
-\sqrt{-1} \varepsilon_{a b c}\left(\frac{\sqrt{-1}}{2} \varepsilon_{c u v} \bar{\omega}_{u v}-\bar{\omega}_{0 c}\right) \wedge\left(-\frac{\sqrt{-1}}{2} \varepsilon_{b u v} \bar{Q}_{u v}+q_{t}\left(d N_{t}, \bar{\omega}_{b}\right)\right) .
\end{gathered}
$$

The real part of this is

$$
d q_{t}\left(d N_{t}, \bar{\omega}_{a}\right)+\frac{1}{2} \varepsilon_{a b c} \varepsilon_{u v c} \bar{\omega}_{u v} q_{t}\left(d N_{t}, \bar{w}_{b}\right)-\frac{1}{2} \varepsilon_{a c b} \varepsilon_{u v b} \bar{Q}_{u v} \bar{\omega}_{0 c}
$$

or still,

$$
d q_{t}\left(d N_{t}, \bar{w}_{a}\right)+\frac{1}{2} \delta^{a b}{ }_{u v} \bar{\omega}_{u v} q_{t}\left(d N_{t}, \bar{u}_{b}\right)-\frac{1}{2} \delta^{a c}{ }_{u v} \overline{Q u v}^{\bar{w}_{0 c}}
$$

or still,

$$
d q_{t}\left(d N_{t}, \bar{\omega}_{a}\right)+\bar{\omega}_{a b} q_{t}\left(d N_{t}, \bar{\omega}_{b}\right)-\bar{Q}_{a c} \bar{\omega}_{0 c}
$$

or still,

$$
d^{\nabla q_{t}} q_{t}\left(d_{t}, \bar{\omega}_{a}\right)-\bar{Q}_{a c} \bar{\omega}_{0 c}
$$

The remaining terms can be identified in the same straightforward fashion, so the details will be omitted.

Section 59: The Constraint Analysis The assumptions and notation are those of the standard setup but with the restriction that $n=4$.

Rappel:

$$
\begin{aligned}
& H(\vec{Q}, \vec{A} ; N, \vec{N}, \vec{Z}) \\
& =\int_{\Sigma} \iota_{\vec{N}} \vec{Q} \dot{A} \vec{A}+\delta_{\Sigma} \vec{Z} \dot{\wedge} d^{A} \vec{Q}+\delta_{\Sigma}-\sqrt{-I} \stackrel{\rightharpoonup}{F} \dot{\wedge} * \vec{Q} .
\end{aligned}
$$

Definition: The physical phase space of the theory (a.k.a. the constraint surface of the theory) is the subset $C^{*}{ }^{*} \underline{Q}_{\underline{C}}$ of $T^{*}{ }_{\underline{Q_{C}^{C}}}$ whose elements are the points $(\vec{Q}, \vec{A})$ such that simultaneously

$$
\frac{\delta H}{\delta N}=0, \frac{\delta H}{\delta \vec{N}}=0, \frac{\delta H}{\delta \vec{Z}}=0 .
$$

$\frac{\delta H}{\delta N}$ : We have

$$
\begin{aligned}
\frac{\delta H}{\delta N} & =-\sqrt{-1} \vec{F} \dot{\wedge} * \vec{Q} \\
& =-\sqrt{-1}\left(F_{a} \wedge-* * \omega^{a}\right) \\
& =\sqrt{-1}\left(F_{a} \wedge \omega^{a}\right) \\
& =\sqrt{-I}\left(\frac{\sqrt{-I}}{2} \varepsilon_{a b c} F_{b c} \wedge \omega^{a}\right) \\
& =-\frac{1}{2} F_{b c} \wedge \varepsilon_{a b c} \omega^{a} \\
& =-\frac{1}{2} F_{b c} \wedge \varepsilon_{b c a} \omega^{a}
\end{aligned}
$$

$$
\begin{aligned}
& =-\frac{1}{2} F_{b c} \wedge *\left(\omega^{b} \wedge \omega^{c}\right) \\
& =-\frac{1}{2} q\left(F_{b c^{\prime}} \omega^{b} \wedge \omega^{c}\right) v o l_{q} \\
& =-\frac{F}{2} \mathrm{vol}_{q}
\end{aligned}
$$

$$
\begin{aligned}
& \frac{\delta H}{\delta N^{a}}: \text { We have } \\
& \qquad \begin{aligned}
& \delta_{a}\left[L_{\vec{N}} Q^{b} \wedge A_{b}\right] \\
&=L_{\left(\delta N^{a}\right) E_{a}} e^{b} \wedge A_{b} .
\end{aligned}
\end{aligned}
$$

Write

$$
\begin{aligned}
& { }^{L}\left(\delta N^{a}\right) E_{a} Q^{b} \wedge A_{b} \\
& \quad=\left(1 \quad\left(\delta N^{a}\right) E_{a} \circ d+d \circ \imath_{\left(\delta N^{a}\right) E_{a}}\right) Q^{b} \wedge A_{b} \\
& \quad=\delta N^{a}\left(l_{E_{a}} d Q^{b} \wedge A_{b}\right)+d\left(\delta N^{a}{ }_{l_{E}} Q_{a}^{b}\right) \wedge A_{b} .
\end{aligned}
$$

But

$$
\begin{aligned}
& d\left(\left(\delta N^{a}{ }_{L_{a}} Q^{b}\right) N A_{b}\right) \\
&=d\left(\delta N^{a}{ }_{l_{E}} Q^{b}\right) N_{b}-\delta N^{a}{ }_{\imath_{E}} Q_{a}^{b} \wedge d A_{b} \\
& \Rightarrow \quad
\end{aligned}
$$

$$
\begin{aligned}
d\left(\delta N^{a}{ }_{E_{E}} Q^{b}\right) \wedge A_{b}= & \delta N^{a}{ }_{1_{E}} Q^{b} \wedge d A_{b} \\
& +d\left(\left(\delta N^{a}{1_{E_{a}}}^{Q^{b}}\right) \wedge A_{b}\right)
\end{aligned}
$$

Since

$$
\delta_{\Sigma} d\left(\left(\delta N^{a}{ }_{L_{a}} Q^{b}\right) \wedge A_{b}\right)=0
$$

it follows that

$$
\frac{\delta H}{\delta N^{a}}=q_{E} d Q^{b} \wedge A_{b}+v_{E_{a}} Q^{b} \wedge d A_{b}
$$

Some additional manipulation of this formula will prove to be convenient. First

$$
\begin{aligned}
& d A_{b}=F_{b}-\frac{\sqrt{-I}}{2} \varepsilon_{b u v v^{A}} u^{\wedge} A_{v} \text { so } \\
& { }^{l_{E}} Q_{a} Q^{b} \wedge d A_{b} \\
& \quad={ }^{l_{E}} Q_{a}^{b} \wedge F_{b}-\frac{\sqrt{-1}}{2} \varepsilon_{b u v} E_{a} Q^{b} \wedge A_{u} \wedge A_{v} .
\end{aligned}
$$

But

$$
\begin{aligned}
& 0= \imath_{E_{a}}\left(Q^{b} \wedge A_{u} \wedge A_{v}\right) \\
&= \imath_{E_{a}} Q^{b} \wedge A_{u} \wedge A_{v} \\
&+Q^{b} \wedge \imath_{E_{a}} A_{u} \wedge A_{v}-Q^{b} \wedge A_{u} \wedge l_{E_{e}} A_{v} \\
& \Rightarrow
\end{aligned}
$$

=>

$$
\begin{aligned}
& -\frac{\sqrt{-I}}{2} \varepsilon_{\text {buv }^{l} E_{a}} Q^{b} \wedge A_{u} \wedge A_{v} \\
& =-\frac{\sqrt{-1}}{2}\left[\varepsilon_{b u v}{ }^{d} \wedge A_{u} \wedge \varepsilon_{E_{a}} A_{v}\right. \\
& \left.-\varepsilon_{b u v}{ }^{\mathrm{b}} \wedge \mathrm{l}_{\mathrm{a}} \mathrm{~A}_{\mathrm{u}} \wedge A_{\mathrm{v}}\right] \\
& =-\frac{\sqrt{-1}}{2}\left[\varepsilon_{b u v}\left(l_{E_{a}}^{A}\right) Q^{b} \wedge A_{u}\right. \\
& \left.-\varepsilon_{b u v}\left(\tau_{E_{a}} A_{u}\right) \ell^{b} \wedge A_{v}\right] \\
& =-\frac{\sqrt{-1}}{2}\left[\varepsilon_{\text {buv }}\left({ }^{( } E_{a} A_{v}\right) Q^{b} \wedge A_{u}\right. \\
& \left.-\varepsilon_{b v u}\left(l_{E_{a}} A_{v}\right) Q^{b}{ }_{\wedge A_{u}}\right] \\
& =-\frac{\sqrt{-1}}{2}\left[\varepsilon_{b u v}\left({ }^{( } E_{a}^{A}\right) Q^{b} \wedge A_{u}\right. \\
& \left.+\varepsilon_{b u v}\left(l_{E_{a}} A_{v}\right) Q^{b} \wedge_{u}\right] \\
& =\left(\imath_{E_{a}} A_{v}\right)\left(-\sqrt{-1} \varepsilon_{b u v} Q^{b} \wedge A_{u}\right) \\
& =\left(\imath_{E_{a}} A_{v}\right)\left(-\sqrt{-1} \varepsilon_{b u v} A_{u} \wedge Q^{b}\right)
\end{aligned}
$$

$$
\begin{aligned}
& =F_{b} \wedge l_{E_{a}} Q^{b}+\left(l_{E} A_{v}\right)\left(-\sqrt{-1} \varepsilon_{b u u^{v}}{ }^{A} \wedge Q^{b}\right)
\end{aligned}
$$

$$
\begin{aligned}
& =F_{b} \wedge \imath_{E_{a}} Q^{b}+\left(\imath_{E_{a}} A_{v}\right)\left(d^{A} Q^{V}-d Q^{v}\right) \\
& =F_{b} \wedge \imath_{E_{a}} Q^{b}+\left(\imath_{E_{a}} A_{b}\right)\left(d^{A} Q^{b}-d Q^{b}\right) .
\end{aligned}
$$

On the other hand,

$$
\begin{aligned}
& 0={ }^{l_{E}}{ }_{a}\left(\mathrm{dQ}^{\mathrm{b}} \wedge \mathrm{~A}_{\mathrm{b}}\right) \\
& ={ }^{l_{E}}{ }_{a} d Q^{b} \wedge A_{b}-d Q^{b} \wedge l_{E_{a}} A_{b} \\
& \text { => } \\
& { }^{l_{E}}{ }_{a}{ }^{d Q^{b}} \wedge A_{b}=d Q^{b} \wedge r_{E_{a}} A_{b} \\
& =\left(\underline{t}_{E_{a}} A_{b}\right) d^{b} .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
\frac{\delta H}{\delta N^{a}} & =\imath_{E_{a}} d Q^{b} \wedge A_{b}+\imath_{E_{a}} Q^{b} \wedge d A_{b} \\
& =\left(\imath_{E_{a}} A_{b}\right) d Q^{b}+F_{b} \wedge l_{E_{a}} Q^{b}+\left(\imath_{E_{a}}^{A_{b}}\right)\left(d^{A} Q^{b}-d Q^{b}\right) \\
& =l_{E_{a}} A_{b} \wedge d^{A} Q^{b}+F_{b} \wedge l_{E_{a}} Q^{b} .
\end{aligned}
$$

One can go further. In fact,

$$
\begin{aligned}
{ }_{\imath_{E}} Q^{b} & ={ }_{\imath_{E}}-* \omega^{b} \\
& =-{ }_{l_{E}} * \omega^{b}
\end{aligned}
$$

6. 

$$
\begin{aligned}
& =-*\left(\omega^{\mathrm{b}} \wedge \omega^{\mathrm{a}}\right) \\
& =-\varepsilon_{b a c}{ }^{c} \\
& =\varepsilon_{a b c}{ }^{\omega}{ }^{\text {c }} \\
& =-\varepsilon_{a b c}{ }^{*} Q^{C} \\
& \text { => } \\
& F_{b} \wedge l_{E_{a}} Q^{b}=-\varepsilon_{a b c} F_{b} \wedge *_{Q}^{C} \\
& =-(\vec{F} \stackrel{\times}{\wedge} \stackrel{\rightharpoonup}{Q})_{a} .
\end{aligned}
$$

IEMMA We have

$$
-\left(\vec{F} \times \times \vec{Q}_{a}=-\sqrt{-1}\left(\overrightarrow{\operatorname{Ric}} F \stackrel{\times}{\wedge} \vec{Q}_{a}\right.\right.
$$

[Start from the LHS -- then

$$
\begin{aligned}
&-\varepsilon_{a b c} F_{b} \wedge * Q^{c} \\
&=-\varepsilon_{a b c} q\left(F_{b} Q^{C}\right) v o l_{q} \\
&=-\varepsilon_{a b c} q\left(\frac{\sqrt{-1}}{2} \varepsilon_{b u v^{\prime}} F_{u v^{\prime}} Q^{c}\right) v o l_{q} \\
&=-\varepsilon_{a b c} q\left(\frac{\sqrt{-1}}{2} \varepsilon_{b u v} F_{u v^{\prime}}-\frac{1}{2} \varepsilon_{c r s} \omega^{r} \Lambda \omega^{s}\right) v o l_{q} \\
&=\frac{\sqrt{-1}}{4} \varepsilon_{a b c} \varepsilon_{b u v} \varepsilon_{c r s} q\left(F_{u v^{\prime}} \omega^{r} \Lambda \omega^{s}\right) v o l_{q}
\end{aligned}
$$

$$
=\frac{\sqrt{-1}}{4} \varepsilon_{a b c} \delta^{\delta^{b u v}} \mathrm{crs}^{\mathrm{q}}\left(\mathrm{~F}_{\mathrm{uv}^{\prime}} \omega^{\mathrm{r}} \wedge \omega^{\mathrm{s}}\right) \mathrm{vol}_{\mathrm{q}} .
$$

But

$$
\begin{aligned}
& =\delta^{b}{ }_{c} \delta^{u}{ }_{r} \delta^{v}{ }_{s}-\delta^{b}{ }_{c} \delta^{u}{ }_{s} \delta^{v}{ }_{r}-\delta^{b}{ }_{r} \delta^{u}{ }_{c} \delta^{v}{ }_{s} \\
& +\delta^{b}{ }_{r} \delta^{u}{ }_{s} \delta^{v}{ }_{c}+\delta^{b}{ }_{s} \delta^{u}{ }_{c} \delta^{v}{ }_{r}-\delta^{b}{ }_{s} \delta^{u} r^{\delta^{v}}{ }_{c} .
\end{aligned}
$$

And

$$
\begin{aligned}
& \text { 1. } \delta^{b} c^{\delta} \delta^{u}{ }^{\prime} \delta^{v}{ }_{s} q\left(F_{u v^{\prime}} \omega^{r} \Lambda \omega^{s}\right) \\
& =\delta^{b} c^{q}\left(F_{u v^{\prime}} \omega^{u} \wedge \omega^{v}\right) \\
& \text { => } \\
& \varepsilon_{a b c}{ }^{\delta}{ }_{c}{ }_{c} q\left(F_{u v^{\prime}} \omega^{u} \wedge \omega^{v}\right) \\
& \left.=\varepsilon_{a b b} \mathrm{q}^{\left(\mathrm{F}_{\mathrm{uv}}\right.}{ }^{\prime} \omega^{\mathrm{u}}{ }^{\prime} \omega^{\mathrm{v}}\right)=0 . \\
& \text { 2. }-\delta^{b}{ }_{c} \delta^{u}{ }_{s} \delta^{v}{ }_{r}{ }^{q}\left(F_{u v^{\prime}} \omega^{r} \wedge \omega^{s}\right) \\
& =-\delta^{b} c^{q}\left(F_{u v^{\prime}}{ }^{v}{ }_{\wedge} \omega^{u}\right) \\
& \text { => }
\end{aligned}
$$

$$
\begin{aligned}
& \left.-\varepsilon_{a b c} \delta^{\delta^{b}}{ }_{c} q^{\left(F_{u v}\right.}{ }^{\prime} \omega^{v} \Lambda \omega^{u}\right) \\
& \quad=-\varepsilon_{a b b} q\left(F_{u v}, \omega^{v} \Lambda \omega^{u}\right)=0
\end{aligned}
$$

3. $-\delta^{\mathrm{b}} \mathrm{r}^{\delta}{ }^{\mathrm{u}} \mathrm{c}^{\delta}{ }^{\mathrm{v}}{ }_{\mathrm{s}} \mathrm{q}\left(\mathrm{F}_{\mathrm{uv}}{ }^{\prime \prime} \omega^{\mathrm{r}} \Lambda \omega^{\mathrm{s}}\right)$

$$
\begin{aligned}
& =-q\left(F_{c v^{\prime}} \omega^{b} \wedge \omega^{v}\right) \\
& =q\left(F_{u c^{\prime}}, \omega^{b} \Lambda \omega^{u}\right) .
\end{aligned}
$$

4. $\quad \delta^{b} r^{\delta}{ }^{u} s^{\delta}{ }^{v}{ }_{c}{ }^{q}\left(F_{u v}{ }^{\prime}{ }^{r} \Lambda \omega^{s}\right)$

$$
=q\left(\mathrm{~F}_{\mathrm{uc}}, \omega^{\mathrm{b}} \wedge \omega^{\mathrm{u}}\right)
$$

5. $\delta^{b} s_{s} \delta^{u} c^{\delta}{ }^{v}{ }^{q}{ }^{q}\left(F_{u v^{\prime}} \omega^{r} \Lambda \omega^{s}\right)$

$$
\begin{aligned}
& =q\left(F_{\mathrm{Cv}^{\prime}} \omega^{\mathrm{v}} \wedge \omega^{\mathrm{b}}\right) \\
& =\mathrm{q}\left(\mathrm{~F}_{\mathrm{uc}^{\prime}} \omega^{\mathrm{b}} \wedge \omega^{\mathrm{u}}\right) .
\end{aligned}
$$

6. $\left.-\delta^{b} s^{\delta}{ }^{u} r^{\delta} \delta^{v} c^{q(F} F_{u v^{\prime}} \omega^{r} \wedge \omega^{s}\right)$

$$
\begin{aligned}
& =-q\left(F_{u c}, \omega^{u} \Lambda \omega^{b}\right) \\
& =q\left(F_{u c^{\prime}}, \omega^{b} \Lambda \omega^{u}\right)
\end{aligned}
$$

Consequently,

$$
\begin{aligned}
& \left.\frac{\sqrt{-I}}{4} \varepsilon_{a b c} \delta^{\text {buv }}{ }_{c r s}{ }^{q\left(F_{u v}\right.}{ }^{r} \omega^{r} \Lambda \omega^{s}\right) \text { vol }_{q} \\
& =\frac{r-I}{4} \varepsilon_{a b c}\left(4 q\left(F_{u c}\left(\omega^{b} \wedge \omega^{u}\right)\right) \text { vol }_{q}\right. \\
& =-\sqrt{-I} \varepsilon_{a b c} q\left(F_{d c^{\prime}} \omega^{d} \Lambda \omega^{b}\right) \operatorname{vol}_{q}
\end{aligned}
$$

$$
\begin{aligned}
& =-\sqrt{-I} \varepsilon_{a b c} q\left(\left(\overrightarrow{\text { Ric } F)}{ }_{c}{ }^{\prime} \omega^{b}\right) \text { vol }_{q}\right. \\
& =-\sqrt{-1} \varepsilon_{\text {acb }} \mathrm{q}\left(\left(\overrightarrow{\text { ric }} \mathrm{F}_{\mathrm{b}}{ }^{\prime} \omega^{\mathrm{C}}\right) \mathrm{vol}_{\mathrm{q}}\right. \\
& =\sqrt{-1} \varepsilon_{\mathrm{abc}} \mathrm{q}\left(\left(\overrightarrow{\text { Ric }} \mathrm{F}_{\mathrm{b}} \mathrm{~b}^{\prime}{ }^{\mathrm{C}}\right) \mathrm{Vol}_{\mathrm{q}}\right. \\
& =\sqrt{-1} \varepsilon_{\mathrm{abc}}{ }^{\mathrm{q}\left((\overrightarrow{\mathrm{Ric}} \mathrm{~F})_{\mathrm{b}}, * * \omega^{\mathrm{C}}\right) \mathrm{Vol}_{\mathrm{q}}} \\
& =\sqrt{-1} \varepsilon_{\mathrm{abc}}(\overrightarrow{\mathrm{RiC}} \mathrm{~F})_{\mathrm{b}}{ }^{\wedge * \omega}{ }^{\mathrm{C}} \\
& =-\sqrt{-I} \varepsilon_{a b c}\left(\overrightarrow{\text { (kic } F)_{b} \wedge}-* \omega^{C}\right. \\
& =-\sqrt{-I} \varepsilon_{a b c} \xrightarrow{(\overrightarrow{\operatorname{Ric}} \mathrm{~F})}{ }_{\mathrm{b}} \wedge^{\mathrm{C}} \\
& \left.=-\sqrt{-I}\left(\overrightarrow{\operatorname{Ric}} F \times{ }_{\wedge}^{X}\right) a^{\prime}\right]
\end{aligned}
$$

10. 

[Note: There is another way to write ( $\bar{F} \times * \times \bar{X}$ ) ${ }_{a}$ which we shall use below. Thus, since $F_{a}$ and $Q^{a}$ are 2-forms,

$$
\begin{aligned}
& \vec{F} \dot{\wedge} \vec{Q}=0 \\
& \text { => } \\
& 0=l_{E_{a}}\left(F_{b} \wedge Q^{b}\right) \\
& ={ }_{l_{E}} F_{a} \wedge Q^{b}+F_{b} \wedge v_{E_{a}} Q^{b} \\
& ={ }^{l_{E}} E_{a} F_{b} \wedge Q^{b}+F_{b} \wedge l_{E_{a}}\left(-* \omega^{b}\right) \\
& \text { => } \\
& l_{E_{a}} \vec{F} \dot{\wedge} \vec{Q}=F_{b} \wedge l_{E_{a}}^{* \omega^{b}} \\
& =F_{b} \wedge *\left(\omega^{b} \wedge \omega^{a}\right) \\
& =F_{b} \wedge \varepsilon_{b a c}{ }^{\omega}{ }^{C} \\
& =-F_{b} \wedge \varepsilon_{b a c} * Q^{c} \\
& =-\varepsilon_{\operatorname{bac}{ }^{F}{ }_{b} \wedge * Q^{C}} \\
& =\varepsilon_{a b c} F_{b} \wedge * Q^{C} \\
& \left.=\left(\vec{F}^{\times} \wedge * \vec{Q}\right) a^{\prime}\right]
\end{aligned}
$$

Therefore

$$
\frac{\delta H}{\delta N^{a}}=l_{E_{a}} A_{b} \wedge d^{A} Q^{b}-\sqrt{-1}(\overrightarrow{\operatorname{Ric}} F \times \vec{D}) a \cdot
$$

Definition:

$$
H_{D}(\vec{N})=\int_{\Sigma} L_{\vec{N}} \vec{D} i \vec{A}
$$

is the integrated diffeomorphism constraint;

$$
H_{R}(\vec{z})=\int_{\Sigma} \frac{\bar{z}}{\lambda} \dot{\lambda} d^{A} \bar{Q}
$$

is the integrated rotational constraint;

$$
H_{H}(\mathbb{N})=\delta_{\Sigma}-\sqrt{-1} \mathrm{NF} \dot{\lambda} * \mathbb{D}
$$

is the integrated hamiltonian constraint.
Remark: The preceding considerations imply that

$$
H_{D}(\vec{N})=\int_{\Sigma}\left[\vec{A}(\vec{N}) d^{A} \bar{X}-\sqrt{-1} \vec{N} \cdot(\overrightarrow{\operatorname{Ric}} F \times \widehat{X})\right]
$$

and

$$
H_{H}(N)=\int_{\Sigma} N\left(-\frac{F}{2}\right) \operatorname{vol}_{q} .
$$

[Note: Here

$$
\begin{aligned}
& \vec{A}(\vec{N}) d^{A} \vec{Q} \\
= & A_{b}(\vec{N}) d^{A} Q^{b} \\
= & A_{b}\left(N^{a} E_{a}\right) d^{A} Q^{b} \\
= & N^{a}{ }^{1}{ }_{E_{a}} A_{b} \wedge d^{A} Q^{b} .
\end{aligned}
$$

Incidentally, in the subset of $T^{*} * \underline{Q}_{\underline{C}}$ where $d^{A+Q}=0, H_{D}(\vec{N})$ reduces to

$$
\begin{aligned}
\int_{\Sigma} & -\sqrt{-1} \overrightarrow{\mathrm{~N}} \cdot(\overrightarrow{\text { Ric }} \mathrm{F} \stackrel{\times}{\wedge} \vec{Q}) \\
& =\int_{\Sigma}-\stackrel{\imath}{\overrightarrow{\mathrm{N}}} \dot{\mathrm{~N}} \stackrel{\mathrm{Q}}{ } \\
& \left.\equiv \bar{H}_{\mathrm{D}}(\overrightarrow{\mathrm{~N}}) \cdot\right]
\end{aligned}
$$

Therefore

$$
H=H_{D}+H_{R}+H_{H}
$$

and we have

1. $\left\{H_{D}\left(\vec{N}_{1}\right), H_{D}\left(\vec{N}_{2}\right)\right\}=H_{D}\left(\left[\vec{N}_{1}, \vec{N}_{2}\right]\right)$;
2. $\left\{H_{D}(\vec{N}), H_{R}(\vec{Z})\right\}=H_{R}\left(L_{\vec{N}}^{\vec{N}}\right)$;
3. $\left\{H_{D}(\vec{N}), H_{H}(N)\right\}=H_{H}\left(L_{\vec{N}} N\right)$;
4. $\left\{H_{R}\left(\vec{Z}_{1}\right), H_{R}\left(\vec{Z}_{2}\right)\right\}=-\sqrt{-1} H_{R}\left(\vec{Z}_{1} \times \vec{Z}_{2}\right)$;
5. $\left\{H_{R}(\vec{Z}), H_{H}(N)\right\}=0$;
6. $\left\{H_{H}\left(N_{1}\right), H_{H}\left(N_{2}\right)\right\}$

$$
\begin{aligned}
=H_{D} & \left(N_{1} \operatorname{grad} N_{2}-N_{2} \operatorname{grad} N_{1}\right) \\
& -H_{R}\left(\vec{A}\left(N_{1} \operatorname{grad} N_{2}-N_{2} \operatorname{grad} N_{1}\right)\right)
\end{aligned}
$$

Remark: A constraint is a function $\mathrm{f}: \mathrm{T}^{*}{ }_{\underline{\mathrm{Q}_{\underline{C}}}} \rightarrow \underline{\mathrm{C}}$ such that $\mathrm{f} \mid \mathrm{Con}_{* \underline{\underline{Q}}_{\underline{C}}}=0$.

Thus, by construction, $H_{D}(\vec{N}), H_{R}(\vec{Z})$, and $H_{H}(N)$ are constraints, these being termed primary. The foregoing relations then imply that the Poisson bracket of two primary constraints is a constraint.

Items 1 and 3 are established in the usual way, so we shall concentrate on Items 2, 4, 5, and 6.

Ad 2: We have

$$
\begin{aligned}
& \left\{H_{D}(\vec{N}), H_{R}(\vec{Z})\right\} \\
& =\int_{\Sigma}\left[\frac{\delta H_{R}(\vec{Z})}{\delta \vec{A}} \wedge \frac{\delta H_{D}(\vec{N})}{\delta \vec{Q}}-\frac{\delta H_{D}(\vec{N})}{\delta \vec{A}} \wedge \frac{\delta H_{R}(\vec{Z})}{\delta \vec{Q}}\right] \\
& =\int_{\Sigma}\left[\frac{\delta H_{R}(\vec{Z})}{\delta A_{a}} \wedge \frac{\delta H_{D}(\vec{N})}{\delta Q^{a}}-\frac{\delta H_{D}(\vec{N})}{\delta A_{a}} \wedge \frac{\delta H_{R}(\vec{Z})}{\delta Q^{a}}\right] \\
& =\delta_{\sum}\left[L_{\vec{N}} A_{a} \wedge \sqrt{-1}(\vec{Z} \times \vec{Q})\right. \\
&
\end{aligned}
$$

Consider first

$$
\delta_{\Sigma}{\underset{\sim}{N}}_{L_{N}}^{a} \wedge d^{A} z_{a} .
$$

Thus

$$
\begin{aligned}
& L_{\vec{N}}{ }^{a}{ }_{\wedge} A^{A} z_{a} \\
& =L_{\vec{N}} Q^{a} \wedge\left(d z_{a}+\sqrt{-1}(\vec{A} \times \overrightarrow{\mathrm{Z}}){ }_{a}\right)
\end{aligned}
$$

14. 

But

$$
\begin{aligned}
& \underset{\vec{N}}{d}\left(Q^{a} \wedge Z_{a}\right) \\
& =d L_{\vec{N}} Q^{a} \wedge z_{a}+\underset{\vec{N}}{L} Q^{\wedge} \wedge d z_{a} \\
& =\underset{\overrightarrow{\mathrm{N}}}{L_{\vec{\prime}}} \mathrm{Q}^{\mathrm{a}} \wedge \mathrm{Z}_{\mathrm{a}}+\operatorname{L}_{\overrightarrow{\mathrm{N}}} \mathrm{Q}_{\mathrm{a}} \wedge d \mathrm{z}_{\mathrm{a}} \\
& \text { => } \\
& 0=\int_{\Sigma} d\left(L_{\vec{N}} Q^{a} \wedge z_{a}\right) \\
& =\int_{\Sigma} L_{\vec{N}} d Q^{a} \wedge z_{a}+\int_{\Sigma} L_{\vec{N}}^{Q_{a}} Q_{a} \\
& \text { => } \\
& \int_{\Sigma} \mathcal{L}_{\vec{N}} Q^{a} \wedge d z_{a}=-\int_{\Sigma} L_{\vec{N}} d Q^{a} \wedge z_{a} .
\end{aligned}
$$

And

$$
\begin{aligned}
& 0=\int_{\Sigma}{\underset{\vec{N}}{ }}^{\left(\mathrm{AQ}^{\mathrm{a}} \wedge \mathrm{Z}_{\mathrm{a}}\right)} \\
& =\int_{\Sigma} L_{\vec{N}} d Q^{a} \wedge Z_{a}+\int_{\Sigma} d Q^{a} \wedge L_{\vec{N}} Z_{a} \\
& \text { => } \\
& -\int_{\Sigma} L_{\vec{N}} d Q^{a} \wedge Z_{a}=\int_{\Sigma} d Q^{a} \wedge L_{\vec{N}} Z_{a} \\
& =\int_{\Sigma} L_{\overrightarrow{\mathrm{N}}} Z_{a} \Lambda d Q^{a} .
\end{aligned}
$$

15. 

Let us now turn to

$$
\int_{\Sigma} \sqrt{-I} L_{\vec{N}} 0^{a} \wedge(\vec{A} \times \vec{Z})_{a}
$$

or still,

$$
\int_{\Sigma}-\sqrt{-I} Q^{a} \wedge L_{\vec{N}}(\vec{A} \times \vec{Z})^{\prime}
$$

$Q^{a} \wedge(\vec{A} \times \vec{Z})$ a being a 3-form. Write

$$
\begin{aligned}
& -\sqrt{-1} Q^{a} \wedge L_{\vec{N}}(\vec{A} \times \vec{Z}){ }_{a} \\
& =-\sqrt{-1} Q^{a} \wedge\left(L_{\vec{N}}\left(\varepsilon_{a b c} A_{b} \wedge Z_{c}\right)\right) \\
& =-\sqrt{-1} Q^{\mathrm{a}} \wedge \varepsilon_{a b c}{ }_{\vec{N}}^{\perp}{ }_{\vec{N}}{ }^{\prime} \wedge Z_{c} \\
& -\sqrt{-1} Q^{a} \wedge \varepsilon_{a b c}{ }^{A}{ }_{b} L_{\vec{N}} Z^{Z} .
\end{aligned}
$$

Rewrite the second term as

$$
\left.\operatorname{Li}_{\vec{N}}^{Z} c^{\wedge(-\sqrt{-1}} \varepsilon_{a b c} A_{b} \Lambda Q^{a}\right)
$$

or still,

$$
\underset{\vec{N}}{L_{c}} z^{\wedge} \wedge\left(-\sqrt{-1} \varepsilon_{c a b} A_{b} \wedge Q^{a}\right)
$$

or still,

$$
\left.\underset{\overrightarrow{\mathrm{N}}}{L_{c}} \mathrm{Z}^{\wedge(\sqrt{-1}} \varepsilon_{c b a} \mathrm{~A}_{\mathrm{b}} \wedge Q^{\mathrm{a}}\right)
$$

or still,

Therefore

$$
\begin{aligned}
& \int_{\Sigma} L_{\vec{N}} Q^{a} \wedge d^{A} Z_{a} \\
& =\int_{\Sigma} L_{\vec{N}} Z_{a} \wedge d Q^{a}+\int_{\Sigma} L_{\vec{N}} Z_{a}^{\wedge \sqrt{-I}}(\vec{A} \wedge \vec{X}) \\
& \\
& \quad+\int_{\Sigma}-\sqrt{-I} Q^{a} \wedge \varepsilon_{a b c} L_{\vec{N}}^{A} b \wedge Z_{C}
\end{aligned}
$$

It remains to compare

$$
-\sqrt{-I} Q^{a} \wedge \varepsilon_{a b c}{ }_{\overrightarrow{\dot{N}}} A^{A} \wedge Z_{c}
$$

with

$$
\operatorname{LA}_{\overrightarrow{\mathrm{N}}}^{A} a^{\wedge} \sqrt{-I}(\vec{Z} \stackrel{\times}{\mathrm{Q}})_{a}
$$

or

$$
-\sqrt{-1} \varepsilon_{a b c} Q^{a} \wedge L_{\vec{N}} A_{b} \wedge Z_{c}
$$

with

$$
\sqrt{-1} \varepsilon_{a b c} Q^{C} \wedge L_{\vec{N}} A_{a} \wedge Z_{b}
$$

In the last line, change
to get

$$
\begin{aligned}
& \sqrt{-I} \varepsilon_{b c a} a^{a} \wedge L_{\vec{N}}^{A} A^{\prime} \wedge Z_{c} \\
& \quad=\sqrt{-I} \varepsilon_{a b c} Q^{a} \wedge L_{\vec{N}} A_{b} \wedge z_{c} .
\end{aligned}
$$

The terms in question thus cancel, leaving

$$
\begin{aligned}
& \int_{\Sigma} L_{\vec{N}} Z_{a} \wedge\left(d Q^{a}+\sqrt{-I}(\vec{A} \stackrel{\times}{\wedge})_{a}\right) \\
&=\int_{\Sigma} L_{\vec{N}} \vec{Z} \dot{A} d^{A} \vec{Q} \\
&=H_{R}\left(L_{\vec{N}} \vec{Z}\right)
\end{aligned}
$$

Ad 4: We have

$$
\begin{aligned}
& \left\{H_{R}\left(\vec{Z}_{1}\right), H_{R}\left(\vec{Z}_{2}\right)\right\} \\
& =\delta_{\Sigma}\left[\frac{\delta H_{R}\left(\vec{Z}_{2}\right)}{\delta \vec{A}} \wedge \frac{\delta H_{R}\left(\vec{Z}_{1}\right)}{\delta \vec{Q}}-\frac{\delta H_{R}\left(\vec{Z}_{1}\right)}{\delta \vec{A}} \wedge \frac{\delta H_{R}\left(\vec{Z}_{2}\right)}{\delta \vec{Q}}\right] \\
& =\int_{\Sigma}\left[\frac{\delta H_{R}\left(\overrightarrow{\mathrm{Z}}_{2}\right)}{\delta A_{a}} \wedge \frac{\delta H_{R}\left(\vec{Z}_{1}\right)}{\delta Q^{a}}-\frac{\delta H_{R}\left(\vec{Z}_{1}\right)}{\delta A_{a}} \wedge \frac{\delta H_{R}\left(\vec{Z}_{2}\right)}{\delta Q^{a}}\right] \\
& =\sqrt{-1} \int_{\Sigma}\left[\alpha^{A} \vec{Z}_{1} \dot{\wedge}\left(\vec{Z}_{2} \stackrel{\times}{\wedge} \overrightarrow{\mathrm{Q}}\right)-\alpha^{\mathrm{A}} \overrightarrow{\mathrm{Z}}_{2} \dot{\wedge}\left(\overrightarrow{\mathrm{Z}}_{1} \stackrel{\times}{\wedge} \overline{\mathrm{Q}}\right)\right] \\
& =\sqrt{-1} \int_{\Sigma}\left[\left(d^{A} \vec{Z}_{1} \times \vec{Z}_{2}\right) \dot{\wedge} \vec{\phi}-\left(d^{A} \vec{Z}_{2} \times \vec{Z}_{1}\right) \dot{\wedge} \vec{\phi}\right] \\
& =\sqrt{-1} \int_{\Sigma}\left[\left(d^{A} \vec{z}_{1} \times \vec{Z}_{2}+\vec{Z}_{1} \times d^{A} \vec{z}_{2}\right) \stackrel{\rightharpoonup}{\phi}\right] .
\end{aligned}
$$

But

$$
\begin{aligned}
& d\left(\left(\vec{Z}_{1} \times \vec{Z}_{2}\right) \dot{\imath} \vec{Q}\right) \\
= & d^{A}\left(\vec{Z}_{1} \times \vec{Z}_{2}\right) \dot{Q}+\left(\vec{Z}_{1} \times \vec{Z}_{2}\right) \dot{\wedge} d^{A \vec{Q}}
\end{aligned}
$$

18. 

$$
=\left(d^{A} \vec{Z}_{1} \times \vec{Z}_{2}\right) \dot{\wedge} \vec{Q}+\left(\vec{Z}_{1} \times d^{A} \vec{Z}_{2}\right) \dot{\wedge} \vec{Q}+\left(\vec{Z}_{1} \times \vec{Z}_{2}\right) \dot{\wedge} d^{A} \vec{Q}
$$

=>

$$
\begin{aligned}
& \left(d^{A} \vec{z}_{1} \times \vec{Z}_{2}+\vec{Z}_{1} \times d^{A} \vec{z}_{2}\right) \dot{\wedge} \\
= & -\left(\vec{z}_{1} \times \vec{Z}_{2}\right) \dot{\wedge} d^{A} \vec{Q}+d\left(\left(\vec{Z}_{1} \times \vec{Z}_{2}\right) \dot{\wedge}\right) .
\end{aligned}
$$

Therefore

$$
\left\{H_{R}\left(\vec{Z}_{1}\right), H_{R}\left(\vec{Z}_{2}\right)\right\}=-\sqrt{-1} H_{R}\left(\vec{Z}_{1} \times \vec{Z}_{2}\right)
$$

Ad 5: We have

$$
\begin{aligned}
& \left\{H_{R}\left(\bar{Z}^{( }\right), H_{H}(N)\right\} \\
& =\int_{\Sigma}\left[\frac{\delta H_{H}(\mathrm{~N})}{\delta \overrightarrow{\mathrm{A}}} \wedge \frac{\delta H_{\mathrm{R}}(\vec{Z})}{\delta \vec{Q}}-\frac{\delta H_{\mathrm{R}}(\overrightarrow{\mathrm{Z}})}{\delta \overrightarrow{\mathrm{Z}}} \wedge \frac{\delta H_{\mathrm{H}}(\mathrm{~N})}{\delta \vec{Q}}\right] \\
& =\int_{\Sigma}\left[\frac{\delta H_{H}(\mathrm{~N})}{\delta A_{a}} \wedge \frac{\delta H_{R}(\bar{Z})}{\delta Q^{a}}-\frac{\delta H_{R}(\vec{Z})}{\delta A_{a}} \wedge \frac{\delta H_{H}(\mathrm{~N})}{\delta Q^{a}}\right] \\
& =\int_{\Sigma}\left[\sqrt{-I} d^{A}\left(N * Q^{a}\right) \wedge d^{A} Z_{a}\right. \\
& +\sqrt{-1}(\vec{Z} \times \underset{\wedge}{X}) a^{\wedge}\left(N\left(\overrightarrow{\text { Ric } F)} a+\frac{1}{4} N F * Q^{a}\right)\right] .
\end{aligned}
$$

Write

$$
\begin{aligned}
& \sqrt{-I} d^{A}\left(N * Q^{a}\right) \wedge d^{A} z_{a} \\
= & \sqrt{-I} d^{A} Z_{a} \wedge d^{A}\left(N * Q^{a}\right) \\
= & -\sqrt{-I}\left(d Z_{a}+A^{a}{ }_{b} \wedge Z_{b}\right) \wedge\left(d N \wedge \omega^{a}+N d \omega^{a}+N A^{a} c^{\Lambda \omega^{C}}\right) .
\end{aligned}
$$

19. 

$$
\begin{aligned}
& \text { - } d\left(Z_{a} \wedge d N \wedge \omega^{a}\right)=d Z_{a} \wedge d N \wedge \omega^{a} \\
& +Z_{a} \wedge d^{2} N \wedge \omega^{a}-z_{a} \wedge d N \wedge d \omega{ }^{a} \\
& \text { => } \\
& \int_{\Sigma} d Z_{a} \wedge d N \wedge \omega^{a}=\int_{\Sigma} Z_{a} \wedge d N \wedge d \omega{ }^{a} . \\
& \text { - } d\left(Z_{a} \wedge N \wedge d \omega^{a}\right)=d Z_{a} \wedge N \wedge d \omega^{a} \\
& +z_{a} \wedge d N \wedge d \omega^{a}+z_{a} \wedge N \wedge d^{2} \omega^{a} \\
& \text { => } \\
& \int_{\Sigma} d Z_{a} \wedge \wedge \wedge d \omega^{a}=-\int_{\Sigma} Z_{a} \wedge d N \wedge d \omega^{a} .
\end{aligned}
$$

Matters thus reduce to consideration of

$$
d Z_{a} \wedge N \wedge A_{c}^{a} \wedge \omega^{c}
$$

and

$$
\begin{aligned}
& \Gamma^{-} \text {1. } \quad A_{b}^{a} \wedge Z_{b} \wedge d N \wedge \omega^{a} \\
& \text { 2. } A_{b}^{a} \wedge z_{b} \wedge N / d w^{a} \\
& \text { 3. } A^{a}{ }_{b} \wedge Z_{b} \wedge N \wedge A^{a}{ }_{c} \wedge^{C} \text {. } \\
& \text { - } d\left(Z_{a} \wedge N \wedge A_{c}^{a} \wedge^{C}\right) \\
& =d Z_{a} \Lambda N \wedge A^{a}{ }_{c} \Lambda \omega^{C}+Z_{a} \wedge d N \wedge A^{a}{ }_{c} \Lambda \omega^{c} \\
& +z_{a} \wedge N \wedge d A^{a}{ }_{c} \wedge \omega^{c}-z_{a} \wedge N \wedge A^{a}{ }_{c} \wedge d \omega^{c} .
\end{aligned}
$$

20. 
21. $-Z_{a} \wedge d N \wedge A^{a}{ }_{c} \wedge^{C}$

$$
\begin{aligned}
& =A^{a} c^{\wedge} Z^{n} \wedge d N \wedge \omega^{c} \\
& =A^{c} a^{\wedge} Z_{c} \wedge d N \wedge \omega^{a} \\
& =A^{b}{ }_{a} \wedge Z_{b} \wedge d N \wedge \omega^{a} \\
& =-A^{a}{ }_{b} \wedge Z_{b} \wedge d N \wedge \omega^{a} .
\end{aligned}
$$

2. $Z_{a} \wedge N \wedge A^{a}{ }_{c} \wedge d \omega^{C}$

$$
\begin{aligned}
& =A_{c}^{a} \wedge Z_{a} \wedge N \wedge d \omega^{c} \\
& =A^{c}{ }_{a} \wedge Z_{c} \wedge N \wedge d \omega^{a} \\
& =A^{b}{ }_{a} \wedge Z_{b} \wedge N \wedge d \omega^{a} \\
& =-A^{a}{ }_{b} \wedge Z_{b} \wedge N \wedge d \omega^{a} .
\end{aligned}
$$

There remains - $\sqrt{-1}$ times

$$
\begin{aligned}
& A_{b}^{a} \wedge Z_{b} \wedge N \wedge A^{a}{ }_{c} \wedge \omega^{c}-Z_{a} \wedge N \wedge d A^{a}{ }_{c} \wedge \omega^{c} \\
& =A^{b}{ }_{a} \wedge Z_{a} \wedge N \wedge A^{b}{ }_{c} \Lambda \omega^{c}-Z_{a} \Lambda N \wedge d A_{b}{ }_{b} \Lambda \omega^{b} \\
& =A_{a}^{C} \wedge Z_{a} \wedge N \wedge A_{b}^{C} N \omega^{b}-Z_{a} \wedge N \wedge A A_{b}^{a} \wedge \omega^{b} \\
& =Z_{a} \wedge N \wedge\left(-d A_{b}^{a}+A_{a}^{C} \wedge A_{b}^{c}\right) \wedge \omega^{b}
\end{aligned}
$$

21. 

$$
\begin{aligned}
& =z_{a} \wedge N \wedge\left(-d A_{b}^{a}-A_{c}^{a} \wedge A_{b}^{c}\right) \wedge \omega^{b} \\
& =Z_{a} \wedge N \wedge-F_{a b} \wedge \omega^{b}
\end{aligned}
$$

or still,

$$
\begin{aligned}
& \sqrt{-1} N\left(Z_{a} \wedge F_{a b} \wedge \omega^{b}\right) \\
& =\sqrt{-1} N\left(z_{a} \wedge-\sqrt{-1} \varepsilon_{a b c} F_{c} \Lambda \omega^{b}\right) \\
& =N \varepsilon \varepsilon_{a b c}{ }^{Z} a^{\wedge E_{c}} c \omega^{b} \\
& =N \varepsilon_{b a c} Z_{b} \wedge F_{c} \wedge \omega^{a} \\
& =-N \varepsilon_{a b c}{ }^{2} b \wedge F_{c} \Lambda \omega{ }^{a} \\
& =N \varepsilon_{a b c}{ }^{2} b_{b} \wedge F_{c} \wedge-\omega^{a} \\
& =N \varepsilon_{a b c}{ }^{Z} b^{\wedge F_{c}}{ }_{c} * Q^{a} \\
& =N(\vec{Z} \times \vec{F}) a^{\wedge * Q^{a}} \\
& =N(\vec{Z} \wedge \overrightarrow{\mathcal{F}}) \wedge * \mathbb{Z} \\
& =N(\vec{Z} \dot{\lambda}(\vec{F} \times * \vec{X})) \\
& =N((\vec{F} \times \star \vec{Q}) \dot{\mathrm{Z}}) .
\end{aligned}
$$

This has now to be combined with
$\sqrt{-1}\left(\frac{1}{Z} \times \vec{Q}\right) a_{a} \wedge\left(N(\overrightarrow{\text { Ric }} F)_{a}+\frac{1}{4} N F * Q^{a}\right)$.

Write

Then

Finally

$$
\sqrt{-I}(\vec{Z} \times \vec{D}) a^{\wedge} \frac{1}{4} N F * Q^{a}
$$

$$
=\frac{\sqrt{-I}}{4} N F \varepsilon_{a b c}{ }^{Z_{b} \wedge Q_{c} \wedge * Q^{a}}
$$

$$
=\frac{\sqrt{-I}}{4} N F \varepsilon_{a b c}{ }^{Z_{b}} \wedge-* \omega_{c} \wedge-* * \omega \omega^{a}
$$

$$
=\frac{\sqrt{-I}}{4} N F \varepsilon_{a b c}{ }^{z_{b}} \wedge \omega^{a} \wedge \star \omega_{c}
$$

$$
=\frac{\sqrt{-1}}{4} N F \varepsilon_{a b c} \mathrm{z}_{b} q\left(\omega^{a}, \omega_{c}\right) \mathrm{vol}_{q}
$$

$$
\begin{aligned}
& =N(\vec{F} \times * \vec{Q}-\sqrt{-I}(\overrightarrow{R i c} F \times \vec{Q})) \dot{\vec{Z}} \\
& =0 .
\end{aligned}
$$

$$
\begin{aligned}
& =N \overrightarrow{F I}(\vec{Z} \times \vec{X}) \dot{\overrightarrow{\operatorname{Ric}} F} \\
& =-\mathrm{N} \sqrt{-\mathrm{I}}(\overrightarrow{\mathrm{Q}} \times \overrightarrow{\mathrm{Z}}) \dot{\wedge} \overrightarrow{\mathrm{Ric}} \mathrm{~F}
\end{aligned}
$$

$$
\begin{aligned}
& =-N \overrightarrow{-I}(\overrightarrow{\operatorname{Ric}} F \times \vec{\chi}) \dot{\lambda} .
\end{aligned}
$$

23. 

$$
\begin{aligned}
& =\frac{\sqrt{-1}}{4} N F \varepsilon_{a b c} \mathrm{z} \delta^{\mathrm{a}}{ }_{\mathrm{c}} \mathrm{VOl}_{\mathrm{q}} \\
& =\frac{\sqrt{-1}}{4} N F \varepsilon_{\mathrm{aba}} \mathrm{Z}_{\mathrm{b}} \mathrm{Vol}{ }_{\mathrm{q}} \\
& =0 .
\end{aligned}
$$

Therefore

$$
\left\{H_{R}(\bar{Z}), H_{H}(N)\right\}=0 .
$$

Ad 6: We have

$$
\begin{aligned}
& \left\{H_{H}\left(\mathrm{~N}_{1}\right), \mathrm{H}_{\mathrm{H}}\left(\mathrm{~N}_{2}\right)\right\} \\
& =\int_{\Sigma}\left[\frac{\delta H_{H}\left(\mathrm{~N}_{2}\right)}{\delta \overrightarrow{\mathrm{A}}} \wedge \frac{\delta H_{\mathrm{H}}\left(\mathrm{~N}_{1}\right)}{\delta \vec{Q}}-\frac{\delta H_{H}\left(\mathrm{~N}_{1}\right)}{\delta \overrightarrow{\mathrm{A}}} \wedge \frac{\delta H_{\mathrm{H}}\left(\mathrm{~N}_{2}\right)}{\delta \vec{Z}}\right] \\
& =\int_{\Sigma}\left[\frac{\delta H_{H}\left(\mathrm{~N}_{2}\right)}{\delta A_{a}} \wedge \frac{\delta H_{H}\left(\mathrm{~N}_{1}\right)}{\delta Q^{a}}-\frac{\delta H_{H}\left(\mathrm{~N}_{1}\right)}{\delta A_{a}} \wedge \frac{\delta H_{H}\left(\mathrm{~N}_{2}\right)}{\delta Q^{a}}\right] \\
& =\int_{\Sigma}\left[-\sqrt{-1} N_{1}(\text { (Ric F) })_{a}+\frac{1}{4} F * Q^{a}\right) \wedge d^{A}\left(N_{2} \times Q^{a}\right) \\
& \left.+\sqrt{-1} N_{2}\left((\overrightarrow{\text { Ric }} \mathrm{F}) \mathrm{a}+\frac{1}{4} \mathrm{~F} * Q^{\mathrm{a}}\right) \wedge \mathrm{d}^{\mathrm{A}}\left(\mathrm{~N}_{1} * Q^{\mathrm{a}}\right)\right] .
\end{aligned}
$$

Write

$$
\begin{aligned}
& -\sqrt{-1} N_{1}\left(\frac{1}{4} F * Q^{a}\right) \wedge d^{A}\left(N_{2} * Q\right. \\
= & -\sqrt{-1} N_{1}\left(\frac{1}{4} F * \vec{Q}\right) \therefore d^{A}\left(N_{2} * \vec{Q}\right) \\
= & -\sqrt{-1} N_{1}\left(\frac{1}{4} F * \vec{Q}\right) \wedge\left(d\left(N_{2} * \vec{Q}\right)+\sqrt{-1} \overrightarrow{\mathrm{~A}} \times N_{2} * \overrightarrow{\mathbb{Q}}\right) \\
= & -\sqrt{-1}\left(\frac{1}{4} F * \vec{Q}\right) i\left(N_{1} d N_{2} \wedge * \vec{Q}\right)
\end{aligned}
$$

$$
\left.-\sqrt{-I}\left(\frac{1}{4} F * \mathbb{Q}\right) \stackrel{\left(N_{1} N_{2} \wedge d * \mathbb{Q}+\sqrt{-I} \vec{A}\right.}{\wedge} N_{1} N_{2} * \vec{X}\right) .
$$

By the same token,

$$
\begin{aligned}
& \sqrt{-1} N_{2}\left(\frac{1}{4} F * Q^{a}\right) \wedge d^{A}\left(N_{1} * Q^{a}\right) \\
= & \left.\sqrt{-1}\left(\frac{1}{4} F * \vec{Q}\right) \stackrel{\left(N_{2} d N_{1} \wedge * Q\right.}{Q}\right) \\
& \left.+\sqrt{-1}\left(\frac{1}{4} F * *\right) \stackrel{\left(N_{2} N_{1} \wedge d * Q\right.}{ } \quad \begin{array}{rl}
-1 \\
A
\end{array} \times N_{2} N_{1} * \vec{Q}\right) .
\end{aligned}
$$

Combining terms thus gives

$$
\sqrt{-1}\left(\frac{1}{4} \mathrm{~F} * \mathrm{X}\right) \dot{\wedge}\left(\mathrm{N}_{2} \mathrm{dN}_{1}-\mathrm{N}_{1} \mathrm{dN}_{2}\right) \wedge * \overline{\mathrm{X}}
$$

which, of course, is equal to zero. Next

$$
\begin{aligned}
& -\sqrt{-1} N_{1}(\overrightarrow{\operatorname{Ric}} \mathrm{~F}){ }_{a} \wedge d^{A}\left(N_{2} * Q^{a}\right) \\
& =-\sqrt{-1} N_{1} \overrightarrow{R i c} F \dot{\lambda} d^{A}\left(N_{2} * \mathbb{Z}\right) \\
& =-\sqrt{-1} N_{1} \overrightarrow{\operatorname{Ric}} \mathrm{~F} \dot{\wedge}\left(\mathrm{dN}_{2} \wedge \star \overrightarrow{\mathrm{O}}+\mathrm{N}_{2} \wedge \mathrm{~d} * \overrightarrow{\mathrm{Z}}+\sqrt{-\mathrm{I}} \overrightarrow{\mathrm{~A}} \times \mathrm{N}_{2} * \overrightarrow{\mathrm{Z}}\right) .
\end{aligned}
$$

Now change the sign, switch the roles of $\mathrm{N}_{1}$ and $\mathrm{N}_{2}$, and add -- then we get

$$
\sqrt{-1} \overrightarrow{\operatorname{Ric} F} \dot{\wedge}\left(\mathrm{~N}_{2} \mathrm{dN}_{1}-\mathrm{N}_{1} \mathrm{dN}_{2}\right) \wedge * \vec{Q}
$$

or still,

$$
\sqrt{-\mathrm{I}} \overrightarrow{(\overrightarrow{\operatorname{Ric}} \mathrm{~F}} \dot{\wedge} * \bar{X}) \wedge\left(\mathrm{N}_{1} \mathrm{dN}_{2}-\mathrm{N}_{2} \mathrm{~d} N_{1}\right)
$$

Put, for the moment,

$$
\left\lvert\, \begin{aligned}
\vec{\alpha} & =\overrightarrow{\operatorname{Ric} F} \\
\beta & =N_{1} d N_{2}-N_{2} d N_{1}
\end{aligned}\right.
$$

25. 

Then we claim that

$$
(\vec{\alpha} \dot{\wedge}(\vec{Q}) \wedge \beta=(\vec{\alpha} \times \vec{Q}) \dot{q}(\beta, * \vec{Q})
$$

To establish this, note that the LHS equals

$$
-\alpha_{a} \wedge \omega^{a} \wedge \beta .
$$

On the other hand, the RHS equals

$$
\begin{aligned}
& (\vec{\alpha} \wedge \times \vec{Q}) a^{\wedge} \wedge\left(\beta, * Q^{a}\right) \\
& =\varepsilon_{a b c} b_{b} \wedge Q^{c} \wedge q\left(\beta, * Q^{a}\right) .
\end{aligned}
$$

It will be simplest to work from left to right. So let

$$
\beta=q\left(\beta, \omega^{b}\right) \omega^{b}
$$

Then

$$
\begin{aligned}
& -\alpha_{a} \wedge \omega^{a} \wedge \beta \\
= & -\alpha_{a} \wedge \omega^{a} \wedge q\left(\beta, \omega^{b}\right) \omega^{b} \\
= & -\alpha_{a} \wedge \omega^{a} \wedge \omega^{b} \wedge q\left(\beta, \omega^{b}\right) \\
= & -\alpha_{a} \wedge \varepsilon_{a b c} \star \omega^{c} \wedge q\left(\beta, \omega^{b}\right) \\
= & \alpha_{a} \wedge \varepsilon_{a b c} Q^{c} \wedge q\left(\beta, \omega^{b}\right) \\
= & \alpha_{b} \wedge \varepsilon_{b a c} Q^{c} \wedge q\left(\beta, \omega^{a}\right) \\
= & \varepsilon_{b a c} \alpha_{b} \wedge Q^{c} \wedge q\left(\beta, \omega^{a}\right)
\end{aligned}
$$

$$
\begin{aligned}
& =-\varepsilon_{a b c}{ }^{\alpha_{b}} \wedge^{c}{ }^{c} \wedge q\left(\beta, \omega^{a}\right) \\
& =\varepsilon_{a b c} \alpha_{b} \wedge Q^{c} \wedge q\left(\beta,-\omega^{a}\right) \\
& =\varepsilon_{a b c} \alpha_{b} \wedge Q^{c} \wedge q\left(\beta, * Q^{a}\right) .
\end{aligned}
$$

Hence the claim. In summary,

$$
\begin{aligned}
& \sqrt{-\mathrm{I}}(\overrightarrow{\operatorname{Ric}} \mathrm{~F} \dot{\wedge} * \overrightarrow{\mathrm{X}}) \wedge\left(\mathrm{N}_{1} \mathrm{dN}_{2}-\mathrm{N}_{2} \mathrm{~d} \mathrm{~N}_{1}\right) \\
& =\sqrt{-1}(\overrightarrow{\operatorname{Ric}} \mathrm{~F} \stackrel{\times}{\wedge} \overline{\mathrm{Q}}) \dot{\mathrm{q}}\left(\mathrm{~N}_{1} \mathrm{dN}_{2}-\mathrm{N}_{2} \mathrm{dN}_{1}, *(\overline{\mathrm{X}}) .\right.
\end{aligned}
$$

But

$$
\begin{aligned}
& \mathrm{N}_{1} \operatorname{grad} N_{2}-N_{2} \operatorname{grad} N_{1} \\
& \quad=q\left(N_{1} d N_{2}-N_{2} d N_{1}, \omega^{a}\right) E_{a} \\
& \\
& =-q\left(N_{1} d N_{2}-N_{2} d N_{1}, * Q^{a}\right) E_{a} .
\end{aligned}
$$

And

$$
\begin{aligned}
\int_{\Sigma}- & \sqrt{-1}\left(N_{1} \operatorname{grad} N_{2}-N_{2} \operatorname{grad} N_{1}\right) \cdot(\overrightarrow{\operatorname{Ric}} F \times \vec{Q}) \\
= & H_{D}\left(N_{1} \operatorname{grad} N_{2}-N_{2} \operatorname{grad} N_{1}\right) \\
& -\int_{\Sigma} \vec{A}\left(N_{1} \operatorname{grad} N_{2}-N_{2} \operatorname{grad} N_{1}\right) d^{A} \vec{Q} \\
= & H_{D}\left(N_{1} \operatorname{grad} N_{2}-N_{2} \operatorname{grad} N_{1}\right) \\
& -H_{R}\left(\vec{A}\left(N_{1} \operatorname{grad} N_{2}-N_{2} \operatorname{grad} N_{1}\right)\right) .
\end{aligned}
$$

Section 60: Densitized Variables The assumptions and notation are those of the standard setup but with the restriction that $n=4$.

The Ashtekar hamiltonian

$$
\begin{aligned}
& H(\vec{Q}, \vec{A} ; N, \vec{N}, \vec{Z}) \\
& =\int_{\Sigma} L_{\vec{N}} \vec{Q} \dot{\wedge} \vec{A}+\int_{\Sigma} \vec{Z} \dot{\wedge} d^{A} \vec{Q}+\delta_{\Sigma}-\sqrt{-1} \stackrel{N}{\mathrm{~F}} \dot{\wedge}+\mathbb{Q}
\end{aligned}
$$

is globally defined but this is not the case of its traditional counterpart which is only defined locally.

Let $x^{1}, x^{2}, x^{3}$ be coordinates on $\Sigma$ consistent with the underlying orientation of $\Sigma$.
[Note: If the domain of $x^{1}, x^{2}, x^{3}$ is $U$, then, for economy of notation, we shall pretend in what follows that $\mathrm{U}=\Sigma$.]

Convention: $\mu, \nu$ and $\alpha, \beta, \gamma, \delta$ are coordinate indices that run between 1 and 3 .

## Local Formulas

1. $\frac{\partial}{\partial x^{\mu}}=e^{a} E_{a} \& E_{a}=e^{\mu} a \frac{\partial}{\partial x^{\mu}}$.
2. $e^{\mu}{ }_{a} e^{a}=\delta_{\nu}^{\mu} \& e^{a} e^{\mu}{ }_{b}=\delta_{b}^{a}$.
3. $q_{\mu \nu}=e^{a} e^{a}{ }_{\nu} \& q^{\mu \nu}=e^{\mu} e^{\nu}{ }_{a}$.

LEMMA We have

$$
\operatorname{det}\left[q_{\mu v}\right]=\operatorname{det}\left[e_{\mu}^{a}\right] \operatorname{det}\left[e_{v}^{a}\right]
$$

2. 

[In fact,

$$
\left.e_{\mu}^{a}=q_{\mu \nu} e_{a}^{\nu}{ }^{\cdot}\right]
$$

Abusing the notation, let

$$
\sqrt{q}=\operatorname{det}\left[e_{\mu}^{a}\right]
$$

and then put

$$
E_{a}^{\mu}=\sqrt{q} e_{a}^{\mu}
$$

[Note: Accordingly,

$$
\begin{aligned}
E_{a}^{\mu} E_{a}^{\nu} & =(\operatorname{det} q) e_{a}^{\mu} e^{\nu} a \\
& \left.=(\operatorname{det} q) q^{\mu \nu} \cdot\right]
\end{aligned}
$$

IEMMA We have

$$
\varepsilon_{\alpha \beta \gamma}\left({ }^{\left(* \omega^{a}\right)_{\alpha \beta}}=2 E_{a}^{\gamma} .\right.
$$

[Write

$$
* \omega^{a}=\frac{1}{2} \varepsilon_{a b c} \omega^{b} \wedge \omega^{c}
$$

Then

$$
\varepsilon_{\alpha \beta \gamma}\left(* \omega^{a}\right)_{\alpha \beta}=\frac{1}{2} \varepsilon_{\alpha \beta \gamma} \varepsilon_{a b c}\left(\omega^{b} \wedge \omega^{c}\right)_{\alpha \beta} .
$$

But

$$
\left[\begin{array}{rl}
\omega & \omega_{\mu}^{b} \\
\omega^{c} & =e_{\nu}^{\mu} d x^{\nu}
\end{array}\right.
$$

$$
\begin{aligned}
& \Rightarrow \\
& \omega^{b} \wedge \omega^{c}=e^{b} e^{c} \nu^{d x} d x^{\mu} d x^{\nu} \\
&=\frac{1}{2}\left(\omega^{b} \wedge \omega^{c}\right)_{\mu \nu} d x^{\mu} \wedge d x^{\nu}
\end{aligned}
$$

Therefore

$$
\begin{aligned}
\varepsilon_{\alpha \beta \gamma}(* \omega)_{\alpha \beta}^{a} & =\varepsilon_{\alpha \beta \gamma}\left(\varepsilon_{a b c} e^{b} e^{c}{ }_{\beta}\right) \\
& =\varepsilon_{\alpha \beta \gamma}\left(\varepsilon_{b c a} e^{b} e_{\alpha}^{c}{ }_{\beta}\right) .
\end{aligned}
$$

Let $A=\left[e_{\alpha}^{a}\right]-$ then

$$
\begin{aligned}
& \varepsilon_{b c a} \operatorname{det} A=\varepsilon_{\alpha \beta \gamma} e^{b}{ }_{\alpha} e^{c}{ }_{\beta} e^{a}{ }_{\gamma} \\
& \text { => } \\
& e^{a^{\prime}}{ }_{\gamma} \cdot \frac{1}{2 \operatorname{det} A} \varepsilon_{\alpha \beta \gamma}\left(\varepsilon_{b c a}{ }^{\prime} e_{\alpha} e_{\beta}^{c}\right) \\
& =\frac{1}{2 \operatorname{det} A} \varepsilon_{b c a}{ }^{\prime \prime}\left(\varepsilon_{\alpha \beta \gamma} e^{b} e^{c}{ }_{\beta} e^{a^{\prime}}{ }_{\gamma}\right) \\
& =\frac{1}{2 \operatorname{det} A} \varepsilon_{b c a}{ }^{\prime}\left(\varepsilon_{b c a}{ }^{\prime} \operatorname{det} A\right) \\
& =\frac{1}{2} \varepsilon_{b c a} \cdot \varepsilon_{b c a "}=\delta^{a^{\prime}} a^{\prime \prime} \\
& \text { => } \\
& e_{a}^{\gamma}=\left(A^{-1}\right)_{a}^{\gamma}=\frac{1}{2 \operatorname{det} A} \varepsilon_{\alpha \beta \gamma}\left(\varepsilon_{b c a} e^{b}{ }_{\alpha} e^{c}{ }_{\beta}\right) \\
& \text { => } \\
& \varepsilon_{\alpha \beta \gamma}\left(* \omega^{a}\right)_{\alpha \beta}=2(\operatorname{det} A) e_{a}^{\gamma}
\end{aligned}
$$

$$
\begin{aligned}
& =2 \sqrt{q} e_{a}^{\gamma} \\
& \left.=2 E_{a}^{\gamma} \cdot\right]
\end{aligned}
$$

We are now in a position to discuss the local version of $H$.
Analysis of $H_{D}(\vec{N})$ : In the literature, it is customary to restrict attention to $\bar{H}_{D}(\vec{N})$ which, by definition, is

$$
\int_{\Sigma}-\imath \overrightarrow{\vec{N}} \stackrel{\vec{F}}{ } \dot{Q}
$$

Here

$$
-\underset{\vec{N}}{\stackrel{\rightharpoonup}{F}} \stackrel{\rightharpoonup}{Q}=-{\underset{N}{N}}_{F^{a}}^{\text {a }}{ }^{\mathrm{a}}
$$

Write

$$
\vec{N}=N^{a} E_{a}=N^{\alpha} \frac{\partial}{\partial x^{\alpha}}
$$

and

$$
\mathrm{F}^{\mathrm{a}}=\frac{1}{2} \mathrm{~F}_{\alpha \beta}^{\mathrm{a}} \mathrm{dx}^{\alpha} \wedge d x^{\beta}
$$

Then

$$
\begin{aligned}
& \imath_{\vec{N}}\left(d x^{\alpha} \wedge d x^{\beta}\right) \\
= & \left(\imath_{\vec{N}} d x^{\alpha}\right) \wedge d x^{\beta}-\underset{\vec{N}}{\left(\imath d x^{\beta}\right) \wedge d x^{\alpha}} \\
= & d x^{\alpha}(\vec{N}) d x^{\beta}-d x^{\beta}(\vec{N}) d x^{\alpha} \\
= & N^{\alpha} d x^{\beta}-N^{\beta} d x^{\alpha} .
\end{aligned}
$$

And

$$
\begin{aligned}
& =F_{\alpha \beta}^{a}{ }^{\alpha}{ }^{\alpha} d x^{\beta} \\
& \text { => } \\
& { }^{2} \vec{N}^{\vec{N}}{ }^{\mathrm{a}}=\mathrm{N}^{\alpha} \mathrm{F}_{\alpha \beta}^{\mathrm{a}}{ }_{\alpha \beta} \mathrm{dx}^{\beta} .
\end{aligned}
$$

Write

$$
Q^{a}=\frac{1}{2} Q_{\gamma \delta}^{a} d x^{\gamma} \wedge d x^{\delta} .
$$

Then

$$
\begin{aligned}
d x^{\beta} \wedge d x^{\gamma} \wedge d x & \\
& =\varepsilon_{\beta \gamma \delta} d^{3} x \\
& =\varepsilon_{\gamma \delta \beta^{d}} d^{3} x .
\end{aligned}
$$

And

$$
\begin{aligned}
& \frac{1}{2} \varepsilon_{\gamma \delta \beta^{Q}}{ }_{\gamma \delta}=-E_{a}^{\beta} \\
\Rightarrow & \\
& { }^{\imath} \vec{N}^{a}{ }^{a} Q^{a}=-N{ }^{\alpha} F_{\alpha \beta^{a}} E^{\beta} a^{3} x .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
\bar{H}_{D}(\vec{N}) & =\int_{\Sigma}-{ }_{\vec{N}} \overrightarrow{\mathrm{~F}} \stackrel{\vec{Q}}{ } \dot{Q} \\
& =\int_{\Sigma} N^{\alpha} F_{\alpha \beta}^{a}{ }^{\beta}{ }^{\beta}{ }_{a} d^{3} x .
\end{aligned}
$$

Analysis of $H_{R}(\overrightarrow{(2)})$ : By definition,

$$
\int_{\Sigma} \vec{z} \dot{\wedge} d^{A} \vec{Q}=\int_{\Sigma} z^{a}\left(d^{A} Q^{a}\right),
$$

where

$$
d^{A} Q^{a}=d Q^{a}-\sqrt{-I} \varepsilon_{a b c} A^{C^{c}} \wedge Q^{b}
$$

Write

$$
Q^{a}=\frac{1}{2} Q_{\alpha \beta}^{a} d x^{\alpha} \wedge d x x^{\beta}
$$

Then

$$
\begin{aligned}
d Q^{a} & =\frac{1}{2} \frac{\partial Q_{\alpha \beta}^{a}}{\partial x^{\gamma}} d x^{\gamma} \wedge d x^{\alpha} \wedge d x^{\beta} \\
& =\frac{1}{2} \frac{\partial Q^{a}{ }_{\alpha \beta}}{\partial x^{\gamma}} \varepsilon_{\gamma \alpha \beta} d^{3} x \\
& =\partial_{\gamma}\left(\frac{1}{2} \varepsilon_{\alpha \beta \gamma} Q_{\alpha \beta}^{a}\right) d^{3} x \\
& =-\partial_{\gamma} E^{\gamma} a^{d^{3}} x \\
& =-\partial_{\alpha} E^{\alpha} a^{3} x .
\end{aligned}
$$

Write

$$
A^{C}=A_{\gamma}^{C} d x^{\gamma} .
$$

Then

$$
\begin{aligned}
& -\sqrt{-1} \varepsilon_{a b c} A^{C} \wedge Q^{b} \\
& =-\sqrt{-1} \varepsilon_{a b c^{A}}{ }_{\gamma} \frac{1}{2} Q^{b}{ }_{\alpha \beta} d x^{\gamma} \wedge d x^{\alpha} \wedge d x^{B}
\end{aligned}
$$

$$
\begin{aligned}
& =-\sqrt{-I} \varepsilon_{a b c}{ }^{A}{ }_{\gamma}{ }_{\gamma}\left(\frac{1}{2} \varepsilon_{\alpha \beta \gamma}{ }^{\mathrm{d}}{ }_{\alpha \beta}\right) d^{3} \mathrm{x} \\
& =\sqrt{-I} \varepsilon_{a b c}{ }^{A}{ }_{\gamma}{ }_{\gamma}{ }^{\Upsilon} b^{d^{3}} x \\
& =\sqrt{-I} \varepsilon_{a c b} A^{b}{ }_{\gamma} E^{\gamma} d^{3} x \\
& =-\sqrt{-I} \varepsilon_{a b c}{ }^{A}{ }_{\alpha}^{b} E^{\alpha} c^{d^{3}} x .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& H_{R}(\vec{z})=\int_{\Sigma} \vec{z} \dot{\wedge} d^{A} \vec{Q} \\
= & -\int_{\Sigma} z^{a}\left(\partial_{\alpha} E^{\alpha} a+\sqrt{-I} \varepsilon_{a b c} A^{b}{ }_{\alpha} E^{\alpha}{ }_{c}\right) d^{3} x .
\end{aligned}
$$

Analysis of $H_{H}(N)$ : To discuss

$$
\delta_{\Sigma}-\sqrt{-I N} N \vec{F} \dot{\wedge} * \vec{Q}
$$

note that

$$
-\vec{F} \dot{\wedge} * \vec{Q}=F^{c}{ }_{\Lambda}{ }^{C}
$$

and then write

$$
\left[\begin{array}{l}
F^{c}=\frac{1}{2} F_{\alpha \beta}^{c}{ }_{\alpha x^{\alpha} \Lambda d x^{\beta}} \\
\omega^{c}=e_{\gamma}^{c} d x^{\gamma}
\end{array}\right.
$$

thus reducing matters to consideration of

$$
\frac{1}{2} F_{\alpha \beta}^{c} e^{c} d x^{\alpha} \wedge d x^{\beta} \Lambda d x^{\gamma}
$$

$$
=\frac{1}{2} F^{c}{ }_{\alpha \beta} \varepsilon_{\alpha \beta \gamma}{ }^{c}{ }_{\gamma} d^{3} x .
$$

But

$$
\begin{aligned}
e_{\gamma}^{c} & =\frac{1}{2 \operatorname{det}\left[e_{c}^{\gamma}\right]} \varepsilon_{c a b}^{\varepsilon_{\gamma \mu \nu}} e^{\mu} e^{\nu} e_{b}^{\nu} \\
& =\frac{1}{2 \sqrt{q}} \varepsilon^{c^{2}}{ }^{\varepsilon}{ }_{\gamma \mu \nu} E^{\mu}{ }_{a} E^{\nu}{ }_{b} .
\end{aligned}
$$

And

$$
\begin{aligned}
& \varepsilon_{\alpha \beta \gamma} \varepsilon_{\gamma \mu \nu} E^{\mu}{ }_{a} E^{\nu}{ }_{b} \\
&=\varepsilon_{\alpha \beta \gamma} \varepsilon_{\mu \nu \gamma} E^{\mu}{ }_{a} E^{\nu}{ }_{b} \\
&=\delta^{\alpha \beta}{ }_{\mu \nu} E^{\mu}{ }_{a} E^{\nu}{ }_{b} \\
&=\left(\delta^{\alpha}{ }_{\mu} \delta^{\beta}{ }_{\nu}-\delta^{\alpha}{ }_{\nu} \delta^{\beta}{ }_{\mu}\right) E^{\mu}{ }_{a} E^{\nu}{ }_{b} \\
&=E^{\alpha}{ }_{a} E^{\beta}{ }_{b}-E^{\beta}{ }_{a} E^{\alpha}{ }_{b} \\
& \varepsilon_{\alpha \beta \gamma} e^{c}{ }_{\gamma}=\frac{1}{2 \sqrt{q}}\left(\varepsilon_{c a b} E^{\alpha}{ }_{a} E^{\beta}{ }_{b}-\varepsilon_{c a b} E^{\beta}{ }_{a} E^{\alpha}{ }_{b}\right) \\
&=\frac{1}{2 \sqrt{q}}\left(\varepsilon_{c a b} E^{\alpha}{ }_{a} E^{\beta}{ }_{b}-\varepsilon_{c b a} E^{\beta}{ }_{b} E_{a}^{\alpha}\right) \\
&=\frac{1}{2 \sqrt{q}}\left(\varepsilon_{c a b} E^{\alpha}{ }_{a} E^{\beta}{ }_{b}+\varepsilon_{c a b} E^{\alpha}{ }_{a} E^{\beta}{ }_{b}\right) \\
&=\frac{1}{\sqrt{q}} \varepsilon_{a b c} E^{\alpha}{ }_{a} E^{\beta}{ }_{b} .
\end{aligned}
$$

9. 

Therefore

$$
\begin{aligned}
H_{H}(N) & =\int_{\Sigma}-\sqrt{-1} N \vec{F} \dot{\wedge} * \vec{Q} \\
& =\int_{\Sigma} \sqrt{-1} \frac{N}{2} \varepsilon_{a b c} E^{\alpha} a^{E^{\beta}}{ }_{b} F^{c}{ }_{\alpha \beta} \frac{d^{3} x}{\sqrt{q}} .
\end{aligned}
$$

Summary: We have
$\underline{D}: \bar{H}_{D}(\vec{N})=\int_{\Sigma} N^{\alpha} F^{a}{ }_{\alpha \beta} E^{\beta} a^{d^{3} x}$.

R: $H_{R}(\vec{Z})=-\int_{\Sigma} z^{a}\left(\partial_{\alpha} E_{a}^{\alpha}+\sqrt{-I} \varepsilon_{a b c} A^{b}{ }_{\alpha} E_{c}^{\alpha}\right) d^{3} x$.
H: $H_{H}(N)=\int_{\Sigma} \sqrt{-1} \frac{N}{2} \varepsilon_{a b c} E^{\alpha}{ }_{a} E^{\beta}{ }_{b} F^{c}{ }_{\alpha \beta} \frac{d^{3} x}{\sqrt{q}}$.
Remark: From the definitions,

$$
F_{\alpha \beta}^{c}=\partial_{\alpha} A_{\beta}^{C}-\partial_{\beta} A_{\alpha}^{C}+\sqrt{-I} \varepsilon_{a b c} A_{\alpha}^{a} A_{\beta}^{b} .
$$

Section 61: Rescaling the Theory The assumptions and notation are those of the standard setup but with the restriction that $n=4$.

Fix a nonzero complex number l (the Immirizi parameter). Define

$$
\mathrm{T}_{\mathrm{I}}: \mathrm{T}^{*} \underline{\mathrm{Q}}_{\underline{C}} \rightarrow \mathrm{~T}^{*} \underline{\underline{Q}}_{\underline{C}}
$$

by

$$
T_{i}(\vec{\omega}, \vec{p})=(\vec{\omega}, \vec{p}-\imath \vec{\omega})
$$

Then $T_{i}$ is bijective.
[Note: Explicitly,

$$
\mathrm{T}_{2}^{-1}: \mathrm{T}^{*} \underline{\mathrm{Q}}_{\underline{C}} \rightarrow \mathrm{~T}^{*} \underline{\underline{Q}}_{\underline{C}}
$$

is given by

$$
\left.T_{\imath}^{-1}(\vec{\omega}, \overrightarrow{\mathrm{p}})=(\vec{\omega}, \overrightarrow{\mathrm{p}}+\imath \mathrm{d} \vec{\omega}) .\right]
$$

N.B. The Ashtekar theory is the case $1=\sqrt{-1}$.

LEMMA $T_{i}$ is a canonical transformation.

Remark: If $\mathfrak{q}$ is real, then $T_{q}$ restricts to a canonical transformation

$$
T^{\star} \underline{\underline{Q}} \rightarrow T^{*} \underline{Q} \underline{.}
$$

Proceeding as before, put

$$
H_{T_{2}}=H \circ T_{2}^{-1} .
$$

Then

$$
H_{T_{\imath}}(\vec{\omega}, \overrightarrow{\mathrm{P}})=H(\vec{\omega}, \overrightarrow{\mathrm{P}}+\imath d \vec{\omega})
$$

$$
\begin{gathered}
=\int_{\Sigma} L_{\vec{N}} \omega^{\mathrm{a}} \wedge \mathrm{P}_{a}+\delta_{\Sigma} \mathbb{w}_{b^{a}} \omega^{\mathrm{b}} \wedge\left(\mathrm{P}_{a}+\imath d \omega_{a}\right) \\
\quad+\delta_{\Sigma} N \mathbb{E}(\vec{\omega} \overrightarrow{\mathrm{P}}+\imath \mathrm{d} \vec{\omega})
\end{gathered}
$$

And

$$
\begin{aligned}
& E(\vec{\omega}, \overrightarrow{\mathbf{P}}+1 d \vec{\omega}) \\
& =\frac{1}{2}\left[q\left(P_{a}+{ }_{2} d \omega_{a}{ }^{\prime * \omega^{b}}\right) q\left(P_{b}+1 d \omega_{b} \not * \omega^{a}\right)\right. \\
& \left.-\frac{1}{2} q\left(P_{a}+1 d \omega_{a}, * \omega^{a}\right)^{2}-S(q)\right] v o l_{q} . \\
& \text { - } q\left(P_{a}+\imath d \omega_{a}, * \omega^{b}\right) q\left(P_{b}+\imath d \omega_{b}, * \omega^{a}\right) \\
& =q\left(P_{a}, * \omega^{b}\right) q\left(P_{b^{\prime}} * \omega^{a}\right) \\
& +21 q\left(P_{a}, * \omega^{b}\right) q\left(d \omega^{b}, * \omega^{a}\right)+i^{2} q\left(d \omega^{a}, * \omega^{b}\right) q\left(d \omega^{b}, * \omega^{a}\right) . \\
& \text { - }-\frac{1}{2} q\left(P_{a}+1 d \omega_{a}, * \omega^{a}\right)^{2} \\
& =-\frac{1}{2} q\left(P_{a}+1 d \omega_{a}, * \omega^{a}\right) q\left(P_{b}+1 d \omega_{b}, * \omega^{b}\right) \\
& =-\frac{P^{2}}{2}-{ }_{\imath} \operatorname{Pq}\left(d \omega^{a}, \star \omega^{a}\right) \\
& -\frac{1}{2} i^{2} q\left(d \omega^{a}, * \omega^{a}\right) q\left(d \omega^{b}, * \omega^{b}\right) \text {, }
\end{aligned}
$$

where

$$
\mathrm{P}=\mathrm{q}\left(\mathrm{P}_{\mathrm{a}^{\prime}} * \omega^{\mathrm{a}}\right)
$$

## 3.

$$
\begin{aligned}
- & -S(q) \vee o l_{q}=2 d\left(\omega^{a} \wedge * d \omega^{a}\right) \\
& -\frac{1}{2}\left(d \omega^{a} \wedge \omega^{a}\right) \wedge *\left(d \omega^{b} \wedge \omega^{b}\right)+\left(d \omega^{a} \wedge \omega^{b}\right) \wedge *\left(d \omega^{b} \wedge \omega^{a}\right) \\
& =2 d\left(\omega^{a} \wedge * d \omega^{a}\right) \\
& -\frac{1}{2} q\left(d \omega^{a}, * \omega^{a}\right) q\left(d \omega^{b}, \star \omega^{b}\right) v o l_{q}+q\left(d \omega^{a}, * \omega^{b}\right) q\left(d \omega^{b}, \star \omega^{a}\right) v o l_{q} .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& E(\vec{\omega}, \vec{p}+\imath d \vec{\omega}) \\
= & \frac{1}{2}\left[q\left(P_{a^{\prime}}, * \omega^{b}\right) q\left(P_{b}, * \omega^{a}\right)\right. \\
+ & 2 \imath q\left(P_{a}, * \omega^{b}\right) q\left(d \omega^{b}, * \omega^{a}\right)-\frac{P^{2}}{2}-\imath P q\left(d \omega^{a}, * \omega^{a}\right) \\
+ & \left.\left(\imath^{2}+1\right) q\left(d \omega^{a}, * \omega^{b}\right) q\left(d \omega^{b}, * \omega^{a}\right)-\frac{\left(r^{2}+1\right)}{2} q\left(d \omega^{a}, * \omega^{a}\right) q\left(d \omega^{b}, * \omega^{b}\right)\right] v o l_{q} \\
& \quad+d\left(\omega^{a} \wedge * d \omega^{a}\right) .
\end{aligned}
$$

Now set

$$
H_{l}=H_{T} \cdot S^{-1}
$$

so that

$$
H_{i}(\vec{X}, \vec{A})=H_{T}(\vec{\omega}, \vec{P}),
$$

where

$$
P_{a}=A_{b} \wedge *\left(\omega^{b} \wedge \omega_{a}\right)
$$

To continue, it will be necessary to introduce some notation that reflects the presence of 1.

Thus given ( $\vec{\omega}, \overrightarrow{\mathrm{P}}$ ), let

$$
A_{a b}=\frac{1}{l}\left[q\left(P_{c}, \omega^{a} \wedge \omega^{b}\right) \omega^{c}-\frac{P}{2} *\left(\omega^{a} \wedge \omega^{b}\right)\right]
$$

Put

$$
A_{C}=\frac{1}{2} \varepsilon_{C u v} A_{u v}
$$

Then

$$
\begin{aligned}
\varepsilon_{a b c} A_{c} & =\varepsilon_{a b c}\left(\frac{l}{2} \varepsilon_{c u v} A_{u v}\right) \\
& =1 A_{a b}
\end{aligned}
$$

And again

$$
\begin{aligned}
& L^{-} A_{a}=q\left(P_{b^{\prime}} * \omega_{a}\right) \omega^{b}-\frac{P}{2} \omega_{a} \\
& P_{-} P_{a}=A_{b} \wedge *\left(\omega^{b} \wedge \omega_{a}\right) . \\
& \text { - } d^{A, r} Q^{a}=d Q^{a}+A^{a}{ }_{b} \wedge Q^{b} \\
& =d Q^{a}+\frac{1}{\imath} \varepsilon^{a}{ }_{b c} A^{C}{ }_{\wedge Q}{ }^{b} \\
& \text { => } \\
& d^{A, r} \vec{Q}=d \vec{Q}-\frac{1}{l} \vec{A} \times \vec{Q} . \\
& \text { - } F_{a}=\frac{l}{2} \varepsilon_{a b c} F_{b c}
\end{aligned}
$$

$$
\begin{aligned}
&=\frac{l}{2} \varepsilon_{a b c}\left(d A_{b c}+A_{b A^{\wedge}} A_{c}^{d}\right) \\
&=d A_{a}-\frac{1}{2 i} \varepsilon_{a b c} A_{b} \wedge A_{c} \\
& \Rightarrow \quad \\
& \vec{F}=d \vec{A}-\frac{1}{2 i} \vec{A} \times \vec{A} .
\end{aligned}
$$

Computation of $H_{1}$ This is simply a matter of replacing $P_{a}$ by $A_{b} \wedge *\left(\omega^{b} \wedge \omega^{a}\right)$
in the foregoing expression for $H_{T}$ and keeping track of the terms obtained thereby. Fortunately most of the work has already been carried out during the course of deriving the Ashtekar hamiltonian, hence there is no point in repeating the details. First

$$
\int_{\Sigma} L_{\vec{N}} \omega^{\mathrm{a}} \wedge \mathrm{P}_{\mathrm{a}}
$$

does not involve 1 and is equal to

$$
\int_{\Sigma} L_{\overrightarrow{\mathrm{N}}} \overrightarrow{\mathrm{Q}} \stackrel{\rightharpoonup}{\mathrm{~A}}
$$

To discuss

$$
\begin{aligned}
& \int_{\Sigma} W_{b}^{a}{ }^{\omega}{ }^{b} \wedge\left(P_{a}+\imath d \omega_{a}\right) \\
& \quad=\delta_{\Sigma} W_{b}^{a} \omega^{b} \wedge\left(A_{c} \wedge *\left(\omega^{c} \wedge \omega_{a}\right)+\imath d \omega_{a}\right)
\end{aligned}
$$

put

$$
z_{a b}=-W_{a b}+\imath \varepsilon_{a b c} W_{c^{\prime}}
$$

6. 

where

$$
W_{c}=-q\left(d N, \omega^{c}\right)
$$

Setting aside

$$
\imath \int_{\Sigma} \varepsilon_{a b c} W_{c}\left(P_{a}+\imath d \omega_{a}\right) \wedge \omega^{b},
$$

we have:

1. $\left.\delta_{\Sigma}-Z_{a b}{ }^{A} c^{\wedge *( } \omega^{C} \wedge \omega^{a}\right) \wedge \omega^{b}$

$$
=\int_{\Sigma} Z_{a} \wedge \frac{l}{l} \varepsilon_{b c}^{a} A^{C^{c}} \wedge Q
$$

2. $\delta_{\Sigma}-z_{a b}\left(1 d \omega^{a}\right) \wedge \omega^{b}$

$$
=\int_{\Sigma} \mathrm{z}_{\mathrm{a}} \wedge \mathrm{dQ} \mathrm{Q}^{\mathrm{a}}
$$

Therefore

$$
1+2=\int_{\Sigma} \vec{z} \dot{\wedge} d^{A, l} \vec{Q}
$$

Finally

$$
\begin{aligned}
& -\imath N \vec{F} \dot{\wedge} * \vec{Q} \\
& =\imath N\left(d A_{a}-\frac{1}{2 \imath} \varepsilon_{a b c} A_{b} \wedge A_{c}\right) \wedge \omega^{a} \\
& =\imath N d A_{a} \wedge \omega^{a}-\frac{N}{2} \varepsilon_{a b c} A_{b} \wedge A_{c} \wedge \omega^{a}
\end{aligned}
$$

But

$$
\text { - } s_{\Sigma}-\frac{N}{2} \varepsilon_{a b c} A_{b} \wedge A_{c} \wedge \omega^{a}
$$

$$
=\int_{\Sigma} \frac{\mathrm{N}}{2}\left[\mathrm{q}^{\left.\left(\mathrm{P}_{\mathrm{a}}, * \omega^{\mathrm{b}}\right) \mathrm{q}\left(\mathrm{P}_{\mathrm{b}}, * \omega^{\mathrm{a}}\right)-\frac{\mathrm{P}^{2}}{2}\right] \mathrm{vol}_{\mathrm{q}} .}\right.
$$

- $\int_{\Sigma}{ }^{\mathrm{Nd} d A} a^{\wedge \omega}{ }^{a}$

$$
\begin{aligned}
& =\imath \int_{\Sigma} N A_{a} \wedge d \omega^{a}-\imath \int_{\Sigma} d N \wedge A_{a} \wedge \omega^{a} \\
& = \\
& \imath \int_{\Sigma} N\left[q\left(P_{a}, * \omega^{b}\right) q\left(d \omega^{b}, * \omega^{a}\right)-\frac{P}{2} q\left(d \omega^{a}, * \omega^{a}\right)\right] v o l_{q} \\
& \\
& -1 \int_{\Sigma} q\left(d N, \omega^{a}\right) P_{b} \wedge *\left(\omega^{a} \Lambda \omega^{b}\right) .
\end{aligned}
$$

Thus it follows that

$$
\begin{aligned}
& \int_{\Sigma} \frac{N}{2}\left[q\left(P_{a}, * \omega^{b}\right) q\left(P_{b^{\prime}} * \omega^{a}\right)\right. \\
+ & \left.2 \imath q\left(P_{a}, * \omega^{b}\right) q\left(d \omega^{b}, * \omega^{a}\right)-\frac{p^{2}}{2}-1 P q\left(d \omega^{a}, * \omega^{a}\right)\right] v o l_{q} \\
= & \int_{\Sigma}-\imath N \vec{F} \dot{\wedge} * \vec{Q}+\imath \int_{\Sigma} q\left(d N, \omega^{a}\right) P_{b} \wedge *\left(\omega^{a} \wedge \omega^{b}\right) .
\end{aligned}
$$

To eliminate

$$
\imath \int_{\Sigma} q\left(d N, \omega^{a}\right) P_{b} \wedge *\left(\omega^{a} \wedge \omega^{b}\right)
$$

reintroduce

$$
\begin{aligned}
& \imath \int_{\Sigma} \varepsilon_{a b c} W_{c}\left(P_{a}+\imath d \omega_{a}\right) \wedge \omega^{b} \\
= & \imath \int_{\Sigma} \varepsilon_{a b c} W_{c} P_{a} \wedge \omega^{b}+\imath^{2} \int_{\Sigma} \varepsilon_{a b c} W_{c} d \omega_{a} \wedge \omega^{b} \\
= & -\imath \int_{\Sigma} q\left(d N, \omega^{a}\right) P_{b} \wedge *\left(\omega^{a} \wedge \omega^{b}\right)+\imath^{2} \int_{\Sigma} \varepsilon_{a b c} W_{c} d \omega_{a} \wedge \omega^{b},
\end{aligned}
$$

8. 

which leaves

$$
\imath^{2} \int_{\Sigma} \varepsilon a b c^{W} c \omega_{a} \omega^{\wedge \omega}
$$

or still,

$$
\imath^{2} \int_{\Sigma}-q\left(d N, \omega^{c}\right) q\left(\omega^{c} \wedge \omega^{a}, d \omega^{a}\right) \operatorname{vol}_{q}
$$

or still,

$$
\imath^{2} \int_{\Sigma} \operatorname{Nd}\left(\omega^{a} \wedge * d \omega^{a}\right)
$$

Definition: The 1 -modification of the Ashtekar hamiltonian is the function

$$
H_{1}: T^{*} * \underline{Q}_{\underline{C}} \rightarrow \underline{C}
$$

defined by the prescription

$$
\begin{aligned}
& H_{\imath}(\vec{Q}, \vec{A} ; N, \vec{N}, \vec{Z}) \\
& =\int_{\Sigma} L_{\vec{N}} \vec{Q} \dot{\hat{N}} \dot{A}+\delta_{\Sigma} \vec{Z} \dot{\wedge} d^{A, l} \vec{Q}+\delta_{\Sigma}-\imath N \vec{F} \dot{\wedge} * \bar{Q} \\
& +\left(\imath^{2}+1\right) \delta_{\Sigma}-\frac{N}{2} S(q) v_{0} q^{\circ}
\end{aligned}
$$

[Note: $H_{\sqrt{-1}}$ is the Ashtekar hamiltonian.]
Remark: If $i$ is real, then the theory restricts to a theory on $T^{*} *$ Q.

LEMMA We have

$$
\frac{\delta}{\delta Q^{a}}\left[\delta_{\Sigma}-\frac{N}{2} S(q) \operatorname{vol}_{q}\right]
$$

$$
\begin{aligned}
=-N\left(R_{i c}\right. & \left.-\frac{1}{2} S(q) \omega^{a}\right) \\
& +\left(\nabla_{a} d N-\left(\Delta_{q} N\right) \omega^{a}\right)
\end{aligned}
$$

[Recall that

$$
\begin{aligned}
\frac{\delta}{\delta \omega} \omega^{a} & {\left[\delta_{\Sigma}-\frac{N}{2} S(q) \operatorname{vol}_{q}\right] } \\
& =N *\left(R_{i c}-\frac{1}{2} S(q) \omega^{a}\right) \\
& \left.-*\left(\nabla_{a} d N-\left(\Delta_{q} N\right) \omega^{a}\right) \cdot\right]
\end{aligned}
$$

Using the lemma and the fact that

$$
\frac{\delta}{\delta A_{a}}\left[\delta_{\Sigma}-\frac{N}{2} S(q) \mathrm{vol}_{q}\right]=0
$$

one can write down the 1 -modified equations of motion and the 1 -modified Poisson bracket structure, a task that will be left to the reader as an exercise ad libitum.

NeB.

$$
\begin{aligned}
& { }^{-} \frac{\delta H_{l}}{\delta N}=\frac{1}{2}\left(i^{2} F-\left(r^{2}+l\right) S(q)\right) \mathrm{vol}_{q} . \\
& \frac{\delta H_{l}}{\delta N^{a}}=l_{E_{a}} A_{b} \wedge d^{A}, Q_{Q}^{b}-\imath\left(\text { Rich } \vec{F} \stackrel{\times}{\wedge} \underset{Q}{Q} a_{a} .\right. \\
& \frac{\delta H_{1}}{\delta Z_{a}}=d^{A, l^{2}}{ }^{a} .
\end{aligned}
$$

10. 

The local expressions for

$$
\bar{H}_{\mathrm{D}}(\overrightarrow{\mathrm{~N}}), H_{\mathrm{R}}(\overrightarrow{\mathrm{Z}}), H_{\mathrm{H}}(\mathrm{~N})
$$

can be repackaged so as to give local expressions for

$$
\bar{H}_{\imath, D}(\vec{N}), H_{\imath, R}(\vec{Z}), H_{\imath, H}(N) .
$$

This is completely obvious but, due to the presence of the potential

$$
\delta_{\Sigma}-\frac{\mathrm{N}}{2} \mathrm{~S}(\mathrm{q}) \mathrm{vol}_{\mathrm{q}^{\prime}}
$$

an additional term is present in $H_{1, H}(N)$ which has to be isolated.
Notation: Given $q$, let $\omega_{b}^{a}$ be the connection l-forms per the metric connection $\nabla{ }^{q}$. Write, as usual,

$$
\Omega_{b}^{a}=d \omega_{b}^{a}+\omega_{c}^{a} \omega_{b}^{c}
$$

and put

$$
\begin{aligned}
& \Omega^{a}=\frac{1}{2} \varepsilon^{a} b c^{\Omega} b c \cdot \\
& \text { - } \varepsilon_{a b c} E^{\alpha}{ }_{a} E^{\beta} b^{\Omega} c\left(\frac{\partial}{\partial x^{\alpha}}, \frac{\partial}{\partial x^{\beta}}\right) \\
& =\varepsilon_{a b c} E^{\alpha}{ }_{a} E^{\beta}{ }_{b} \frac{l}{2} \varepsilon_{c u v}{ }^{\Omega} u v\left(\frac{\partial}{\partial x^{\alpha}}, \frac{\partial}{\partial x^{\beta}}\right) \\
& =\frac{1}{2} \varepsilon_{a b c} \varepsilon_{u v c} E^{\alpha}{ }_{a} E^{\beta}{ }_{b}{ }^{\Omega}{ }_{u v v}\left(\frac{\partial}{\partial x^{\alpha}}, \frac{\partial}{\partial x^{\beta}}\right) \\
& =\frac{1}{2} \delta^{a b}{ }_{u v} E^{\alpha}{ }_{a} E^{\beta}{ }_{b}{ }^{\Omega} u v\left(\frac{\partial}{\partial x^{\alpha}}, \frac{\partial}{\partial x^{\beta}}\right) \\
& =\frac{1}{2}\left(\delta_{u}^{a}{ }_{u} \delta_{v}{ }_{v}-\delta^{a}{ }_{v} \delta^{b}{ }_{u}\right) E^{\alpha}{ }_{a} E^{\beta}{ }_{b}{ }^{\Omega}{ }_{u v}\left(\frac{\partial}{\partial x^{\alpha}}, \frac{\partial}{\partial x^{\beta}}\right)
\end{aligned}
$$

11. 

$$
=E^{\alpha}{ }_{a} E^{\beta} b^{\Omega} a b\left(\frac{\partial}{\partial x^{\alpha}}, \frac{\partial}{\partial x^{\beta}}\right) .
$$

Working locally, write

$$
\begin{aligned}
& S(q) \operatorname{vol}_{q}=*\left(\omega^{a} \wedge \omega^{b}\right) \wedge \Omega_{a b} \\
& =\left(\varepsilon_{a b c}{ }^{\omega}{ }^{c}\right) \wedge \frac{1}{2} \Omega_{a b}^{a b} \beta^{d x} \wedge d x^{\beta} \\
& =\left(\varepsilon_{a b c} e^{c}{ }_{\mu} d x^{\mu}\right) \wedge \frac{1}{2} \Omega^{a b}{ }_{\alpha \beta} d x^{\alpha} \wedge d x^{\beta} \\
& =\frac{1}{2} \varepsilon_{a b c}{ }^{\varepsilon}{ }_{\mu \alpha \beta} e^{c} \mu^{\Omega}{ }^{\Omega b} \beta^{a b} d^{3} x \\
& =\frac{1}{2 \sqrt{q}} \varepsilon_{a b c}{ }^{\varepsilon} \mu \alpha \beta e^{c} \mu^{\Omega}{ }_{\alpha \beta}^{a b} \sqrt{q} d^{3} x \\
& =\frac{1}{2 \sqrt{q}} \varepsilon_{a b c} \varepsilon_{\mu \alpha \beta} e^{c} \mu^{\Omega^{a b}}{ }_{\alpha \beta}{ }^{\mathrm{vol}_{q}} \\
& \text { => } \\
& \sqrt{q S}(q)=\frac{1}{2} \varepsilon_{a b c}{ }^{\varepsilon} \mu \alpha \beta e^{c} \mu^{\Omega^{a b}} \alpha \beta \\
& =\frac{1}{2} \varepsilon_{a b c}{ }^{\varepsilon}{ }_{\mu \alpha \beta}\left(\frac{1}{2 \sqrt{q}} \varepsilon_{c u v} \varepsilon_{\mu \gamma \delta} E^{E^{\gamma}}{ }_{u} E^{\delta}{ }_{v}\right) \Omega^{a b}{ }_{\alpha \beta} \\
& \text { => } \\
& (\operatorname{det} q) S(q)=\frac{1}{4} \varepsilon_{a b c} \varepsilon_{\mu \alpha \beta} \varepsilon_{c u v}{ }^{\varepsilon} \mu \gamma \delta^{E^{\gamma}} u^{E^{\delta}} v^{\Omega^{\Omega}}{ }_{\alpha \beta} \\
& =\frac{1}{4} \varepsilon_{a b c}{ }^{\varepsilon}{ }_{\gamma \alpha \beta} \varepsilon_{c u v}{ }^{\varepsilon}{ }_{\gamma \mu \nu} E^{\mu}{ }_{u} E^{\nu} v^{\Omega}{ }^{a b}{ }_{\alpha \beta}
\end{aligned}
$$

12. 

$$
\begin{aligned}
& =\frac{1}{4} \varepsilon_{a b c} \varepsilon_{u v c} \varepsilon_{\alpha \beta \gamma} \varepsilon_{\mu \nu \gamma} E^{\mu} u^{E^{\nu}} v^{\Omega^{\Omega}}{ }_{\alpha \beta}^{a b} \\
& =\frac{1}{4} \varepsilon_{a b c} \varepsilon_{u v c} \delta^{\alpha \beta}{ }_{\mu \nu} E^{\mu} u^{E^{\nu}} v^{\Omega} \delta^{a b}{ }_{\alpha \beta} \\
& =\frac{1}{4} \varepsilon_{a b c} \varepsilon_{u v c}\left(\delta^{\alpha}{ }_{\mu} \delta^{\beta} v_{v}-\delta^{\alpha}{ }_{v} \delta^{\beta}{ }_{\mu}\right) E^{\mu}{ }_{u} E^{\nu} v^{\Omega}{ }^{a b}{ }_{\alpha \beta} \\
& =\frac{1}{4} \varepsilon_{a b c} \varepsilon_{u v c}\left(E_{u}^{\alpha} E_{v}^{\beta}-E^{\beta} u^{E^{\alpha}}{ }_{v}\right) \Omega^{a b}{ }_{\alpha \beta} \\
& =\frac{1}{4} \delta^{a b}{ }_{u v}\left(E^{\alpha}{ }_{u} E^{\beta} v_{v}-E^{\beta}{ }_{u} E^{\alpha}{ }_{v}\right) \Omega^{a b}{ }_{\alpha \beta} \\
& =\frac{1}{4}\left(\delta_{u}^{a} \delta^{b}{ }_{v}-\delta_{V}^{a} \delta_{u}{ }^{b}\right)\left(E_{u}^{\alpha} E^{\beta}{ }_{v}-E^{\beta}{ }_{u} E^{\alpha}{ }_{v}\right) \Omega^{a b}{ }_{\alpha \beta} \\
& =\frac{1}{4}\left(2 E^{\alpha}{ }_{a} E^{\beta}{ }_{b}-2 E^{\alpha}{ }_{b} E^{\beta}{ }_{a}\right) \Omega^{a b}{ }_{\alpha \beta} \\
& =\frac{1}{2} E^{\alpha}{ }_{a} E^{\beta}{ }_{b}{ }^{\Omega^{\Omega}}{ }^{a b}{ }_{\alpha \beta}-\frac{1}{2} E^{\alpha}{ }_{b} E^{\beta}{ }_{a}{ }^{\Omega}{ }^{a b}{ }_{\alpha \beta} \\
& =\frac{1}{2} E^{\alpha} a^{E^{\beta}} b^{\delta^{\Omega}}{ }^{a b}{ }_{\alpha \beta}-\frac{1}{2} E^{\alpha}{ }_{a} E^{\beta} b^{\Omega,}{ }^{b a}{ }_{\alpha \beta} \\
& =\frac{1}{2} E^{\alpha}{ }_{a} E^{\beta}{ }_{b} \Omega^{\Omega b}{ }_{\alpha \beta}+\frac{1}{2} E^{\alpha}{ }_{a} E^{\beta}{ }_{b} \Omega^{a b}{ }_{\alpha \beta} \\
& =E^{\alpha} a^{E^{\beta}} b^{\Omega}{ }^{\Omega b}{ }_{\alpha \beta} \\
& =E^{\alpha}{ }_{a} E^{\beta}{ }_{b^{\Omega} a b}\left(\frac{\partial}{\partial x^{\alpha}}, \frac{\partial}{\partial x^{\beta}}\right) .
\end{aligned}
$$

Therefore

$$
S(q) \operatorname{vol}_{q}=S(q) \sqrt{q} d^{3} x
$$

$$
\begin{gathered}
=(\operatorname{det} q) S(q) \frac{d^{3} x}{\sqrt{q}} \\
=E^{\alpha}{ }_{a} E^{\beta}{ }_{b}{ }^{\Omega}{ }_{a b}\left(\frac{\partial}{\partial x^{\alpha}}, \frac{\partial}{\partial x^{\beta}}\right) \frac{d^{3} x}{\sqrt{q}} \\
=\varepsilon_{a b c} E^{\alpha}{ }_{a} E^{\beta}{ }_{b}{ }^{\Omega}{ }^{c}{ }_{\alpha \beta} \frac{d^{3} x}{\sqrt{q}} .
\end{gathered}
$$

And then

$$
\begin{aligned}
H_{\imath, H}(N) & =\delta_{\Sigma} \imath \frac{N}{2} \varepsilon_{a b c} E^{\alpha}{ }_{a} E^{\beta}{ }_{b} F^{C}{ }_{\alpha \beta} \frac{d^{3} x}{\sqrt{q}} \\
& -\left(\imath^{2}+1\right) \delta_{\Sigma} \frac{N}{2} \varepsilon_{a b c} E^{\alpha}{ }_{a} E^{\beta} b^{\Omega^{\prime}}{ }_{\alpha \beta} \frac{d^{3} x}{\sqrt{q}} \\
& =\int_{\Sigma} \frac{N}{2} \varepsilon_{a b c} E^{\alpha} a^{E} E_{b}^{\beta}\left(\imath^{F}{ }_{\alpha \beta}^{C}-\left(\imath^{2}+1\right) \Omega^{c}{ }_{\alpha \beta}\right) \frac{d^{3} x}{\sqrt{q}} .
\end{aligned}
$$

Reconciliation In the literature, one will find a different formula for $H_{l, H}(N)$. To explain this, consider the path $t \rightarrow\left(\vec{\omega}_{t}, \vec{p}_{t}\right)$ and suppose that the constraint

$$
\frac{1}{2}\left(S\left(q_{t}\right)+K_{t}^{2}-\left[k_{t}, k_{t}\right]_{q_{t}}\right)=0
$$

is in force. Bearing in mind that $\left(k_{t}\right)_{a b}=\kappa_{a b}$, write

$$
\begin{aligned}
\kappa_{a b} & =\kappa\left(E_{a}, E_{b}\right) \\
& =\kappa\left(e_{a}^{\mu} \frac{\partial}{\partial x^{\mu}}, e_{b}^{\nu} \frac{\partial}{\partial x^{\nu}}\right) \\
& =e_{a}^{\mu} e^{\nu}{ }_{b}{ }_{\mu \nu}
\end{aligned}
$$

$$
\begin{aligned}
& =e^{\mu} a_{\mu \nu}^{k} e^{\nu}{ }_{b} \\
& =\frac{\left(\sqrt{q_{t}} e^{\mu} a^{\mu} k_{\mu \nu}\left(\sqrt{q_{t}} e_{b}^{\nu}\right)\right.}{\operatorname{det} q_{t}} \\
& =\frac{E^{\mu} a^{\kappa}{ }_{\mu \nu} E_{b}^{\nu}}{\operatorname{det} q_{t}} \\
& =\frac{1}{\sqrt{q_{t}}} E_{a}^{\mu} K_{\mu^{\prime}}^{b}
\end{aligned}
$$

where we have put

$$
K_{\mu}^{b}=\frac{1}{\sqrt{q_{t}}} \kappa_{\mu \nu} V_{b}^{\nu}
$$

Therefore

$$
\begin{aligned}
& s\left(q_{t}\right)=\left[k_{t}, \kappa_{t}\right]_{t}-k_{t}^{2} \\
& =\kappa_{a b} k_{b a}-\kappa_{a a} k_{b b} \\
& =\frac{1}{\operatorname{det} q_{t}}\left[E^{\mu}{ }_{a} K^{b}{ }_{\mu} E^{\nu}{ }_{b} K^{a}{ }_{\nu}-E^{\mu}{ }_{a} K^{a}{ }_{\mu} E^{\nu}{ }_{b} K^{b}{ }_{\nu}\right] \\
& =\frac{1}{\operatorname{det} q_{t}} E_{a}^{\mu} E^{\nu}{ }_{b}\left(K^{a}{ }_{\nu} K_{\mu}^{b}-K_{\mu}^{a}{ }_{\mu}{ }^{b}{ }_{\nu}\right)
\end{aligned}
$$

or still,

$$
\left(\operatorname{det} q_{t}\right) S\left(q_{t}\right)=E_{a}^{\mu} E_{b}^{\nu}\left(K_{\nu}^{a} K_{\mu}^{b}-K_{\mu}^{a} K_{\nu}^{b}\right)
$$

from which

$$
\left(1^{2}+1\right) s_{\Sigma}-\frac{N}{2} S\left(q_{t}\right) \mathrm{vol}_{q_{t}}
$$

$$
\begin{aligned}
& =\left(\tau^{2}+1\right) \int_{\Sigma}-\frac{N}{2}\left(\operatorname{det} q_{t}\right) S\left(q_{t}\right) \frac{d^{3} x}{\sqrt{q_{t}}} \\
& =\left(r^{2}+1\right) \delta_{\Sigma}-\frac{N}{2} E^{\mu}{ }_{a} E^{\nu}{ }_{b}\left(K_{\nu}^{a} K^{K^{b}}{ }_{\mu}-K^{a}{ }_{\mu} K^{b}{ }_{\nu}\right) \frac{d^{3} x}{\sqrt{q_{t}}} \\
& =\left(r^{2}+1\right) \delta_{\Sigma} \frac{N}{2} E^{\mu}{ }_{a} E^{\nu}{ }_{b}\left(K_{\mu}^{a}{ }_{\mu}{ }^{b}{ }_{\nu}-K^{a}{ }_{\nu} K^{b}{ }_{\mu}\right) \frac{d^{3} x}{\sqrt{q_{t}}}
\end{aligned}
$$

So, under the above assumptions,

$$
\begin{aligned}
H_{t, H}(N) & =\delta_{\Sigma} l \frac{N}{2} \varepsilon_{a b c} E^{\alpha} a^{E^{\beta}}{ }_{b} F^{c}{ }_{\alpha \beta} \frac{d^{3} x}{\sqrt{q_{t}}} \\
& +\left(t^{2}+1\right) \delta_{\Sigma} N E^{\mu}{ }_{a} E^{\nu}{ }_{b} K^{a}{ }_{[\mu} K^{b}{ }_{\nu]} \frac{d^{3} x}{\sqrt{q_{t}}} .
\end{aligned}
$$

Section 62: Asymptotic Flatness In the metric theory, take $M=\underline{R} \times \Sigma$ ( $\operatorname{dim} \mathrm{M}=\mathrm{n}>2$ ) and recall:

Constraint Equations These are the relations

$$
\left.\right|_{-\left(\left[\pi_{t}, \pi_{t}\right]_{q_{t}}-\frac{1}{n-2} \operatorname{tr}_{q_{t}}\left(\pi_{t}\right)^{2}-s\left(q_{t}\right)\right) \otimes\left|q_{t}\right|^{1 / 2}=0} ^{\operatorname{div}_{q_{t}} p_{t}=0} .
$$

Evolution Equations These are the relations

$$
\dot{q}_{t}=2 N_{t}\left(\pi_{t}^{b}-\frac{1}{n-2} \operatorname{tr}_{q_{t}}\left(\pi_{t}^{b}\right) q_{t}\right)+L_{\vec{N}_{t}} q_{t}
$$

and

$$
\begin{aligned}
\dot{p}_{t}= & -2 N_{t}\left(\pi_{t} * \pi_{t}-\frac{1}{n-2} \operatorname{tr}{q_{t}}\left(\pi_{t}\right) \pi_{t}\right) \otimes\left|q_{t}\right|^{1 / 2} \\
& +\frac{N_{t}}{2}\left(\left[\pi_{t}, \pi_{t}\right]_{q_{t}}-\frac{1}{n-2} t r_{q_{t}}\left(\pi_{t}\right)^{2}\right) q_{t}^{\#} \otimes\left|q_{t}\right|^{1 / 2} \\
& -N_{t} \operatorname{Ein}\left(q_{t}\right)^{\#} \otimes\left|q_{t}\right|^{1 / 2} \\
& +\left(H_{N_{t}}-\left(\Delta_{q_{t}} N_{t}\right) q_{t}\right)^{\#} \otimes\left|q_{t}\right|^{1 / 2}+L_{\vec{N}_{t}} p_{t} .
\end{aligned}
$$

THEOREM Ain $(g)=0$ iff the constraint equations and the evolution equations are satisfied by the pair $\left(q_{t}, p_{t}\right)$.

For this, we assumed that $\sum$ was compact. But actually compactness played no role at all in the proof which was purely algebraic.

Q: So where does compactness play a role?
A: In the hamiltonian formulation of the dynamics.
N.B. The point is that this interpretation hinges on the calculation of certain functional derivatives and the formulas derived thereby depend on ignoring all boundary terms. While permissible if $\Sigma$ is compact, in the noncompact case the boundary terms have to be taken into account.

To minimize technicalities, we shall assume that $M=\underline{R}^{4}=\underline{R} \times \underline{R}^{3}$, thus now $\Sigma=\underline{R}^{3}$. The strategy then is to consider a certain class of riemannian structures on $\underline{R}^{3}$ which is sufficiently broad to cover the standard examples but sufficiently restrictive to give a sensible theory.
[Note: For the sake of simplicity, I shall pass in silence on the role of covariance in the theory.]

Notation: Put

$$
r=\left[x^{i} x^{j_{i j}}\right]^{l / 2}(=|x|)
$$

Parity Let $\rho \in C^{\infty}\left(\underline{S}^{2}\right)$-- then $\rho$ determines a radially constant function $\tilde{\rho}$ on $\underline{R}^{3}-\{0\}:$

$$
\tilde{\rho}(x)=\rho\left(\frac{x}{r}\right) .
$$

If the parity of $\rho$ is even (odd), then $\tilde{\rho}$ is even (odd).
[Note: The antipodal map on $\underline{S}^{2}$ sends $p$ to $-p$. In terms of the azimuthal angle $\theta$ and the polar angle $\phi$, it is the arrow

$$
\begin{aligned}
& (\cos \theta \sin \phi, \sin \theta \sin \phi, \cos \phi) \\
& \quad \rightarrow(\cos (\theta+\pi) \sin (\pi-\phi), \sin (\theta+\pi) \sin (\pi-\phi), \cos (\pi-\phi)) .]
\end{aligned}
$$

SUBLEMMA If the parity of $\rho$ is even (odd), then $\partial_{k} \tilde{\rho}$ is odd (even) $(k=1,2,3)$.
[Note: $\tilde{\rho}$ is homogeneous of degree 0 , hence $\partial_{k} \tilde{\rho}$ is homogeneous of degree -1 . But then $r\left(\partial_{k} \tilde{\rho}\right)$ is homogeneous of degree 0 , thus $\exists \rho_{k} \in C^{\infty}\left(\underline{s}^{2}\right)$ :

$$
\left.r\left(\partial_{k} \tilde{\rho}\right)\right|_{x}=\rho_{k}\left(\frac{x}{r}\right)
$$

or still,

$$
\left.\left.\partial_{k} \tilde{\rho}\right|_{x}=\frac{1}{r} \rho_{k}\left(\frac{x}{r}\right) \cdot\right]
$$

Notation:

$$
\begin{aligned}
& O^{+}\left(\frac{1}{r^{\varepsilon}}\right) \text { stands for an even function which is } O\left(\frac{1}{r}\right)(\varepsilon \geq 0) \\
& O^{-}\left(\frac{1}{r^{\varepsilon}}\right) \text { stands for an odd function which is } O\left(\frac{1}{r}\right)(\varepsilon \geq 0)
\end{aligned}
$$

[Note: In either case, $\varepsilon=0$ is admitted, so $O^{+}(1)\left(O^{-}(1)\right)$ represents a bounded even (odd) function. In particular: If $\rho \in C^{\infty}\left(\underline{S}^{2}\right)$ and is of even (odd) parity, then $\left.\tilde{\rho}=O^{+}(1) \quad\left(0^{-}(1)\right).\right]$

Example: Let $\rho \in C^{\infty}\left(\underline{S}^{2}\right)$.

- If the parity of $\rho$ is even, then

$$
\partial_{k} \tilde{\rho}=0^{-}\left(\frac{1}{\mathrm{r}}\right)
$$

- If the parity of $\rho$ is odd, then

$$
\partial_{k} \tilde{\rho}=0^{+}\left(\frac{1}{r}\right)
$$

Example: Let $\rho \in C^{\infty}\left(\underline{S}^{2}\right)$.

- If the parity of $\rho$ is even, then

$$
\partial_{k}\left(\frac{\tilde{\rho}}{r}\right)=O^{-}\left(\frac{1}{r^{2}}\right)
$$

4. 

- If the parity of $\rho$ is odd, then

$$
\partial_{k}\left(\frac{\tilde{\rho}}{r}\right)=0^{+}\left(\frac{1}{r^{2}}\right)
$$

Integrals If $\mathrm{f}=\mathrm{O}\left(\frac{1}{\mathrm{r}^{3+\delta}}\right)(\delta>0)$, then

$$
\begin{aligned}
& \int_{\underline{R}^{3}}|f| d^{3} x \\
& \quad=\int_{0}^{\infty} \int_{\underline{S}^{2}}|f(r p)| r^{2} d \Omega(p) d r \\
& \quad<\infty
\end{aligned}
$$

hence $f$ is Lebesgue integrable, so

$$
\int_{\underline{R}^{3}} f d^{3} x=\lim _{R \rightarrow \infty} \int_{\underline{D}^{3}(R)}{f d^{3} x .}^{3}
$$

In general, however, our integrals will be improper, i.e., by

$$
\int_{\mathbb{R}^{3}} f d^{3} x
$$

we shall simply understand

$$
\lim _{R \rightarrow \infty} \int_{\underline{D}^{3}(R)}{f d^{3} x .}^{3}
$$

Accordingly, if f is odd, then

$$
\int_{\underline{R}^{3}} \operatorname{fd}^{3} x=0 .
$$

Notation: Let $f \in C^{\infty}\left(\underline{R}^{3}\right)$ - then we write

$$
\mathrm{f}=0^{\infty}\left(\frac{1}{\mathrm{r}}\right)
$$

provided $f$ is $O\left(\frac{l}{r \varepsilon}\right)$ and its partial derivatives of order $m$ are $O\left(\frac{1}{r^{m+\varepsilon}}\right)$ ( $m=1,2, \ldots$ ).
[Note: Here $\varepsilon$ is nonnegative. E.g.: Let $\rho \in C^{\infty}\left(\underline{S^{2}}\right)$ - then $\tilde{\rho}=0^{\infty}(1)$, meaning that $\tilde{\rho}=O(1), \partial_{i} \tilde{\rho}=O\left(\frac{1}{r}\right), \partial_{i} \partial_{j} \tilde{\rho}=O\left(\frac{1}{r^{2}}\right)$ etc. $]$

Example: If for large $r$,

$$
f=\frac{\sin \left(r^{4}\right)}{r^{2}}
$$

then

$$
\mathrm{f}=\mathrm{o}^{+}\left(\frac{1}{\mathrm{r}^{2}}\right)
$$

but its partial derivatives of every order blow up at infinity.
Observation: If $f_{1}=0^{\infty}\left(\frac{1}{\varepsilon_{1}}\right)$ and $f_{2}=0^{\infty}\left(\frac{l}{\varepsilon_{2}}\right)$, then $f_{1} f_{2}=0^{\infty}\left(\frac{1}{\varepsilon_{1}+\varepsilon_{2}}\right)$.
Let $S_{2, \infty}$ stand for the set of 2-covariant symetric tensors in $\underline{R}^{3}$ with the following property: Given $s, \exists$

$$
\left[\begin{array}{ll}
\sigma_{i j} \in C^{\infty}\left(\underline{S}^{2}\right) & \left(\sigma_{i j}=\sigma_{j i}\right) \\
u_{i j} \in C^{\infty}\left(\underline{R}^{3}\right) & \left(u_{i j}=\mu_{j i}\right)
\end{array}\right.
$$

such that for $r \gg 0$,

$$
s_{i j}(x)=\frac{1}{r} \sigma_{i j}\left(\frac{x}{r}\right)+\mu_{i j}(x)
$$

where

$$
\sigma_{i j}(-p)=\sigma_{i j}(p) \quad\left(\underline{\mathrm{ES}}^{2}\right)
$$

and

$$
u_{i j}=0^{\infty}\left(\frac{1}{r^{1+\delta}}\right) \quad(0<\delta \leq 1)
$$

Definition: Let $\eta$ be the usual flat metric on $\underline{R}^{3}$ and let $q$ be a riemannian structure on $\underline{R}^{3}$-- then $q$ is said to be asymtotically flat provided $q-\eta \in S_{2, \infty}$.

Notation: $Q_{\infty}$ is the set of asymtotically flat riemannian structures on $\underline{R}^{3}$.
Example: If for $r \gg 0$,

$$
q_{i j}(x)=n_{i j}+m \frac{x^{i} x^{j}}{r^{3}}(m>0)
$$

then $q \in Q_{\infty}$.

LEMMA Let $q \in Q_{\infty}$ and $s \in S_{2, \infty}$-- then $q+\varepsilon s \in Q_{\infty}$ for $\varepsilon$ sufficiently small.
[This is certainly true on compact sets, in particular on the $\underline{D}^{3}(R)$. As for the situation at infinity, one has only to show that $q+\varepsilon s$ is nonsingular provided $|\varepsilon| \ll 1$. Indeed, $q+\varepsilon s \rightarrow \eta$ as $|x| \rightarrow \infty$ and the property of being positive definite is closed in the set of nonsingular symmetric 3 -by-3 matrices. Fix positive constants $C$ and $D$ such that

$$
\left[\begin{array}{ll}
\|q(x)-n(x)\|_{O P} \leq \frac{C}{|x|} \\
& (|x| \geq 1)
\end{array}\right.
$$

Then

Choose $\mathrm{R}>\mathrm{l}$ :

$$
\begin{aligned}
& |x| \geq R \Rightarrow \frac{C+D}{R}<1 \\
\Rightarrow \quad & \\
& \|q(x)+\varepsilon S(x)-\eta(x)\|_{O P}<1 .
\end{aligned}
$$

Therefore $q(x)+\varepsilon s(x)$ is nonsingular. Now restrict $\varepsilon$ so that it also works on $\left.\mathrm{D}^{3}(\mathrm{R}) \cdot\right]$
[Note: Thus, on formal grounds, the tangent space to $Q_{\infty}$ at $q$ is $S_{2, \infty^{\prime}}$ i.e.,

$$
\left.\mathrm{T}_{\mathrm{q}} \mathrm{Q}_{\infty}=S_{2, \infty} \cdot\right]
$$

LEMMA Let $q \in Q_{\infty}$ - then

$$
q^{i j}=n_{i j}+O\left(\frac{l}{r}\right) .
$$

[In fact, the map

$$
\left[\begin{array}{rl}
\underline{G L}(3, \underline{R}) & \rightarrow \underline{\underline{G}}(3, \underline{R}) \\
-\quad A \rightarrow A^{-1}
\end{array}\right.
$$

is $C^{l}$, thus is Lipschitz in a neighborhood of the identity.]
[Note: One can be more precise, viz. for $r \gg 0$,

$$
\left.q^{i j}(x)=n_{i j}-\frac{1}{r} \sigma_{i j}\left(\frac{x}{r}\right)+o\left(\frac{1}{r^{1+\delta}}\right) \cdot\right]
$$

Connection Coefficients Let $q \in Q_{\infty}$-- then, per the metric connection,

$$
\Gamma_{i j}^{k}=\frac{1}{2} q^{k \ell}\left(q_{\ell i, j}+q_{\ell j, i}-q_{i j, \ell}\right)
$$

Therefore

$$
\begin{aligned}
\Gamma_{i j}^{k} & =\frac{1}{2}\left(\eta_{k \ell}+O\left(\frac{1}{r}\right)\right)\left(O^{-}\left(\frac{1}{r^{2}}\right)+O\left(\frac{1}{r^{2+\delta}}\right)\right) \\
& =O^{-}\left(\frac{1}{r^{2}}\right)+O\left(\frac{1}{r^{2+\delta}}\right)
\end{aligned}
$$

Miscellaneous Estimates Let $q \in Q_{\infty}$.

- $\operatorname{det} q=1+O\left(\frac{1}{r}\right)$.
- $\sqrt{\operatorname{det} q}=1+O\left(\frac{1}{\mathrm{r}}\right)$.
[Explicitly,

$$
\begin{aligned}
& \left.\operatorname{det} q\right|_{x}=1+\frac{1}{r} \sum_{i=1}^{3} \sigma_{i i}\left(\frac{x}{r}\right)+o\left(\frac{1}{r^{1+\delta}}\right) \\
& \left.\left.\sqrt{\operatorname{det} q}\right|_{x}=1+\frac{1}{2 r} \sum_{i=1}^{3} \sigma_{i i}\left(\frac{x}{r}\right)+o\left(\frac{1}{r^{1+\delta}}\right) \cdot\right]
\end{aligned}
$$

LEMMA Let $q \in Q_{\infty}$ - then

$$
\partial_{k} q^{i \cdot j}=O^{-}\left(\frac{1}{r^{2}}\right)+O\left(\frac{1}{r^{2+\delta}}\right)
$$

[For

$$
\begin{gathered}
\partial_{k} q^{i j}=-q^{i u_{2}} \partial_{k} q_{u v^{\prime}} q^{v j} \\
=-\left(\eta_{i u}+O\left(\frac{1}{r}\right)\right)\left(O^{-}\left(\frac{1}{r^{2}}\right)+O\left(\frac{1}{r^{2+\delta}}\right)\right)\left(\eta_{v j}+O\left(\frac{1}{r}\right)\right) \\
\left.=O^{-}\left(\frac{1}{r^{2}}\right)+O\left(\frac{1}{r^{2+\delta}}\right) \cdot\right]
\end{gathered}
$$

[Note: Iteration of this procedure shows that the partial derivatives of $q^{i j}$ of order $m>1$ are $\left.O\left(\frac{1}{r^{m+1}}\right) \cdot\right]$

Let $S_{\mathrm{d}}^{2, \infty}$ stand for the set of 2-contravariant symmetric tensor densities on $\underline{R}^{3}$ with the following property: Given $\Lambda=\lambda d^{3} x, \exists$

$$
\left[\begin{array}{rl}
\tau^{i j} \in C^{\infty}\left(\underline{S}^{2}\right) & \left(\tau^{i j}=\tau^{j i}\right) \\
\nu^{i j} \in C^{\infty}\left(\underline{R}^{3}\right) & \left(v^{i j}=v^{j i}\right)
\end{array}\right.
$$

such that for $r \gg 0$,

$$
\lambda^{i j}(x)=\frac{1}{r^{2}} \tau^{i j}\left(\frac{x}{r}\right)+v^{i j}(x)
$$

where

$$
\tau^{i j}(-p)=-\tau^{i j}(p) \quad\left(p \in \underline{S}^{2}\right)
$$

and

$$
\nu^{i j}{ }_{e 0^{\infty}}\left(\frac{1}{r^{2+\delta}}\right) \quad(0<\delta \leq 1) .
$$

Define

$$
<,>: S_{2, \infty} \times S_{d}^{2, \infty} \rightarrow \underline{R}
$$

by

$$
\langle\mathbf{s}, \Lambda\rangle=\int_{\underline{R}^{3}} \lambda^{i j} s_{i j} d^{3} x .
$$

[Note: This integral is finite. Thus fix $R_{0} \gg 0$-- then for $R>R_{0}$,

$$
\int_{\underline{D}^{3}(R)}=\int_{R \geq|x| \geq R_{0}}+\int_{\underline{D}^{3}\left(R_{0}\right)}
$$

and

$$
\begin{aligned}
& \int_{R} \geq|x| \geq R_{0} \lambda^{i j}(x) s_{i j}(x) d^{3} x \\
& =\int_{R \geq|x| \geq R_{0}}\left(\frac{1}{r^{2}} \tau^{i j}\left(\frac{x}{r}\right)+O\left(\frac{1}{r^{2+\delta}}\right)\right)\left(\frac{1}{r} \sigma_{i j}\left(\frac{x}{r}\right)+O\left(\frac{1}{r^{1+\delta}}\right)\right) d^{3} x \\
& =\int_{R \geq|x| \geq R_{0}}\left(\frac{1}{r^{3}} \tau^{i j}\left(\frac{x}{r}\right) \sigma_{i j}\left(\frac{x}{r}\right)+O\left(\frac{1}{r^{3+\delta}}\right)\right) d^{3} x \\
& =\int_{R \geq|x| \geq R_{0}} \frac{1}{r^{3}} \tilde{\tau}^{i j}(x) \tilde{\sigma}_{i j}(x) d^{3} x \\
& +\int_{R \geq|x| \geq R_{0}} O\left(\frac{1}{r^{3+\delta}}\right) d^{3} x \\
& =0+\delta_{R \geq|x| \geq R_{0}} O\left(\frac{1}{r^{3+\delta}}\right) d^{3} x,
\end{aligned}
$$

the parity of $\tau^{i j} \sigma_{i j}$ being odd.]

Put

$$
\Gamma=Q_{\infty} \times s_{d}^{2, \infty}
$$

Then

$$
T_{(q, \Lambda)} \Gamma=S_{2, \infty} \times s_{d}^{2, \infty}
$$

and the map

$$
\Omega_{(q, \Lambda)}: T T_{(q, \Lambda)} \Gamma \times T_{(q, \Lambda)} \Gamma \rightarrow \underline{R}
$$

defined by the prescription

$$
{ }_{(q, \Lambda)}\left(\left(s_{1}, \Lambda_{1}\right),\left(s_{2}, \Lambda_{2}\right)\right)=\left\langle s_{1}, \Lambda_{2}\right\rangle-\left\langle s_{2}, \Lambda_{1}\right\rangle
$$

serves to equip $\Gamma$ with a globally constant symplectic structure.
The hamiltonian $H: \Gamma \rightarrow \underline{R}$ of the metric theory depends on external variables $\mathrm{N}, \overrightarrow{\mathrm{N}}$ :

$$
\begin{aligned}
& H(q, \Lambda ; N, \vec{N})=\int_{R^{3}}-2 \operatorname{div}_{q} \Lambda(\vec{N}) \\
+ & \int_{\underline{R}^{3}} N\left([s, s]_{q}-\frac{1}{2} \operatorname{tr}_{q}(s)^{2}-S(q)\right) \sqrt{q} d^{3} x
\end{aligned}
$$

if $\Lambda=s^{\#} \otimes|q|^{1 / 2}$. However, there is a difficulty in that neither integral will be convergent unless conditions are imposed on $N$ and $\vec{N}$.

## Assumption:

$$
\left[\begin{array}{ll}
N(x)=\psi\left(\frac{x}{r}\right)+O^{\infty}\left(\frac{1}{r^{\varepsilon}}\right) & \\
N^{i}(x)=\psi^{i}\left(\frac{x}{r}\right)+0^{\infty}\left(\frac{1}{r^{\varepsilon}}\right), & (\varepsilon>0)
\end{array}\right.
$$

where $\psi$ and $\psi^{\mathbf{i}}$ are $C^{\infty}$ functions on $\underline{S}^{2}$ of odd parity.
[Note: These are, by definition, the standard conditions on $N$ and $\vec{N}$.

LEMMA If $N$ and $\vec{N}$ satisfy the standard conditions, then the integrals defining

$$
H(q, \Lambda ; N, \vec{N})
$$

are convergent.

While elementary, it will be safest to run through the particulars.
Convention: In the sequel, we shall sometimes write ho when it is a question of terms that are $O\left(\frac{1}{r^{3+\delta}}\right) \quad(\hat{\rho}>0)$.

To deal with

$$
\int_{\underline{R}^{3}} \operatorname{div}_{q} \Lambda(\vec{N})
$$

amounts to dealing with

$$
\int_{\underline{R}^{3}}\left(\operatorname{div}_{q} s\right){ }_{i} N^{i} \sqrt{q} d^{3} x
$$

where, as will be recalled,

$$
\left(\operatorname{div}_{q} s\right)_{i}=q^{j k_{\nabla_{j}} s_{i k}}
$$

Put $\lambda=s^{\#} \sqrt{q}$-- then

$$
\begin{gathered}
\left(\operatorname{div}_{q} s\right)_{i^{\prime}} N^{i} \sqrt{q}=\left(\operatorname{div}_{q} \frac{\lambda^{b}}{\sqrt{q}}\right)_{i} N^{i} \sqrt{q} \\
=q^{j k} \nabla_{j}\left(\frac{\lambda^{b}}{\sqrt{q}}\right){ }_{i k^{N}} N^{i} \sqrt{q}
\end{gathered}
$$

=>

$$
\begin{aligned}
& =q^{j k} \frac{1}{\sqrt{q}}\left(\nabla_{j} \lambda_{i k}\right) N^{i} \sqrt{q} \\
& =q^{j k}\left(\nabla_{j} \lambda_{i k}\right) N^{i} \\
& =q^{j k}\left(\nabla_{j} q_{i i} q_{k k^{\prime}} \lambda^{i^{\prime \prime} k^{\prime}}\right) N^{i} \\
& =q^{j k} q_{k k^{\prime}} q_{i i^{\prime}}\left(\nabla_{j} \lambda^{i^{\prime} k^{\prime}}\right) N^{i} \\
& =\delta^{j}{ }_{k \prime} q_{i i^{\prime}}\left(\nabla_{j} \lambda^{i^{\prime \prime} k^{\prime}}\right) N^{i} \\
& =q_{i i^{\prime}}\left(\nabla_{j} \lambda^{i \prime j}\right) N^{i} \\
& =q_{i j}\left(\nabla_{k} \lambda^{j k}\right) N^{i} . \\
& \text { - } q_{i j}=n_{i j}+O\left(\frac{1}{r}\right) . \\
& \text { - } \nabla_{k} \lambda^{j \mathrm{k}}=\partial_{\mathrm{k}} \lambda^{j \mathrm{k}}+\Gamma_{\mathrm{k}} \ell^{\lambda^{\ell k}}+\Gamma_{k} \mathrm{k} \ell^{\lambda^{j \ell}} \\
& =\partial_{k} \lambda^{j k}+O\left(\frac{1}{r^{4}}\right) . \\
& N^{i}=O(1) . \\
& q_{i j}\left(\nabla_{k} \lambda^{j k}\right) N^{i} \\
& =\left(n_{i j}+O\left(\frac{l}{r}\right)\right)\left(\partial_{k} \lambda^{j k}+O\left(\frac{1}{r^{4}}\right)\right) N^{i}
\end{aligned}
$$

$$
=\eta_{i j}\left(\partial_{k} \lambda^{j k}\right) N^{i}+O\left(\frac{l}{r}\right)\left(\partial_{k} \lambda^{j k}\right) N^{i}+O\left(\frac{l}{r^{4}}\right)
$$

The issue of integrability thus becomes that of

$$
\begin{aligned}
& \eta_{i j}\left(\partial_{k} \lambda^{j k}\right) N^{i}+O\left(\frac{1}{r}\right)\left(\partial_{k} \lambda^{j k}\right) N^{i} . \\
& \cdot \partial_{k} \lambda^{j k}=\partial_{k}\left(\frac{1}{r^{2}} \tilde{\tau}^{j k}\right)+\partial_{k} \nu^{j k} \\
&=-\frac{2 x_{k}}{r^{4}} \tilde{\tau}^{j k}+\frac{1}{r^{2}} \partial_{k} \tilde{\tau}^{j k}+O\left(\frac{1}{r^{3+\delta}}\right) \\
&=O^{+}\left(\frac{1}{r^{3}}\right)+h o .
\end{aligned}
$$

This reduces matters to consideration of

$$
\eta_{i j} O^{+}\left(\frac{1}{r^{3}}\right) N^{i}=\eta_{i j} O^{+}\left(\frac{1}{r^{3}}\right)\left(\tilde{\psi}^{i}+O\left(\frac{1}{r}\right)\right)
$$

or still, to

$$
\eta_{i j} 0^{+}\left(\frac{1}{r^{3}}\right) \tilde{\psi}^{i}
$$

which is $0^{-}\left(\frac{1}{r^{3}}\right)$.

Therefore the integral

$$
\int_{\underline{R}^{3}}-2 \operatorname{div}_{q} \Lambda(\vec{N})
$$

is convergent.
To discuss the integral

$$
\int_{R^{3}} N\left([s, s]_{q}-\frac{1}{2} \operatorname{tr}_{q}(s)^{2}-s(q)\right) \sqrt{q} d^{3} x
$$

15. 

start by writing

$$
\begin{aligned}
{[s, s]_{q} } & =s^{i j} s_{i j} \\
& =\frac{\lambda^{i j}}{\sqrt{q}} s_{i j} \\
& =\frac{\lambda^{i j}}{\sqrt{q}} q_{i k} q_{j \ell^{s}}{ }^{k \ell} \\
& =\frac{\lambda^{i j}}{\sqrt{q}} q_{i k} q_{j \ell} \frac{\lambda^{k \ell}}{\sqrt{q}} \\
& =\frac{1}{\sqrt{q}} \frac{1}{\sqrt{q}} q_{i k} q_{j \ell^{\lambda^{i j}} \lambda^{k \ell}}
\end{aligned}
$$

Then

$$
\begin{aligned}
N[s, s] & q^{\sqrt{q}} \\
& =\frac{N}{\sqrt{q}} q_{i k} q_{j \ell^{\lambda^{i j}}} \lambda^{i k \ell} \\
& =O(1) \lambda^{i j} \lambda^{k \ell} \\
& =O\left(\frac{1}{r^{4}}\right)
\end{aligned}
$$

Next

$$
\begin{aligned}
\operatorname{tr}_{q}(s)^{2} & =\left(q^{i j} s_{i j}\right)^{2} \\
& =\left(q^{i j} q_{i k} q_{j \ell} s^{k \ell}\right)^{2}
\end{aligned}
$$

$$
\begin{aligned}
&=\left(\delta_{k}^{j} q_{j \ell^{s}}{ }^{k \ell}\right)^{2} \\
&=\left(q_{j \ell^{s}}{ }^{j \ell}\right)^{2} \\
&=\left(q_{j \ell} \frac{\lambda^{j \ell}}{\sqrt{q}}\right)^{2} \\
&=\left(q_{i j} \frac{\lambda^{i j}}{\sqrt{q}}\right)\left(q_{k \ell} \frac{\lambda^{k}}{\sqrt{q}}\right) \\
&=\frac{1}{\sqrt{q}} \frac{1}{\sqrt{q}} q_{i j} q_{k \ell} \ell^{i j} \lambda^{k \ell} \\
& \Rightarrow \quad \begin{aligned}
N t r & (s)^{2} \sqrt{q} \\
& =\frac{N}{\sqrt{q}} q_{i j} q_{k \ell^{\lambda^{i j}} \lambda^{k \ell}} \\
& =o(1) \lambda^{i j} \lambda^{k \ell} \\
& =o\left(\frac{1}{r^{4}}\right)
\end{aligned}
\end{aligned}
$$

Finally

$$
S(q)=q^{j \ell_{R}^{i}}{ }_{j i \ell}
$$

And

$$
\begin{aligned}
R_{j i \ell}^{i} & =\Gamma_{\ell j, i}^{i}-\Gamma_{i j, \ell}^{i}+\Gamma_{\ell j}^{a} \Gamma_{i a}^{i}-\Gamma_{i j}^{a} \Gamma_{\ell a}^{i} \\
& =\Gamma_{\ell j, i}^{i}-\Gamma_{i j, \ell}^{i}+O\left(\frac{1}{r^{4}}\right) \\
& =O^{+}\left(\frac{l}{r^{3}}\right)+\text { ho. }
\end{aligned}
$$

But then

$$
\begin{aligned}
\operatorname{NS}(q) \sqrt{q} & =\left(\tilde{\psi}+O\left(\frac{1}{r^{\varepsilon}}\right)\right)\left(O^{+}\left(\frac{1}{r^{3}}\right)+h o\right)\left(1+O\left(\frac{1}{r}\right)\right) \\
& =O^{-}\left(\frac{1}{r^{3}}\right)+h o .
\end{aligned}
$$

Therefore the integral

$$
\int_{\underline{R}^{3}} N\left([s, s]_{q}-\frac{1}{2} \operatorname{tr}_{q}(s)^{2}-s(q)\right) \sqrt{q} d^{3} x
$$

is convergent.
Maintaining the assumption that N and $\overrightarrow{\mathrm{N}}$ are subject to the standard conditions, if we ignore the boundary terms, then

$$
\begin{aligned}
\frac{\delta H}{\delta q}= & 2 N\left(s * s-\frac{1}{2} t r_{q}(s) s\right)^{\#} \otimes|q|^{1 / 2} \\
- & \frac{N}{2}\left([s, s]_{q}-\frac{1}{2} t r_{q}(s)^{2}\right) q^{\#} \otimes|q|^{1 / 2} \\
& +N \operatorname{Ein}(q)^{\#} \otimes|q|^{1 / 2} \\
& -\left(H_{N}-\left(\Delta_{q} N\right) q\right)^{\#} \otimes|q|^{1 / 2}-{\underset{\vec{N}}{ }}_{L^{\prime}}
\end{aligned}
$$

and

$$
\frac{\delta H}{\delta \Lambda}=2 N\left(s-\frac{1}{2} \operatorname{tr}_{q}(s) q\right)+L_{\vec{N}} q
$$

[Note: These formulas imply that

$$
\left.\frac{\delta H}{\delta q} \in S_{d}^{2, \infty} \text { and } \frac{\delta H}{\delta \Lambda} \in S_{2, \infty} \cdot\right]
$$

To justify the foregoing, one has to identify the boundary terms and show that they make no contribution.

Surface Integrals Working in $\underline{R}^{n}$, let

$$
\left\{\begin{array}{l}
\underline{D}^{n}(R)=\left\{x: \sum_{i=1}^{n}\left(x^{i}\right)^{2} \leq R\right\} \\
\underline{S}^{n-1}(R)=\left\{x: \sum_{i=1}^{n}\left(x^{i}\right)^{2}=R\right\}
\end{array}\right.
$$

Equip $\underline{R}^{n}$ with its usual riemannian structure and view $\underline{S}^{n-1}(R)$ as a riemannian submanifold -- then the volume form on $\underline{S}^{n-1}(R)$ is the pullback of the $(n-1)$-form

$$
\omega_{R}^{n-1}=\frac{1}{R} \sum_{i=1}^{n}(-1)^{i-1} x^{i} d x^{1} \wedge \ldots \wedge \hat{d x^{i}} \wedge \ldots \wedge d x^{n}
$$

on $\underline{R}^{n}-\{0\}$. E.g.: When $n=3$,

$$
\omega_{R}^{2}=\frac{1}{R}\left(x^{1} d x^{2} \wedge d x^{3}-x^{2} d x^{1} \wedge d x^{3}+x^{3} d x^{1} \wedge d x^{2}\right)
$$

The exterior unit normal to $\underline{S}^{n-1}(R)$, considered as the boundary of $\underline{D}^{n}(R)$, is

$$
\left.\underline{n}\right|_{x}=\frac{1}{R}\left(x^{l} \frac{\partial}{\partial x^{l}}+\cdots+x^{n} \frac{\partial}{\partial x^{n}}\right)
$$

and the divergence theorem says that

$$
\int_{\underline{D}^{n}(R)}(\operatorname{div} x) d^{n} x=\int_{\underline{S}^{n-1}(R)}(x \cdot \underline{n}) \omega_{R}^{n-1} .
$$

[Note: Take $\mathrm{n}=3$ and define

$$
\left.l_{R}:\right] 0,2 \pi[\times] 0, \pi\left[\rightarrow \underline{S}^{2}(R)\right.
$$

by

$$
{ }^{2} R^{(\theta, \phi)}=(R \cos \theta \sin \phi, R \sin \theta \sin \phi, R \cos \phi) .
$$

Then

$$
\int_{\underline{S}^{2}(R)} f \omega_{R}^{2}=R^{2} \int_{0}^{2 \pi} \int_{0}^{\pi} f \circ{ }_{l_{R}} \sin \phi d \phi d \theta
$$

Therefore

$$
\int_{\underline{S}^{2}(R)}(X \cdot \underline{n}) \omega_{R}^{2}=\int_{\underline{S}^{2}(R)}\left(\frac{1}{R} x^{i} x^{i}\right) \omega_{R}^{2}
$$

$=\frac{R^{2}}{R} \int_{0}^{2 \pi} \int_{0}^{\pi}\left(R \cos \theta \sin \phi X^{l} \circ l_{R}+R \sin \theta \sin \phi X^{2} \circ l_{R}+R \cos \phi X^{3} \circ l_{R}\right) \sin \phi d \phi d \theta$
$=R^{2} \int_{0}^{2 \pi} \int_{0}^{\pi}\left(\cos \theta \sin \phi X^{l} \circ l_{R}+\sin \theta \sin \phi X^{2} \circ l_{R}+\cos \phi X^{3} \circ l_{R}\right) \sin \phi d \phi d \theta$.

So, if

$$
\int_{\underline{R}^{3}}(\operatorname{div} x) d^{3} x
$$

is defined to be

$$
\lim _{R \rightarrow \infty} \int_{\underline{D}^{3}(R)}(\operatorname{div} x) d^{3} x
$$

and if

$$
X=O\left(\frac{1}{R^{2+\delta}}\right) \quad(\delta>0)
$$

then

$$
\lim _{R \rightarrow \infty} \int_{\underline{S}^{2}(R)}(X \cdot \underline{n}) \omega_{R}^{2}=0
$$

However the weaker assumption that

$$
X=O\left(\frac{1}{R^{2}}\right)
$$

does not guarantee that

$$
\int_{\underline{R}^{3}}(\operatorname{div} x) d^{3} x
$$

exists: Without additional data, the conclusion is merely that

$$
\int_{\underline{S}^{2}(R)}(X \cdot \underline{n}) \omega_{R}^{2}=O(1)
$$

To appreciate the point, consider

$$
\left.x=\frac{\sin r}{r^{3}}\left(x^{i} \frac{\partial}{\partial x^{i}}\right)(r \gg 0) \cdot\right]
$$

Later on, it will be necessary to differentiate under the integral sign, a process that requires some backup. Here is one such result, tailored for improper integrals.

Criterion Suppose given $f(x, t)\left(x \in \underline{R}^{3}, t \in[-a, a]\right)$. Make the following assumptions.

1. f is a continuous function of $(x, t)$.
2. $\frac{\partial f}{\partial t}$ is a continuous function of $(x, t)$.
3. $\int_{\mathbb{R}^{3}} f(x, t) d^{3} x$ exists and is a continuous function of $t$.
4. $\int_{\mathbb{R}^{3}} \frac{\partial f}{\partial t}(x, t) d^{3} x$ exists and is a continuous function of $t$.
5. $\exists \mathrm{M}>0: \forall \mathrm{R}$,

$$
M \geq\left|\int_{\underline{D}^{3}(R)} \frac{\partial f}{\partial t}(x, t) d^{3} x\right|(-a \leq t \leq a)
$$

Then

$$
\frac{d}{d t}\left[\int_{\underline{R}^{3}} f(x, t) d^{3} x\right]=\int_{\underline{R}^{3}} \frac{\partial f}{\partial t}(x, t) d^{3} x .
$$

[Choose $R_{n}: R_{n}<R_{n+1} \& \lim R_{n}=\infty$ :

$$
\int_{-a}^{t} \int_{\underline{R}^{3}} \frac{\partial f}{\partial t^{\prime}}\left(x, t^{\prime}\right) d^{3} x d t^{\prime}
$$

$$
\begin{aligned}
& =\int_{-a}^{t} \lim _{n \rightarrow \infty} \int_{\underline{D}^{3}}\left(R_{n}\right) \frac{\partial f}{\partial t^{\prime}}\left(x, t^{\prime}\right) d^{3} x d t^{\prime} \\
& =\lim _{n \rightarrow \infty} \int_{-a}^{t} \int_{\underline{D}^{3}\left(R_{n}\right)} \frac{\partial f}{\partial t^{\prime}}\left(x, t^{\prime}\right) d^{3} x d t^{\prime} \quad \text { (dominated convergence) } \\
& =\lim _{n \rightarrow \infty} \int_{\underline{D}^{3}\left(R_{n}\right)} \int_{-a}^{t} \frac{\partial f}{\partial t^{\prime}}\left(x, t^{\prime}\right) d t^{\prime} d^{3} x \quad \text { (Fubini) } \\
& =\lim _{n \rightarrow \infty} \int_{\underline{D}^{3}\left(R_{n}\right)}(f(x, t)-f(x,-a)) d^{3} x \\
& =\int_{\underline{R}^{3}} f(x, t) d^{3} x-\int_{\underline{R}^{3}} f(x,-a) d^{3} x \\
& \text { => } \\
& \frac{d}{d t}\left[\int_{\underline{R}^{3}} f(x, t) d^{3} x\right] \\
& =\frac{d}{d t}\left[\int_{-a}^{t} \int_{\underline{R}^{3}} \frac{\partial f}{\partial t^{\prime}}\left(x, t^{\prime}\right) d^{3} x d t^{\prime}\right] \\
& \left.=\int_{\underline{R}^{3}} \frac{\partial f}{\partial t}(x, t) d^{3} x .\right]
\end{aligned}
$$

Rappel:

$$
\begin{aligned}
& H(q, \Lambda ; N, \vec{N})=\int_{\underline{R}^{3}}-2 \operatorname{div}_{q} \Lambda(\vec{N}) \\
& +\int_{\underline{R}^{3}} N\left([s, s]_{q}-\frac{1}{2} t r_{q}(s)^{2}-s(q)\right) \sqrt{q} d^{3} x .
\end{aligned}
$$

The computation of

$$
\frac{\delta}{\delta q}\left[\int_{\underline{R}^{3}}-2 \operatorname{div}_{q} \Lambda(\vec{N})\right]
$$

and

$$
\frac{\delta}{\delta \Lambda}\left[\int_{\underline{R}^{3}}-2 d \operatorname{div}_{q} \Lambda(\vec{N})\right]
$$

depends on rewriting

$$
\int_{\underline{R}^{3}}-2 \operatorname{div}_{q} \Lambda(\vec{N})
$$

as

$$
\int_{\underline{R}^{3}} \Lambda\left(L_{\vec{N}} q\right)
$$

and this is where an integration by parts creeps in.

LEMMA The integral

$$
\int_{\underline{R}^{3}} \Lambda\left(L_{\vec{N}} q\right)
$$

is convergent.
[We have

$$
\begin{aligned}
& \int_{\underline{R}^{3}} \Lambda\left(L_{\vec{N}} q\right)=\int_{\underline{R}^{3}} s^{\#}\left(L_{\vec{N}} q\right) \sqrt{q} d^{3} x \\
& \quad=\int_{\underline{R}^{3}} s^{i j}\left(N_{i ; j}+N_{j ; i}\right) \sqrt{q} d^{3} x .
\end{aligned}
$$

Since $s^{i j}=s^{j i}$, it suffices to consider

$$
\int_{R^{3}} s^{i j} N_{i ; j} \sqrt{q} d^{3} x
$$

Write

$$
\begin{aligned}
& s^{i j_{N}} N_{i ; j} \sqrt{q} \\
& \quad=\frac{\lambda^{i j}}{\sqrt{q}} N_{i ; j} \sqrt{q}
\end{aligned}
$$

$$
\begin{aligned}
& =\lambda^{i j} N_{i ; j} \\
& =\lambda^{i j} \nabla_{j} q_{i k} N^{k} \\
& =\lambda^{i j} q_{i k} \nabla_{j} N^{k} \\
& =\lambda^{i j} q_{i k}\left(\partial_{j} N^{k}+\Gamma_{j \ell^{N}}{ }^{k}\right)
\end{aligned}
$$

Then

- $\lambda^{i j} q_{i k}{ }^{\partial}{ }_{j} N^{k}$

$$
\begin{aligned}
& =\left(0^{-}\left(\frac{1}{r^{2}}\right)\right. \\
& \left.=0\left(\frac{1}{r^{2+\delta}}\right)\right)\left(n_{i k}+o\left(\frac{1}{r}\right)\right)\left(0^{+}\left(\frac{1}{r}\right)+o\left(\frac{1}{r^{1+\varepsilon}}\right)\right) \\
& =0^{-}\left(\frac{1}{r^{3}}\right)+\text { ho. }
\end{aligned}
$$

- $\lambda^{i j} q_{i k}{ }^{K^{k}}{ }_{j \ell^{V^{l}}}$

$$
\begin{aligned}
& =O\left(\frac{1}{r^{2}}\right)\left(\eta_{i k}+O\left(\frac{1}{r}\right)\right) O\left(\frac{1}{r^{2}}\right) O(1) \\
& \left.=O\left(\frac{1}{r^{4}}\right) \cdot\right]
\end{aligned}
$$

The boundary term that figures in the passage from

$$
\int_{\underline{R}^{3}}-2 \operatorname{div}_{q} \Lambda(\vec{N})
$$

to

$$
\int_{\underline{R}^{3}} \Lambda\left(L_{\vec{N}} q\right)
$$

arises from the identity

$$
N_{i ; j} s^{i j}=-N_{i} \nabla_{j} s^{i j}+\nabla_{j}\left(N_{i} s^{i j}\right)
$$

Here

$$
\nabla_{j}\left(N_{i} s^{i j}\right)=x_{i j}^{j}
$$

where

$$
x^{j}=s^{i j} N_{i} .
$$

We then want to argue that

$$
\int_{\underline{R}^{3}}\left(\operatorname{div}_{q} X\right) \operatorname{vol}_{q}=0 .
$$

For this purpose, write

$$
\begin{aligned}
\int_{\underline{R}^{3}} & \left(\operatorname{div}_{q} x\right) \operatorname{vol}_{q} \\
& =\int_{\underline{R}^{3}}\left(\frac{1}{\sqrt{q}} \frac{\partial\left(\sqrt{q} x^{j}\right)}{\partial x^{j}}\right) \sqrt{q} d^{3} x \\
& =\int_{\underline{R}^{3}} \frac{\partial\left(\sqrt{q} x^{j}\right)}{\partial x^{j}} d^{3} x \\
= & \lim _{R \rightarrow \infty} \int_{\underline{D}^{3}(R)}(\operatorname{div} \sqrt{q} x) d^{3} x \\
& =\lim _{R \rightarrow \infty} \int_{S^{2}(R)}(\sqrt{q} x \cdot \underline{n}) \omega_{R}^{2} .
\end{aligned}
$$

If

$$
\sqrt{q} x=O\left(\frac{1}{R^{2+\delta}}\right)
$$

then

$$
\int_{\underline{R}^{3}}\left(\operatorname{div}_{q} x\right) \operatorname{vol}_{q}=0
$$

and we are done. But we don't quite have this. To see what we do have, note that for $R \gg 0$,

$$
\begin{aligned}
\sqrt{q} X^{j} & =\sqrt{q} s^{i j} N_{i} \\
& =\sqrt{q}\left(\frac{\lambda^{i j}}{\sqrt{q}}\right) N_{i} \\
& =\lambda^{i j_{N}} N_{i} \\
& =\lambda^{i j} q_{i k} N^{k} \\
=\left(\frac{1}{R^{2}} \tilde{\tau}^{i j}+\right. & \left.O\left(\frac{1}{R^{2+\delta}}\right)\right)\left(\eta_{i k}+\frac{1}{R} \tilde{\sigma}_{i k}+O\left(\frac{1}{R^{1+\delta}}\right)\right)\left(\tilde{\psi}^{k}+O\left(\frac{1}{R^{\varepsilon}}\right)\right) \\
& =\frac{1}{R^{2}} \tilde{\tau}^{i j} \eta_{i k} \tilde{\psi}^{k}+O\left(\frac{1}{R^{2+c}}\right) \quad(c>0) .
\end{aligned}
$$

Accordingly, it remains to examine

$$
R^{2} \int_{0}^{2 \pi} \int_{0}^{\pi} \frac{1}{R^{2}}(1+2+3) \sin \phi d \phi d \theta,
$$

where

$$
\left[\begin{array}{l}
1=\cos \theta \sin \phi \tau^{i l}(\theta, \phi) \eta_{i k} \psi^{k}(\theta, \phi) \\
2=\sin \theta \sin \phi \tau^{i 2}(\theta, \phi) \eta_{i k} \psi^{k}(\theta, \phi) \\
3=\cos \phi \tau^{i 3}(\theta, \phi) \eta_{i k} \psi^{k}(\theta, \phi)
\end{array}\right.
$$

But since the parity of $1,2,3$ is odd, the integral vanishes, thus

$$
\int_{\mathbb{R}^{3}}\left(\operatorname{div}_{q} X\right) \operatorname{vol}_{q}=0
$$

The functional derivative of

$$
\int_{\underline{R}^{3}} N\left([s, s]_{q}-\frac{1}{2} \operatorname{tr}_{q}(s)^{2}-s(q)\right) \sqrt{q} d^{3} x
$$

w.r.t. $\Lambda$ does not involve a boundary term. As for the functional derivative of

$$
\int_{\underline{R}^{3}} N\left([s, s]_{q}-\frac{1}{2} \operatorname{tr}_{q}(s)^{2}-s(q)\right) \sqrt{q} d^{3} x
$$

w.r.t. q, a boundary term is encountered only in the computation of

$$
\frac{\delta}{\delta q}\left[\int_{\mathbb{R}^{3}}-N S(q) \sqrt{q} d^{3} x\right]
$$

We have

$$
\begin{aligned}
& \left.\frac{d}{d \varepsilon}\left[\int_{\underline{R}^{3}}-N S(q+\varepsilon \delta q) \sqrt{q+\varepsilon \delta q} d^{3} x\right]\right|_{\varepsilon=0} \\
& \quad=\int_{\underline{R}^{3}}-\left.N \frac{d}{d \varepsilon}[S(q+\varepsilon \delta q) \sqrt{q+\varepsilon \delta q}]\right|_{\varepsilon=0} d^{3} x,
\end{aligned}
$$

where $\delta q \in S_{2, \infty^{\circ}}$ But

$$
\begin{aligned}
& \quad \int_{\underline{R}^{3}}-\left.N \frac{d}{d \varepsilon}[S(q+\varepsilon \delta q) \sqrt{q+\varepsilon \delta q}]\right|_{\varepsilon=0} d^{3} x \\
& =\int_{\underline{R}^{3}} N\left[\Delta_{q} \operatorname{tr}_{q}(\delta q)+\delta_{q} d i v_{q} \delta q\right] \sqrt{q} d^{3} x \\
& \quad+\int_{\underline{R}^{3}} N q\left[\left[_{2}^{0}\right](\operatorname{Ein}(q), \delta q) \sqrt{q} d^{3} x\right.
\end{aligned}
$$

Since both integrals are convergent (Cf. infra), this makes sense.

That the second integral is convergent is easy to see: In fact,

$$
\begin{aligned}
& \operatorname{Nq}\left[\frac{0}{2}\right](\operatorname{Ein}(q), \delta q) \sqrt{q} \\
& =N \operatorname{Ein}(q)_{i j}(\delta q)^{i j_{\sqrt{q}}} \\
& =N \operatorname{Ein}(q)_{i j} q^{i k_{q} j^{j \ell}(\delta q)_{k} \ell^{\sqrt{q}}} \\
& =O(1) O\left(\frac{1}{r^{3}}\right)\left(\eta_{i k}+O\left(\frac{1}{r}\right)\right)\left(\eta_{j \ell}+O\left(\frac{1}{r}\right)\right) O\left(\frac{1}{r}\right)\left(1+O\left(\frac{1}{r}\right)\right) \\
& =O\left(\frac{1}{r^{4}}\right)
\end{aligned}
$$

[Note: No additional manipulation is needed for the second integral (it contributes directly to $\frac{\delta H}{\delta q}$.]

Notation: Put

$$
(d N \cdot \delta q)_{i}=(d N)_{j} \delta q_{i}^{j}
$$

Identity We have

$$
\begin{gathered}
N\left[\Delta_{q} \operatorname{tr}_{q}(\delta q)+\delta_{q} \operatorname{div}_{q} \delta q\right] \\
=-\left[H_{N}-\left(\Delta_{q} N\right) q_{r} \delta q\right] \\
-\delta_{q}\left(N\left(\operatorname{dtr}_{q}(\delta q)-\operatorname{div}_{q} \delta q\right)\right) \\
\\
\\
-\delta_{q}\left(d N \cdot \delta q-\operatorname{tr}_{q}(\delta q) d N\right)
\end{gathered}
$$

The integral

$$
\int_{\underline{R}^{3}}-\left[H_{N}-\left(\Delta q^{N}\right) q, \delta q\right] q^{\sqrt{q}} d^{3} x
$$

28. 

is convergent and leads to the remaining term in the expression for $\frac{\delta H}{\delta q}$.
Details Write

$$
\begin{aligned}
& {\left[H_{N}, \delta q\right] ~ q^{\sqrt{q}}} \\
& =\left(\mathrm{H}_{\mathrm{N}}\right)_{i j}(\delta \mathrm{q})^{i j} \sqrt{\mathrm{q}} \\
& =\left(\partial_{i} \partial_{j} N-\Gamma_{i j}^{a} \partial_{a} N\right) q^{i k}{ }_{q}{ }^{i \ell}(\delta q)_{k \ell} \sqrt{q} . \\
& \text { - } \partial_{i} \partial_{j} N q^{i k} q^{j \ell}(\delta q)_{k} \ell^{\sqrt{q}} \\
& =\left(O^{-}\left(\frac{1}{r^{2}}\right)+O\left(\frac{1}{r^{2+\varepsilon}}\right)\right)\left(\eta_{i k}+O\left(\frac{1}{r}\right)\right)\left(\eta_{j \ell}+O\left(\frac{1}{r}\right)\right) \\
& \times\left(O^{+}\left(\frac{1}{r}\right)+O\left(\frac{1}{r^{1+\delta}}\right)\right)\left(1+O\left(\frac{1}{r}\right)\right) \\
& =0^{-}\left(\frac{1}{r^{3}}\right)+\text { ho. } \\
& \text { - } \Gamma_{i j}^{a} \partial_{a} N q^{i k}{ }_{q} j \ell_{(\delta q)}^{k} \ell^{\sqrt{q}} \\
& =\left(O^{-}\left(\frac{1}{r^{2}}\right)+O\left(\frac{1}{r^{2+\delta}}\right)\right)\left(O^{+}\left(\frac{1}{r}\right)+O\left(\frac{1}{r^{1+\varepsilon}}\right)\right)\left(\eta_{i k}+O\left(\frac{1}{r}\right)\right)\left(\eta_{j \ell}+O\left(\frac{1}{r}\right)\right) \\
& \times\left(O^{+}\left(\frac{1}{r}\right)+O\left(\frac{1}{r^{1+\delta}}\right)\right)\left(1+O\left(\frac{1}{r}\right)\right) \\
& =O\left(\frac{1}{r^{4}}\right) \text {. }
\end{aligned}
$$

[Note: The discussion of

$$
\left[\left(\Delta_{q} N\right) q_{1}, \delta q\right]_{q} \sqrt{q}
$$

is analogous.]
29.

Therefore, to finish up, it has to be shown that

$$
\left[\begin{array}{l}
\int_{\underline{R}^{3}} \delta_{q}\left(N\left(d t r_{q}(\delta q)-\operatorname{div}_{q} \delta q\right)\right) \sqrt{q} d^{3} x=0 \\
\int_{\underline{R}^{3}} \delta_{q}\left(d N \cdot \delta q-\operatorname{tr}_{q}(\delta q) d N\right) \sqrt{q} d^{3} x=0 .
\end{array}\right.
$$

Rappel: Let $\omega=f_{i} d x^{i}-$ then

$$
\delta_{q} \omega=-\frac{1}{\sqrt{q}} \frac{\partial}{\partial x^{i}}\left(\sqrt{q} q^{i j_{f}}{ }_{j}\right)
$$

Because of this, each integral is an ordinary divergence, hence it suffices to consider

$$
\mathrm{x}^{\mathrm{i}}=\sqrt{\mathrm{q}} \mathrm{q}^{i \mathrm{ij}_{\mathrm{f}^{\prime}}}
$$

where

$$
\left[\begin{array}{rl}
f_{j} & =N \frac{\partial}{\partial x^{j}} \operatorname{tr}_{q}(\delta q), f_{j}=N\left(\operatorname{div}_{q} \delta q\right)_{j} \\
f_{j} & =(d N \cdot \delta q)_{j}, f_{j}=\operatorname{tr}_{q}(\delta q) \frac{\partial N}{\partial x^{j}}
\end{array}\right.
$$

N.B.

$$
\sqrt{q} q^{i j}=\eta_{i j}+O\left(\frac{1}{r}\right) .
$$

- $N \frac{\partial}{\partial x^{j}} \operatorname{tr}_{q}(\delta q)$

$$
\begin{aligned}
& =N \frac{\partial}{\partial x^{j}}\left(q^{k \ell} \delta q_{k \ell}\right) \\
& =N\left(\frac{\partial}{\partial x^{j}} q^{k \ell}\right) \delta q_{k \ell}+N q^{k \ell} \frac{\partial}{\partial x^{j}} \delta q_{k \ell}
\end{aligned}
$$

$$
\begin{aligned}
& =O(1) O\left(\frac{1}{r^{2}}\right) O\left(\frac{1}{r}\right)+N q^{k \ell} \frac{\partial}{\partial x^{j}} \delta q_{k \ell} \\
& =O\left(\frac{1}{r^{3}}\right)+N q^{k \ell} \frac{\partial}{\partial x^{j}} \delta q_{k \ell} .
\end{aligned}
$$

And

$$
\begin{aligned}
& N q^{k l} \frac{\partial}{\partial x^{j}} \delta q_{k l} \\
& =\left(\tilde{\psi}+O\left(\frac{1}{r^{\varepsilon}}\right)\right)\left(\eta_{k \ell}+O\left(\frac{1}{r}\right)\right)\left(O^{-}\left(\frac{1}{r^{2}}\right)+O\left(\frac{1}{r^{2+\delta}}\right)\right) \\
& =O^{+}\left(\frac{1}{r^{2}}\right)+O\left(\frac{1}{r^{2+c}}\right)(c>0) . \\
& \text { - } N\left(\operatorname{div}_{q} \delta q\right)_{j} \\
& =N q^{k \ell} \nabla_{k} \delta q_{j \ell} \\
& =N q^{k \ell}\left[\partial_{k} \delta q_{j \ell}-\Gamma_{k j}^{a} \delta q_{a \ell}-\Gamma_{k}^{a} \ell_{j a}^{\delta q_{j a}}\right] \\
& =N q^{k \ell} \partial_{k} \delta q_{j \ell} \\
& -N q^{k \ell}\left[r_{k j}^{\mathrm{a}} \delta q_{a \ell}+\Gamma_{k \ell}^{\mathrm{a}}{ }^{\delta q_{j a}}\right] \\
& =O^{+}\left(\frac{1}{r^{2}}\right)+O\left(\frac{1}{r^{2+C}}\right) \quad(c>0) \\
& -N q^{k \ell}\left[\Gamma_{k j}{ }^{\mathrm{a}} \mathrm{q}_{\mathrm{a} \ell}+\Gamma_{\mathrm{k} \ell}^{\mathrm{a}} \delta \mathrm{q}_{j \mathrm{a}}\right] .
\end{aligned}
$$

And

$$
\mathrm{Nq}{ }^{\mathrm{k} \ell}\left[\Gamma_{k j} \mathrm{a} q_{a \ell}+\mathrm{r}_{\left.\mathrm{k} \ell^{\delta} \delta q_{j a}\right]}\right.
$$

$$
\begin{gathered}
=O(1)\left(\eta_{k \ell}+O\left(\frac{l}{r}\right)\right) O\left(\frac{1}{r^{2}}\right) O\left(\frac{1}{r}\right) \\
=O\left(\frac{1}{r^{3}}\right)
\end{gathered}
$$

- $(\mathrm{dN} \cdot \delta \mathrm{q})_{\mathrm{j}}$

$$
\begin{aligned}
& =(d N)_{i} \delta q_{j}^{i} \\
& =\left(\partial_{i} N\right) \delta q_{j}^{i} \\
& =\left(\partial_{i} N\right) q^{i k_{\delta}}{q_{k j}}^{r^{\prime}} \\
& =\left(O^{+}\left(\frac{1}{r}\right)+O\left(\frac{1}{r^{1+\varepsilon}}\right)\right)\left(\eta_{i k}+O\left(\frac{1}{r}\right)\right)\left(O^{+}\left(\frac{1}{r}\right)+O\left(\frac{1}{r^{1+\delta}}\right)\right) \\
& =O^{+}\left(\frac{1}{r^{2}}\right)+O\left(\frac{1}{r^{2+c}}\right) \quad(c>0) .
\end{aligned}
$$

- $\operatorname{tr}_{q}(\delta q) \frac{\partial N}{\partial x^{j}}$

$$
\begin{aligned}
& =q^{k \ell} \delta q_{k \ell} \frac{\partial N}{\partial x^{j}} \\
& =\left(\eta_{k \ell}+O\left(\frac{1}{r}\right)\right)\left(O^{+}\left(\frac{1}{r}\right)+O\left(\frac{1}{r^{1+\delta}}\right)\right)\left(O^{+}\left(\frac{1}{r}\right)+O\left(\frac{1}{r^{l+\varepsilon}}\right)\right) \\
& =O^{+}\left(\frac{1}{r^{2}}\right)+O\left(\frac{1}{r^{2+C}}\right) \quad(c>0) .
\end{aligned}
$$

Conclusion: The potentially troublesome part of $\mathrm{X}^{i}$ is $\mathrm{O}^{+}\left(\frac{1}{r^{2}}\right)$ which, when multiplied by $x^{i}$, integrates to zero over $\underline{S}^{2}(R)$.

Poisson Brackets Put

$$
H_{D}(\vec{N})=\int_{\underline{R}^{3}}-2 \operatorname{div}_{q} \Lambda(\vec{N})
$$

and

$$
H_{H}(N)=\int_{\underline{R}^{3}} N\left([s, s]_{q}-\frac{1}{2} \operatorname{tr}_{q}(s)^{2}-s(q)\right) \sqrt{q} d^{3} x
$$

Therefore

$$
H=H_{D}+H_{H}
$$

and we have:

1. $\left\{H_{D}\left(\vec{N}_{1}\right), H_{D}\left(\vec{N}_{2}\right)\right\}=H_{D}\left(\left[\vec{N}_{1}, \vec{N}_{2}\right]\right)$;
2. $\left\{H_{D}(\vec{N}), H_{H}(N)\right\}=H_{H}\left(L_{\vec{N}} N\right)$;
3. $\left\{H_{H}\left(N_{1}\right), H_{H}\left(N_{2}\right)\right\}$

$$
=H_{D}\left(N_{1} \operatorname{grad} N_{2}-N_{2} \operatorname{grad} N_{1}\right) .
$$

N.B. Tacitly, $\vec{N}, N, \vec{N}_{1}, \vec{N}_{2}, N_{1}, N_{2}$ are subject to the standard conditions. To ensure consistency, one then has to check that

$$
\left[\vec{N}_{1}, \vec{N}_{2}\right], \underset{\vec{N}}{L_{N}} \mathrm{~N}, \text { and } \mathrm{N}_{1} \operatorname{grad} \mathrm{~N}_{2}-\mathrm{N}_{2} \operatorname{grad} \mathrm{~N}_{1}
$$

also satisfy the standard conditions, which is straightforward (they all have the form $\left.0^{\infty}\left(\frac{1}{r}\right) \quad(\varepsilon>0)\right)$.
[Note: In this context, the gradient depends on q, i.e., grad $=\operatorname{grad}_{\mathrm{q}}$.]
Each of the three computations leads to a boundary term, ignorable in the
case of a compact $\Sigma$ but, of course, not in general.
To illustrate, consider the derivation of the relation

$$
\left\{H_{D}(\vec{N}), H_{H}(N)\right\}=H_{H}\left(L_{\vec{N}} N\right)
$$

Here the boundary term is

$$
-\int_{\underline{R}^{3}} L_{\vec{N}}\left(\text { NEvol }_{q}\right),
$$

where

$$
E=[s, s]_{q}-\frac{1}{2} t r_{q}(s)^{2}-s(q)
$$

This said, write

$$
\begin{aligned}
& \int_{\underline{R}^{3}} L_{\vec{N}}\left(\text { NEvol }_{q}\right) \\
& \left.=\int_{\underline{R}^{3}}{ }^{d\left(l_{N}\right.}\left(\text { NEvol }_{q}\right)\right) \\
& =\int_{\underline{R}^{3}} d\left(\mathrm{NE}_{\mathrm{N}} \mathrm{~N}_{\mathrm{NO}}^{\mathrm{VOl}}\right)^{\prime} \\
& =\int_{\underline{R}^{3}} \mathrm{~d}\left(\mathrm{l}_{\mathrm{NEN}} \mathrm{VOL}_{\mathrm{q}}\right) \\
& =\int_{\mathbb{R}^{3}} d\left(1 \underset{N E N}{ } \sqrt{q} d^{3} x\right) \\
& =\int_{\underline{R}^{3}} d(1) \sqrt{q} \operatorname{NEN}^{\left.d^{3} x\right)} \\
& =\int_{\underline{R}^{3}}(\operatorname{div} x) d^{3} x,
\end{aligned}
$$

the vector field

$$
x=x^{i} \frac{\partial}{\partial x^{i}} \in \mathcal{D}^{l}\left(\underline{R}^{3}\right)
$$

being given by

$$
x^{i}=\sqrt{q} N E N^{i} .
$$

But, on the basis of earlier work,

$$
\left\{\begin{array}{l}
\sqrt{q} N[s, s] q^{N^{i}=O\left(\frac{1}{r^{4}}\right)} \\
\sqrt{q} N \operatorname{tr}_{q}(s)^{2} N^{i}=O\left(\frac{1}{r^{4}}\right) \\
\sqrt{q} N S(q) N^{i}=O\left(\frac{1}{3}\right)
\end{array}\right.
$$

Therefore

$$
\begin{aligned}
& x=0\left(\frac{1}{r^{3}}\right) \\
\Rightarrow \quad & \int_{\underline{R}^{3}}(\text { div } x) d^{3} x=0 .
\end{aligned}
$$

- Denote by $\mathrm{Con}_{\mathrm{D}}$ the subset of $\Gamma$ consisting of those pairs ( $q, \Lambda$ ) such that

$$
\operatorname{div}_{q} s=0
$$

- Denote by $\mathrm{Con}_{\mathrm{H}}$ the subset of $\Gamma$ consisting of those pairs ( $q, \Lambda$ ) such that

$$
[s, s]_{q}-\frac{1}{2} \operatorname{tr}_{q}(s)^{2}-s(q)=0
$$

[Note: Here, as always, $\Lambda=s^{\#} \otimes|q|^{1 / 2}$.]
Put

$$
\mathrm{Con}_{Q_{\infty}}=\mathrm{Con}_{\mathrm{D}} \mathrm{nCon}_{\mathrm{H}} \subset \Gamma .
$$

Definition: A constraint is a function $f: \Gamma \rightarrow \underline{R}$ such that $f \mid \operatorname{Con}_{Q_{\infty}}=0$.
35.

Therefore

$$
\left[\begin{array}{l}
H_{D}(\overrightarrow{\mathrm{~N}}) \\
H_{H}(\mathrm{~N})
\end{array}\right.
$$

are constraints, these being termed primary. Since the Poisson bracket of two primary constraints is a constraint, our system is first class.

Section 63: The Integrals of Motion-Energy and Center of Mass

The assumptions and notation are those of Section 62.
Rappel:

$$
H=H_{D}+H_{H^{\prime}}
$$

where

$$
H_{D}(\vec{N})=\int_{\underline{R}^{3}}-2 \operatorname{div}_{q} \Lambda(\vec{N})
$$

and

$$
H_{H}(N)=\int_{\mathcal{R}^{3}} N\left([s, s]_{q}-\frac{1}{2} \operatorname{tr}_{q}(s)^{2}-s(q)\right) \sqrt{q} d^{3} x .
$$

Needless to say, $\vec{N}$ and $N$ are subject to the standard conditons. However, in order to formulate the definition of energy, linear momentum, angular momentum, and center of mass, the standard conditions are too restrictive, thus must be relaxed.

In this section, we shall deal with $H_{H}(N)$ and suppose that

$$
N=A+B_{1} x^{1}+B_{2} x^{2}+B_{3} x^{3}+s c
$$

where $A$ and $B_{1}, B_{2}, B_{3}$ are constants and sc stands for a function which satisfies the standard conditions.

Problem: Determine whether the integral defining $H_{H}(N)$ is convergent or not.
Since this is the case of $H_{H}(S C)$, it suffices to consider the matter when $N=A+B x^{b} \quad(b=1,2,3)$.

First,

$$
\int_{\mathrm{R}^{3}}{ }^{N[s, s]} q^{\sqrt{q}} d^{3} x
$$

is convergent, as is

$$
\int_{\underline{R}^{3}}-\frac{N}{2} \operatorname{tr}_{q}(s)^{2} \sqrt{q} d^{3} x
$$

2. 

E.g.:

$$
\begin{gathered}
N[s, s] q^{\sqrt{q}} \\
=\frac{N}{\sqrt{q}} q_{i k} q_{j \ell^{\lambda}}^{i j_{\lambda} k \ell} \\
=\left(A+B x^{b}\right)\left(1+O\left(\frac{1}{r}\right)\right)\left(\eta_{i k}+O\left(\frac{1}{r}\right)\right)\left(\eta_{j \ell}+O\left(\frac{1}{r}\right)\right) \\
\times\left(\frac{\tilde{\tau}^{i j}}{r^{2}}+O\left(\frac{1}{r^{2+\delta}}\right)\right)\left(\frac{\tilde{\tau}^{k} \ell}{r^{2}}+O\left(\frac{1}{r^{2+\delta}}\right)\right) \\
=A O\left(\frac{1}{r^{4}}\right)+B X^{b}+\left(\frac{1}{r^{4}}\right)+\cdots \\
=A O\left(\frac{1}{r^{4}}\right)+B O^{-}\left(\frac{1}{r^{3}}\right)+\cdots .
\end{gathered}
$$

There remains

$$
\int_{\underline{R}^{3}}-N S(q) \sqrt{q} d^{3} x .
$$

Write

$$
\begin{aligned}
s(q) & =q^{j \ell}{ }_{R}^{i}{ }_{j i \ell} \\
& =q^{j \ell}\left(\Gamma_{\ell j, i}^{i}-\Gamma_{i j, \ell}^{i}+\Gamma_{\ell j}^{a} \Gamma_{i a}^{i}-\Gamma_{i j}^{a} \Gamma^{i}{ }_{\ell a}\right)
\end{aligned}
$$

Then

$$
\begin{aligned}
& N q^{j \ell}\left(\Gamma_{\ell j}{ }_{l}^{\Gamma^{i}}{ }_{i a}-\Gamma_{i j}^{a} \Gamma_{\ell a}^{\Gamma^{i}}\right) \sqrt{q} \\
& \left.\quad=\left(A+B x^{b}\right)\left(\eta_{j \ell}+O\left(\frac{1}{r}\right)\right)\left(O^{-\left(\frac{1}{2}\right.}\right)+O\left(\frac{1}{r^{2+\delta^{2}}}\right)\right)^{2}\left(1+O\left(\frac{1}{r}\right)\right) \\
& \quad=A O\left(\frac{1}{r^{4}}\right)+B x^{b} O^{+}\left(\frac{1}{r^{4}}\right)+\cdots
\end{aligned}
$$

$$
=\mathrm{AO}\left(\frac{1}{r^{4}}\right)+\mathrm{BO}^{-}\left(\frac{1}{r^{3}}\right)+\cdots
$$

Accordingly, the convergence of the integral defining $H_{H}(N)$ hinges on the behavior of

$$
\begin{aligned}
& -N q^{j \ell}\left(\Gamma_{\ell j, i}^{i}-\Gamma_{i j, \ell}^{i}\right) \sqrt{q} . \\
& \text { - } q^{j \ell_{\Gamma}^{i}}{ }_{\ell j, i} \\
& =q^{j \ell} \partial_{i}\left[\frac{1}{2} q^{i k}\left(q_{k \ell, j}+q_{k j, \ell}-q_{\ell j, k}\right)\right] \\
& =\frac{1}{2} q^{j \ell}\left[\left(\partial_{i} q^{i k}\right)\left(q_{k \ell, j}+q_{k j, \ell}-q_{\ell j, k}\right)\right. \\
& \left.+q^{i k}\left(q_{k \ell, j, i}+q_{k j, \ell, i}-q_{\ell j, k, i}\right)\right] . \\
& -q^{j \ell}{ }_{i j}^{i}{ }_{i j} \\
& =-q^{j \ell} \partial_{\ell}\left[\frac{1}{2} q^{i k}\left(q_{k i, j}+q_{k j, i}-q_{i j, k}\right)\right] \\
& =-\frac{1}{2} q^{j \ell}\left[\left(\partial_{\ell} q^{i k}\right)\left(q_{k i, j}+q_{k j, i}-q_{i j, k}\right)\right. \\
& \left.+q^{i k}\left(q_{k i, j, \ell}+q_{k j, i, \ell}-q_{i j, k, \ell}\right)\right] .
\end{aligned}
$$

The integral of a term involving $\partial_{i} q^{i k}$ or $\partial_{\ell} q^{i k}$ is convergent. E.g.:

$$
\begin{gathered}
N q^{j \ell}\left(\partial_{i} q^{i k}\right) q_{k \ell, j} \sqrt{q} \\
=\left(A+B x^{b}\right)\left(\eta_{j \ell}+O\left(\frac{1}{r}\right)\right)\left(O^{-}\left(\frac{1}{r^{2}}\right)+O\left(\frac{1}{r^{2+\delta}}\right)\right) \\
\times\left(O^{-}\left(\frac{1}{r^{2}}\right)+O\left(\frac{1}{r^{2+\delta}}\right)\right)\left(1+O\left(\frac{1}{r}\right)\right)
\end{gathered}
$$

$$
=q^{j \ell} q^{i k_{q^{\prime}}}{ }_{\ell, i}
$$

Thus things simplify to

$$
q^{j \ell} q^{i k}\left(q_{i j, k, \ell}-q_{k i, j, \ell}\right)
$$

But

$$
\left[\begin{array}{l}
q^{j \ell} q^{i k} q_{i j, k, \ell}=q^{k \ell} q^{i j} q_{i k, j, \ell}=q^{i j} q^{k \ell} q_{i k, j, \ell} \\
\quad q^{j \ell} q^{i k} q_{k i, j, \ell}=q^{k \ell} q^{i j} q_{j i, k, \ell}=q^{i j} q^{k \ell} q_{i j, k, \ell}
\end{array}\right.
$$

So we are left with

$$
q^{i j} q^{k \ell}\left(q_{i k, j, \ell}-q_{i j, k, \ell}\right)
$$

Write

$$
\begin{aligned}
& \partial_{\ell}\left(N q^{i j} q^{k \ell}\left(q_{i k, j}-q_{i j, k}\right) \sqrt{q}\right) \\
&=\left(\partial_{\ell} N\right) q^{i j} q^{k \ell}\left(q_{i k, j}-q_{i j, k}\right) \sqrt{q} \\
&+N \partial_{\ell}\left(q^{i j} q^{k \ell} \sqrt{q}\right)\left(q_{i k, j}-q_{i j, k}\right) \\
&+N q^{i j} q^{k \ell}\left(q_{i k, j, \ell}-q_{i j, k, \ell}\right) \sqrt{q}
\end{aligned}
$$

or, for later convenience,

$$
\begin{aligned}
& \left(\partial_{\ell} N\right) q^{i j} q^{k \ell}\left(\partial_{j}\left(q_{i k}-n_{i k}\right)-\partial_{k}\left(q_{i j}-\eta_{i j}\right)\right) \sqrt{q} \\
& \quad+N \partial_{\ell}\left(q^{i j} q^{k \ell} \sqrt{q}\right)\left(q_{i k, j}-q_{i j, k}\right) \\
& \quad+N q^{i j} q^{k \ell}\left(q_{i k, j, \ell}-q_{i j, k, \ell}\right) \sqrt{q} .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& { }_{N q}{ }^{i j} q^{k \ell}\left(q_{i k, j, \ell}-q_{i j, k, \ell}\right) \sqrt{q} \\
& =\partial_{\ell}\left(N q^{i j} q^{k \ell}\left(q_{i k, j}-q_{i j, k}\right) \sqrt{q}\right) \\
& -N \partial_{\ell}\left(q^{i j} q^{k \ell} \sqrt{q}\right)\left(q_{i k, j}-q_{i j, k}\right) \\
& -\left(\partial_{\ell}{ }^{N}\right) q^{i j} q^{k \ell}\left(\partial_{j}\left(q_{i k}-\eta_{i k}\right)-\partial_{k}\left(q_{i j}-\eta_{i j}\right)\right) \sqrt{q} \\
& =\partial_{\ell}\left(N q^{i j} q^{k \ell}\left(q_{i k, j}-q_{i j, k}\right) \sqrt{q}\right) \\
& -N \partial_{\ell}\left(q^{i j} q^{k \ell} \sqrt{q}\right)\left(q_{i k, j}-q_{i j, k}\right) \\
& +\left(\partial_{\ell} \ell^{N}\right) q^{i j} q^{k \ell}\left(\partial_{k}\left(q_{i j}-\eta_{i j}\right)-\partial_{j}\left(q_{i k}-\eta_{i k}\right)\right) \sqrt{q} . \\
& \text { - } \partial_{\ell}\left(\left(\partial_{k} N\right) q^{i j} q^{k \ell}\left(q_{i j}-\eta_{i j}\right) \sqrt{q}\right) \\
& -\partial_{k}\left(\left(\partial_{\ell}{ }^{N}\right) q^{i j} q^{k \ell} \sqrt{q}\right)\left(q_{i j}-\eta_{i j}\right) \\
& =\left(\partial_{\ell} \partial_{k} N\right)\left(q^{i j} q^{k \ell} \sqrt{q}\right)\left(q_{i j}-\eta_{i j}\right) \\
& +\left(\partial_{k} N\right) \partial_{\ell}\left(q^{i j} q^{k \ell} \sqrt{q}\right)\left(q_{i j}-\eta_{i j}\right) \\
& +\left(\partial_{k} N\right)\left(q^{i j} q^{k l} \sqrt{q}\right) \partial_{\ell}\left(q_{i j}-n_{i j}\right) \\
& -\left(\partial_{k} \ell^{N}\right)\left(q^{i j} q^{k \ell} \sqrt{q}\right)\left(q_{i j}-n_{i j}\right) \\
& -\left(\partial_{\ell} N\right) \partial_{k}\left(q^{i j} q^{k \ell} \sqrt{q}\right)\left(q_{i j}-\eta_{i j}\right)
\end{aligned}
$$

$$
\begin{aligned}
& =\left(\partial_{\ell} N\right) q^{i j} q^{k \ell} \partial_{k}\left(q_{i j}-\eta_{i j}\right) \sqrt{q} . \\
& \text { - }-\partial_{j}\left(\left(\partial_{\ell}{ }^{N}\right) q^{i j} q^{k \ell}\left(q_{i k}-n_{i k}\right) \sqrt{q}\right) \\
& +\partial_{j}\left(\left(\partial_{\ell}{ }^{N}\right) q^{i j} q^{k \ell} \sqrt{q}\right)\left(q_{i k}-n_{i k}\right) \\
& =-\left(\partial_{j} \partial^{N}\right)\left(q^{i j} q^{k \ell} \sqrt{q}\right)\left(q_{i k}-n_{i k}\right) \\
& -\left(\partial_{\ell} N\right) \partial_{j}\left(q^{i j} q^{k \ell} \sqrt{q}\right)\left(q_{i k}-\eta_{i k}\right) \\
& -\left(\partial_{\ell} N\right)\left(q^{i j} q^{k \ell} \sqrt{q}\right) \partial_{j}\left(q_{i k}-\eta_{i k}\right) \\
& +\left(\partial_{j} \partial^{N}{ }^{N}\right)\left(q^{i j} q^{k l} \sqrt{q}\right)\left(q_{i k}-\eta_{i k}\right) \\
& +\left(\partial_{\ell} N\right) \partial_{j}\left(q^{i j} q^{k \ell} \sqrt{q}\right)\left(q_{i k}-\eta_{i k}\right) \\
& =-\left(\partial_{\ell}{ }^{N)} q^{i j} q^{k \ell} \partial_{j}\left(q_{i k}-\eta_{i k}\right) \sqrt{q} .\right.
\end{aligned}
$$

These relations then imply that

$$
\begin{gathered}
{N q^{i j} q^{k \ell}\left(q_{i k, j, \ell}-q_{i j, k, \ell}\right) \sqrt{q}}_{=}^{\partial_{\ell}\left(N q^{i j} q^{k \ell}\left(q_{i k, j}-q_{i j, k}\right) \sqrt{q}\right)} \\
-{ }^{N \partial_{\ell}}\left(q^{i j} q^{k \ell} \sqrt{q}\right)\left(q_{i k, j}-q_{i j, k}\right) \\
+\partial_{\ell}\left(\left(\partial_{k} N\right) q^{i j} q^{k \ell}\left(q_{i j}-n_{i j}\right) \sqrt{q}\right) \\
-\partial_{k}\left(\left(\partial_{\ell} N\right) q^{i j} q^{k \ell} \sqrt{q}\right)\left(q_{i j}-n_{i j}\right)
\end{gathered}
$$

$$
\begin{aligned}
& -\partial_{j}\left(\left(\partial_{\ell} \ell^{\mathrm{N}}\right) q^{i j} q^{k \ell}\left(q_{i k}-\eta_{i k}\right) \sqrt{q}\right) \\
& +\partial_{j}\left(\left(\partial_{\ell} \mathbb{N}\right) q^{i j} q^{k \ell} \sqrt{q}\right)\left(q_{i k}-n_{i k}\right) . \\
& \text { - }-\partial_{j}\left(\left(\partial_{\ell}{ }^{\mathrm{N})} q^{i j} q^{k l}{ }_{\left(q_{i k}\right.}-\eta_{i k}\right) \sqrt{q}\right) \\
& =-\partial_{\ell}\left(\left(\partial_{j} N\right) q^{i \ell} q^{k j}\left(q_{i k}-\eta_{i k}\right) \sqrt{q}\right) \\
& =-\partial_{\ell}\left(\left(\partial_{j} N\right) q^{k \ell} q^{i j}\left(q_{k i}-\eta_{k i}\right) \sqrt{q}\right) \\
& =-\partial_{\ell}\left(\left(\partial_{j} \mathrm{~N}\right) q^{i j} q^{k \ell}\left(q_{i k}-\eta_{i k}\right) \sqrt{q}\right) . \\
& \text { - } \partial_{j}\left(\left(\partial_{\ell}{ }^{\mathrm{N})} q^{i j} q^{k \ell} \sqrt{q}\right)\left(q_{i k}-n_{i k}\right)\right. \\
& =\left(\partial_{j} \partial \ell^{N}\right) q^{i j} q^{k \ell} \sqrt{q}\left(q_{i k}-\eta_{i k}\right) \\
& +\left(\partial_{\ell} N\right) \partial_{j}\left(q^{i j} q^{k \ell} \sqrt{q}\right)\left(q_{i k}-n_{i k}\right) \\
& =\left(\partial_{k} \partial_{\ell} N\right) q^{i k} q^{j \ell} \sqrt{q}\left(q_{i j}-n_{i j}\right) \\
& +\left(\partial_{j} N\right) \partial_{\ell}\left(q^{i \ell_{q} k j} \sqrt{q}\right)\left(q_{i k}-n_{i k}\right) \\
& =\left(\partial_{k} \partial \ell^{N}\right) q^{i k_{q}}{ }^{j \ell} \sqrt{q}\left(q_{i j}-n_{i j}\right) \\
& +\left(\partial_{j} N\right) \partial_{\ell}\left(q^{i j} q^{k \ell} \sqrt{q}\right)\left(q_{i k}-\eta_{i k}\right) .
\end{aligned}
$$

Therefore

$$
\mathrm{Nq}^{i j} q^{k \ell}\left(q_{i k, j, \ell}-q_{i j, k, \ell}\right) \sqrt{q}
$$

$$
\begin{aligned}
& =\partial_{\ell}\left(N q^{i j} q^{k \ell}\left(q_{i k, j}-q_{i j, k}\right) \sqrt{q}\right. \\
& \\
& \left.\quad+\left(\partial_{k} N\right) q^{i j} q^{k \ell}\left(q_{i j}-\eta_{i j}\right) \sqrt{q}-\left(\partial_{j} N\right) q^{i j_{q} k \ell}\left(q_{i k}-\eta_{i k}\right) \sqrt{q}\right) \\
& + \\
& \left(\partial_{k} \partial \ell^{N}\right)\left(q^{i k} q^{j \ell} \sqrt{q}\left(q_{i j}-n_{i j}\right)-q^{i j_{q} k \ell} \sqrt{q}\left(q_{i j}-\eta_{i j}\right)\right) \\
& + \\
& \partial_{\ell}\left(q^{i j} q^{k \ell} \sqrt{q}\right)\left(-N\left(q_{i k, j}-q_{i j, k}\right)\right. \\
& - \\
&
\end{aligned}
$$

If

$$
N=A+B x^{b}+s c
$$

then the integrals

$$
\left[\begin{array}{l}
\int_{\mathbb{R}^{3}}\left(\partial_{k} \partial^{N}\right)(\ldots) d^{3} x \\
\int_{-\mathbb{R}^{3}} \partial_{\ell}\left(q^{i j_{q} k \ell} \sqrt{q}\right)(\ldots) d^{3} x
\end{array}\right.
$$

are convergent.
Details To discuss the second integral, write

$$
\begin{aligned}
& \partial_{\ell}\left(q^{i j} q^{k \ell} \sqrt{q}\right) \\
& =\left(\partial_{\ell} q^{i j}\right) q^{k \ell} \sqrt{q}+q^{i j}\left(\partial \ell^{q}{ }^{k \ell}\right) \sqrt{q}+q^{i j} q^{k \ell} \partial_{\ell} \sqrt{q} \\
& =\left(O^{-}\left(\frac{l}{r^{2}}\right)+O\left(\frac{l}{r^{2+\delta}}\right)\right)\left(n_{k \ell}+O\left(\frac{l}{r}\right)\right)\left(1+O\left(\frac{l}{r}\right)\right) \\
& \quad+\left(n_{i j}+O\left(\frac{l}{r}\right)\right)\left(O^{-}\left(\frac{l}{r^{2}}\right)+O\left(\frac{l}{r^{2+\delta}}\right)\right)\left(l+O\left(\frac{l}{r}\right)\right)
\end{aligned}
$$

$$
\begin{aligned}
& +\left(\eta_{i j}+O\left(\frac{1}{r}\right)\right)\left(\eta_{k \ell}+O\left(\frac{1}{r}\right)\right) \partial_{\ell} \sqrt{q} \\
& =0^{-}\left(\frac{1}{r^{2}}\right)+O\left(\frac{1}{r^{2+\delta}}\right) \\
& +\left(\eta_{i j}+O\left(\frac{1}{r}\right)\right)\left(\eta_{k \ell}+O\left(\frac{1}{r}\right)\right) \partial_{\ell} \sqrt{q} . \\
& \text { - } \partial_{\ell} \operatorname{det} q=(\operatorname{det} q) q^{i j} \partial_{\ell} q_{i j} \\
& =\left(1+O\left(\frac{1}{r}\right)\right)\left(\eta_{i j}+O\left(\frac{1}{r}\right)\right)\left(O^{-}\left(\frac{1}{r^{2}}\right)+O\left(\frac{1}{r^{2+\delta}}\right)\right) \\
& =O^{-}\left(\frac{1}{r^{2}}\right)+O\left(\frac{1}{r^{2+\delta}}\right) \\
& \text { => } \\
& \partial_{\ell} \sqrt{q}=\partial_{\ell}(\operatorname{det} q)^{1 / 2} \\
& =\frac{1}{2} \frac{1}{\sqrt{q}} \partial_{\ell} \operatorname{det} q \\
& =\frac{1}{2}\left(1+O\left(\frac{1}{r}\right)\right)\left(O^{-}\left(\frac{1}{r^{2}}\right)+O\left(\frac{1}{r^{2+\delta}}\right)\right) \\
& =O^{-}\left(\frac{1}{r^{2}}\right)+O\left(\frac{1}{r^{2+\delta}}\right) .
\end{aligned}
$$

Thus

$$
\partial_{\ell}\left(q^{i j} q^{k \ell} \sqrt{q}\right)=0^{-}\left(\frac{1}{r^{2}}\right)+O\left(\frac{1}{r^{2+\delta}}\right)
$$

1. Suppose that $\mathrm{N}=\mathrm{sc}-$ - then

$$
N\left(q_{i k, j}-q_{i j, k}\right)=O\left(\frac{1}{r^{2}}\right)
$$

and

$$
\left.\right|_{-} ^{\left(\partial_{k} N\right)\left(q_{i j}-n_{i j}\right)}=o\left(\frac{1}{r^{2}}\right)
$$

So in this case parity plays no role.
2. Suppose that $N=A+B x^{b}-$ then

$$
\begin{aligned}
& N\left(q_{i k, j}-q_{i j, k}\right) \\
& =\left(A+\mathrm{Bx}^{\mathrm{b}}\right)\left(\mathrm{O}^{-}\left(\frac{1}{\mathrm{r}^{2}}\right)+O\left(\frac{1}{\mathrm{r}^{2+\delta}}\right)\right) \\
& =\mathrm{AO}\left(\frac{1}{\mathrm{r}^{2}}\right)+\mathrm{BO}^{+}\left(\frac{1}{\mathrm{r}}\right)+\cdots
\end{aligned}
$$

and

$$
\left[\begin{array}{l}
\left(\partial_{k} N\right)\left(q_{i j}-\eta_{i j}\right)=B \delta_{k}^{b}\left(O^{+}\left(\frac{1}{r}\right)+O\left(\frac{1}{r^{1+\delta}}\right)\right) \\
\left(\partial_{j} N\right)\left(q_{i k}-\eta_{i k}\right)=B \delta_{j}^{b}\left(O^{+}\left(\frac{1}{r}\right)+O\left(\frac{1}{r^{1+\delta}}\right)\right)
\end{array}\right.
$$

So in this case parity is crucial.
Notation: Let

$$
x=x^{\ell} \frac{\partial}{\partial x^{\ell^{\prime}}}
$$

where

$$
\begin{gathered}
x^{\ell}=N q^{i j} q^{k \ell}\left(q_{i k, j}-q_{i j, k}\right) \sqrt{q} \\
+\left(\partial_{k} N\right) q^{i j} q^{k \ell}\left(q_{i j}-\eta_{i j}\right) \sqrt{q}-\left(\partial_{j} N\right) q^{i j} q^{k \ell}\left(q_{i k}-n_{i k}\right) \sqrt{q} .
\end{gathered}
$$

Then

$$
\operatorname{div} x=\partial \ell^{\ell}
$$

and we have

$$
\begin{aligned}
\int_{\underline{R}^{3}}(\operatorname{div} x) d^{3} x & =\lim _{R \rightarrow \infty} \int_{\underline{D}^{3}(R)}(\operatorname{div} x) d^{3} x \\
& =\lim _{R \rightarrow \infty} \int_{S^{2}(R)}(x \cdot \underline{n}) \omega_{R}^{2}
\end{aligned}
$$

Observation: If $\mathrm{N}=\mathbf{s c}$, then

$$
\int_{\underline{R}^{3}}(\operatorname{div} x) d^{3} x=0
$$

[The terms that might cause trouble are $O^{+}\left(\frac{l}{r^{2}}\right)$ but, before carrying out the integration, they must be multiplied by a function of odd parity.]

Assume next that $\mathrm{N}=1$, hence

$$
x^{l}=q^{i j} q^{k \ell}\left(q_{i k, j}-q_{i j, k}\right) \sqrt{q} .
$$

Write

$$
\begin{aligned}
& \text { - } q^{i j} q^{k \ell} q_{i k, j} \sqrt{q} \\
& =\left(n_{i j}+O\left(\frac{1}{r}\right)\right)\left(n_{k \ell}+O\left(\frac{1}{r}\right)\right) q_{i k, j} \sqrt{q} \\
& =n_{i j} \eta_{k} \ell^{q_{i k}, j} \sqrt{\text { q}}+O\left(\frac{1}{r}\right) q_{i k, j} \sqrt{q}+O\left(\frac{1}{r^{2}}\right) q_{i k, j} \sqrt{q} \\
& =\eta_{i j} \eta_{k} \ell_{i k, j} \sqrt{q}+O\left(\frac{1}{r}\right) O\left(\frac{1}{r^{2}}\right) O(1)+O\left(\frac{1}{r^{2}}\right) O\left(\frac{1}{r^{2}}\right) O(1) \\
& =n_{i j} n_{k} \ell_{i k, j} \sqrt{q}+O\left(\frac{1}{r^{3}}\right)
\end{aligned}
$$

$$
=q_{i l, i} \sqrt{q}+o\left(\frac{1}{r^{3}}\right)
$$

$$
\bullet-q^{i j} q^{k \ell} q_{i j, k} \sqrt{\text { q }}
$$

$$
\begin{gathered}
=-\left(\eta_{i j}+O\left(\frac{1}{r}\right)\right)\left(\eta_{k l}+O\left(\frac{1}{r}\right)\right) q_{i j, k} \sqrt{q} \\
=-\eta_{i j} \eta_{k} \ell_{i j, k} \sqrt{q}+O\left(\frac{1}{r^{3}}\right) \\
=-q_{i i, \ell} \sqrt{q}+O\left(\frac{1}{r^{3}}\right) .
\end{gathered}
$$

The integral of $O\left(\frac{1}{r^{3}}\right)$ over $\underline{S}^{2}(R)$ vanishes in the limit, thus we need only consider

$$
R^{2} \int_{0}^{2 \pi} \int_{0}^{\pi}\left(\cos \theta \sin \phi\left(q_{i l, i}-q_{i i, 1}\right) \circ \imath_{R}\right.
$$

$\left.+\sin \theta \sin \phi\left(q_{i 2, i}-q_{i i, 2}\right) \circ l_{R}+\cos \phi\left(q_{i 3, i}-q_{i i, 3}\right) \circ l_{R}\right) \sqrt{q}{ }^{\circ} l_{R} \sin \phi d \phi d \theta$.
From the definitions,

$$
\begin{aligned}
q_{i \ell, i} & -q_{i i, \ell} \\
& =\partial_{i}\left(\frac{\tilde{\sigma}_{i \ell}}{r}\right)-\partial_{\ell}\left(\frac{\tilde{\sigma}_{i i}}{r}\right)+o\left(\frac{1}{r^{2+\delta}}\right)
\end{aligned}
$$

But

$$
\partial_{i}\left(\frac{\tilde{\sigma}_{i \ell}}{r}\right)-\partial_{\ell}\left(\frac{\tilde{\sigma}_{i i}}{r}\right)
$$

is homogeneous of degree -2, so

$$
r^{2}\left(\partial_{i}\left(\frac{\tilde{\sigma}_{i \ell}}{r}\right)-\partial_{\ell}\left(\frac{\tilde{\sigma}_{i i}}{r}\right)\right)
$$

14. 

is homogeneous of degree 0 and is therefore the radial extension of a function $\mathrm{F}_{\ell} \in \mathrm{C}^{\infty}\left(\underline{\mathrm{S}}^{2}\right)$. Consequently, the dependence on R in the integral

$$
\int_{0}^{2 \pi} \int_{0}^{\pi}\left(\cos \theta \sin \phi F_{1}(\theta, \phi)+\sin \theta \sin \phi F_{2}(\theta, \phi)+\cos \phi F_{3}(\theta, \phi)\right) \sqrt{q^{\circ}} l_{R} \sin \phi d \phi d \theta
$$

resides solely in $\sqrt{q^{\circ}}{ }_{R^{\prime}}$. Since $\sqrt{q}=1+O\left(\frac{l}{r}\right)$, it follows that

$$
\lim _{R \rightarrow \infty} \int_{0}^{2 \pi} \int_{0}^{\pi}(\ldots) \sqrt{q}^{\circ} l_{R} \sin \phi d \phi d \theta
$$

exists, the traditional notation for this being the symbol

$$
\int_{\underline{s}^{2}(\infty)}\left(q_{i \ell, i}-q_{i i, \ell}\right) \Omega_{\infty}^{\ell}
$$

N.B. What the analysis really shows is:

$$
\begin{aligned}
\int_{R^{3}} & \left(q^{i j} q^{k \ell \ell}\left(q_{i k, j}-q_{i j, k}\right) \sqrt{q}\right), \ell^{d^{3} x} \\
& =\lim _{R \rightarrow \infty} \int_{\underline{D}^{3}(R)}\left(q^{i j} q^{k \ell}\left(q_{i k, j}-q_{i j, k}\right) \sqrt{q}\right), \ell^{d^{3} x} \\
& =\lim _{R \rightarrow \infty} \int_{S^{2}(R)}\left(q_{i \ell, i}-q_{i i}, \ell\right) \Omega_{R^{\prime}}^{\ell}
\end{aligned}
$$

where

$$
\Omega_{R}^{\ell}=\frac{x^{\ell}}{R} \omega_{R}^{2}
$$

Definition: The energy is the function

$$
P^{0}: Q_{\infty}+\underline{R}
$$

given by the prescription

$$
P^{0}(q)=\int_{\underline{S}^{2}(\infty)}\left(q_{i \ell, i}-q_{i i, \ell}\right) \Omega_{\infty}^{\ell}
$$

15. 

Example: If for $r \gg 0$,

$$
q_{i j}=n_{i j}+m \frac{x^{i} x^{j}}{r^{3}}(m>0),
$$

then

$$
\mathrm{P}^{0}(\mathrm{q})=8 \mathrm{rm}
$$

[Set $m=1$ and, to facilitate the computation, use $x, y, z$ instead of $x^{1}, x^{2}, x^{3}$.

1. $\partial_{x}\left(\frac{x^{2}}{r^{3}}\right)+\partial_{y}\left(\frac{y x}{r^{3}}\right)+\partial_{z}\left(\frac{z x}{r^{3}}\right)=\frac{x}{r^{3}}$.
2. $\partial_{x}\left(\frac{x y}{r^{3}}\right)+\partial_{y}\left(\frac{y^{2}}{r^{3}}\right)+\partial_{z}\left(\frac{z y}{r^{3}}\right)=\frac{y}{r^{3}}$.
3. $\partial_{\mathrm{x}}\left(\frac{\mathrm{xz}}{\mathrm{r}^{3}}\right)+\partial_{\mathrm{y}}^{\mathrm{y}}\left(\frac{\mathrm{yz}}{\mathrm{r}^{3}}\right)+\partial_{\mathrm{z}}\left(\frac{\mathrm{z}^{2}}{\mathrm{r}^{3}}\right)=\frac{\mathrm{z}}{\mathrm{r}^{3}}$.
4. $\partial_{x}\left(\frac{x^{2}}{r^{3}}+\frac{y^{2}}{r^{3}}+\frac{z^{2}}{r^{3}}\right)=-\frac{x}{r^{3}}$.
5. $\partial_{y}\left(\frac{x^{2}}{r^{3}}+\frac{y^{2}}{r^{3}}+\frac{z^{2}}{r^{3}}\right)=-\frac{y}{r^{3}}$.
6. $\partial_{z}\left(\frac{x^{2}}{r^{3}}+\frac{y^{2}}{r^{3}}+\frac{z^{2}}{r^{3}}\right)=-\frac{z}{r^{3}}$.
=>

$$
\left[\begin{array}{rl}
1-4 & =2 \frac{\mathrm{x}}{\mathrm{r}^{3}} \\
2-5 & =2 \frac{\mathrm{y}}{\mathrm{r}^{3}} \\
3-6 & =2 \frac{\mathrm{z}}{\mathrm{r}^{3}}
\end{array}\right.
$$

Take $\mathrm{R} \gg 0$-- then

$$
\begin{aligned}
& R^{2} \int_{0}^{2 \pi} \int_{0}^{\pi}\left(\cos \theta \sin \phi\left(\frac{2 R \cos \theta \sin \phi}{R^{3}}\right)\right. \\
& \left.+\sin \theta \sin \phi\left(\frac{2 R \sin \theta \sin \phi}{R^{3}}\right)+\cos \phi\left(\frac{2 R \cos \phi}{R^{3}}\right)\right) \sin \phi d \phi d \theta \\
& =2 \int_{0}^{2 \pi} \int_{0}^{\pi}\left((\cos \theta \sin \phi)^{2}+(\sin \theta \sin \phi)^{2}+\cos ^{2} \phi\right) \sin \phi d \phi d \theta \\
& =2 \int_{0}^{2 \pi}\left(\int_{0}^{\pi} \sin \phi d \phi\right) d \theta \\
& =8 \pi \cdot]
\end{aligned}
$$

LEMMA We have

$$
\begin{aligned}
& \left.\frac{d}{d \varepsilon} P^{0}(q+\varepsilon \delta q)\right|_{\varepsilon=0} \\
& =\int_{\underline{R}^{3}} \delta_{q}\left(d t r_{q}(\delta q)-\operatorname{div}_{q} \delta q\right) \sqrt{q} d^{3} x
\end{aligned}
$$

Suppose now that $\mathrm{N}=\mathrm{x}^{\mathrm{b}}-$ then

$$
\begin{gathered}
x^{\ell}=x^{b} q^{i j} q^{k \ell}\left(q_{i k, j}-q_{i j, k}\right) \sqrt{q} \\
+\delta_{k}^{b} q^{i j} q^{k \ell}\left(q_{i j}-\eta_{i j}\right) \sqrt{q}-\delta_{j}^{b} q^{i j} q^{k \ell}\left(q_{i k}-\eta_{i k}\right) \sqrt{q} \\
=x^{b} q^{i j} q^{k \ell}\left(q_{i k, j}-q_{i j, k}\right) \sqrt{q} \\
+q^{i j} q^{b \ell}\left(q_{i j}-n_{i j}\right) \sqrt{q}-q^{i b} q^{k \ell}\left(q_{i k}-\eta_{i k}\right) \sqrt{q} .
\end{gathered}
$$

Unfortunately, for arbitrary $q$, the integral

$$
\int_{\mathbb{R}^{3}}(\operatorname{div} x) d^{3} x
$$

is divergent. However, if $q$ is suitably restricted, then, as we shall see, convergence is guaranteed.

Definition: Let $q \in Q_{\infty}$ - then $q$ is said to satisfy condition * if for $r \gg 0$,

$$
q_{i j}(x)=\eta_{i j}+\frac{1}{r} \sigma_{i j}\left(\frac{x}{r}\right)+\frac{1}{r^{2}} \sigma_{i j}^{*}\left(\frac{x}{r}\right)+\mu_{i j}(x)
$$

where $\sigma_{i j}, \sigma_{i j}^{*} \in C^{\infty}\left(\underline{S}^{2}\right), \sigma_{i j}$ is of even parity, and

$$
\mu_{i j}=0^{\infty}\left(\frac{1}{r^{2+\delta}}\right) \quad(0<\delta \leq 1) .
$$

[Note: Here it is understood that

$$
\sigma_{i j}=\sigma_{j i}, \sigma_{i j}^{*}=\sigma_{j i}^{*}, \mu_{i j}=\mu_{j i}
$$

Observe too that

$$
\partial_{k}\left(\frac{1}{r} \tilde{\sigma}_{i j}\right)
$$

is odd and homogeneous of degree -2 while

$$
\partial_{k}\left(\frac{1}{r^{2}} \tilde{\sigma}_{i j}^{*}\right)
$$

is homogeneous of degree -3 ( $\tilde{\sigma}_{i j}^{*}$ is not subject to a parity assumption).]
Notation: $Q_{\infty}^{*}$ is the subset of $Q_{\infty}$ consisting of those $q$ which satisfy condition \#.

Remark: Let $q \in Q_{\infty}^{*}-$ then for $r \gg 0$,

$$
q^{i j}(x)=\eta_{i j}-\frac{1}{r} \sigma_{i j}\left(\frac{x}{r}\right)-\frac{1}{r^{2}} \sigma_{i j}^{*}\left(\frac{x}{r}\right)+o\left(\frac{1}{r^{2+\delta}}\right) .
$$

LEMMA $\forall \mathrm{q}_{\mathrm{Q}}^{\mathrm{o}} \mathrm{Q}^{*}$, the integral

$$
\int_{\mathbb{R}^{3}}(\operatorname{div} x) d^{3} x
$$

is convergent.

It will be enough to consider

$$
\text { I: } \quad x^{b} q^{i j} q^{k l} q_{i k, j} \sqrt{q}
$$

and
II: $\quad q^{i j} q^{b l}\left(q_{i j}-\eta_{i j}\right) \sqrt{q}$.
As usual, pass from $\underline{D}^{3}(R)$ to $\underline{S}^{2}(R)$.
Ad I: Write

$$
\begin{aligned}
& x^{b} q^{i j} q^{k} \ell_{q_{i k}, j} \sqrt{q} \\
& =x^{b}\left(\eta_{i j}-\frac{1}{r} \tilde{\sigma}_{i j}-\frac{1}{r^{2}} \tilde{\sigma}_{i j}^{*}+O\left(\frac{1}{r^{2+\delta}}\right)\right) \\
& \quad \times\left(\eta_{k \ell}-\frac{1}{r} \tilde{\sigma}_{k \ell}-\frac{1}{r^{2}} \tilde{\sigma}_{k \ell}^{*}+O\left(\frac{1}{r^{2+\delta}}\right)\right) \\
& \quad \times\left(\partial_{j}\left(\frac{1}{r} \tilde{\sigma}_{i k}\right)+\partial_{j}\left(\frac{1}{r^{2}} \tilde{\sigma}_{i k}^{*}\right)+\partial_{j} \mu_{i k}\right) \sqrt{q}
\end{aligned}
$$

When expanded, there is a total of 48 terms but not all of them need be considered
individually provided we first do some judicious regrouping. To this end, start by writing

$$
\begin{aligned}
x^{b}\left(n_{i j}\right. & \left.-\frac{1}{r} \tilde{\sigma}_{i j}-\frac{1}{r^{2}} \tilde{\sigma}_{i j}^{*}+O\left(\frac{1}{r^{2+\delta}}\right)\right) \\
& =x^{b} \eta_{i j}-\frac{x^{b}}{r} \tilde{\sigma}_{i j}+O\left(\frac{1}{r}\right)
\end{aligned}
$$

and

$$
\partial_{j}\left(\frac{1}{r} \tilde{\sigma}_{i k}\right)+\partial_{j}\left(\frac{1}{r^{2}} \tilde{\sigma}_{i k}^{*}\right)+\partial_{j} \mu_{i k}=O\left(\frac{1}{r^{2}}\right)
$$

Then

$$
\begin{aligned}
& O\left(\frac{1}{r}\right)\left(\eta_{k \ell}-\frac{1}{r} \tilde{\sigma}_{k \ell}-\frac{1}{r^{2}} \tilde{\sigma}_{k \ell}^{*}+O\left(\frac{1}{r^{2+\delta}}\right)\right) O\left(\frac{1}{r^{2}}\right) \sqrt{q} \\
& =O\left(\frac{1}{r^{3}}\right) \\
& 0 x^{b} \eta_{i j}\left(\eta_{k \ell}-\frac{1}{r} \tilde{\sigma}_{k \ell}-\frac{1}{r^{2}} \tilde{\sigma}_{k \ell}^{*}+O\left(\frac{1}{r^{2+\delta}}\right)\right) O\left(\frac{1}{r^{2}}\right) \sqrt{q} \\
& =x^{b} \eta_{i j}\left(\eta_{k \ell}-\frac{1}{r} \tilde{\sigma}_{k \ell}\right) O\left(\frac{1}{r^{2}}\right) \sqrt{q}+O\left(\frac{1}{r^{3}}\right) \\
& -\frac{x^{b}}{r} \tilde{\sigma}_{i j}\left(\eta_{k \ell}-\frac{1}{r} \tilde{\sigma}_{k \ell}-\frac{1}{r^{2}} \tilde{\sigma}_{k \ell}^{*}+O\left(\frac{1}{r^{2+\sigma}}\right)\right) O\left(\frac{1}{r^{2}}\right) \sqrt{q} \\
& =-\frac{x^{b}}{r} \tilde{\sigma}_{i j} \eta_{k \ell} O\left(\frac{1}{r^{2}}\right) \sqrt{q}+O\left(\frac{1}{r^{3}}\right) .
\end{aligned}
$$

Bearing in mind that

$$
O\left(\frac{1}{r^{2}}\right)=\partial_{j}\left(\frac{1}{r} \tilde{\sigma}_{i k}\right)+\partial_{j}\left(\frac{1}{r^{2}} \tilde{\sigma}_{i k}^{*}\right)+\partial_{j} \mu_{i k^{\prime}}
$$

there remains

1. $x^{b} \eta_{i j} \eta_{k} \ell_{j}\left(\frac{l}{r} \tilde{\sigma}_{i k}\right) \sqrt{q}$
2. $x^{b} \eta_{i j} \eta_{k l}{ }_{j}\left(\frac{1}{r^{2}} \tilde{\sigma}_{i k}^{*}\right) \sqrt{q}$
3. $x^{b} \eta_{i j} \eta_{k} \ell^{\partial}{ }_{j}{ }_{i k} \sqrt{q}$
4. $-x^{b} \eta_{i j}\left(\frac{1}{r} \tilde{\sigma}_{k \ell}\right) \partial_{j}\left(\frac{1}{r} \tilde{\sigma}_{i k}\right) \sqrt{q}$
5. $-x^{b} \eta_{i j}\left(\frac{1}{r} \tilde{\sigma}_{k \ell}\right) \partial_{j}\left(\frac{1}{r^{2}} \tilde{\sigma}_{i k}^{*}\right) \sqrt{q}$
6. $-x^{b} \eta_{i j}\left(\frac{1}{r} \tilde{\sigma}_{k \ell}\right) a_{j} \mu_{i k} \sqrt{q}$
7. $-\frac{x^{b}}{r} \tilde{\sigma}_{i j} \eta_{k} \ell_{j}\left(\frac{1}{r} \tilde{\sigma}_{i k}\right) \sqrt{q}$
8. $-\frac{x^{b}}{r} \tilde{\sigma}_{i j} \eta_{k l} \partial_{j}\left(\frac{1}{r^{2}} \tilde{\sigma}_{i k}^{*}\right) \sqrt{q}$
9. $-\frac{x^{b}}{r} \tilde{\sigma}_{i j} \eta_{k} \ell^{\partial}{ }_{j}{ }_{i k} \sqrt{q}$.

Since $\sqrt{q}=O(1)$ and

$$
\partial_{j} \mu_{i k}=o\left(\frac{l}{r^{3+\delta}}\right)
$$

Items 3, 6, and 9 are, respectively,

$$
O\left(\frac{1}{r^{2+\delta}}\right), O\left(\frac{1}{r^{3+\delta}}\right), O\left(\frac{1}{r^{3+\delta}}\right) .
$$

Rappel:

$$
\sqrt{q}=1+O^{+}\left(\frac{1}{r}\right)+O\left(\frac{1}{r^{1+\delta}}\right) .
$$

Item 1:

$$
x^{b} \eta_{i j} \eta_{k \ell} \partial_{j}\left(\frac{1}{r} \tilde{\sigma}_{i k}\right) \sqrt{q}
$$

$$
\begin{aligned}
& =0^{+}\left(\frac{1}{r}\right) \sqrt{q} \\
& =0^{+}\left(\frac{1}{r}\right)+0^{+}\left(\frac{1}{r^{2}}\right)+O\left(\frac{1}{r^{2+\delta}}\right) .
\end{aligned}
$$

Item 2:

$$
\begin{aligned}
& x^{b} \eta_{i j} \eta_{k l} \partial_{j}\left(\frac{l}{r^{2}} \tilde{\sigma}_{i k}^{*}\right) \sqrt{q} \\
& \quad=x^{b} \eta_{i j} \eta_{k l} \frac{1}{r^{3}}\left(r^{3} \partial_{j}\left(\frac{1}{r^{2}} \tilde{\sigma}_{i k}^{*}\right)\right) \sqrt{q} \\
& \quad=x^{b} \eta_{i j} \eta_{k l} \frac{l}{r^{3}}\left(r^{3} \partial_{j}\left(\frac{1}{r^{2}} \tilde{\sigma}_{i k}^{*}\right)\right)+O\left(\frac{1}{r^{3}}\right)
\end{aligned}
$$

Item 4:

$$
\begin{aligned}
& -x^{b} \eta_{i j}\left(\frac{1}{r} \tilde{\sigma}_{k \ell}\right) \partial_{j}\left(\frac{1}{r} \tilde{\sigma}_{i k}\right) \sqrt{q} \\
& \quad=o^{+}\left(\frac{1}{r^{2}}\right) \sqrt{q} \\
& \quad=o^{+}\left(\frac{1}{r^{2}}\right)+O\left(\frac{1}{r^{3}}\right)
\end{aligned}
$$

Item 5:

$$
\begin{aligned}
& -x^{b} \eta_{i j}\left(\frac{l}{r} \tilde{\sigma}_{k \ell}\right) \partial_{j}\left(\frac{l}{r^{2}} \tilde{\sigma}_{i k}^{*}\right) \sqrt{q} \\
& \quad=O\left(\frac{1}{r^{3}}\right)
\end{aligned}
$$

Item 7:

$$
-\frac{x^{b}}{r} \tilde{\sigma}_{i j} \eta_{k} l^{\partial_{j}}\left(\frac{l}{r} \tilde{\sigma}_{i k}\right) \sqrt{q}
$$

$$
\begin{aligned}
& =0^{+}\left(\frac{1}{r^{2}}\right) \sqrt{q} \\
& =O^{+}\left(\frac{1}{r^{2}}\right)+O\left(\frac{1}{r^{3}}\right) .
\end{aligned}
$$

Item 8:

$$
\begin{aligned}
& -\frac{x^{b}}{r} \tilde{\sigma}_{i j} \eta_{k l} \partial_{j}\left(\frac{1}{r^{2}} \tilde{\sigma}_{i k}^{*}\right) \sqrt{q} \\
& \quad=O\left(\frac{1}{r^{3}}\right) .
\end{aligned}
$$

On the basis of the foregoing, it is clear that only Item 2 has the potential to make a finite nonzero contribution to

$$
\int_{\underline{R}^{3}}(\text { div } x) d^{3} x .
$$

Ad II: Write

$$
\begin{aligned}
& \quad q^{i j} q^{b l}\left(q_{i j}-\eta_{i j}\right) \sqrt{q} \\
& =\left(\eta_{i j}-\frac{1}{r} \tilde{\sigma}_{i j}-\frac{1}{r^{2}} \tilde{\sigma}_{i j}^{*}+O\left(\frac{1}{r^{2+\delta}}\right)\right) \\
& \times\left(\eta_{b l}-\frac{1}{r} \tilde{\sigma}_{b l}-\frac{1}{r^{2}} \tilde{\sigma}_{b l}^{*}+O\left(\frac{1}{r^{2+\delta}}\right)\right) \\
& \times\left(\frac{1}{r} \tilde{\sigma}_{i j}+\frac{1}{r^{2}} \tilde{\sigma}_{i j}^{*}+\mu_{i j}\right) \sqrt{q} \\
& \quad=\left(\eta_{i j}-\frac{1}{r} \tilde{\sigma}_{i j}+O\left(\frac{1}{r}\right)\right) \\
& \times\left(\eta_{b l}-\frac{1}{r} \tilde{\sigma}_{b l}+O\left(\frac{1}{r^{2}}\right)\right)
\end{aligned}
$$

$$
\begin{aligned}
& \times\left(\frac{1}{r} \tilde{\sigma}_{i j}+\frac{1}{r^{2}} \tilde{\sigma}_{i j}^{*}+o\left(\frac{1}{r^{2+\delta}}\right)\right) \sqrt{q} \\
= & \left(\eta_{i j} n_{b l}-\eta_{i j} \frac{1}{r} \tilde{\sigma}_{b \ell}-\eta_{b \ell} \frac{1}{r} \tilde{\sigma}_{i j}+o\left(\frac{1}{r^{2}}\right)\right) \\
& \times\left(\frac{1}{r} \tilde{\sigma}_{i j}+\frac{1}{r^{2}} \tilde{\sigma}_{i j}^{*}+o\left(\frac{1}{r^{2+\delta}}\right)\right) \sqrt{q} .
\end{aligned}
$$

The relevant terms are then:

1. $\eta_{i j} \eta_{b \ell} \frac{1}{r} \widetilde{\sigma}_{i j} \sqrt{q}$
2. $\eta_{i j} \eta_{b \ell} \frac{1}{r^{2}} \tilde{\sigma}_{i j}^{*} \sqrt{q}$
3. $-\eta_{i j} \frac{1}{r^{2}} \tilde{\sigma}_{b l} \tilde{\sigma}_{i j} \sqrt{q}$
4. $-\eta_{b l} \frac{1}{r^{2}} \tilde{\sigma}_{i j} \tilde{\sigma}_{i j} \sqrt{\mathrm{q}}$.

And of these, only Item 2 is germane in that it might make a finite nonzero contribution to

$$
\int_{\underline{R}^{3}}(\operatorname{div} X) d^{3} x
$$

Definition: The center of mass $J^{0}$ is the triple

$$
\left(J^{01}, J^{02}, J^{03}\right),
$$

where for $b=1,2,3$,

$$
J^{0 b}: Q_{\infty}^{*} \rightarrow \underline{R}
$$

sends $q$ to

$$
\int_{\underline{s}^{2}(\infty)}\left(x^{b} q^{i j} q^{k \ell}\left(q_{i k, j}-q_{i j, k}\right)\right.
$$

$$
\left.+q^{i j} q^{b \ell}\left(q_{i j}-n_{i j}\right)-q^{i b} q^{k \ell}\left(q_{i k}-\eta_{i k}\right)\right) \Omega_{\infty}^{\ell}
$$

Exercise: Compute $J^{0 \mathrm{~b}}(\mathrm{q})$, where for $r \gg 0$,

$$
q_{i j}=\eta_{i j}+m \frac{x^{i} x^{j}}{r^{3}}(m>0)
$$

N.B. Let $N=A+B x^{b}+s c-$ then for arbitrary $q \in Q_{\infty^{\prime}}$ the preceding investigation isolates the potentially divergent part of

$$
\int_{\underline{R}^{3}}-N S(q) \sqrt{q} d^{3} x
$$

as a limit of surface integrals, namely

$$
\begin{gathered}
\int_{\underline{s}^{2}(\infty)}\left(-N q^{i j} q^{k \ell}\left(q_{i k, j}-q_{i j, k}\right)\right. \\
\left.+N_{, j} q^{i j} q^{k \ell}\left(q_{i k}-n_{i k}\right)-N_{, k} q^{i j} q^{k \ell}\left(q_{i j}-\eta_{i j}\right)\right) \Omega_{\infty}^{\ell} .
\end{gathered}
$$

Scholium: On $\mathrm{Con}_{\mathrm{H}}$ (hence too on $\mathrm{Con}_{\mathrm{Q}_{\infty}}$ ),

$$
\begin{aligned}
& \int_{\underline{S}^{2}(\infty)}\left(-N q^{i j} q^{k \ell}\left(q_{i k, j}-q_{i j, k}\right)\right. \\
& \left.+N_{, j} q^{i j} q^{k \ell}\left(q_{i k}-\eta_{i k}\right)-N_{, k} q^{i j} q^{k \ell}\left(q_{i j}-\eta_{i j}\right)\right) \Omega_{\infty}^{\ell}
\end{aligned}
$$

is finite.
[If $(\mathrm{q}, \Lambda) \in \mathrm{Con}_{\mathrm{H}}$, then

$$
N S(q)=N[s, s] q-\frac{N}{2} \operatorname{tr}_{q}(s)^{2}
$$

And, as we have seen earlier, the integrals

$$
\left[\begin{array}{l}
\int_{\underline{R}^{3}} N[s, s] \\
\int_{q^{3}} \sqrt{q} d^{3} x \\
\int_{R^{3}}-\frac{N}{2} \operatorname{tr}_{q}(s)^{2} \sqrt{q} d^{3} x
\end{array}\right.
$$

are convergent, thus the same is true of

$$
\left.\int_{\underline{R}^{3}}-\mathrm{NS}(\mathrm{q}) \sqrt{\mathrm{q}} \mathrm{~d}^{3} \mathrm{x} .\right]
$$

Recall now that

$$
\begin{aligned}
& \int_{\underline{R}^{3}} N\left[\Delta_{q} \operatorname{tr}_{q}(\delta q)+\delta_{q} \operatorname{div}_{q} \delta q\right] \sqrt{q} d^{3} x \\
& =\int_{\underline{R}^{3}}-\left[H_{N}-\left(\Delta_{q} N\right) q, \delta q\right] q^{\sqrt{q} d^{3} x} \\
& +\int_{\underline{R}^{3}}-\delta_{q}\left(N\left(\operatorname{dtr}_{q}(\delta q)-\operatorname{div}_{q} \delta q\right)\right) \sqrt{q} d^{3} x \\
& +\delta_{\underline{R}^{3}}-\delta_{q}\left(d N \cdot \delta q-\operatorname{tr}_{q}(\delta q) d N\right) \sqrt{q} d^{3} x .
\end{aligned}
$$

But

$$
\begin{aligned}
& N\left[\Delta_{q} \operatorname{tr}_{q}(\delta q)+\delta_{q} \operatorname{div}_{q} \delta q\right] \\
& =-N q^{i j} q^{k \ell}\left(\delta q_{i k ; j ; \ell}-\delta q_{i j ; k ; \ell}\right) \\
& \text { => } \\
& \int_{\underline{R}^{3}} N\left[\Delta_{q} \operatorname{tr}_{q}(\delta q)+\delta_{q} \operatorname{div}_{q} \delta q\right] \sqrt{q} d^{3} x \\
& =\int_{\mathrm{R}^{3}}-\left[\mathrm{H}_{\mathrm{N}}-\left(\Delta_{\mathrm{q}} \mathrm{~N}\right) \mathrm{q}, \delta \mathrm{q}\right] \mathrm{q}^{\sqrt{\mathrm{q}} \mathrm{~d}^{3} \mathrm{x}} \\
& +\int_{\underline{S}^{2}(\infty)}-\operatorname{Nq}^{i j} q^{k \ell}\left(\delta q_{i k ; j}-\delta q_{i j ; k}\right) \Omega_{\infty}^{\ell} \\
& +\int_{\underline{S}^{2}(\infty)}{ }^{N} ; \ell q^{i j} q^{k \ell} \delta q_{i k} \Omega_{\infty}^{j}-\int_{\underline{S}^{2}(\infty)}{ }^{N} ; \ell^{q^{i j}} q^{k \ell} \delta q_{i j} \Omega_{\infty}^{k} .
\end{aligned}
$$

And (see below)

$$
\begin{aligned}
& \text { - } \int_{\underline{S}^{2}(\infty)}-N q^{i j} q^{k \ell}\left(\delta q_{i k ; j}-\delta q_{i j ; k^{\prime}}\right) \Omega_{\infty}^{\ell} \\
& =\int_{\underline{R}^{3}}-\delta_{q}\left(N\left(d t r_{q}(\delta q)-\operatorname{div}_{q} \delta q\right)\right) \sqrt{q} d^{3} x .
\end{aligned}
$$

$$
\begin{aligned}
& =\int_{\underline{R}^{3}}-\delta q\left(d N \cdot \delta q-\operatorname{tr}_{q}(\delta q) d N\right) \sqrt{q} d^{3} x .
\end{aligned}
$$

[Note:

- Formally, the variation of

$$
\int_{\underline{S}^{2}(\infty)}-N q^{i j} q^{k \ell}\left(q_{i k, j}-q_{i j, k}\right) \Omega_{\infty}^{\ell}
$$

is equal to

$$
\delta_{\underline{s}_{(\infty)}^{2}}-N q^{i j} q^{k \ell}\left(\delta q_{i k ; j}-\delta q_{i j ; k}\right) \Omega_{\infty}^{\ell}
$$

- Formally, the variation of

$$
\mathcal{S}_{\underline{S}}{ }_{(\infty)}\left(N_{, j} q^{i j} q^{k \ell}\left(q_{i k}-\eta_{i k}\right)-N_{, k} q^{i j} q^{k \ell}\left(q_{i j}-n_{i j}\right)\right) \Omega_{\infty}^{\ell}
$$

is equal to

$$
\int_{\underline{S}_{(\infty)}^{2}} ; \ell^{q^{i j} q^{k \ell} \delta q_{i k} \Omega_{\infty}^{j}-\int_{\underline{S}^{2}(\infty)} ; \ell^{q^{i j} q^{k \ell}} \delta q_{i j} \Omega_{\infty}^{\left.\Omega_{\infty}\right]}}
$$

Details While the integrals may very well be infinite, let us manipulate them as if they were finite. So, for example,

$$
\int_{\underline{S}^{2}(\infty)} N q^{i j} q^{k \ell}\left(\delta q_{i k ; j}-\delta q_{i j ; k}\right) \Omega_{\infty}^{\ell}
$$

$$
\begin{aligned}
& =\int_{\underline{R}^{3}}\left(N q^{i j} q^{k \ell}\left(\delta q_{i k ; j}-\delta q_{i j ; k}\right) \sqrt{q}\right), \ell^{d^{3} x} \\
& =\int_{\underline{R}^{3}}\left(\sqrt{q} N\left(q^{l k_{\nabla}} \delta q_{k}^{j}-q^{l k_{\nabla_{k}}}\left(q^{i j} \delta q_{i j}\right)\right)\right), \ell^{d^{3} x} \\
& =\int_{\underline{R}^{3}} \frac{1}{\sqrt{q}}\left(\sqrt{q} N q^{l k}\left(\left(\operatorname{div}_{q} \delta q\right)_{k}-\left(\operatorname{dtr}_{q}(\delta q)\right)_{k}\right)\right), \ell^{\sqrt{q} d^{3} x} \\
& =\int_{\underline{R}^{3}}-\frac{1}{\sqrt{q}}\left(\sqrt{q} N q^{l k}\left(\left(\operatorname{dtr}_{q}(\delta q)\right)_{k}-\left(\operatorname{div}_{q} \delta q\right)_{k}\right)\right), \ell^{\sqrt{q} d^{3} x} \\
& =\int_{R^{R}} \delta \delta_{q}\left(N\left(d t r_{q}(\delta q)-\operatorname{div}_{q} \delta q\right)\right) \sqrt{q} d^{3} x .
\end{aligned}
$$

LEMMA Suppose that $N=A+\mathrm{Bx}^{\mathrm{b}}+\mathrm{sc}$ - then $\forall \mathrm{qE} \mathrm{Q}_{\infty}$, the integral

$$
\int_{\underline{R}^{3}} N q\left[{ }_{2}^{0}\right](\operatorname{Ein}(q), \delta q) \sqrt{q} d^{3} x
$$

is convergent.
[The case when $N=A+$ sc was dispatched in the last section, thus it suffices to take $N=x^{b}$. Write

$$
\begin{gathered}
\operatorname{Nq}\left[\left[_{2}^{0}\right](\operatorname{Ein}(q), \delta q) \sqrt{q}\right. \\
=x^{b} \operatorname{Ein}(q)_{i j}(\delta q)^{i j} \sqrt{q} \\
=x^{b} \operatorname{Ein}(q)_{i j} q^{i k_{q} j^{\ell}(\delta q)_{k \ell} \sqrt{q}} \\
=x^{b}\left(O^{+}\left(\frac{1}{r^{3}}\right)+O\left(\frac{1}{r^{3+\delta}}\right)\right)\left(\eta_{i k}+O\left(\frac{l}{r}\right)\right)\left(\eta_{j \ell}+O\left(\frac{l}{r}\right)\right) \\
\times\left(O^{+}\left(\frac{1}{r}\right)+O\left(\frac{1}{r^{1+\delta}}\right)\right)\left(1+O\left(\frac{1}{r}\right)\right)
\end{gathered}
$$

28. 

$$
\begin{aligned}
& =x^{b}\left(O^{+}\left(\frac{1}{r^{3}}\right)+O\left(\frac{1}{r^{3+\delta}}\right)\right)\left(O^{+}\left(\frac{1}{r}\right)+O\left(\frac{1}{r^{1+\delta}}\right)\right)\left(C+O\left(\frac{1}{r}\right)\right) \\
& =\left(O^{-}\left(\frac{1}{r^{2}}\right)+O\left(\frac{1}{r^{2+\delta}}\right)\right)\left(O^{+}\left(\frac{1}{r}\right)+O\left(\frac{1}{r^{1+\delta}}\right)\right)\left(C+O\left(\frac{1}{r}\right)\right) \\
& \quad=\left(O^{-}\left(\frac{1}{r^{3}}\right)+O\left(\frac{1}{r^{3+\delta}}\right)\right)\left(C+O\left(\frac{1}{r}\right)\right) \\
& \quad=O^{-}\left(\frac{1}{r^{3}}\right)+\text { ho.] }
\end{aligned}
$$

Section 64: The Integrals of Motion-Linear and Angular Momentum
The assumptions and notation are those of Section 62.
Rappel: If $\bar{N}$ satisfies the standard conditions, then the integral

$$
\int_{\underline{R}^{3}}-2 \operatorname{div}_{q} \Lambda(\vec{N})
$$

defining $H_{D}(\vec{N})$ is convergent and equals

$$
\int_{\mathbb{R}^{3}} \Lambda\left(\mathrm{~L}_{\overrightarrow{\mathrm{N}}}^{\mathrm{q}}\right) .
$$

[Note: Recall that the boundary term implicit in this relation necessarily vanishes.]

Suppose now that

$$
\vec{N}=\vec{A}+\overrightarrow{B r}+\overrightarrow{s C} .
$$

Here

$$
\vec{A} \in \underline{R}^{3}, B \in \underline{S O} \text { (3), }
$$

and $\overrightarrow{S C}$ stands for a vector field satisfying the standard conditions, so

$$
N^{i}(x)=A^{i}+\sum_{j=1}^{3} B^{i}{ }_{j} x^{j}+\psi^{i}\left(\frac{x}{r}\right)+O^{\infty}\left(\frac{1}{r^{\varepsilon}}\right),
$$

where $A^{i}, B_{j}^{i}\left(=-B_{i}^{j}\right)$ are constants, $\psi^{i}$ is a $C^{\infty}$ function on $\underline{S}^{2}$ of odd parity, and $\varepsilon>0$.

Problem: Determine whether the integral defining $H_{D}(\vec{N})$ is convergent or not. To isolate the issues, drop the standard conditions and assume only that $\vec{N}=\vec{A}+B \overrightarrow{B r}$.

On formal grounds,

$$
\int_{\underline{R}^{3}}-2 \operatorname{div}_{q} \Lambda(\vec{N})+2 \int_{\underline{R}^{3}} \nabla_{j}\left(N_{i} s^{i j}\right) \sqrt{q} d^{3} x
$$

$$
=\int_{\mathbb{R}^{3}} \Lambda\left(L_{\overline{\mathrm{N}}} \mathrm{q}\right)
$$

LEMMA The integral

$$
\int_{\underline{R}^{3}} \Lambda\left(L_{\vec{N}} q\right)
$$

is convergent.
[We have

$$
\begin{aligned}
& \int_{\underline{R}^{3}} \Lambda\left(L_{\vec{N}} \mathrm{~N}^{\mathrm{q}}\right)=\int_{\underline{R}^{3}} \mathrm{~s}^{\#}(\underset{\vec{N}}{\mathrm{~L}} \mathrm{q}) \sqrt{\mathrm{q}} \mathrm{~d}^{3} \mathrm{x} \\
& =\int_{\underline{R}^{3}} s^{i j}\left(N_{i ; j}+N_{j ; i}\right) \sqrt{q} d^{3} x \\
& =\int_{\underline{R}^{3}} \lambda^{i j}\left(\nabla_{j} q_{i k}{ }^{N^{k}}+\nabla_{i} q_{j k}{ }^{N^{k}}\right) d^{3} x \\
& =\int_{\underline{R}^{3}} \lambda^{i j}\left(q_{i k} \nabla_{j} N^{k}+q_{j k} \nabla_{i} N^{k}\right) d^{3} x \\
& =\int_{\underline{R}^{3}} \lambda^{i j}\left(q_{i k}{ }^{\partial}{ }_{j} N^{k}+q_{j k}{ }^{\partial} i N^{k}\right) d^{3} x \\
& +\int_{\underline{R}^{3}} \lambda^{i j}\left(q_{i k}{ }^{r^{k}}{ }_{j \ell^{N^{l}}}+q_{j k}{ }^{K}{ }_{i} \ell^{N^{l}}\right) d^{3} x .
\end{aligned}
$$

Then

- $\lambda^{i j}\left(q_{i k} \partial_{j} \mathrm{~N}^{k}+q_{j k} \partial_{i} \mathrm{~N}^{k}\right)$

$$
=\lambda^{i j}\left(q_{i k}{ }^{k}{ }_{j}+q_{j k}{ }^{k}{ }_{i}\right)
$$

3. 

$$
\begin{aligned}
& =\lambda^{i j} q_{i k}{ }^{k}{ }_{j}+\lambda^{i j} q_{j k} B_{i}^{k} \\
& =2 \lambda^{i j} q_{i k} B_{j}{ }_{j}
\end{aligned}
$$

And

$$
\begin{aligned}
& \lambda^{i j}{\underset{q}{i k}}{ }^{k}{ }_{j} \\
& =\left(\frac{1}{r^{2}} \tilde{\tau}^{i j}+\nu^{i j}\right)\left(\eta_{i k}+\frac{1}{r} \tilde{\sigma}_{i k}+\mu_{i k}\right) B_{j}^{k} \\
& =\left(\frac{1}{r^{2}} \tilde{\tau}^{i j}+\nu^{i j}\right) \eta_{i k} B_{j}^{k}+\frac{1}{r^{3}} \tilde{\tau}^{i j} \tilde{\sigma}_{i k} B_{j}^{k}+\frac{1}{r} \nu^{i j} \tilde{\sigma}_{i k} B^{k}{ }_{j} \\
& +\left(\frac{1}{r^{2}} \tilde{\tau}^{i j}+v^{i j}\right) \mu_{i k} B_{j}^{k} \\
& =\left(\frac{1}{r^{2}} \tilde{\tau}^{i j}+v^{i j}\right) \eta_{i k^{B}}{ }^{k}{ }_{j}+O^{-}\left(\frac{1}{r^{3}}\right)+\text { ho. }
\end{aligned}
$$

But

$$
\begin{aligned}
&\left(\frac{1}{r^{2}}\right.\left.\tilde{\tau}^{i j}+v^{i j}\right) n_{i k} B_{j}^{k} \\
&=\left(\frac{1}{r^{2}} \tilde{\tau}^{i j}+v^{i j}\right) B_{j}^{i} \\
& \quad=-\left(\frac{1}{r^{2}} \tilde{\tau}^{i j}+v^{i j}\right) B_{i}^{j} \\
& \quad=-\left(\frac{1}{r^{2}} \tilde{\tau}^{j i}+\nu^{j i}\right) B_{i}^{j} \\
& \quad=-\left(\frac{1}{r^{2}} \tilde{\tau}^{i j}+v^{i j}\right) B_{j}^{i}
\end{aligned}
$$

4. 

$$
\begin{aligned}
& \Rightarrow \\
& \quad\left(\frac{1}{r^{2}} \tilde{\tau}^{i j j}+v^{i j}\right) \eta_{i k} B^{k} j=0 . ~
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& \lambda^{i j}{ }_{q_{i k}}{ }^{k}{ }_{j}=0^{-}\left(\frac{1}{r^{3}}\right)+h o . \\
& \text { - } \lambda^{i j}\left(q_{i k} \Gamma^{k}{ }_{j \ell^{N}}{ }^{\ell}+q_{j k} \Gamma^{k}{ }_{i \ell^{N^{l}}}\right) \\
& =\lambda^{i j} q_{i k} \Gamma_{j \ell^{k}}{ }^{\ell}+\lambda^{i j} q_{j k} \Gamma_{i \ell^{N}}{ }^{\ell} \\
& =2 \lambda^{i j} q_{i k}{ }^{\Gamma^{k}}{ }_{j \ell^{N}}{ }^{\ell} \\
& =2 \lambda^{i j} q_{i k} \Gamma_{j \ell}{ }^{k}\left(A^{\ell}+B_{\ell}^{\ell}{ }^{\prime} x^{\ell^{\prime}}\right) \\
& =O\left(\frac{1}{r^{4}}\right)+\lambda^{i j} \underline{q}_{i k} \Gamma^{k}{ }_{j} \ell^{O^{-}}(r) .
\end{aligned}
$$

And

$$
\begin{aligned}
& \lambda^{i j} q_{i k^{\Gamma}}{ }_{j \ell^{O^{-}}(r)} \\
& =\left(O^{-}\left(\frac{1}{r^{2}}\right)+O\left(\frac{1}{r^{2+\delta}}\right)\right)\left(\eta_{i k}+O\left(\frac{1}{r}\right)\right)\left(O^{-}\left(\frac{1}{r^{2}}\right)+O\left(\frac{1}{r^{2+\delta}}\right)\right) O^{-}(r) \\
& =O^{-}\left(\frac{1}{r^{3}}\right)+\text { ho.] }
\end{aligned}
$$

Application: Let $\vec{N}=\vec{A}+\overrightarrow{\mathrm{Br}}-$ then the sum

$$
\int_{\underline{R}^{3}}-2 \operatorname{div}_{q} \Lambda(\vec{N})+2 \int_{\underline{R}^{3}} \nabla_{j}\left(N_{i} s^{i j}\right) \sqrt{q} d^{3} x
$$

is convergent.
5.
[Note: It is not claimed that the individual constituents are convergent.]
N.B. We have

$$
\begin{aligned}
& \frac{d}{d \varepsilon}\left[\int_{\underline{R}^{3}} \Lambda\left(L_{\vec{N}}(q+\varepsilon \delta q)\right)\right] \\
= & -\int_{\mathbb{R}^{3}}\left(L_{\vec{N}} \Lambda\right)(\delta q)+\int_{\underline{R}^{3}} \operatorname{div}_{q}\left(s^{\#}(\delta q) \vec{N}\right) \operatorname{vol}_{q} .
\end{aligned}
$$

And

$$
\begin{aligned}
& \int_{\underline{R}^{3}} \operatorname{div}_{q}\left(s^{\#}(\delta q) \vec{N}\right) v o l_{q} \\
= & \int_{R^{3}}\left(\frac{1}{\sqrt{q}} \partial_{\ell}\left(\sqrt{q} s^{\#}(\delta q) N^{\ell}\right)\right) \sqrt{q} d^{3} x \\
= & \int_{\underline{R}^{3}} \partial_{\ell}\left(\sqrt{q} s^{\#}(\delta q) N^{\ell}\right) d^{3} x \\
= & \lim _{R \rightarrow \infty} \int_{\underline{D}^{3}(R)} \operatorname{div}\left(\sqrt{q} s^{\#}(\delta q) \vec{N}\right) d^{3} x \\
= & \lim _{R \rightarrow \infty} \int_{S^{2}(R)}\left(\sqrt{q} s^{\#}(\delta q) \vec{N} \cdot \underline{n}\right) \omega_{R}^{2} \\
= & 0 .
\end{aligned}
$$

To see this, write

$$
\begin{aligned}
& \sqrt{q} s^{\#}(\delta q) N^{\ell} \\
&= \lambda^{i j} \delta q_{i j} N^{\ell} \\
&=\left(O^{-}\left(\frac{1}{r^{2}}\right)+O\left(\frac{1}{r^{2+\delta}}\right)\right)\left(O^{+}\left(\frac{1}{r}\right)+O\left(\frac{1}{r^{1+\delta}}\right)\right)\left(A^{\ell}+B^{\ell} \ell^{\prime} x^{\ell^{\prime}}\right)
\end{aligned}
$$

6. 

$$
\begin{aligned}
& =O\left(\frac{1}{r^{3}}\right)+\left(O^{-}\left(\frac{1}{r^{2}}\right)+O\left(\frac{1}{r^{2+\delta}}\right)\right)\left(O^{+}\left(\frac{1}{r}\right)+O\left(\frac{1}{r^{1+\delta}}\right)\right) B_{\ell}^{\ell} x^{\ell^{\prime}} \\
& =O\left(\frac{1}{r^{3}}\right)+O^{-}\left(\frac{1}{r^{2}}\right) O^{+}\left(\frac{1}{r}\right) B \ell_{\ell^{\prime}} x^{\ell^{\prime}}+O\left(\frac{1}{r^{2+\delta}}\right) \\
& =O\left(\frac{1}{r^{3}}\right)+O^{+}\left(\frac{1}{r^{2}}\right)+O\left(\frac{1}{r^{2+\delta}}\right) .
\end{aligned}
$$

IEMMA Suppose that $\vec{N}=\vec{A}$ - then the integral

$$
\int_{R^{3}} \nabla_{j}\left(N_{i} s^{i j}\right) \sqrt{q} d^{3} x
$$

is convergent.
[In fact,

$$
\begin{aligned}
\nabla_{j} & \left(N_{i} s^{i j}\right) \sqrt{q} \\
& =\partial_{j}\left(N_{i} s^{i j} \sqrt{q}\right) \\
& =\partial_{j}\left(N_{i} \lambda^{i j}\right) \\
& =\partial_{j}\left(\lambda^{i j} q_{i k} N^{k}\right) \\
& =\partial_{j}\left(\lambda^{i j} q_{i k} A^{k}\right)
\end{aligned}
$$

But on $\underline{S}^{2}(R) \quad(R \gg 0)$,

$$
\begin{aligned}
& \lambda^{i j} q_{i k} A^{k} \\
& \quad=\left(\frac{1}{R^{2}} \tilde{\tau}^{i j}+O\left(\frac{1}{R^{2+\delta}}\right)\right)\left(\eta_{i k}+O\left(\frac{1}{R}\right)\right) A_{k}
\end{aligned}
$$

$$
=\frac{1}{R^{2}} \tilde{\tau}^{i j} \eta_{i k} A_{k}+O\left(\frac{l}{R^{2+c}}\right) \quad(c>0) .
$$

And

$$
\begin{aligned}
& \int_{0}^{2 \pi} \int_{0}^{\pi}\left(\cos \theta \sin \phi \tau^{i l}(\theta, \phi) \eta_{i k} A_{k}\right. \\
& \left.+\sin \theta \sin \phi \tau^{i 2}(\theta, \phi) \eta_{i k} A_{k}+\cos \phi \tau^{i 3}(\theta, \phi) \eta_{i k} A^{k}\right) \sin \phi d \phi d \theta
\end{aligned}
$$

is independent of R .]

Consequently, the integral

$$
\int_{\underline{R}^{3}}-2 \operatorname{div}_{q} \Lambda(\vec{A})
$$

is convergent.
Heuristics To motivate the next definition, take

$$
\vec{A}=\underbrace{(1,0,0)} \begin{aligned}
& (0,1,0) \\
& \\
& (0,0,1)
\end{aligned}
$$

To be specific, work with $(1,0,0)$ - then

$$
\begin{aligned}
N_{i} & =q_{i k^{N^{k}}}=q_{i l} \\
\Rightarrow \quad & \nabla_{j}\left(N_{i} s^{i j}\right) \sqrt{q} \\
& =\partial_{j}\left(\lambda^{i j} q_{i 1}\right)
\end{aligned}
$$

And

$$
\lambda^{i j} q_{i l}=\lambda^{i j}\left(n_{i l}+o\left(\frac{l}{r}\right)\right)
$$

$$
=\lambda^{l j}+O\left(\frac{l}{r^{3}}\right)
$$

Therefore

$$
\lim _{R \rightarrow \infty} \int_{\underline{S}^{2}(R)} \lambda^{l j} \Omega_{R}^{j}
$$

exists and equals

$$
\int_{\underline{R}^{3}} \nabla_{j}\left(q_{i l} s^{i j}\right) \sqrt{q} d^{3} x
$$

Definition: The linear momentum is the triple

$$
\left(\mathrm{P}^{1}, \mathrm{P}^{2}, \mathrm{P}^{3}\right)
$$

where for $b=1,2,3$,

$$
\mathrm{P}^{\mathrm{b}}: \mathrm{S}_{\mathrm{d}}^{2, \infty} \rightarrow \underline{R}
$$

sends $\Lambda$ to

$$
2 \int_{\underline{s}^{2}(\infty)} \lambda^{\mathrm{b} \ell_{\Omega_{\infty}}^{\ell}}
$$

[Note: In view of what has been said above, the integral defining $\mathrm{P}^{\mathrm{b}}$ is convergent.]

If $\overrightarrow{\mathrm{N}}=\overrightarrow{\mathrm{Br}}$, then, in general, the integral

$$
\int_{\underline{R}^{3}} \nabla_{j}\left(N_{i} s^{i j}\right) \sqrt{q} d^{3} x
$$

is divergent (however, it will be convergent if $(q, \Lambda) \in C O n_{D}$ ).
Notation: Let $\bar{S}_{d}^{2, \infty}$ stand for the subset of $S_{d}^{2, \infty}$ consisting of those $\Lambda=\lambda d^{3} x$ such that for $r \gg 0$,

$$
\lambda^{i j}(x)=\frac{1}{r^{2}} \tau^{i j}\left(\frac{x}{r}\right)+\frac{1}{r^{3}} \tau^{i j}\left(\frac{x}{r}\right)+v^{i j}(x),
$$

where $\tau^{i j}, \bar{\tau}^{i j} \in C^{\infty}\left(\underline{S}^{2}\right), \tau^{i j}$ is of odd parity, and

$$
v^{i j}=0^{\infty}\left(\frac{1}{r^{3+\delta}}\right) \quad(0<\delta \leq 1)
$$

[Note: Tacitly,

$$
\left.\tau^{i j}=\tau^{j i}, \bar{\tau}^{i j}=\bar{\tau}^{j i}, v^{i j}=v^{j i} \cdot\right]
$$

LEMMA Suppose that $\vec{N}=\overrightarrow{\mathrm{Br}}$-- then $\forall \Lambda \in \bar{S}_{\mathrm{d}}^{2, \infty}$, the integral

$$
\int_{\mathbb{R}^{3}} \nabla_{j}\left(N_{i} s^{i j}\right) \sqrt{q} d^{3} x
$$

is convergent.
[We have

$$
\begin{aligned}
\nabla_{j} & \left(N_{i} s^{i j}\right) \sqrt{q} \\
& =\partial_{j}\left(\lambda^{i j} q_{i k} B^{k} e^{x^{\ell}}\right) .
\end{aligned}
$$

But on $\underline{S}^{2}(R) \quad(R \gg 0)$,

$$
\begin{gathered}
\lambda^{i j} q_{i k} B^{k} \ell^{X^{\ell}} \\
=\left(\frac{1}{R^{2}} \tilde{\tau}^{i j}+\frac{1}{R^{3}} \tilde{\tau}_{i j}^{i j}+O\left(\frac{1}{R^{3+\delta}}\right)\right)\left(\eta_{i k}+\frac{1}{R} \tilde{\sigma}_{i k}+O\left(\frac{1}{R^{1+\delta}}\right)\right) B^{k} e^{X^{\ell}} .
\end{gathered}
$$

Obviously,

$$
\begin{gathered}
\left(\frac{1}{R^{2}} \tilde{\tau}^{i j}+\frac{1}{R^{3}} \tilde{\tau}^{i j}\right) O\left(\frac{1}{R^{1+\delta}}\right) B^{k} \ell^{X^{\ell}} \\
+ \\
O\left(\frac{1}{R^{3+\delta}}\right)\left(n_{i k}+\frac{1}{R} \tilde{\sigma}_{i k}+O\left(\frac{1}{R^{1+\delta}}\right)\right) B^{k} \ell^{X^{\ell}}
\end{gathered}
$$

10. 

$$
=O\left(\frac{1}{R^{2+c}}\right) \quad(c>0)
$$

## which leaves

1. $\frac{1}{R^{2}} \tilde{\tau}^{i j} \eta_{i k} B^{k} e^{x^{\ell}}$
2. $\frac{1}{R^{3}} \stackrel{\sim}{\tau}^{i} j_{n} n_{i k} B^{k} \ell^{x^{l}}$
3. $\frac{1}{\mathrm{R}^{2}} \tilde{\mathrm{~T}}^{\mathrm{ij}} \frac{1}{\mathrm{R}} \tilde{\sigma}_{i k} \mathrm{~B}^{\mathrm{k}} e^{\mathrm{x}}{ }^{\ell}$
4. $\frac{1}{R^{3}} \frac{\sim}{\mathrm{~T}} \mathrm{ij} \frac{1}{\mathrm{R}} \tilde{\sigma}_{i k} \mathrm{~B}^{\mathrm{k}} \ell^{\mathrm{X}}$.

Bearing in mind that $\tau^{i j}, \bar{\tau}^{i j}$ are functions of the angular variables alone, it remains only to note that Items 1 and 3 are even while Item 4 is $o\left(\frac{1}{R^{3}}\right)$.]

Consequently, the integral

$$
\int_{\underline{R}^{3}}-2 \operatorname{div}_{q} \Lambda(\overrightarrow{B r})
$$

is convergent provided $\Lambda \in \bar{S}_{\mathrm{d}}^{2, \infty}$.
Rappel: The canonical basis for so(3) is

$$
\left.X=\left[\begin{array}{ccc}
0 & 0 & 0 \\
0 & 0 & -1 \\
0 & 1 & 0
\end{array}\right], \quad Y=\left\lvert\, \begin{array}{ccc}
0 & 0 & 1 \\
0 & 0 & 0 \\
-1 & 0 & 0
\end{array}\right.\right], \quad Z=\left[\begin{array}{rrr}
0 & -1 & 0 \\
1 & 0 & 0 \\
0 & 0 & 0
\end{array}\right]
$$

Thus
11.

$$
\begin{aligned}
& x \cdot\left[\begin{array} { c } 
{ x ^ { 1 } } \\
{ x ^ { 2 } } \\
{ x ^ { 3 } }
\end{array} \left|=\left|\begin{array}{c}
0 \\
-x^{3} \\
x^{2}
\end{array}\right| \longleftrightarrow\left(0,-x^{3}, x^{2}\right)\right.\right. \\
& Y \cdot\left|\begin{array}{c}
x^{1} \\
x^{2} \\
x^{3}
\end{array}\right|=\left|\begin{array}{c}
x^{3} \\
0 \\
-x^{1}
\end{array}\right| \longleftrightarrow\left(x^{3}, 0,-x^{1}\right) \\
& \text { z. }\left[\begin{array}{c}
x^{1} \\
x^{2} \\
x^{3}
\end{array}\right]=\left[\begin{array}{c}
-x^{2} \\
x^{1} \\
0
\end{array}\right] \longleftrightarrow\left(-x^{2}, x^{1}, 0\right) .
\end{aligned}
$$

In addition,

$$
\begin{aligned}
& {[\mathrm{X}, \mathrm{Y}]=\mathrm{Z},[\mathrm{Y}, \mathrm{Z}]=\mathrm{X},[\mathrm{Z}, \mathrm{X}]=\mathrm{Y} } \\
\Rightarrow & \\
& {[\overline{\mathrm{X}}, \overline{\mathrm{Y}}]=-\overline{\mathrm{Z}},[\overline{\mathrm{Y}}, \overline{\mathrm{Z}}]=-\overline{\mathrm{X}},[\overline{\mathrm{Z}}, \overline{\mathrm{X}}]=-\overline{\mathrm{Y}} }
\end{aligned}
$$

if

$$
\bar{X}=-\mathrm{X}, \overline{\mathrm{Y}}=-\mathrm{Y}, \overline{\mathrm{Z}}=-\mathrm{z}
$$

Heuristics To motivate the next definition, take

$$
\overrightarrow{B r}=\left[\begin{array}{r}
\left(0,-x^{3}, x^{2}\right)=x^{2} \frac{\partial}{\partial x^{3}}-x^{3} \frac{\partial}{\partial x^{2}} \\
\left(x^{3}, 0,-x^{1}\right)=x^{3} \frac{\partial}{\partial x^{1}}-x^{1} \frac{\partial}{\partial x^{3}} \\
\left(-x^{2}, x^{1}, 0\right)=x^{1} \frac{\partial}{\partial x^{2}}-x^{2} \frac{\partial}{\partial x^{1}}
\end{array}\right.
$$

To be specific, work with $\left(0,-x^{3}, x^{2}\right)$ and restrict $\Lambda$ to $\bar{S}_{d}^{2, \infty}-$ then

$$
\begin{aligned}
& N_{i}=q_{i k} N^{k}=q_{i 3} x^{2}-q_{i 2} x^{3} \\
& \Rightarrow \quad \\
& \nabla_{j}\left(N_{i} s^{i j}\right) \sqrt{q} \\
&=\partial_{j}\left(\lambda^{i j}\left(q_{i 3} x^{2}-q_{i 2} x^{3}\right)\right)
\end{aligned}
$$

And

$$
\begin{aligned}
& \lambda^{i j}\left(q_{i 3} x^{2}-q_{i 2^{x}} x^{3}\right) \\
& \quad=\lambda^{i j}\left(n_{i 3^{2}} x^{2}-n_{i 2} x^{3}\right)+\cdots \\
& \quad=x^{2} \lambda^{3 j}-x^{3} \lambda^{2 j}+\cdots
\end{aligned}
$$

Therefore

$$
\lim _{R \rightarrow \infty} \int_{\underline{S}^{2}(R)}\left(x^{2} \lambda^{3 j}-x^{3} \lambda^{2 j}\right) \Omega_{R}^{j}
$$

exists and equals

$$
\int_{R^{3}} \nabla_{j}\left(\left(q_{i 3} x^{2}-q_{i 2} x^{3}\right) s^{i j}\right) \sqrt{q} d^{3} x .
$$

[Note: The proof of the preceding lemma shows that

$$
\left.\lim _{R \rightarrow \infty} s_{\underline{S}^{2}(R)} \cdots \Omega_{R}^{j}=0 .\right]
$$

Definition: The angular momentum is the triple

$$
\left(J^{1}, J^{2}, J^{3}\right)
$$

where for $b=1,2,3$,

$$
J^{\mathrm{b}}: \bar{S}_{\mathrm{d}}^{2, \infty} \rightarrow \underline{R}
$$

sends $\Lambda$ to

$$
2 \int_{\underline{s}^{2}(\infty)} \varepsilon_{b j k} x^{j} k \ell_{\Omega_{\infty} \ell}
$$

[Note: In view of what has been said above, the integral defining $\mathrm{J}^{\mathrm{b}}$ is convergent.]

Example: Suppose that

$$
\begin{aligned}
& \lambda^{11}=-\frac{2}{r^{3}} \frac{x^{1} x^{2}}{r^{2}}+0^{\infty}\left(\frac{1}{r^{3+\delta}}\right) \\
& \lambda^{22}=\frac{2}{r^{3}} \frac{x^{1} x^{2}}{r^{2}}+0^{\infty}\left(\frac{1}{r^{3+\delta}}\right) \\
& \lambda^{33}=0+0^{\infty}\left(\frac{1}{r^{3+\delta}}\right) \\
& \lambda^{12}=\frac{1}{r^{3}}\left(\frac{x^{1} x^{1}}{r^{2}}-\frac{x^{2} x^{2}}{r^{2}}\right)+0^{\infty}\left(\frac{1}{r^{3+\delta}}\right) \\
& \lambda^{13}=-\frac{1}{r^{3}} \frac{x^{2} x^{3}}{r^{2}}+0^{\infty}\left(\frac{1}{r^{3+\delta}}\right) \\
& \lambda^{23}=\frac{1}{r^{3}} \frac{x^{1} x^{3}}{r^{2}}+0^{\infty}\left(\frac{1}{r^{3+\delta}}\right) .
\end{aligned}
$$

Then $\Lambda \in \bar{S}_{d}^{2, \infty}$ (here, $\tau^{i j}=0$ ) and we claim that

$$
J^{I}(\Lambda)=0, J^{2}(\Lambda)=0, J^{3}(\Lambda)=\frac{16 \pi}{3}
$$

Consider first $J^{l}(\Lambda)$ which, by definition, is
14.

$$
\begin{aligned}
& 2 \underline{S}^{2}(\infty)\left(x^{2} \lambda^{3 \ell}-x^{3} \lambda^{2 \ell}\right) \Omega_{\infty}^{\ell} \\
& =2 \lim _{R \rightarrow \infty} \int_{\underline{S}^{2}(R)}\left(x^{2} \lambda^{3 \ell}-x^{3} \lambda^{2 \ell}\right) \frac{x^{\ell}}{R} \omega_{R}^{2} .
\end{aligned}
$$

Dropping the 2 and setting aside the $0^{\infty}\left(\frac{1}{r^{3+\delta}}\right)$ (as they will not contribute), we have

1. $\mathrm{R}^{2} \int_{0}^{2 \pi} \int_{0}^{\pi}(\cos \theta \sin \phi)\left[(\mathrm{R} \sin \theta \sin \phi)\left(-\frac{1}{\mathrm{R}^{3}}\right) \sin \theta \sin \phi \cos \phi\right.$
$-(R \cos \phi)\left(\frac{1}{R^{3}}\right)\left((\cos \theta \sin \phi)^{2}-(\sin \theta \sin \phi)^{2}\right] \sin \phi d \phi d \theta$
2. $\mathrm{R}^{2} \int_{0}^{2 \pi} \int_{0}^{\pi}(\sin \theta \sin \phi)\left[(\mathrm{R} \sin \theta \sin \phi)\left(\frac{1}{\mathrm{R}^{3}}\right) \cos \theta \sin \phi \cos \phi\right.$
$\left.-(R \cos \phi)\left(\frac{2}{R^{3}}\right) \cos \theta \sin \phi \sin \theta \sin \phi\right] \sin \phi d \phi d \theta$
3. $R^{2} \int_{0}^{2 \pi} f_{0}^{\pi}(\cos \phi)[(R \sin \theta \sin \phi) 0$
$\left.-(R \cos \phi)\left(\frac{1}{R}\right) \cos \theta \sin \phi \cos \phi\right] \sin \phi d \phi d \theta$
or still,
4. $\int_{0}^{2 \pi} \int_{0}^{\pi}(\cos \theta \sin \phi)\left[-\sin ^{2} \theta \sin ^{2} \phi \cos \phi\right.$
$\left.-\cos \phi \sin ^{2} \phi\left(\cos ^{2} \theta-\sin ^{2} \theta\right)\right] \sin \phi d \phi d \theta$
5. $\int_{0}^{2 \pi} \int_{0}^{\pi}(\sin \theta \sin \phi)\left[\sin \theta \cos \theta \sin ^{2} \phi \cos \phi\right.$
$\left.-2 \sin \theta \cos \theta \sin ^{2} \phi \cos \phi\right] \sin \phi d \phi d \theta$
6. $\int_{0}^{2 \pi} \int_{0}^{\pi}-\cos \theta \sin ^{2} \phi \cos ^{2} \phi d \phi d \theta$
7. 

or still,

1. $\int_{0}^{2 \pi} f_{0}^{\pi}-\sin ^{4} \phi \cos \phi \cos ^{3} \theta d \phi d \theta$
2. $\int_{0}^{2 \pi} \int_{0}^{\pi}\left[\sin ^{4} \phi \cos \phi \sin ^{2} \theta \cos \theta\right.$
$\left.-2 \sin ^{4} \phi \cos \phi \sin ^{2} \theta \cos \theta\right] d \phi d \theta$
3. $\int_{0}^{2 \pi} f_{0}^{\pi}-\cos \theta \sin ^{2} \phi \cos ^{3} \phi d \phi d \theta$
=>
$1+2+3$
$=-\int_{0}^{2 \pi} f_{0}^{\pi}\left[\sin ^{4} \phi \cos \phi \cos ^{3} \theta\right.$
$\left.+\sin ^{4} \phi \cos \phi \sin ^{2} \theta \cos \theta+\sin ^{2} \phi \cos ^{3} \phi \cos \theta\right] d \phi d \theta$
$=-\int_{0}^{2 \pi} \int_{0}^{\pi}\left[\sin ^{4} \phi \cos \phi \cos ^{3} \theta\right.$
$+\sin ^{4} \phi \cos \phi\left(1-\cos ^{2} \theta\right) \cos \theta$

$$
\left.+\sin ^{2} \phi \cos ^{3} \phi \cos \theta\right] d \phi d \theta
$$

$=-\int_{0}^{2 \pi} \int_{0}^{\pi}\left[\sin ^{4} \phi \cos \phi \cos \theta+\sin ^{2} \phi \cos ^{3} \phi \cos \theta\right] d \phi d \theta$
$=-\int_{0}^{2 \pi} \int_{0}^{\pi}\left[\sin ^{2} \phi\left(1-\cos ^{2} \phi\right) \cos \phi \cos \theta\right.$

$$
\left.+\sin ^{2} \phi \cos ^{3} \phi \cos \theta\right] d \phi d \theta
$$

$$
\begin{gathered}
=-\left(\int_{0}^{2 \pi} \cos \theta d \theta\right)\left(\int_{0}^{\pi} \sin ^{2} \phi \cos \phi d \phi\right) \\
=0
\end{gathered}
$$

Analogously,

$$
J^{2}(\Lambda)=0
$$

Turning to $J^{3}(\Lambda)$, insertion of the data leads to

$$
\begin{aligned}
& J^{3}(\Lambda)=2 \int_{0}^{2 \pi} d \theta \int_{0}^{\pi} \sin ^{3} \phi d \phi \\
= & 8 \pi \int_{0}^{\pi / 2} \sin ^{3} \phi d \phi \\
= & 8 \pi \cdot 4 B(2,2) \\
= & 8 \pi \cdot \frac{4}{\Gamma(4)} \\
= & \frac{32 \pi}{3!}=\frac{16 \pi}{3}
\end{aligned}
$$

Section 65: Modifying the Hamiltonian The assumptions and notation are those of Section 62.

Definition: A lapse $N \in C^{\infty}\left(\underline{R}^{3}\right)$ is said to be asymptotic if

$$
N=A+B_{1} x^{1}+B_{2} x^{2}+B_{3} x^{3}+s c
$$

where $A$ and $B_{1}, B_{2}, B_{3}$ are constants.
Definition: A shift $\vec{N} \in D^{1}\left(\underline{R}^{3}\right)$ is said to be asymptotic if

$$
\vec{N}=\vec{A}+\overrightarrow{B r}+\overrightarrow{s C},
$$

where $\vec{A} \in \underline{R}^{3}$ and $B \in S O$ (3).
N.B. Recall that $s c$ and $\overrightarrow{S C}$ are short for the standard conditions.

Suppose that $N=s C$ and $\vec{N}=\overrightarrow{S C}-$ then

$$
\begin{aligned}
& H(q, \Lambda ; N, \vec{N})=\int_{\mathbb{R}^{3}}-2 \operatorname{div}_{q} \Lambda(\vec{N}) \\
+ & \int_{\mathbb{R}^{3}} N\left([s, s]_{q}-\frac{1}{2} t r_{q}(s)^{2}-S(q)\right) \sqrt{q} d^{3} x
\end{aligned}
$$

if $\Lambda=s^{\#} \otimes|q|^{1 / 2}$. Furthermore, the functional derivatives $\frac{\delta H}{\delta q}$ and $\frac{\delta H}{\delta \Lambda}$ exist and satisfy what we shall term the ADM relations, i.e.,

$$
\begin{aligned}
\frac{\delta H}{\delta q}= & 2 N\left(s * s-\frac{1}{2} \operatorname{tr}_{q}(s) s\right)^{\#} \otimes|q|^{1 / 2} \\
- & \frac{N}{2}\left(\left[s_{r} s\right]_{q}-\frac{1}{2} \operatorname{tr}_{q}(s)^{2}\right) q^{\#} \otimes|q|^{1 / 2} \\
& +N \operatorname{Ein}(q)^{\#} \otimes|q|^{1 / 2} \\
- & \left(H_{N}-\left(\Delta_{q} N\right) q\right)^{\#} \otimes|q|^{1 / 2}-L_{\vec{N}} \Lambda
\end{aligned}
$$

and

$$
\frac{\delta H}{\delta \Lambda}=2 N\left(s-\frac{1}{2} t r_{q}(s) q\right)+L_{\vec{N}} q .
$$

However, for an arbitrary asymptotic lapse or shift, the boundary terms come into play and the ADM relations break down. To restore them, it is necessary to modify the definition of H .
[Note: Implicit in this is the functional differentiability of the modification.]

Example: Consider the situation when $N=1$ and $\vec{N}=\overrightarrow{S C}$. Define

$$
H_{\mathrm{RT}}: \Gamma \rightarrow \underline{R}
$$

by

$$
H_{R T}(q, \Lambda)=H(q, \Lambda)+p^{0}(q)
$$

or still,

$$
H_{R T}(q, \Lambda)=H(q, \Lambda)+\int_{\underline{S}^{2}(\infty)}\left(q_{i \ell, i}-q_{i i, \ell}\right) \Omega_{\infty}^{\ell} .
$$

Then $H_{R T}$ is functionally differentiable and satisfies the ADM relations.
Example: Consider the situation when $N=s c$ and $\vec{N}=\left(\delta_{1}{ }^{\prime}, \delta_{2}^{b} \delta_{3}^{b}\right)$
( $b=1,2,3$ ). Define

$$
H_{\mathrm{RT}}: \Gamma \rightarrow \underline{\mathrm{R}}
$$

by

$$
H_{R T}(q, \Lambda)=H(q, \Lambda)+p^{b}(\Lambda)
$$

or still,

$$
H_{R T}(q, \Lambda)=H(q, \Lambda)+2 \int_{\underline{S}^{2}(\infty)} \lambda^{b \ell_{\Omega} \ell} .
$$

Then $H_{R T}$ is functionally differentiable and satisfies the $A D M$ relations.
Definition: The Regge-Teitelboim modification of the hamiltonian is the function

$$
H_{\mathrm{RT}}: \Gamma \rightarrow \underline{R}
$$

defined by the prescription

$$
\begin{aligned}
& H_{R T}(q, \Lambda ; N, \vec{N})=\int_{R^{3}} \Lambda\left(L_{\vec{N}} q\right) \\
& \quad+H_{H}(N)(q, \Lambda) \\
& +\int_{S^{2}(\infty)}\left(N q^{i j} q^{k \ell}\left(q_{i k, j}-q_{i j, k}\right)\right. \\
& \left.-N_{, j} q^{i j_{q} k \ell}\left(q_{i k}-\eta_{i k}\right)+N_{, k} q^{i j} q^{k \ell}\left(q_{i j}-\eta_{i j}\right)\right) \Omega_{\infty}^{\ell}
\end{aligned}
$$

[Note: Here, of course, $N$ and $\vec{N}$ are asymptotic.]

THEOREM $H_{R T}$ is functionally differentiable and satisfies the ADM relations.
[This follows from what has been said in Sections 63 and 64.]

Remark: If $N=s c$ and $\vec{N}=\overrightarrow{S C}$, then $H_{R T}=H$ and $H \mid \operatorname{Con}_{Q_{\infty}}=0$. But for arbitrary asymptotic $N$ and $\vec{N}, H_{R T} \mid \operatorname{Con}_{Q_{\infty}} \neq 0$. E.g.: Take $N=1$ and suppose that $\vec{N}=\overrightarrow{S C}--$ then $H_{R T} \mid \operatorname{Con}_{Q_{\infty}}=P^{0}$.

LEMMA Suppose that $\mathrm{N}_{1}, \mathrm{~N}_{2}, \overrightarrow{\mathrm{~N}}_{1}, \overrightarrow{\mathrm{~N}}_{2}$ are asymptotic - then

$$
\left.\right|_{\quad} ^{L_{\vec{N}_{1}} N_{2}} \begin{aligned}
& \mathrm{L}_{\vec{N}_{2}} \mathrm{~N}_{1}
\end{aligned}
$$

and

$$
\left[\vec{N}_{1}, \vec{N}_{2}\right],\left.\right|_{-} ^{N_{1} \text { grad } N_{2}} \begin{aligned}
& N_{2} \text { grad } N_{1}
\end{aligned}
$$

are asymptotic.
[Note: If $N_{1}=S C, \vec{N}_{1}=\overrightarrow{\mathrm{SC}}$, then the resulting entities also satisfy the standard conditions (and ditto if instead $N_{2}=s c, \vec{N}_{2}=\overrightarrow{s c}$ ). Let us also remind ourselves that grad refers to $\operatorname{grad}_{q}\left(q \in Q_{\infty}\right)$.]

THEOREM We have

$$
\begin{aligned}
& \left\{H_{R T}\left(\mathrm{~N}_{1}, \overrightarrow{\mathrm{~N}}_{1}\right), H_{\mathrm{RT}}\left(\mathrm{~N}_{2}, \overrightarrow{\mathrm{~N}}_{2}\right)\right\} \\
= & H_{R T}\left(L_{\overrightarrow{\mathrm{N}}_{1}} \mathrm{~N}_{2}-L_{\stackrel{N}{N}_{2}} \mathrm{~N}_{1},\left[\overrightarrow{\mathrm{~N}}_{1}, \overrightarrow{\mathrm{~N}_{2}}\right]+\mathrm{N}_{1} \text { grad } \mathrm{N}_{2}-\mathrm{N}_{2} \text { grad } \mathrm{N}_{1}\right) .
\end{aligned}
$$

Remark: In general, the Poisson bracket

$$
\left\{H_{\mathrm{RT}}\left(\mathrm{~N}_{1}, \overrightarrow{\mathrm{~N}}_{1}\right), \mathrm{H}_{\mathrm{RT}}\left(\mathrm{~N}_{2}, \overrightarrow{\mathrm{~N}}_{2}\right)\right\}
$$

does not vanish on ${ }^{\mathrm{Con}}{ }_{Q_{\infty}}$, hence is not a constraint (but this will be true if either $N_{1}=s c, \vec{N}_{1}=\overrightarrow{s c}$ or $\left.N_{2}=s c, \vec{N}_{2}=\overrightarrow{s C}\right)$.

Section 66: The Poincare Structure The assumptions and notation are those of Section 62.

Definition:

$$
H_{R T}(1, \overrightarrow{0}) \text { - generator of time translations. }
$$

## Definition:

$$
\begin{aligned}
& H_{R T}\left(0,\left(\delta^{b}{ }_{1}, \delta_{2}^{b}, \delta_{3}^{b}\right)\right)-\text { generators of space translations } \\
& H_{R T}\left(x^{b}, \overrightarrow{0}\right)-\text { generators of boosts } \\
& H_{R T}\left(0,\left(\varepsilon_{b j 1} x^{j}, \varepsilon_{b j 2} x^{j}, \varepsilon_{b j} 3^{x^{j}}\right)\right)-\text { generators of rotations. }
\end{aligned}
$$

[Note: In each case, $b=1,2,3$.
The objective now will be to compute all of the Poisson brackets amongst these 10 entities.

For use below, recall the following points.

- Given $X, Y \in D^{l}\left(\underline{R}^{3}\right)$,

$$
[X, Y]=\left(X^{i} Y_{, i}^{j}-Y^{i} X_{, i}^{j}\right) \frac{\partial}{\partial X^{j}},
$$

thus

$$
[X, Y]^{j}=X^{i} \partial_{i} Y^{j}-Y^{i} \partial_{i} X^{j}
$$

- Given $f \in C^{\infty}\left(\underline{R}^{3}\right)$ and $q \in Q_{\infty}$,

$$
\operatorname{grad} f\left(=\operatorname{grad}_{q} f\right)=\left(\frac{\partial f}{\partial x^{i}} q^{i j}\right) \frac{\partial}{\partial y^{j}},
$$

thus

$$
(\operatorname{grad} f)^{j}=\left(\partial_{i} f\right) q^{i j}
$$

Time Translation/Space Translation: We have

$$
\begin{aligned}
& \left\{H_{R T}(1, \vec{\delta}), H_{R T}\left(0,\left(\delta{ }_{1}, \delta_{2}^{b}, \delta_{3}^{b}\right)\right)\right\} \\
& \quad=H_{R T}\left(-L_{\left.(\delta)_{1}, \delta_{2}, \delta_{3}\right)}^{1, \vec{\delta})=0 .}\right.
\end{aligned}
$$

Time Translation/Boost: We have

$$
\begin{aligned}
& \left\{H_{R T}(1, \overrightarrow{0}), H_{R T}\left(x^{b}, \overrightarrow{0}\right)\right\} \\
& \quad=H_{R T}\left(0, \text { grad } x^{b}\right) \\
& \quad=H_{R T}\left(0, \delta{ }_{i} \eta_{i j} \frac{\partial}{\partial y^{j}}+\overrightarrow{\mathrm{sc}}\right) \\
& \quad=H_{R T}\left(0,\left(\delta_{1}^{b}, \delta_{2}^{b}, \delta{ }_{3}^{b}\right)\right)+H(0, \overrightarrow{\mathrm{sc}})
\end{aligned}
$$

Time Translation/Rotation: We have

$$
\begin{aligned}
& \left\{H_{R T}(1, \overrightarrow{0}), H_{R T}\left(0,\left(\varepsilon_{b j 1} x^{j}, \varepsilon_{\left.\left.\left.b j 2^{x^{j}}, \varepsilon_{b j} x^{j}\right)\right)\right\}}\right.\right.\right. \\
& \quad=H_{R T}\left(-L_{\left.\left(\varepsilon_{b j 1} x^{j}, \varepsilon_{b j 2^{3}}, \varepsilon_{b j 3} x^{j}\right)^{1, \overrightarrow{0}}\right)=0 .}\right.
\end{aligned}
$$

Boost/Boost: We have

$$
\begin{aligned}
& \left\{H_{R T}\left(x^{b^{\prime}}, \overrightarrow{0}\right), H_{R T}\left(x^{b^{\prime \prime}}, \overrightarrow{0}\right)\right\} \\
& \quad=H_{R T}\left(0, x^{b^{\prime}} \operatorname{grad} x^{b^{\prime \prime}}-x^{b^{\prime \prime}} \operatorname{grad} x^{b^{\prime}}\right)
\end{aligned}
$$

## 3.

Take, for example, $b^{\prime}=1, b^{\prime \prime}=2$ - then

$$
\begin{aligned}
& x^{1} \operatorname{grad} x^{2}-x^{2} \operatorname{grad} x^{1} \\
& =\left(-x^{2}, x^{1}, 0\right)+\overrightarrow{s C}
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& \left\{H_{R T}\left(x^{1}, \overrightarrow{0}\right), H_{R T}\left(x^{2}, \overrightarrow{0}\right)\right\} \\
& \quad=H_{R T}\left(0,\left(\varepsilon_{3 j 1} x^{j}, \varepsilon_{3 j 2} x^{j}, \varepsilon_{3 j 3} x^{j}\right)\right)+H(0, \overrightarrow{\mathrm{sc}}) .
\end{aligned}
$$

In general:

$$
\begin{aligned}
& \left\{H_{R T}\left(x^{b^{\prime}}, \overrightarrow{0}\right), H_{R T}\left(x^{b "}, \vec{\delta}\right)\right\} \\
& \quad=\varepsilon_{b} b_{b " c} H_{R T}\left(0,\left(\varepsilon_{c j 1} x^{j}, \varepsilon_{c j 2} x^{j}, \varepsilon_{c j 3} x^{j}\right)\right)+H(0, \overrightarrow{\mathrm{sc}}) .
\end{aligned}
$$

Boost/Space Translation: We have

$$
\begin{aligned}
& \left\{H_{R T}\left(x^{b^{\prime}}, ~(\delta), H_{R T}\left(0,\left(\delta^{b "} 1^{\prime} \delta^{b "} 2^{\prime \delta^{b "}} 3\right)\right)\right\}\right. \\
& =H_{R T}\left(-L_{\left(\delta^{b "}\right.}^{1^{\prime}} \delta^{b^{\prime \prime}} 2^{\prime} \delta^{b b^{\prime \prime}}\right)^{\left.x^{b^{\prime}}, ~ \overrightarrow{0}\right)} \\
& =-H_{R T}\left(\delta^{b "} c_{c}{ }_{c} x^{b^{\prime}}, \overrightarrow{0}\right) \\
& =-H_{R T}\left(\delta^{b^{\prime \prime}} c^{\delta^{b^{\prime}}} c^{\prime}, \overrightarrow{0}\right) \\
& =-\delta_{b}{ }^{\prime} b^{\prime \prime} H_{R T}(1, ठ) .
\end{aligned}
$$

Boost/Rotation: We have

$$
\begin{aligned}
& \left\{H_{R T}\left(x^{b^{\prime}}, \overrightarrow{0}\right), H_{R T}\left(0,\left(\varepsilon_{b " j 1} x^{j}, \varepsilon_{b " j 2^{x^{j}}}, \varepsilon_{b " j} 3^{x^{j}}\right)\right)\right\} \\
& \quad=H_{R T}\left(-L \varepsilon_{b^{\prime \prime} j 1^{j}}, \varepsilon_{b " j} 2^{x^{j}}, \varepsilon_{b " j} 3^{x^{j}}\right)^{\left.x^{b^{\prime}}, \overrightarrow{0}\right)} .
\end{aligned}
$$

Take, for example, $b^{\prime}=1, b^{\prime \prime}=2$-- then

$$
\begin{aligned}
& \mathcal{L}_{\left(\varepsilon_{2 j 1} x^{j}, \varepsilon_{2 j 2} x^{j}, \varepsilon_{2 j 3} x^{j}\right)^{x^{1}}}^{\left.\quad=L_{\left(x^{3}, 0,-x^{1}\right.}\right)^{x^{1}}} \\
& =\left(x^{3} \frac{\partial}{\partial x^{I}}-x^{1} \frac{\partial}{\partial x^{3}}\right) x^{I} \\
& =x^{3}
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& \left\{H_{R T}\left(x^{1}, \overrightarrow{0}\right), H_{R T}\left(0,\left(\varepsilon_{2 j 1} x^{j}, \varepsilon_{2 j 2} x^{j}, \varepsilon_{2 j} 3^{x^{j}}\right)\right)\right\} \\
& \quad=-H_{R T}\left(x^{3}, \overrightarrow{0}\right) .
\end{aligned}
$$

In general:

$$
\begin{aligned}
& \left\{H_{R T}\left(x^{b}, \overrightarrow{0}\right), H_{R T}\left(0,\left(\varepsilon_{b " j 1} x^{j}, \varepsilon_{b " j 2} x^{j}, \varepsilon_{b " j} 3^{x^{j}}\right)\right)\right\} \\
& \quad=-\varepsilon_{b} b^{\prime \prime} c^{H_{R T}}\left(x^{c}, \overrightarrow{0}\right)
\end{aligned}
$$

Space Translation/Space Translation: We have

$$
\left\{H_{R T}\left(0,\left(\delta^{b^{\prime}}{ }_{1}, \delta^{b^{\prime}}{ }_{2}, \delta^{b^{\prime}}{ }_{3}\right)\right), H_{R T}\left(0,\left(\delta^{b^{\prime \prime}}{ }_{1}, \delta^{b^{b^{\prime \prime}}}{ }_{2}, \delta^{b^{\prime \prime}}{ }_{3}\right)\right)\right\}
$$

## 5.

$$
\begin{aligned}
& =H_{R T}\left(0,\left[\left(\delta^{b^{\prime}}, \delta^{b^{\prime}} 2^{\prime} \delta^{b^{\prime}}{ }_{3}\right),\left(\delta^{b^{\prime \prime}}, \delta^{b^{\prime \prime}},_{2}^{b^{\prime \prime}}{ }_{3}\right)\right]\right) \\
& =0 .
\end{aligned}
$$

## Space Translation/Rotation: We have

$$
\begin{aligned}
& \left\{H_{R T}\left(0,\left(\delta^{b^{\prime}} 1^{\prime}, \delta^{b^{\prime}}{ }_{2}^{\prime} \delta^{b^{\prime}}{ }_{3}\right)\right), H_{R T}\left(0,\left(\varepsilon_{b " j 1} x^{j}, \varepsilon_{b " j} 2^{x^{j}}, \varepsilon_{b " j} 3^{x^{j}}\right)\right)\right\} \\
& \quad=H_{R T}\left(0,\left[\left(\delta^{b^{\prime}} 1^{\prime} \delta^{b^{\prime}}{ }_{2}, \delta^{b^{\prime}}{ }_{3}\right),\left(\varepsilon_{b " j 1} x^{j}, \varepsilon_{b " j} 2^{x^{j}}, \varepsilon_{b " j} 3^{x^{j}}\right)\right]\right)
\end{aligned}
$$

Take, for example, $\mathrm{b}^{\prime}=2, \mathrm{~b}^{\prime \prime}=3$-- then

$$
\begin{aligned}
& {\left[\left(\delta^{2}{ }_{1}, \delta^{2}{ }_{2}, \delta^{2}{ }_{3}\right),\left(\varepsilon_{3 j 1} x^{\mathrm{x}}, \varepsilon_{3 j 2} x^{\mathrm{j}}, \varepsilon_{3 j} 3^{x^{j}}\right)\right]} \\
& \quad=\left[(0,1,0),\left(-x^{2}, x^{1}, 0\right)\right] \\
& \quad=(-1,0,0) \\
& \quad=-\left(\delta_{1}^{1}, \delta_{2}^{1}, \delta_{3}^{1}\right)
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& \left\{H_{R T}\left(0,\left(\delta_{1}^{2}, \delta_{2}^{2}, \delta_{3}^{2}\right)\right), H_{R T}\left(0,\left(\varepsilon_{3 j 1} x^{j}, \varepsilon_{3 j 2} x^{j}, \varepsilon_{3 j 3} x^{j}\right)\right)\right\} \\
& \quad=-H_{R T}\left(0,\left(\delta_{1}, \delta_{2}, \delta_{3}^{l}\right)\right) .
\end{aligned}
$$

In general:

$$
\begin{aligned}
& \left\{H_{R T}\left(0,\left(\delta^{b^{\prime}} 1^{, \delta^{b}} 2^{\prime} \delta^{b^{\prime}}{ }_{3}\right)\right), H_{R T}\left(0,\left(\varepsilon_{b " j 1} x^{j}, \varepsilon_{b " j 2} x^{j}, \varepsilon_{b " j 3} x^{j}\right)\right)\right\} \\
& \quad=-\varepsilon_{b} b^{\prime \prime} c^{H_{R T}}\left(0,\left(\delta_{1}^{c}, \delta_{2}^{c}, \delta_{3}^{c}\right)\right) .
\end{aligned}
$$

6. 

Rotation/Rotation: We have

$$
\begin{aligned}
& \left\{H_{R T}\left(0,\left(\varepsilon_{b}{ }^{\prime} j 1^{x^{j}}, \varepsilon_{b}{ }^{\prime} j 2^{x^{j}}, \varepsilon_{b}{ }^{\prime} j 3^{x^{j}}\right)\right), H_{R T}\left(0,\left(\varepsilon_{b " j 1} x^{j}, \varepsilon_{b " j 2} x^{x^{j}}, \varepsilon_{b " j} 3^{x^{j}}\right)\right)\right\} \\
& =H_{R T}\left(0,\left[\left(\varepsilon_{b}{ }^{\prime} 1^{x^{j}}, \varepsilon_{b}{ }^{\prime} j 2^{x^{j}}, \varepsilon_{b}{ }^{\prime} j 3^{x^{j}}\right),\left(\varepsilon_{b " j 1} x^{j}, \varepsilon_{b " j 2} x^{j}, \varepsilon_{b " j} 3^{x^{j}}\right)\right]\right) .
\end{aligned}
$$

Take, for example, $b^{\prime}=1, b^{\prime \prime}=2$ - then

$$
\begin{aligned}
& {\left[\left(\varepsilon_{1 j 1} x^{j}, \varepsilon_{l j} 2^{x^{j}}, \varepsilon_{1 j} 3^{x^{j}}\right),\left(\varepsilon_{2 j 1} x^{j}, \varepsilon_{2 j 2} x^{j}, \varepsilon_{2 j} 3^{x^{j}}\right)\right]} \\
& \quad=\left[\left(0,-x^{3}, x^{2}\right),\left(x^{3}, 0,-x^{1}\right)\right] \\
& \quad=\left(x^{2},-x^{1}, 0\right)
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& \left\{H_{R T}\left(0,\left(\varepsilon_{1 j 1} x^{j}, \varepsilon_{1 j 2} x^{j}, \varepsilon_{1 j} 3^{x^{j}}\right)\right), H_{R T}\left(0,\left(\varepsilon_{2 j 1} x^{j}, \varepsilon_{2 j 2} x^{j}, \varepsilon_{2 j 3} x^{j}\right)\right)\right\} \\
& \quad=-H_{R T}\left(0,\left(\varepsilon_{3 j 1} x^{j}, \varepsilon_{3 j 2} x^{j}, \varepsilon_{3 j 3} x^{j}\right)\right)
\end{aligned}
$$

In general:

$$
\begin{aligned}
& \left\{H_{R T}\left(0,\left(\varepsilon_{b}{ }^{\prime} j 1^{x^{j}}, \varepsilon_{b}{ }^{\prime} j 2^{x^{j}}, \varepsilon_{b}{ }^{\prime} j 3^{x^{j}}\right)\right), H_{R T}\left(0,\left(\varepsilon_{b " j 1} x^{j}, \varepsilon_{b " j 2} x^{j}, \varepsilon_{b " j} 3^{x^{j}}\right)\right)\right\} \\
& \quad=-\varepsilon_{b} b^{\prime} c^{H} H_{R T}\left(0,\left(\varepsilon_{c j 1} x^{j}, \varepsilon_{c j 2} x^{j}, \varepsilon_{c j} 3^{x^{j}}\right)\right) .
\end{aligned}
$$

Rappel: Let $\underline{g}$ be the Lie algebra of the Poincaré group -- then dim $\underline{g}=10$ and admits a basis

$$
\left[\begin{array}{l}
P^{0}-\text { generator of time translations } \\
P^{1}, P^{2}, P^{3}-\text { generators of space translations } \\
N^{1}, N^{2}, N^{3}-\text { generators of boosts } \\
J^{1}, J^{2}, J^{3}-\text { generators of rotations }
\end{array}\right.
$$

subject to the following commatation relations:

$$
\begin{gathered}
{\left[P^{0}, P^{b}\right]=0,\left[P^{0}, N^{b}\right]=P^{b},\left[P^{0}, J^{b}\right]=0,} \\
{\left[N^{b^{\prime}}, N^{b^{\prime \prime}}\right]=\varepsilon_{b}, b^{\prime \prime} c^{J^{c}},\left[N^{b^{\prime}}, P^{b^{\prime \prime}}\right]=-\delta_{b} b^{\prime} P^{0},} \\
\\
{\left[N^{b^{\prime}}, J^{b^{\prime \prime}}\right]=-\varepsilon_{b}, b^{\prime \prime} c^{c},} \\
{\left[P^{b^{\prime}}, P^{b^{\prime \prime}}\right]=0,\left[P^{b^{\prime}}, J^{b^{\prime \prime}}\right]=-\varepsilon_{b}, b^{\prime \prime} c^{c},} \\
{\left[J^{b^{\prime}}, J^{b^{\prime \prime}}\right]=-\varepsilon_{b}, b^{\prime} c^{J^{c}} .}
\end{gathered}
$$

The formulas for

$$
\left.\right|_{\text {- Time Translation/Boost }} ^{\text {Boost/Boost }}
$$

each contain a term of the form $H(0, \overrightarrow{\mathrm{SC}})$, which somewhat spoils what otherwise would be a very pretty picture. Still,

$$
\left.H(0, \overrightarrow{\mathrm{sc}})\right|_{C o n_{D}}=0 .
$$

Therefore, upon restriction to $C^{C o n}{ }_{D}$, the Poisson brackets derived above have exactly the same structure as the commutation relations of $g$.

Section 67: Function Spaces In $\underline{R}^{\mathrm{n}}$, Sobolev space theory is standard fare but weighted Sobolev space theory is less so. Since it is the latter which will be needed for the applications, a brief account seems appropriate.
[Note: In what follows, it will be assumed that $n \geq 3$ ( $n=3$ being the case of ultimate interest).]

Notation: Let

$$
\sigma(x)=\left(1+|x|^{2}\right)^{1 / 2}\left(x \in \underline{R}^{n}\right),
$$

i.e., let

$$
\sigma=\left(1+r^{2}\right)^{1 / 2}
$$

Given a multiindex $\alpha=\left(\alpha_{1}, \ldots, \alpha_{n}\right)$, write

$$
\partial^{\alpha}=\left(\frac{\partial}{\partial x^{1}}\right)^{\alpha} 1 \ldots\left(\frac{\partial}{\partial x^{n}}\right)^{\alpha}
$$

and put

$$
|\alpha|=\sum_{1}^{n} \alpha_{i} .
$$

Definition: Let $k \in \underline{Z} \geq 0$, $\delta \in \underline{R}$-- then by $C_{\delta}^{k}$ we understand the Banach space consisting of those functions $f: \underline{R}^{n} \rightarrow \underline{R}$ of class $C^{k}$ such that

$$
\|f\|_{C_{\delta}^{k}}=\sum_{|\alpha| \leq k} \sup _{\underline{R}^{n}} \sigma^{\delta+|\alpha|}\left|\partial^{\alpha} f\right|<\infty .
$$

[Note: The indexing has been arranged so that

$$
\left.\partial^{\alpha} \mathrm{f}=0\left(\frac{1}{r^{|\alpha|+\delta}}\right) \quad(|\alpha| \leq k) .\right]
$$

Example: Take $\mathrm{n}=3$ and suppose that q is an asymptotically flat riemannian
structure on $\underline{R}^{3}$ - then

$$
q_{i j}-\eta_{i j} \in C_{1}^{k} \forall k \geq 0
$$

LEMMA Pointwise multiplication induces a continuous bilinear map

$$
C_{\delta_{1}}^{k} \times C_{\delta_{2}}^{k} \rightarrow C_{\delta_{1}+\delta_{2}}^{k}
$$

Definition: Let $k \in \underline{Z}_{\geq 0}, \delta \in \underline{R}-$ then by $W_{\delta}^{k}$ we understand the Hilbert space consisting of those locally integrable functions $f: \underline{R}^{n} \rightarrow R$ possessing locally integrable distributional derivatives up to order k such that

$$
\|\left. f\right|_{W_{\delta}^{k}}=\left[\sum_{|\alpha| \leq k} \int_{\underline{R}^{n}} \sigma^{2(\delta+|\alpha|)}\left|\partial^{\alpha} f\right|^{2} d^{n} x\right]^{1 / 2}<\infty .
$$

[Note: The inner product in $W_{\delta}^{k}$ is

$$
\left.\left\langle f_{1}, f_{2}\right\rangle{ }_{W_{\delta}^{k}}=\sum_{|\alpha| \leq k} \delta_{\underline{R}^{n}} \sigma^{2(\delta+|\alpha|)}\left(\partial^{\alpha} f_{1}\right)\left(\partial^{\alpha_{f}}\right) d^{n} x .\right]
$$

N.B. $\quad C_{C}^{\infty}\left(\underline{R}^{n}\right)$ is dense in $W_{\delta}^{k}$.

Example: Suppose that $f \in W_{-1}^{1}$ - then the partial derivatives $\partial_{i} f$ are square integrable.

Example: Let $c \in \underline{R}$ - then $\sigma^{c} \in W_{\delta}^{k} \Leftrightarrow c<-\left(\delta+\frac{n}{2}\right)$. In particular: The constants belong to $W_{\delta}^{k}$ iff $\delta<-\frac{n}{2}$.
[Since

$$
\partial^{\alpha} \sigma^{c}=O\left(r^{c-|\alpha|}\right)
$$

it suffices to take $k=0$. But

$$
\begin{aligned}
\sigma^{2 c} \sigma^{2 \delta} r^{n-1} & =O\left(r^{2 c+2 \delta+n-1}\right) \\
& =O\left(r^{-(-(2 c+2 \delta+n-1))}\right)
\end{aligned}
$$

And

$$
\left.-(2 c+2 \delta+n-1)>1 \Leftrightarrow c<-\left(\delta+\frac{n}{2}\right) \cdot\right]
$$

FACT Multiplication $\mathrm{f} \rightarrow \mathrm{f} \sigma^{C}$ defines a continuous map $W_{\delta}^{k} \rightarrow W_{\delta-c}^{k}$.

LEMMA The operator

$$
\partial_{i}: W_{\delta}^{k} \rightarrow W_{\delta+1}^{k-1} \quad(k \geq 1)
$$

is a bounded linear transformation.

Heuristics One reason for introducing the $W_{\delta}^{k}$ is that they are better suited for the study of certain elliptic differential operators. Take, e.g., the laplacian $\Delta$ corresponding to $\eta$ (the usual flat metric on $\underline{R}^{n}$ ). As a densely defined operator on $L^{2}\left(\underline{R}^{n}\right)$, its maximal domain is the set of $f \in L^{2}\left(\underline{R}^{n}\right)$ such that $\Delta f \in \Theta^{2}\left(\underline{R}^{n}\right)$ in the sense of distributions, i.e., is the ordinary Sobolev space $H^{2}\left(\underline{R}^{n}\right)$ (and there, $\Delta$ is selfadjoint). Viewed as a map $\Delta: H^{2}\left(\underline{R}^{n}\right) \rightarrow L^{2}\left(\underline{R}^{n}\right)$, the kernel of $\Delta$ is trivial:

$$
\begin{aligned}
\Delta f=0 \Rightarrow 0 & =-\int_{R^{n}} f \Delta f d^{n} x \\
& =\int_{R^{n}}|\operatorname{grad} f|^{2} d^{n} x
\end{aligned}
$$

$$
\begin{aligned}
& \Rightarrow \\
& f=0
\end{aligned}
$$

On the other hand, the range of $\Delta$ is not closed. For if it were, then $\exists C>0: \forall f \in H^{2}\left(\underline{R}^{n}\right)$,

$$
\|f\|_{H^{2}\left(\underline{R}^{n}\right)} \leq C\|\Delta f\|_{L\left(\underline{R}^{n}\right)}
$$

But such a relation cannot be true. To see this, let

$$
\left(S_{R} f\right)(x)=f(R x)
$$

Then

$$
\Delta S_{R} f=R^{2} S_{R} \Delta f
$$

Therefore

$$
\begin{aligned}
\|f\|_{L^{2}\left(\underline{R}^{n}\right)} & =R^{-n / 2}\left\|S_{1 / R^{f}}\right\|_{L^{2}\left(\underline{R}^{n}\right)} \\
& \leq R^{-n / 2}\left\|S_{1 / R^{f}}\right\|_{H^{2}\left(\underline{R}^{n}\right)} \\
& \leq C R^{-n / 2}\left\|\Delta S_{1 / R^{f}}\right\|_{L^{2}\left(\underline{R}^{n}\right)} \\
& =C R^{-2}\|\Delta f\|_{L^{2}\left(\underline{R}^{n}\right)}
\end{aligned}
$$

an impossibility.
Put

$$
L_{\delta}^{2}=W_{\delta}^{0}
$$

Then the $L_{\delta}^{2}$ are, by definition, the weighted $L^{2}$-spaces $\left(L_{0}^{2}=L^{2}\left(\underline{R}^{n}\right)\right)$.

## 5.

FACT Suppose that $f \in U_{\$}^{2}$ has the property that $\Delta f \in \in_{\delta+2}^{2}$ in the sense of distributions -- then $\mathrm{fen}_{\delta}^{2}$.

Observation: The dual of $\mathrm{L}_{\delta}^{2}$ is $\mathrm{L}_{-\delta^{\prime}}^{2}$. Indeed,

$$
\begin{aligned}
& u \in \Theta_{\delta}^{2}, v \in \in_{-\delta}^{2} \\
& \text { => } \\
& \int_{\underline{R}^{n}}|u v| d^{n} x=\int_{\underline{R}^{n}}|u| \sigma^{\delta} \cdot|v| \sigma^{-\delta} d^{n} x \\
& \leq\left(\int _ { \underline { R } ^ { n } } | u | ^ { 2 } \sigma ^ { 2 \delta _ { d } } x _ { x } { } ^ { 1 / 2 } \left(\int_{\underline{R}}{ }^{n}|v|^{2} \sigma^{\left.-2 \delta_{d} n_{x}\right)}\right.\right. \\
& <\infty \text {. }
\end{aligned}
$$

Remark: The dual of $W_{\delta}^{k}$ contains $L_{-\delta}^{2}$. However, to completely explicate it, one has to introduce a weighted Sobolev space $W_{-\delta}^{-k}$, which is a certain subset of the space of tempered distributions on $\underline{R}^{n}$ and, by construction, is the dual of $W_{\delta}^{k}$.

If $k \geq k^{\prime}, \delta \geq \delta^{\prime}$, then

$$
W_{\delta}^{k} \subset W_{\delta}^{k^{\prime}} .
$$

RELLICH LEMMA Suppose that $k>k^{\prime}, \delta>\delta^{\prime}-$ then the injection

$$
W_{\delta}^{k} \rightarrow W_{\delta}^{k^{\prime}}
$$

is compact.
[Note: In other words, if $\left\{f_{n}\right\} \subset W_{\delta}^{k}$ is a bounded sequence, then there is a subsequence $\left\{f_{n_{k}}\right\}$ which converges in $W_{\delta^{\prime}}^{k^{\prime}} \cdot$ ]

Remark: The injection

$$
W_{\delta}^{k} \rightarrow W_{\delta}^{k-1} \quad(k \geq 1)
$$

is continuous but not compact.

EMBEDDING LEAMA I We have

$$
W_{\delta}^{k} \subset C_{\delta^{\prime}}^{k^{\prime}}
$$

if

$$
\int_{-} \begin{aligned}
& k^{\prime}<k-\frac{n}{2} \\
& \delta^{\prime}<\delta+\frac{n}{2}
\end{aligned}
$$

Application: Fix k $>\frac{\mathrm{n}}{2}$ - then $\forall \mathrm{f} \in \mathrm{w}_{\delta^{\prime}}^{\mathrm{k}}$,

$$
\sigma^{c}|f|=o(1)
$$

provided $c<\delta+\frac{n}{2}$.
[Take $k^{\prime}=0$, choose $\delta^{\prime}: c<\delta^{\prime}<\delta+\frac{n}{2}$, and write

$$
\begin{aligned}
\sigma^{c}|f| & =\sigma^{c-\delta^{\prime}} \sigma^{\prime}|f| \\
& =\sigma^{c-\delta^{\prime}} \circ(1) \\
& =o(1) \circ(1)=o(1) .]
\end{aligned}
$$

[Note: If $0<\delta+\frac{\mathrm{n}}{2}$, then

$$
|f|=o(1) .]
$$

EMBEDDING IFMMA II We have

$$
c_{\delta^{\prime}}^{k^{\prime}} \subset W_{\delta}^{k}
$$

if

$$
\left[\begin{array}{l}
k^{\prime} \geq k \\
\delta^{\prime}>\delta+\frac{n}{2} .
\end{array}\right.
$$

Example: If f is $\mathrm{C}^{2}$ and if

$$
f=O\left(\frac{1}{r}\right), \quad \partial_{i} f=O\left(\frac{1}{r^{2}}\right), \partial_{i} \partial_{j} f=O\left(\frac{1}{r^{3}}\right),
$$

then

$$
\mathrm{f} \in \mathrm{C}_{1}^{2} \subset W_{\delta}^{2} \quad\left(\delta<1-\frac{\mathrm{n}}{2}\right) .
$$

POINCARE INEQUALITY Suppose that $\delta>-\frac{n}{2}-$ then $\exists C>0$ such that $\forall f \in W_{\delta}^{1}$,

$$
\int_{\underline{R}^{n}}|f|^{2} \sigma^{2 \delta} d^{n} x \leq C \int_{R^{n}}|\operatorname{grad} f|^{2} \sigma^{2(\delta+1)} d^{n} x .
$$

[Note: Take $\delta=-1$ to get

$$
\left.\int_{\underline{R}^{n}}|f|^{2} \sigma^{-2} d^{n} x \leq C \int_{\underline{R}^{n}}|\operatorname{grad} f|^{2} d^{n} x .\right]
$$

PRODUCT LEMMA Pointwise multiplication induces a continuous bilinear map

$$
W_{\delta_{1}}^{\mathrm{k}_{1}} \times \mathrm{W}_{\delta_{2}}^{\mathrm{k}_{2}} \rightarrow W_{\delta}^{k}
$$

if

$$
\mathrm{k}_{1}, \mathrm{k}_{2} \geq \mathrm{k}, \mathrm{k}<\mathrm{k}_{1}+\mathrm{k}_{2}-\frac{\mathrm{n}}{2}, \delta<\delta_{1}+\delta_{2}+\frac{\mathrm{n}}{2} .
$$

Application: Suppose that $k>\frac{n}{2}, \delta>-\frac{n}{2}-$ then $W_{\delta}^{k}$ is closed under the formation of products.

The theory outlined above admits an obvious extension to the case of functions $f: \underline{R}^{n} \rightarrow \underline{R}^{m}$ but it is customary to abbreviate and use the symbol $W_{\delta}^{k}$ in this situation as well.
[Note: To say that a tensor $T \in D_{q}^{P}\left(R^{n}\right)$ is in $W_{\delta}^{k}$ simply means that its components $T^{i_{1} \cdots i_{p}}{ }_{j_{1} \ldots j_{q}}$ are in $\left.W_{\delta}^{k} \cdot\right]$

Notation: Let $I: \underline{R}^{n} \rightarrow \underline{R}^{n}$ be the identity map and write $W_{\delta}^{k}(I)$ for the set of functions $f: \underline{R}^{n} \rightarrow \underline{R}^{n}$ such that $f-I \in W_{\delta}^{k}$.
[Note: The arrow $W_{\delta}^{k}(I) \rightarrow W_{\delta}^{k}$ that sends $f$ to $f-I$ is bijective, thus $W_{\delta}^{k}(I)$ can be topologized by demanding that it be a homeomorphism.]

Denote now by

$$
\mathrm{D}_{\delta-1}^{k+1} \quad\left(\mathrm{k}>\frac{\mathrm{n}}{2}, \delta>-\frac{\mathrm{n}}{2}\right)
$$

the set of diffeomorphisms

$$
\phi: \underline{R}^{\mathrm{n}} \rightarrow \underline{\mathrm{R}}^{\mathrm{n}}
$$

such that

$$
\phi-\mathrm{I} \in \mathrm{~W}_{\delta-1}^{\mathrm{k}+1}
$$

and equip it with the topology inherited from $W_{\delta-1}^{k+1}$ (I).
[Note: Given $\phi \in D_{\delta-1}^{k+1}$, write $\phi=I+F$, where $F \in W_{\delta-1}^{k+1}$. Fix $\varepsilon>0$ :

$$
(\delta-1)+\frac{n}{2}>-1+\varepsilon>-1
$$

Then

$$
\begin{aligned}
& W_{\delta-1}^{k+1} \subset C_{-l+\varepsilon}^{l} \\
\Rightarrow \quad & \\
& F=O\left(r^{1-\varepsilon}\right) .
\end{aligned}
$$

Therefore the derivative $\mathrm{D} \phi$ of $\phi$ (viewed as an $\mathrm{n} \times \mathrm{n}$ matrix of partial derivatives) is the identity matrix plus a matrix whose entries are in $C_{\varepsilon}^{0}$, hence are $O\left(\frac{l}{r}\right)$.]

THEOREM $D_{\delta-1}^{\mathrm{k}+\mathrm{l}}$ is closed under composition and inversion, thus is a group (in fact, a topological group). Moreover, $\mathrm{D}_{\delta-1}^{\mathrm{k}+1}$ operates continuously to the right on $W_{\delta}^{k^{\prime}}$ ( $\left.k^{\prime} \leq k+1, \delta^{\prime} \in \underline{R}\right)$ by pullback:

$$
\left[\begin{array}{rl}
W_{\delta \prime}^{k^{\prime}} \times D_{\delta-l}^{k+l} & \rightarrow W_{\delta^{\prime}}^{k^{\prime}} \\
\quad(f, \phi) & \rightarrow \phi^{*} f(=f \circ \phi) .
\end{array}\right.
$$

Terminology: A diffeomorphism $\phi: \underline{R}^{n} \rightarrow \underline{R}^{n}$ is called an asymptotic symmetry of class ( $k, \delta$ ) if $\phi \oplus_{\delta-1}^{k+1}$.

LEMMA Let $\phi \in D_{\delta-1}^{k+1}$. Suppose that $T \in D_{q}^{0}\left(\underline{R}^{n}\right)(q>0)$ is in $W_{\delta^{\prime}}^{k^{\prime}}\left(k^{\prime} \leq k, \delta^{\prime} \in \underline{R}\right)-$ then the same is true of $\phi^{*} T$.
[Take $q=2$ and write

$$
\left(\phi^{*} T\right)_{i j}=\sum_{a, b=1}^{n} \frac{\partial\left(x^{a} \circ \phi\right)}{\partial x^{i}} \frac{\partial\left(x^{b} \circ \phi\right)}{\partial x^{j}} T\left(\partial_{a}, \partial_{b}\right) \circ \phi
$$

$$
=\sum_{a, b=1}^{n}\left(\delta_{i}^{a}+F_{i}^{a}\right)\left(\delta_{j}^{b}+F_{j}^{b}\right) T_{a b} \circ \phi
$$

Here

$$
\left[\begin{array}{l}
F_{i^{\prime}}^{\mathrm{a}} \mathrm{~F}^{\mathrm{b}}{ }_{j} \in W_{\delta}^{k} \\
\mathrm{~T}_{\mathrm{ab}} \circ \phi \in W_{\delta^{\prime}}^{k}
\end{array}\right.
$$

But $\mathrm{k}>\frac{\mathrm{n}}{2}, \delta>-\frac{\mathrm{n}}{2}$, and $\mathrm{k}^{\prime} \leq \mathrm{k}$, which implies that the product of an element in $W_{\delta}^{k}$ with an element of $W_{\delta^{\prime}}^{k^{\prime}}$ is again in $\left.W_{\delta^{\prime}}^{k^{\prime}}.\right]$

The definition of $W_{\delta}^{k}$ can be extended in the obvious way to "sufficiently regular" open subsets of $\underline{R}^{n}$, e.g., to

## exterior domains:

$$
\mathrm{E}_{\mathrm{R}}=\{\mathrm{x}:|\mathrm{x}|>\mathrm{R}\}
$$

or
annular domains:

$$
A_{-R}=\{x: R<|x|<2 R\}
$$

Suppose that $f \in W_{\delta}^{k}\left(E_{R}\right) \quad(R \geq 1)$-- then for elementary reasons,

$$
\|f\|_{W_{\delta}^{k}\left(\mathcal{A}_{R}\right)} \doteq R^{\delta+\frac{n}{2}}| | S_{R^{f}}| |_{H^{k}\left(\underline{A}_{1}\right)},
$$

the implicit positive constants being independent of $R, f$, and where, as before $\left(S_{R} f\right)(x)=f(R X):$

LEMMA If $k>\frac{n}{2}$, then

$$
\sup _{A_{-R}} \sigma^{\delta+\frac{n}{2}}|f| \leq K| | f| |_{W_{\delta}^{k}\left(A_{R}\right)}(R \geq 1) .
$$

[Applying the usual Sobolev inequality to $S_{R} f$ on $A_{-1}$, for $x \in A_{R}$ we have

$$
\begin{aligned}
& \sigma^{\delta+\frac{n}{2}}(x)|f(x)| \leq \sqrt{5} R^{\delta+\frac{n}{2}}|f(x)| \\
& \leq \sqrt{5} \mathrm{R}^{\delta+\frac{n}{2}} \sup _{\mathrm{A}_{\mathrm{R}}}|\mathrm{f}(\mathrm{x})| \\
& =\sqrt{5} R^{\delta+\frac{n}{2}} \sup _{{\underset{A}{1}}^{1}}|f(\mathrm{Rx})| \\
& \leq \sqrt{5} C\left(\underline{A}_{1}\right) R^{\delta+\frac{n}{2}}\left\|\mid S_{R^{f}}\right\|_{H^{k}\left(\underline{A}_{1}\right)} \\
& \left.\leq \sqrt{5} \mathrm{C}\left(\mathrm{~A}_{1}\right) \mathrm{C}| | \mathrm{f}| |{\underset{W}{\mathrm{~W}}\left(\mathrm{~A}_{-\mathrm{R}}\right)} \cdot\right]
\end{aligned}
$$

[Note: $K>0$ is independent of $R, f$.

Let $\mathrm{f} \in \mathrm{W}_{\delta}^{\mathrm{k}}$ and take $\mathrm{k}>\frac{\mathrm{n}}{2}$-- then the estimate

$$
\sigma^{c}|f|=o(1) \quad\left(c<\delta+\frac{n}{2}\right)
$$

can be sharpened to

$$
\sigma^{\delta+\frac{n}{2}}|f|=o(1)
$$

To see this, just note that

$$
\|f\|_{W_{\delta}^{k}}<\infty \Rightarrow\|f\|_{W_{\delta}^{k}\left(A_{R}\right)}=o(I)
$$

and then quote the lemma.
previous section, it will be assumed that $n \geq 3$.
Definition: Let $q$ be a riemannian structure on $\underline{\underline{R}}^{n}$ - then $q$ is said to be asymptotically euclidean of class $(k, \delta)\left(k>\frac{n}{2}, \delta>-\frac{n}{2}\right)$ if

$$
q-n \in W_{\delta}^{k}
$$

[Note: Here $\eta$ is the usual flat metric on $\underline{R}^{n}$.]

SUBLEMMA Let $\phi \in D_{\delta-1}^{k+1}$-- then

$$
\phi_{\star} \eta-n \in W_{\delta^{\prime}}^{k}
$$

hence $\phi_{\star} n$ is asymptotically euclidean of class $(k, \delta)$.
[We have

$$
\begin{aligned}
\left(\phi_{\star} \eta\right)_{i j} & =\sum_{a, b=1}^{n} \frac{\partial\left(x^{a} \circ \phi^{-1}\right)}{\partial x^{i}} \frac{\partial\left(x^{b} \circ \phi^{-1}\right)}{\partial x^{j}} \eta\left(\partial_{a}, \partial_{b}\right) \circ \phi^{-1} \\
& =\sum_{a, b=1}^{n} \frac{\partial\left(x^{a} \circ \phi^{-1}\right)}{\partial x^{i}} \frac{\partial\left(x^{b} \circ \phi^{-1}\right)}{\partial x^{j}} \eta_{a b} \\
& =\sum_{a=1}^{n} \frac{\partial\left(x^{a} \circ \phi^{-1}\right)}{\partial x^{i}} \frac{\partial\left(x^{a} \circ \phi^{-1}\right)}{\partial x^{j}} .
\end{aligned}
$$

But

$$
\begin{array}{ll} 
& \phi^{-1} \in D_{\delta-1}^{k+1} \\
& \phi^{-1}-I \in W_{\delta-1}^{k+1}
\end{array}
$$

$$
\Rightarrow
$$

$$
x^{a} \circ \phi^{-1}-x^{a} \in N_{\delta-1}^{k+1}
$$

=>

$$
\frac{\partial\left(x^{a} \circ \phi^{-1}\right)}{\partial x^{b}}=\delta_{b}^{a}+F_{b^{\prime}}^{a}
$$

where $F_{b}^{a} E W_{\delta}^{k}$. Therefore

$$
\begin{aligned}
& \left(\phi_{*} \eta\right)_{i j}=\sum_{a=1}^{n}\left(\delta_{i}^{a}+F_{i}^{a}\right)\left(\delta_{j}^{a}+F_{j}^{a}\right) \\
& =\sum_{a=1}^{n} \delta_{i}^{a} \delta_{j}^{b}+F_{j}^{i}+F_{i}^{j}+\sum_{a=1}^{n} F_{i}^{a} F_{j}^{a} \\
& =\eta_{i j}+F_{j}^{i}+F_{i}^{j}+\sum_{a=1}^{n} F_{i}^{a}{ }_{i} F_{j}^{a} \\
\Rightarrow \quad & \left(\phi_{*} \eta\right)_{i j}-\eta_{i j}=F_{j}^{i}+F_{i}^{j}+\sum_{a=1}^{n} F_{i}^{a} F_{j}^{a}
\end{aligned}
$$

And the RHS of this equation is in $W_{\delta}^{k}$.]
[Note: Recall that $W_{\delta}^{k}$ is closed under the formation of products $\left.\left(\mathrm{k}>\frac{\mathrm{n}}{2}, \delta>-\frac{\mathrm{n}}{2}\right).\right]$

LEMMA Suppose that $q$ is asymptotically euclidean of class ( $k, \delta$ ) -- then $\forall \phi \in D_{\delta-1}^{k+1}, \phi_{*} q$ is asymptotically euclidean of class $(k, \delta)$.
[Bearing in mind that $q-n \in D_{2}^{0}\left(\underline{R}^{n}\right)\left(\Rightarrow \phi_{*}(q-n) \in W_{\delta}^{k}\right)$, one has only to write

$$
\phi_{*} q-\eta=\phi_{*} q-\phi_{*} \eta+\phi_{*} \eta-\eta
$$

$$
\left.=\phi_{*}(q-\eta)+\phi_{*} \eta-\eta_{.}\right]
$$

From this point on, it will be assumed that $n=3$. Therefore the threshold values for ( $k, \delta$ ) are

$$
\left.\right|_{\quad} \quad \begin{array}{r}
\mathrm{k}>\frac{3}{2} \\
\delta>-\frac{3}{2}
\end{array}
$$

Obviously,

$$
C_{1}^{k}=W_{\delta}^{k} \quad\left(-\frac{3}{2}<\delta<-\frac{1}{2}\right) .
$$

In particular:

$$
c_{1}^{k} \subset W_{-1}^{k} .
$$

On the other hand,

$$
W_{\delta}^{k} c C_{\delta \prime}^{k-2} \quad\left(\delta^{\prime}<\delta+\frac{3}{2}\right) .
$$

N.B.

$$
f \in W_{\delta}^{2} \Rightarrow r^{\delta+\frac{3}{2}}|f|=o(1) .
$$

So

$$
f \in W_{-1}^{2} \Rightarrow r^{\frac{1}{2}}|f|=o(1) .
$$

LEMMA Suppose that $q$ is asymptotically euclidean of class $(k, \delta)$-- then

$$
q^{i j}-\eta_{i j} \in \omega_{\delta}^{2}
$$

The proof of this hinges on some preliminary considerations. To begin with, we claim that

$$
\operatorname{det} q-1 \in W_{\delta}^{k}
$$

Thus write

$$
\begin{aligned}
& \operatorname{det} q=\left|\begin{array}{lll}
q_{11} & q_{12} & q_{13} \\
q_{21} & q_{22} & q_{23} \\
q_{31} & q_{32} & q_{33}
\end{array}\right| \\
& =q_{11}\left|\begin{array}{ll|ll|ll}
q_{22} & q_{23} \\
q_{32} & q_{33}
\end{array}\right|-q_{21}\left|\begin{array}{ll}
q_{12} & q_{13} \\
& \\
q_{32} & q_{33}
\end{array}\right|+q_{31}\left|\begin{array}{ll}
q_{12} & q_{13} \\
& \\
q_{22} & q_{23}
\end{array}\right| . \\
& \text { - } q_{11}\left(q_{22} q_{33}-q_{23} q_{32}\right) \\
& =\left(q_{11}-1+1\right)\left(\left(q_{22}-1+1\right)\left(q_{33}-1+1\right)-q_{23} q_{32}\right) \\
& =\left(q_{11}-1+1\right)\left(\left(q_{22}-1\right)\left(q_{33}-1\right)\right. \\
& \left.+\left(q_{22}-1\right)+\left(q_{33}-1\right)-q_{23} q_{32}+1\right) \\
& =\left(q_{11}-1\right)\left(q_{22}-1\right)\left(q_{33}-1\right) \\
& +\left(q_{11}-1\right)\left(q_{22}-1\right)+\left(q_{11}-1\right)\left(q_{33}-1\right) \\
& -\left(q_{11}-1\right)\left(q_{23} q_{32}\right)+\left(q_{11}-1\right)
\end{aligned}
$$

$$
\begin{aligned}
+\left(q_{22}-1\right)\left(q_{33}-1\right) & +\left(q_{22}-1\right)+\left(q_{33}-1\right)-q_{23} q_{32} \\
& +1
\end{aligned}
$$

$$
\begin{aligned}
& -q_{21}\left(q_{12} q_{33}-q_{13} q_{32}\right) \\
& \quad=-q_{21}\left(q_{12}\left(q_{33}-1+1\right)-q_{13} q_{32}\right) \\
& \quad=-q_{21}\left(q_{12}\left(q_{33}-1\right)+q_{12}-q_{13} q_{32}\right)
\end{aligned}
$$

- $q_{31}\left(q_{12} q_{23}-q_{13} q_{22}\right)$

$$
\begin{aligned}
& =q_{31}\left(q_{12} q_{23}-q_{13}\left(q_{22}-1+1\right)\right) \\
& =q_{31}\left(q_{12} q_{23}-q_{13}\left(q_{22}-1\right)-q_{13}\right)
\end{aligned}
$$

Now move the +1 to the other side and use the fact that $W_{\delta}^{k}$ is an algebra. Since $\operatorname{det} q>0$ and since $\operatorname{det} q-1 \in W_{\delta^{\prime}}^{k}$, hence is $O\left(\frac{l}{r^{\varepsilon}}\right)$ for some $\varepsilon>0$, it follows that $\exists C_{1}>0, C_{2}>0$ :

$$
\mathrm{C}_{1} \leq \operatorname{det} \mathrm{q} \leq \mathrm{C}_{2} .
$$

Observation:

$$
\begin{aligned}
& \quad(\operatorname{det} q) q^{i j}=\operatorname{cof} q_{i j} \\
\Rightarrow \quad & (\operatorname{det} q) q^{i j}-\eta_{i j} \in W_{\delta}^{k}
\end{aligned}
$$

With this preparation, the verification that

$$
\int_{\mathbb{R}^{3}} \sigma^{2 \delta}\left|q^{i j}-\eta_{i j}\right|^{2} d^{3} x<\infty
$$

6. 

is straightforward.
i $\neq j$ : We have

$$
\begin{aligned}
\int_{\mathbb{R}^{3}} & \sigma^{2 \delta}\left|q^{i j}\right|^{2} d^{3} x \\
& =\int_{\underline{R}^{3}} \frac{1}{(\operatorname{det} q)^{2}} \sigma^{2 \delta}\left|(\operatorname{det} q) q^{i j}\right|^{2} d^{3} x \\
& \left.\leq \frac{1}{C_{l}^{2}} \int_{\underline{R}^{3}} \sigma^{2 \delta} \right\rvert\,\left.(\text { get } q) q^{i j}\right|^{2} d^{3} x<\infty .
\end{aligned}
$$

$i=j:$ We have

$$
\begin{aligned}
\int_{\underline{R}^{3}} & \sigma^{2 \delta}\left|q^{i i}-1\right|^{2} d^{3} x \\
& =\int_{\underline{R}^{3}} \frac{1}{(\operatorname{det} q)^{2}} \sigma^{2 \delta}\left|(\operatorname{det} q)\left(q^{i i}-1\right)\right|^{2} d^{3} x \\
& \left.\leq \frac{1}{C_{1}^{2}} \int_{\mathbb{R}^{3}} \sigma^{2 \delta} \right\rvert\,\left.(\text { get } q)\left(q^{i i}-1\right)\right|^{2} d^{3} x
\end{aligned}
$$

But

$$
(\operatorname{det} q)\left(q^{i i}-1\right)
$$

$$
=(\operatorname{det} q) q^{i i}-1+(1-\operatorname{det} q)
$$

And both

$$
\left[\begin{array}{l}
(\operatorname{det} q) q^{i i}-1 \\
1-\operatorname{det} q
\end{array}\right.
$$

are in $L_{\delta}^{2}$, hence so is their sum.

Notation: $Q_{A E}(k, \delta)$ is the set of asymtotically euclidean riemannian structures on $\underline{R}^{3}$ of class $(k, \delta)(k \geq 2, \delta \geq-1)$.
[Note: Accordingly, $\forall(k, \delta), W_{\delta}^{k} \subset W_{-1}^{2}$ and

$$
\left.Q_{A E}(k, \delta) \subset Q_{A E}(2,-1) .\right]
$$

Remark: If $q$ is asymptotically flat, then $q$ is asymptotically euclidean of class $(2,-1)$, i.e.,

$$
Q_{\infty} \subset Q_{A E}(2,-1)
$$

Let $q \in Q_{A E}(2,-1)-$ then $q$ is said to satisfy the integrability condition if

$$
\int_{\underline{R}^{3}}|S(q)| d^{3} x<\infty .
$$

[Note: In view of the relation

$$
\sqrt{\mathrm{C}}_{1} \leq \sqrt{\mathrm{q}} \leq{\sqrt{\mathrm{C}_{2}}}^{\prime}
$$

it is clear that $q$ satisfies the integrability condition iff

$$
\left.\int_{R^{3}}|S(q)| \sqrt{q} d^{3} x<\infty .\right]
$$

To recast the integrability condition, write

$$
S(q)=q^{j \ell}\left(\Gamma_{\ell j, i}^{i}-\Gamma_{i j, \ell}^{i}+\Gamma_{\ell j^{\Gamma^{i}}}^{i a}-\Gamma_{i j}^{a} \Gamma_{\ell a}^{i}\right) .
$$

Since the $q^{a b}$ are $O(1)$ and the $q_{a b, c} \in W_{0}^{1} c N_{0}^{0}=L^{2}\left(\underline{R}^{3}\right)$, any product of the form

$$
o(1) q_{i j, k} q_{i} j^{\prime}, k '
$$

is integrable. Therefore

$$
q^{j \ell}\left(\Gamma_{\ell j^{\mathrm{a}}}{ }_{i a}^{i}-\Gamma_{i j}^{\mathrm{a}} \Gamma_{\ell \mathrm{I}^{i}}\right) \in \mathrm{L}^{1}\left(\underline{R}^{3}\right) .
$$

Next

$$
\begin{aligned}
& q^{j \ell}\left(\Gamma_{\ell j, i}^{i}-r_{i j, \ell}^{i}\right) \\
& \quad=\frac{1}{2} q^{j \ell}\left[\left(\partial_{i} q^{i k}\right)\left(q_{k \ell, j}+q_{k j, \ell}-q_{\ell j, k}\right)\right] \\
& \quad-\frac{1}{2} q^{j \ell}\left[\left(\partial_{\ell} q^{i k}\right)\left(q_{k i, j}+q_{k j, i}-q_{i j, k}\right)\right] \\
& \quad \\
& \quad+q^{i j} q^{k \ell}\left(q_{i k, j, \ell}-q_{i j, k, \ell}\right) .
\end{aligned}
$$

The first and second terms are integrable. Indeed

$$
\left[\begin{array}{l}
\partial_{i} q^{i k}=-q^{i u_{q v, i} q^{v k}} \\
\partial_{\ell} q^{i k}=-q^{i u_{q v, \ell}} q_{u k}^{v k}
\end{array}\right.
$$

so the preceding reasoning is applicable. The integrability of $S(q)$ is thus equivalent to the integrability of

$$
q^{i j} q^{k \ell}\left(q_{i k, j, \ell}-q_{i j, k, l}\right) .
$$

Now write

$$
\begin{aligned}
& \quad q^{i j} q^{k \ell}\left(q_{i k, j, \ell}-q_{i j, k, \ell}\right) \\
& \quad=q_{i \ell, i, \ell}-q_{i i, \ell, \ell} \\
& +\left(\left(q^{i j}-\eta_{i j}\right) q^{k \ell}+\eta_{i j}\left(q^{k \ell}-\eta_{k \ell}\right)\right)\left(q_{i k, j, \ell}-q_{i j, k, \ell}\right)
\end{aligned}
$$

We have

$$
\begin{aligned}
& \Gamma^{-} q_{i k, j, \ell} \\
& \in W_{1}^{0} \equiv L_{1}^{2} . \\
& q_{i j, k, \ell}
\end{aligned}
$$

On the other hand, thanks to the lemma above,

$$
\left[\begin{array}{lll}
q^{i j}-\eta_{i j} & & \\
& & \in_{-1}^{2}(\delta=-1) \\
q^{k \ell}-\eta_{k \ell} &
\end{array}\right.
$$

But the product of an element in $L_{1}^{2}$ with an element in $L_{-1}^{2}$ is integrable. And multiplying such a product by a term which is $O(1)$ does not affect integrability. Therefore

$$
\left(\left(q^{i j}-n_{i j}\right) q^{k \ell}+n_{i j}\left(q^{k \ell}-n_{k \ell}\right)\right)\left(q_{i k, j, \ell}-q_{i j, k, \ell}\right)
$$

is integrable.
Let

$$
x=x^{l} \frac{\partial}{\partial x^{l}}
$$

where

$$
x^{\ell}=q_{i \ell, i}-q_{i i, \ell}
$$

Scholium:

$$
S(q) \in U^{1}\left(\underline{R}^{3}\right) \Leftrightarrow \operatorname{div} X \in L^{1}\left(\underline{R}^{3}\right)
$$

Consequently, if q satisfies the integrability condition, then

$$
\begin{aligned}
\int_{\underline{R}^{3}}(\operatorname{div} x) d^{3} x & =\lim _{R \rightarrow \infty} \int_{\underline{D}^{3}(R)}(\operatorname{div} X) d^{3} x \\
& =\lim _{R \rightarrow \infty} \int_{S^{2}(R)}(X \cdot \underline{n}) \omega_{R}^{2}
\end{aligned}
$$

10. 

I.e.:

$$
\delta_{\underline{s}^{2}(\infty)}\left(q_{i \ell, i}-q_{i i, \ell}\right) \Omega_{\infty}^{\ell}
$$

exists.

Remark: In the literature, it is sometimes asserted that $S(q)$ is integrable iff

$$
\int_{\underline{S}^{2}(\infty)}\left(q_{i \ell, i}-q_{i i, \ell}\right) \Omega_{\infty}^{\ell}
$$

exists, a statement which is patently false. The point, of course, is that an improper integral is not necessarily a Lebesgue integral, hence the mere existence of

$$
\begin{aligned}
\lim _{R \rightarrow \infty} & \delta_{\underline{S}^{2}(R)}(X \cdot \underline{n}) \omega_{R}^{2} \\
& =\lim _{R \rightarrow \infty} \int_{\underline{D}^{3}(R)}(\operatorname{div} X) d^{3} x
\end{aligned}
$$

does not imply that div $X \in L^{1}\left(\underline{R}^{3}\right)$.

Let $Q_{A E}^{*}(k, \delta)$ stand for the subset of $Q_{A E}(k, \delta)$ consisting of those $q$ which satisfy the integrability condition.

LEEMMA Suppose that $q \in Q_{A E}^{*}(k, \delta)-$ then $\forall \phi \in D_{\delta-1}^{k+1}, \phi_{*} q \in Q_{A E}^{*}(k, \delta)$.
[Earlier considerations imply that $\phi_{\star} G \in Q_{A E}(k, \delta)$. This said, let $\psi=\phi^{-1}$, thus $\psi^{*}=\phi_{*}$ and

$$
\mathrm{S}\left(\phi_{*} \mathrm{q}\right)=\mathrm{S}\left(\psi^{*} \mathrm{q}\right)=\mathrm{S}(\mathrm{q}) \circ \psi
$$

11. 

Fix $C>0: \operatorname{det}(D \psi) \geq C>0$. Put $y=\psi(x)-$ then $d^{3} y=\operatorname{det}(D \psi) d^{3} x$ and

$$
\begin{aligned}
& \int_{\underline{R}^{3}}|S(q)(\psi(x))| d^{3} x \\
&=\int_{\underline{R}^{3}}|S(q)(y)| \frac{1}{\operatorname{det}(D \psi)} d^{3} y \\
&\left.\quad \leq \frac{1}{C} \int_{\underline{R}^{3}}|S(q)(y)| d^{3} y<\infty_{0}\right]
\end{aligned}
$$

Definition: The energy is the function

$$
\mathrm{P}^{0}: \mathrm{Q}_{\mathrm{A} E}^{*}(\mathrm{k}, \delta) \rightarrow \underline{R}
$$

given by the prescription

$$
P^{0}(q)=\int_{\underline{s^{2}}(\infty)}\left(q_{i \ell, i}-q_{i i, \ell}\right) \Omega_{\infty}^{\ell} .
$$

N.B. If the partial derivatives of $q_{i j}$ are $O\left(\frac{1}{r^{2+\varepsilon}}\right)$, then $P^{0}(q)=0$.

Example: Let

$$
\mathrm{q}=\mathrm{u}^{4} \mathrm{n}
$$

where $u \in C_{>0}^{\infty}\left(\underline{R}^{3}\right)$ and for $r \gg 0$,

$$
u=1+\frac{A}{r}+\mu\left(\mu=0^{\infty}\left(\frac{1}{r^{2}}\right)\right) .
$$

Then $q$ is asymptotically flat (hence $q \in Q_{A E}(2,-1)$ ) and

$$
\mathrm{P}^{0}(\mathrm{q})=32 \pi \mathrm{~A} .
$$

To begin with:

$$
\begin{gathered}
\text { 1. } \partial_{i}\left(u^{4} \eta_{i 1}\right)=\partial_{1}\left(u^{4}\right) \\
\text { 2. } \partial_{i}\left(u^{4} \eta_{i 2}\right)=\partial_{2}\left(u^{4}\right) . \\
\text { 3. } \partial_{i}\left(u^{4} \eta_{i 3}\right)=\partial_{3}\left(u^{4}\right) . \\
\text { 4. }-\partial_{1}\left(u^{4} \eta_{i i}\right)=-\partial_{1}\left(3 u^{4}\right) . \\
\text { 5. }-\partial_{2}\left(u^{4} \eta_{i i}\right)=-\partial_{2}\left(3 u^{4}\right) . \\
\Rightarrow \quad-\partial_{3}\left(u^{4} \eta_{i i}\right)=-\partial_{3}\left(3 u^{4}\right) . \\
\Rightarrow \quad 1-4=-2 \partial_{1} u^{4} \\
2-5=-2 \partial_{2} u^{4} . \\
3-6=-2 \partial_{3} u^{4} .
\end{gathered}
$$

But

$$
\begin{aligned}
& \left(1+\frac{A}{r}+\mu\right)^{4} \\
= & \left(1+\frac{A}{r}\right)^{4}+4\left(1+\frac{A}{r}\right)^{3} \mu \\
& +6\left(1+\frac{A}{r}\right)^{2} \mu^{2}+4\left(1+\frac{A}{r}\right) \mu^{3}+\mu^{4}
\end{aligned}
$$

Therefore the only term that is relevant is

$$
\left(1+\frac{A}{r}\right)^{4}=1+\frac{4 A}{r}+\frac{6 A^{2}}{r^{2}}+\frac{4 A^{3}}{r^{3}}+\frac{A^{4}}{r^{4}} .
$$

However, of the terms on the RHS, only

$$
\frac{4 A}{r}
$$

can contribute and we have

$$
\partial_{1}\left(\frac{1}{r}\right)=-\frac{x^{1}}{r^{3}}, \partial_{2}\left(\frac{1}{r}\right)=-\frac{x^{2}}{r^{3}}, \partial_{3}\left(\frac{l}{r}\right)=-\frac{x^{3}}{r^{3}} .
$$

Taking $R \gg 0$, matters thus reduce to

$$
\begin{aligned}
& 8 A R^{2} \int_{0}^{2 \pi} \int_{0}^{\pi}\left(\cos \theta \sin \phi\left(\frac{R \cos \theta \sin \phi}{R^{3}}\right)\right. \\
+ & \left.\sin \theta \sin \phi\left(\frac{R \sin \theta \sin \phi}{R^{3}}\right)+\cos \phi\left(\frac{R \cos \phi}{R^{3}}\right)\right) \sin \phi d \phi d \theta \\
= & 8 A \cdot 4 \pi=32 \pi A .
\end{aligned}
$$

[Note: This is a legal computation. It does not depend on whether $S(q) \in L^{l}\left(\underline{R}^{3}\right)$ or, equivalently, whether $\operatorname{div} X \in U^{l}\left(\underline{R}^{3}\right)$. In the case at hand,

$$
\begin{aligned}
& q_{i \ell, i, \ell}-q_{i i, \ell, \ell} \\
& \quad=-2\left[\partial_{1} \partial_{1} u^{4}+\partial_{2} \partial_{2} u^{4}+\partial_{3} \partial_{3} u^{4}\right]
\end{aligned}
$$

and since $\mu=0^{\infty}\left(\frac{l}{r^{2}}\right)$, it can be set equal to zero. The potential trouble then lies with the divergence of

$$
\left(\frac{x^{1}}{r^{3}}, \frac{x^{2}}{r^{3}}, \frac{x^{3}}{r^{3}}\right)
$$

## 14.

there being no actual difficulty in that

$$
\operatorname{div} \frac{\vec{r}}{r^{3}}=0
$$

So, in this situation, $\mathrm{S}(\mathrm{q}) \in \mathrm{L}^{l}\left(\underline{\mathrm{R}}^{3}\right)$.

Exercise: Suppose that for $r \gg 0$,

$$
u=1+\frac{A}{r}+\sum_{i=1}^{3} B_{i} \frac{x^{i}}{r^{3}}+\mu\left(\mu=0^{\infty}\left(\frac{1}{r^{3}}\right)\right) .
$$

Then

$$
B_{i}=\frac{3}{64 \pi}{\underset{\underline{s}}{ }}^{2}(\infty) \quad x^{i}\left(q_{i \ell, i}-q_{i i, \ell}\right) \Omega_{\infty}^{\ell} .
$$

Given $q \in Q_{A E}^{*}(k, \delta)$, let $O_{q}$ be its orbit under the left action of $D_{\delta-1}^{k+1}$ by pushforward:

$$
o_{q}=\left\{\phi_{*} q: \phi \in D_{\delta-1}^{k+1}\right\}
$$

The lenma implies that $P^{0}$ is finite on $0_{q}$. However, much more is true: $P^{0}$ is constant on $\mathrm{O}_{\mathrm{q}}$.

THEOREM Let $q \in Q_{A E}^{*}(k, \delta)-$ then $\forall \phi \in D_{\delta-1}^{k+1}$

$$
P^{0}\left(\phi_{*} q\right)=P^{0}(q) .
$$

The most difficult case is when $k=2, \delta=-1$, so we'11 concentrate on it. Estimation Principle $F i x R_{0} \geq 1$. Suppose that $f \in W_{0}^{1}\left(E_{R_{0}}\right)$-- then

$$
\int_{\underline{S}^{2}(R)}|f| d \Omega=o\left(R^{\frac{1}{2}}\right)
$$

[Start with the fact that

$$
\left\|\left.f\right|_{W_{0}^{1}\left(\mathcal{A}_{R}\right)} \doteq R^{\frac{3}{2}}| | S_{R} f\right\|_{H^{1}\left(\underline{A}_{1}\right)}\left(R \geq R_{0}\right) .
$$

Next, in view of the trace theorem from ordinary Sobolev theory (viz. that restriction to a compact hypersurface entails the loss of one half of a derivative),

$$
S_{R} f \in H^{1}\left(\underline{A}_{1}\right) \Rightarrow S_{R} f \left\lvert\, \underline{S}^{2} \in H^{\frac{1}{2}}\left(\underline{S}^{2}\right)\right.
$$

with

$$
\left\|\operatorname{H}_{H^{2}}\right\|_{\left(\underline{s}^{2}\right)} \leq C\left\|S_{R} f\right\|_{H^{1}\left(\underline{A}_{1}\right)} .
$$

On general grounds,

$$
H^{s}\left(\underline{S}^{2}\right) \subset L^{q}\left(\underline{S}^{2}\right)
$$

if

$$
\frac{l}{q}=\frac{1}{2}-\frac{s}{2} .
$$

In particular:

$$
H^{\frac{1}{2}}\left(\underline{S}^{2}\right) \subset L^{4}\left(\underline{S}^{2}\right)
$$

Therefore

$$
\begin{gathered}
\int_{\underline{S}^{2}(R)}|f| d \Omega=R^{2} \int_{\underline{S}^{2}}\left|S_{R} f\right| d \Omega \\
\quad=R^{2}| | S_{R} f| |_{L}{ }^{1}\left(\underline{S}^{2}\right)
\end{gathered}
$$

$$
\begin{aligned}
& \leq C R^{2}| | S_{R}\left\|_{L}\right\|_{\left(\underline{S}^{2}\right)} \\
& \leq C R^{2}| | S_{R} f| | \\
& H^{\frac{1}{2}}\left(\underline{S}^{2}\right) \\
& \leq C R^{2}| | S_{R^{f}} \|_{H^{1}\left(\mathcal{A}_{1}\right)} \\
& \leq C R^{\frac{1}{2}}| | f| |_{W_{0}^{1}\left(A_{R}\right)} \\
& \leq R^{\frac{1}{2}} \mathrm{O}(1) \\
& \text { => } \\
& \left.\int_{\underline{S}^{2}(R)}|f| d \Omega=o\left(R^{\frac{1}{2}}\right) .\right]
\end{aligned}
$$

[Note: As usual in estimates of this type, $C$ is a positive constant that can vary from line to line.]

Application: If $f \in W_{0}^{1}$ and $F \in W_{-1}^{2}$, then

$$
\int_{\underline{S}^{2}(R)}|\mathrm{f}| \cdot|\mathrm{F}| \mathrm{d} \Omega=o(1)
$$

[Recall that

$$
F \in W_{-1}^{2} \Rightarrow F=o\left(R^{-\frac{1}{2}}\right)
$$

so

$$
\mathrm{R}^{\frac{1}{2}}|\mathrm{~F}| \leq \mathrm{C}
$$

## But then

$$
\begin{aligned}
& \int_{\underline{s}^{2}(R)}|f| \cdot|F| d \Omega \\
& \quad=\int_{\underline{S}^{2}(R)} R^{-\frac{1}{2}}|f| \cdot R^{\frac{1}{2}}|F| d \Omega \\
& \quad \leq C^{-\frac{1}{2}} \int_{S^{2}(R)}|f| d \Omega \\
& \quad=C R^{-\frac{1}{2}}{ }_{O\left(R^{\left.\frac{1}{2}\right)}\right.} \\
& \quad=O(1) \cdot]
\end{aligned}
$$

Passing to the proof of the theorem, we shall begin with the special situation when $q=n$, the objective being to show that $P^{0}\left(\phi_{*} \eta\right)=0$.

Let $y^{a}=x^{a} \circ \phi^{-1}-$ then

$$
\begin{aligned}
& { }^{\left(\phi_{\star} \eta\right)_{i \ell, i}-\left(\phi_{\star} \eta\right)_{i i}, \ell} \\
& =\partial_{i}\left(y_{, i}^{a} y_{, \ell}^{a}\right)-\partial_{\ell}\left(y_{, i}^{a} y_{, i}^{a}\right)
\end{aligned}
$$

$$
\begin{aligned}
& =y_{, i, i}^{\mathrm{a}} \mathrm{Y}_{, \ell}^{\mathrm{a}}-\mathrm{y}_{, i, \ell}^{\mathrm{a}} \mathrm{Y}_{, i}^{\mathrm{a}} \\
& =\partial_{i i}^{2} y^{a} \partial_{\ell} y^{a}-\partial_{i \ell}^{2} y^{a} \partial_{i} y^{a}
\end{aligned}
$$

$$
\begin{aligned}
= & \partial_{i i}^{2} Y^{a}\left(\partial_{\ell} y^{a}-\delta_{\ell}^{a}+\delta_{\ell}^{a}\right) \\
& \quad-\partial_{i \ell}^{2} Y^{a}\left(\partial_{i} y^{a}-\delta_{i}^{a}+\delta_{i}^{a}\right) \\
= & \partial_{i i}^{2} Y^{\ell}-\partial_{i \ell}^{2} Y^{i} \\
& \quad+\partial_{i i}^{2} Y^{a}\left(\partial_{\ell} Y^{a}-\delta_{\ell}^{a}\right)-\partial_{i \ell}^{2} Y^{a}\left(\partial_{i} Y^{a}-\delta_{i}^{a}\right) .
\end{aligned}
$$

- $y^{a}-x^{a} \in W_{-2}^{3}$

$$
\begin{aligned}
& \Rightarrow \quad y_{, b}^{a}-\delta_{b}^{a} \in W_{-1}^{2} \\
& \Rightarrow \quad y_{, b, c}^{a} \in W_{0}^{1} .
\end{aligned}
$$

Because of this, each of the terms

$$
\left[\begin{array}{l}
\partial_{i i}^{2} y^{a}\left(\partial_{\ell} y^{a}-\delta^{a}{ }_{\ell}\right) \\
\partial_{i \ell^{y}}^{2}{ }^{a}\left(\partial_{i} y^{a}-\delta^{a}{ }_{i}\right)
\end{array}\right.
$$

has the form $f \cdot F$, where $f \in W_{0}^{1}$ and $F \in W_{-1}^{2}$, so their integrals over $\underline{S}^{2}(R)$ will not contribute when $R \rightarrow \infty$. We are thus left with

$$
\partial_{i i}^{2} Y^{\ell}-\partial_{i \ell}^{2} Y^{i}
$$

Rappel: For any $X \in \mathcal{D}^{1}\left(\underline{R}^{3}\right)$,

$$
{ }_{x}\left(d x^{1} \wedge d x^{2} \wedge d x^{3}\right) \mid \underline{S}^{2}(R)=\langle x, \underline{n}\rangle w_{R}^{2}
$$

Therefore

$$
\left[\begin{array}{l}
l^{1} \frac{\partial}{\partial x^{1}}\left(d x^{1} \wedge d x^{2} \wedge d x^{3}\right)\left|\underline{S}^{2}(R)=d x^{2} \wedge d x^{3}\right| \underline{S}^{2}(R)=\frac{x^{1}}{R} \omega_{R}^{2} \\
{ }^{1} \frac{\partial}{\partial x^{2}}\left(d x^{1} \wedge d x^{2} \wedge d x^{3}\right)\left|\underline{S}^{2}(R)=-d x^{1} \wedge d x^{3}\right| \underline{S}^{2}(R)=\frac{x^{2}}{R} \omega_{R}^{2} \\
{ }^{1} \frac{\partial}{\partial x^{3}}\left(d x^{1} \wedge d x^{2} \wedge d x^{3}\right)\left|\underline{S}^{2}(R)=d x^{1} \wedge d x^{2}\right| \underline{S}^{2}(R)=\frac{x^{3}}{R} \omega_{R}^{2}
\end{array}\right.
$$

But

$$
\left[\begin{array}{l}
* d x^{1}=d x^{2} \wedge d x^{3} \\
* d x^{2}=-d x^{1} \wedge d x^{3} \\
\quad * d x^{3}=d x^{1} \wedge d x^{2}
\end{array}\right.
$$

Accordingly, in a mild abuse of notation,

$$
\int_{\underline{D}^{3}(R)} \operatorname{div} x=\int_{\underline{S}^{2}(R)}\left(x^{1} * d x^{1}+x^{2} * d x^{2}+x^{3} * d x^{3}\right)
$$

The relation $\mathrm{P}^{0}\left(\phi_{\star} \eta\right)=0$ then follows upon observing that

$$
\left(\partial_{i i}^{2} Y^{\ell}-\partial_{i \ell}^{2} Y^{i}\right) * d x^{\ell}=d\left(\varepsilon_{i k \ell} \partial_{i} Y^{l} d x x^{k}\right)
$$

Details To illustrate the procedure, note that the coefficient of $d x^{1} \Lambda d x^{2}$ on the LHS is

$$
\partial_{i}\left(\partial_{i} y^{3}-\partial_{3} y^{i}\right)
$$

or still,

$$
\begin{gathered}
\partial_{1} \partial_{1} y^{3}-\partial_{1} \partial_{3} y^{1}+\partial_{2} \partial_{2} y^{3}-\partial_{2} \partial_{3} y^{2}+\partial_{3} \partial_{3} y^{3}-\partial_{3} \partial_{3} y^{3} \\
=\partial_{1} \partial_{1} y^{3}-\partial_{1} \partial_{3} y^{1}+\partial_{2} \partial_{2} y^{3}-\partial_{2} \partial_{3} y^{2}
\end{gathered}
$$

As for the RHS, write

$$
\begin{aligned}
& d\left(\varepsilon_{i k \ell}{ }_{i} y^{\ell} d x x^{k}\right)=\varepsilon_{i k \ell} \partial_{j} \partial_{i} y^{\ell} d x j_{\Lambda d x}^{k} \\
& =\varepsilon_{i k l}{ }^{\partial_{j}}{ }^{\partial} i y^{1} d x{ }^{j} \wedge d x{ }^{k} \\
& +\varepsilon_{i k 2} \partial_{j} \partial_{i} y^{2} d x x^{j} \wedge d x{ }^{k}+\varepsilon_{i k 3} \partial_{j} \partial_{i} y^{3} d x j_{\wedge d x} k \\
& =\varepsilon_{i 21} \partial_{j} \partial_{i} y^{1} d x x^{j} \wedge d x{ }^{2}+\varepsilon_{i 31} \partial_{j} \partial_{i} y^{1} d x^{j} \wedge d x^{3} \\
& +\varepsilon_{i 12} \partial_{j} \partial_{i} y^{2} d x x^{j} \wedge d x^{1}+\varepsilon_{i 32}{ }_{j} \partial_{i} y^{2} d x^{j} \wedge d x^{3} \\
& +\varepsilon_{i 13} \partial_{j} \partial_{i} y^{3} d x^{j} \wedge d x^{1}+\varepsilon_{i 23} \partial_{j} \partial_{i} y^{3} d x^{j} \wedge d x^{2} .
\end{aligned}
$$

Then the coefficient of $d x^{1} \Lambda d x^{2}$ is

$$
\varepsilon_{i 21} \partial_{1} \partial_{i} Y^{1}-\varepsilon_{i 12} \partial_{2} \partial_{i} y^{2}-\varepsilon_{i 13} \partial_{2} \partial_{i} Y^{3}+\varepsilon_{i 23} \partial_{1} \partial_{i} y^{3}
$$

or still,

$$
\varepsilon_{321} \partial_{1} \partial_{3} y^{1}-\varepsilon_{312} \partial_{2} \partial_{3} y^{2}-\varepsilon_{213} \partial_{2} \partial_{2} y^{3}+\varepsilon_{123} \partial_{1} \partial_{1} y^{3}
$$

or still,

$$
-\partial_{1} \partial_{3} y^{1}-\partial_{2} \partial_{3} y^{2}+\partial_{2} \partial_{2} y^{3}+\partial_{1} \partial_{1} y^{3}
$$

as desired.

$$
\begin{aligned}
& \text { Passing now to the general case, let again } \psi=\phi^{-1} \text {-- then } \\
& \left.{ }^{\left(\psi^{*} q\right.}\right)_{i \ell, i}-\left(\psi^{*} q\right)_{i i, \ell} \\
& =\partial_{i}\left(\partial_{i} y^{a} \partial_{\ell} y^{b} q_{a b} \circ \psi\right)-\partial_{\ell}\left(\partial_{i} y^{a} \partial_{i} y^{b} q_{a b} \circ \psi\right) \\
& =\partial_{i i}^{2} y^{a} \partial_{\ell} y^{b} q_{a b} \circ \psi+\partial_{i} y^{a} \partial_{i \ell} \ell^{2} y^{b} q_{a b} \circ \psi+\partial_{i} y^{a} \partial_{\ell} y^{b} \partial_{i}\left(q_{a b} \circ \psi\right) \\
& -\partial_{\ell i}^{2} y^{a} \partial_{i} y^{b} q_{a b} \circ \psi-\partial_{i} y^{a} \partial_{\ell i}^{2} y^{b} q_{a b} \circ \psi-\partial_{i} y^{a} \partial_{i} y^{b} \partial_{\ell}\left(q_{a b} \circ \psi\right) \\
& =\partial_{i i}^{2} y^{a} \partial_{\ell} y^{b} q_{a b} \circ \psi+\partial_{i} y^{a} \partial_{\ell} y^{b} \partial_{i}\left(q_{a b} \circ \psi\right) \\
& -\partial_{\ell i}^{2} y^{a_{2}}{ }_{i} y^{b} q_{a b} \circ \psi-\partial_{i} y^{a^{a_{i}} y^{b} \partial_{\ell}\left(q_{a b} \circ \psi\right) .}
\end{aligned}
$$

To discuss

$$
\partial_{i i}^{2} y^{a} \partial_{\ell} y^{b} q_{a b} \circ \psi
$$

write

$$
\partial_{\ell} y^{b}=\partial_{\ell^{y}} y^{b}-\delta_{\ell}^{b}+\delta_{\ell}^{b}
$$

Then

$$
\begin{aligned}
& \partial_{i i}^{2} Y^{a} \partial_{\ell} Y^{b} q_{a b} \circ \psi \\
& \quad=\partial_{i i}^{2} y^{a}\left(\partial_{\ell} y^{b}-\delta_{\ell}^{b}\right) q_{a b} \circ \psi+\partial_{i i}^{2} y^{a} \delta^{b} \ell_{a b} \circ \psi \\
& \quad=\partial_{i i}^{2} Y^{a}\left(\partial_{\ell} y^{b}-\delta_{\ell}^{b}\right) q_{a b} \circ \psi+\partial_{i i}^{2} Y^{a} q_{a \ell} \circ \psi .
\end{aligned}
$$

Since $q \in Q_{A E}(2,-1)$, we have

$$
q_{a b}=\eta_{a b}+F_{a b^{\prime}}
$$

where $\mathrm{F}_{\mathrm{ab}} \mathrm{EW}_{-1}^{2}$, hence

$$
q_{a b} \circ \psi=\eta_{a b}+F_{a b} \circ \psi
$$

And still, $\mathrm{F}_{\mathrm{ab}} \circ{\psi \in W_{-1}}_{2}$. Therefore

$$
\begin{aligned}
& \partial_{i i}^{2} y^{a}\left(\partial_{\ell} y^{b}-\delta_{\ell}^{b}\right) q_{a b} \circ \psi \\
& =\partial_{i i}^{2} Y^{a}\left(\partial_{\ell} y^{b}-\delta_{\ell}^{b}\right) \eta_{a b} \\
& \quad \\
& \quad+\partial_{i i}^{2} Y^{a}\left(\partial_{\ell} y^{b}-\delta_{\ell}^{b}\right) F_{a b} \circ \psi .
\end{aligned}
$$

Recalling that $W_{-1}^{2}$ is closed under the formation of products, the upshot is that the integral of

$$
\partial_{i i}^{2} y^{a}\left(\partial_{\ell} y^{b}-\delta_{\ell}^{b}\right) q_{a b} \circ \psi
$$

over $\underline{S}^{2}(R)$ is $o(1)$. There remains
23.

$$
\partial_{i i}^{2} Y^{a} q_{a l} \circ \psi
$$

or, equivalently,

$$
\partial_{i i}^{2} y^{a}\left(q_{a \ell} \circ \psi-n_{a \ell}\right)+\partial_{i i}^{2} y^{a}\left(q_{a \ell} \circ \psi\right)
$$

But

$$
\partial_{i i}^{2} Y^{a}\left(q_{a \ell} \circ \psi-n_{a \ell}\right)
$$

is ignorable, leaving

$$
\partial_{i i}^{2} Y^{\ell}
$$

[Note: Analogously,

$$
-\partial_{\ell i}^{2} Y^{a} \partial_{i} y^{b} q_{a b} \circ \psi
$$

provides the contribution

$$
\left.-\partial_{i \ell}^{2} \ell^{i} \cdot\right]
$$

To discuss

$$
\partial_{i} y^{a} \partial_{\ell} y^{b} \partial_{i}\left(q_{a b} \circ \psi\right)
$$

write

$$
\left\{\begin{array}{l}
\partial_{i} y^{a}=\partial_{i} y^{a}-\delta_{i}^{a}+\delta_{i}^{a} \\
\partial_{\ell} y^{b}=\partial_{\ell} y^{b}-\delta_{\ell}^{b}+\delta_{\ell}^{b}
\end{array}\right.
$$

Then

$$
\partial_{i} y^{a^{2}} \partial_{\ell} y^{b} \partial_{i}\left(q_{a b} \circ \psi\right)
$$

$$
\begin{aligned}
& =\partial_{i} y^{a} \partial_{\ell} y^{b} \partial_{i}\left(q_{a b} \circ \psi-\eta_{a b}+\eta_{a b}\right) \\
& =\partial_{i} y^{a} \partial_{\ell} Y^{b} \partial_{i}\left(q_{a b} \circ \psi-\eta_{a b}\right) \\
& =\left(\partial_{i} y^{a}-\delta_{i}^{a}\right)\left(\partial_{\ell^{y}}{ }^{b}-\delta_{\ell}^{b}\right) \partial_{i}\left(q_{a b} \circ \psi-\eta_{a b}\right) \\
+\left(\partial_{i} y^{a}\right. & \left.-\delta_{i}^{a}\right) \delta^{b} \ell_{i}\left(q_{a b} \circ \psi-\eta_{a b}\right)+\delta_{i}^{a}\left(\partial_{\ell} y^{b}-\delta_{\ell}^{b}\right) \partial_{i}\left(q_{a b} \circ \psi-\eta_{a b}\right) \\
& +\delta_{i}^{a} \delta^{b} \ell_{i}\left(q_{a b} \circ \psi-\eta_{a b}\right) .
\end{aligned}
$$

The terms on the first and second line can, for the usual reasons, be set aside. In this connection, bear in mind that

$$
\begin{aligned}
& q_{a b} \circ \psi-\eta_{a b} \in W_{-1}^{2} \\
\Rightarrow & \\
& \partial_{i}\left(q_{a b} \circ \psi-n_{a b}\right) e w_{0}^{1} .
\end{aligned}
$$

It remains to deal with

$$
\begin{gathered}
\delta_{i}^{a} \delta^{b}{ }_{\ell} \partial_{i}\left(q_{a b} \circ \psi-n_{a b}\right) \\
\quad=\partial_{i}\left(q_{i \ell} \circ \psi-n_{i \ell}\right) \\
\quad=\partial_{i}\left(q_{i \ell} \circ \psi\right)
\end{gathered}
$$

or still,

$$
\partial_{i}\left(q_{i \ell} \circ(\psi-I+I)\right)
$$

$$
=\partial_{i}\left(q_{i \ell} \circ(\psi-I)\right)+\partial_{i} q_{i \ell}
$$

But

$$
\begin{aligned}
& \psi-I \in W_{-2}^{3} \\
& \\
& D \psi-[I] \in W_{-1}^{2} .
\end{aligned}
$$

So, by the chain rule,

$$
\partial_{i}\left(q_{i \ell} \circ(\psi-I)\right)
$$

is a sum of terms of the form $f \cdot F\left(f \in W_{0}, \mathrm{FGW}_{-1}^{2}\right)$, thus is ignorable. All that is left, then, is

$$
\partial_{i} q_{i \ell}\left(\equiv q_{i \ell, i}\right)
$$

[Note: Analogously,

$$
-\partial_{i} Y^{a_{2}}{ }_{i} Y^{b^{2}} \partial_{\ell}\left(q_{a b} \circ \psi\right)
$$

provides the contribution

$$
\left.-\partial_{\ell} q_{i i}\left(\equiv-q_{i i, \ell}\right) \cdot\right]
$$

Summary:

$$
\left(\phi_{\star} q\right)_{i \ell, i}-\left(\phi_{\star} q\right)_{i i, \ell}
$$

can be written in the form

$$
\Phi_{\ell}+q_{i \ell, i}-q_{i i, \ell}+\partial_{i i}^{2} Y^{\ell}-\partial_{i \ell}^{2} Y^{i}
$$

where

$$
\int_{\underline{S}^{2}(R)}\left|\Phi_{\ell}\right| d \Omega=o(1)
$$

It was shown above that

$$
\left(\partial_{i i}^{2} y^{\ell}-\partial_{i \ell}^{2} y^{i}\right) * d x=d\left(\varepsilon_{i k \ell} \partial_{i} y^{\ell} d x x^{k}\right)
$$

Therefore

$$
\int_{\underline{s}^{2}(\infty)}\left(\left(\phi_{*} \mathrm{q}\right)_{i \ell, i}-\left(\phi_{*} \mathrm{q}\right)_{i i, \ell}\right) \Omega_{\infty}^{\ell}=\delta_{\underline{s}^{2}(\infty)}\left(q_{i \ell, i}-q_{i i, \ell}\right) \Omega_{\infty}^{\ell}
$$

I.e.:

$$
P^{0}\left(\phi_{\star} q\right)=P^{0}(q)
$$

the contention of the theorem.
Remark: The invariance of the energy definitely depends on the assumption that the diffeomorphism $\phi$ is an element of $D_{\delta-1}^{k+1}$. To see this, fix constants $C \geq 0, \alpha>0$ and let

$$
f(t)=t+C t^{1-\alpha}(t \gg 0)
$$

Working in a neighborhood of infinity, put $\rho=f^{-1}(x)(\Rightarrow r=f(\rho))$ and take $y^{a}=\frac{\rho}{r} x^{a}\left(=>x^{a}=y^{a}\left(1+\frac{C}{\rho^{\alpha}}\right)\right)$ - then it can be shown that

$$
P^{0}\left(\phi_{\star} n\right)=16 \pi \times\left[\begin{array}{cc}
\infty & \left(\alpha<\frac{1}{2}\right) \\
c^{2} / 8 & \left(\alpha=\frac{1}{2}\right) \\
0 & \left(\alpha>\frac{1}{2}\right)
\end{array}\right.
$$

Section 69: Laplacians Continuing to work in $\underline{R}^{3}$, in this section we shall formulate a few background results from elliptic theory and illustrate their use by deriving some consequences which will play a role later on.

Criterion Assume:

- $\Phi \in C^{\infty}(I)$, where IcR is an open interval (possibly infinite).
- $f \in W_{\delta}^{k}\left(k>\frac{3}{2}, \delta>-\frac{3}{2}\right)$ with [inf $\left.f, \sup f\right] c I$.

Let $0 \leq k^{\prime} \leq k, \delta^{\prime} \in \mathbb{R}-$ then

$$
f^{\prime} \in W_{\delta}^{k \prime} \Rightarrow \Phi(f) f^{\prime} \in W_{\delta^{\prime}}^{k^{\prime}} .
$$

Rappel: Suppose that $q$ is asymptotically euclidean of class ( $k, \delta$ ) -- then

$$
q^{i j}-\eta_{i j} \in L_{\delta}^{2}
$$

More is true:

$$
q^{i j}-\eta_{i j} \in W_{\delta}^{k}
$$

[Note: It was shown in the last section that

$$
\left.(\operatorname{det} q) q^{i j}-\eta_{i j}{e W_{\delta}^{k}}^{k}\right]
$$

To see this, take $\Phi(x)=\frac{1}{x+1}(x>-1)$. Since det $q-1 \in W_{\delta}^{k}$ and since $[\inf (\operatorname{det} q-1), \sup (\operatorname{det} q-1)] \subset]-1, \infty[$,
it makes sense to form

$$
\Phi(\operatorname{det} q-1)=\frac{1}{\operatorname{det} q}
$$

Accordingly, $\forall f \in W_{\delta}^{k}$,

$$
\frac{1}{\operatorname{det} q} \cdot \cdot f \in W_{\delta}^{k} .
$$

$$
\begin{aligned}
\underline{i \neq j}: & (\operatorname{det} q) q^{i j} \in W_{\delta}^{k} \\
\Rightarrow & \\
& q^{i j}=\frac{1}{\operatorname{det} q} \cdot\left((\operatorname{det} q) q^{i j}\right) \in W_{\delta}^{k} . \\
\underline{i=j}: & (\text { det } q)\left(q^{i i}-1\right) \in W_{\delta}^{k} \\
\Rightarrow & q^{i i}-1=\frac{1}{\operatorname{det} q} \cdot(\operatorname{det} q)\left(q^{i i}-1\right) \in W_{\delta}^{k}
\end{aligned}
$$

Consider the laplacian $\Delta$ corresponding to $\eta$-- then it is clear that

$$
\Delta: W_{\delta}^{k} \rightarrow W_{\delta+2}^{k-2}
$$

Now let $q \in Q_{A E}(k, \delta)$ and consider

$$
\Delta_{q}=\frac{1}{\sqrt{q}} \sum_{i, j=1}^{3} \frac{\partial}{\partial x^{i}}\left(\sqrt{q} q^{i j} \frac{\partial}{\partial x^{j}}\right)
$$

Then it is still the case that

$$
\Delta_{q}: W_{\delta}^{k} \rightarrow W_{\delta+2}^{k-2}
$$

## Details First

$$
f \in W_{\delta}^{k} \Rightarrow \frac{\partial f}{\partial x^{j}} \in W_{\delta+1}^{k-1} .
$$

And

$$
\begin{aligned}
q^{i j} \frac{\partial f}{\partial x^{j}} & =\left(q^{i j}-\eta_{i j}+\eta_{i j}\right) \frac{\partial f}{\partial x^{j}} \\
& =\left(q^{i j}-n_{i j}\right) \frac{\partial f}{\partial x^{j}}+n_{i j} \frac{\partial f}{\partial x^{j}}
\end{aligned}
$$

3. 

is also in $W_{\delta+1}^{k-1}$ :

$$
\left.\right|_{-} \quad \begin{aligned}
& \mathrm{k}-1<\mathrm{k}-\frac{3}{2}+\mathrm{k}-1 \\
& \\
& \delta+1<\delta+\frac{3}{2}+\delta+1
\end{aligned}
$$

Next take $\Phi(x)=\sqrt{1+x} \quad(x>-1)$, hence

$$
\begin{aligned}
& \Phi(\operatorname{det} q-1)=\sqrt{\operatorname{det} q} \\
\Rightarrow \quad & \\
& \sqrt{q} q^{i j} \frac{\partial f}{\partial x^{j}} \in W_{\delta+1}^{k-1} \\
\Rightarrow & \\
& \frac{\partial}{\partial x^{i}}\left(\sqrt{q} q^{i j} \frac{\partial f}{\partial x^{j}}\right) \in W_{\delta+2}^{k-2} .
\end{aligned}
$$

Finally choose $\Phi(x)=\frac{1}{\sqrt{1+x}}(x>-1)$ to get

$$
\frac{1}{\sqrt{q}} \frac{\partial}{\partial x^{i}}\left(\sqrt{q} q^{i j} \frac{\partial f}{\partial x^{j}}\right) \in W_{\delta+2}^{k-2}
$$

N.B. By the same argument, $\Delta_{q}$ induces a map

$$
W_{\delta^{\prime}}^{k} \rightarrow W_{\delta^{\prime}+2}^{k-2} \quad\left(\delta^{\prime} \in \underline{R}\right)
$$

THEOREM Let $q \in Q_{A E}(k, \delta)$. Suppose that $-\frac{3}{2}<\delta^{\prime}<-\frac{1}{2}-$ then

$$
\Delta_{q^{\prime}}: W_{\delta^{\prime}}^{k} \rightarrow W_{\delta^{\prime}+2}^{k-2}
$$

is an isomorphism.
[Note: Take $\delta^{\prime}=-1$ to get that

$$
\Delta_{q}: W_{-1}^{k} \rightarrow W_{1}^{k-2}
$$

is an isomorphism, in particular that

$$
\Delta_{q}: W_{-1}^{2} \rightarrow W_{1}^{0}
$$

is an isomorphism provided $\left.q \in Q_{A E}(2,-1).\right]$

Let E and F be Hilbert spaces - then a bounded linear transformation $T: E \rightarrow F$ is said to be Fredholm if $K e r T$ is finite dimensional, Ran $T$ is closed, and Co Ker $\mathrm{T}=\mathrm{F} /$ Ran T is finite dimensional.
[Note: $T$ is semi-Fredholm if Ker $T$ is finite dimensional and Ran $T$ is closed.]
If $T: E \rightarrow F$ is Fredholm, then its index is

$$
\text { ind } T=\operatorname{dim} \operatorname{Ker} T-\operatorname{dim} C o \operatorname{Ker} T .
$$

Example: The operator

$$
\Delta: W_{-3 / 2}^{2}+W_{l / 2}^{0}
$$

has a trivial kernel (a bounded harmonic function is a constant and the constants do not belong to $W_{-3 / 2}^{2}$. Still, its range is not closed, so $\Delta$ is not Fredholm.

Let $v \in W_{\delta+2}^{k-2}$-- then $V$ determines an arrow

$$
W_{\delta^{\prime}}^{k} \rightarrow W_{\delta^{\prime}+2^{\prime}}^{k-2}
$$

viz. $f \rightarrow V f$.

Convention: Henceforth, it will be assumed that $V$ is, in addition, $\mathrm{C}^{\infty}$.

THEOREM Let $q \in Q_{A E}(k, \delta)$. Suppose that $-\frac{3}{2}<\delta^{\prime}<-\frac{1}{2}-$ then

$$
\Delta_{q}-V: W_{\delta^{\prime}}^{k}+W_{\delta^{\prime}+2}^{k-2}
$$

is Fredholm with index 0 and is an isomorphism if $\mathrm{V} \geq 0$.

There are various results that go under the name "maximum principle". Here are two, tailored to our specific situation.

Strong Maximum Principle If $f$ is a nonnegative $C^{\infty}$ function such that

$$
\Delta_{\mathrm{q}} \mathrm{f}-\mathrm{Vf} \leq 0
$$

and if $f\left(x_{0}\right)=0$ at some $x_{0} \in \underline{R}^{3}$, then $f$ vanishes identically.
[Note: There is no sign restriction on V.]
Weak Maximum Principle If $\mathrm{f}=\mathrm{o}(\mathrm{l})$ is a $\mathrm{C}^{\infty}$ function such that

$$
\Delta_{q} f-V f \geq 0
$$

and if $\mathrm{V} \geq 0$, then $\mathrm{f} \leq 0$.

SUBLEMMA If $q \in Q_{A E}(k, \delta)$, then $S(q) \in N_{\delta+2}^{k-2}$.
[For, as was shown above,

$$
q^{i j}-\eta_{i j} \in w_{\delta}^{k}
$$

And the product of two elements in $W_{\delta+1}^{k-1}$ lies in $W_{\delta+2}^{k-2}$ :

$$
\int_{-} \quad \begin{aligned}
& k-2<k-1+k-1-\frac{n}{2} \\
& \left.\delta+2<\delta+1+\delta+1+\frac{n}{2} .\right]
\end{aligned}
$$

Definition: Let $q \in Q_{A E}(k, \delta)$ - then the operator

$$
\Delta_{q}-\frac{1}{8} S(q)
$$

is called the conformal laplacian attached to q .
Conformal Replacement Principle Let $q \in Q_{A E}(k, \delta) \quad\left(-1 \leq \delta<-\frac{1}{2}\right)$. Assume: $S(q) \geq 0$ - then $\exists x \in C_{>0}^{\infty}\left(\underline{R}^{3}\right)$ subject to $x-1 \in W_{\delta}^{k}$ such that

$$
s\left(x^{4} q\right)=0
$$

[Viewing $X$ as the unknown, put $q^{\prime}=x^{4} q$. The rule for the change of scalar curvature under a conformal transformation then gives:

$$
x^{5} S\left(q^{\prime}\right)=-8 \Delta q^{x}+S(q) x
$$

or still,

$$
x^{5} S\left(q^{\prime}\right)=-8\left(\Delta_{q} x-\frac{1}{8} S(q) x\right)
$$

Since $S(q) \geq 0$ and belongs to $W_{\delta+2}^{k-2}$, the conformal laplacian

$$
\Delta_{q}-\frac{1}{8} S(q): W_{\delta}^{k} \rightarrow W_{\delta+2}^{k-2}
$$

is an isomorphism, thus there exists a unique $\bar{\chi} \in W_{\delta}^{k}$ such that

$$
\left(\Delta_{q}-\frac{1}{8} s(q)\right) \bar{\chi}=\frac{1}{8} s(q)
$$

Define $x$ by $\chi-1=\bar{x}-$ then

$$
\begin{aligned}
& \Delta_{\mathrm{q}} X-\frac{1}{8} \mathrm{~S}(\mathrm{q}) \mathrm{X} \\
&=\Delta_{\mathrm{q}} \bar{\chi}-\frac{1}{8} \mathrm{~s}(\mathrm{q})(\overline{\mathrm{x}}+1) \\
& \quad=\frac{1}{8} \mathrm{~S}(\mathrm{q})-\frac{1}{8} \mathrm{~S}(\mathrm{q}) \\
& \quad=0
\end{aligned}
$$

Elliptic regularity implies that $x$ is $C^{\infty}$, so it remains to show that $\chi>0$. To this end, let $0 \leq a \leq 1$ and determine $\bar{X}_{a} \in W_{\delta}^{k}$ via

$$
\left(\Delta_{q}-\frac{1}{8} S(q)\right) \bar{X}_{a}=\frac{a}{8} S(q)
$$

Put $X_{a}=1+\bar{x}_{a}$ and let $I=\left\{a: x_{a}>0\right\}-$ then $I$ is not empty $\left(X_{0}=1\right)$. On the other hand,

$$
\left\{f \in C_{E}^{0}: f>-1\right\}
$$

is open in $C_{\varepsilon}^{0}$ and the map $a \rightarrow X_{a} \in C_{\varepsilon}^{0}$ is continuous ( $\varepsilon>0 \& \varepsilon<\frac{1}{2} \leq \delta+\frac{3}{2}$ ). Therefore $I$ is open. But $I$ is also closed. For $a_{0} \in \bar{I} \Rightarrow X_{a_{0}} \geq 0$. However, $\chi_{a_{0}} \rightarrow 1$ at infinity, so, thanks to the strong maximm principle, $X_{a_{0}}>0$.
I.e.: $a_{0} \in I$. Consequently, $I=[0,1]$, hence $\left.X_{1}=x>0.\right]$

Remark: $\exists C>0$ such that

$$
c \leq x \leq 1
$$

- $C \leq \chi$ : Choose $R \gg 0: \chi \geq \frac{1}{2}$ in $\underline{R}^{3}-\underline{D}^{3}(R)$. As for the restriction $X \mid \underline{D}^{3}(\mathrm{R})$, it is positive, thus by compactness, $\exists \mathrm{c}>0$ :

$$
x \in \underline{D}^{3}(R) \Rightarrow x(x) \geq c .
$$

Take $C=\min \left(\frac{1}{2}, c\right)$.

- $\underline{x \leq 1:}$ Since $\bar{x}=O(1)$ and since

$$
\left(\Delta_{q}-\frac{1}{8} S(q)\right) \bar{X}=\frac{1}{8} S(q) \geq 0
$$

the weak maximum principle implies that $\bar{X} \leq 0$ or, equivalently, that $X \leq 1$.

IEMMA Let $q \in Q_{A E}(k, \delta)$. Suppose that $x \in C_{>0}^{\infty}\left(\underline{R}^{3}\right)$ subject to $x-1 \in W_{\delta}^{k}-$ then

$$
x^{4}{ }_{q \in Q_{A E}}(k, \delta)
$$

[Write

$$
x^{4} q-n=x^{4}(q-n)+\left(x^{4}-1\right) n
$$

Let $\mathrm{I}=\underline{\mathrm{R}}$ and $\Phi(\mathrm{x})=(1+\mathrm{x})^{4}-$ then $\Phi(\chi-1)=\chi^{4}$, so, in view of the criterion,

$$
x^{4}(q-\eta) \in W_{\delta}^{k}
$$

And

$$
\begin{aligned}
& \Phi(\mathrm{x})-1=\Psi(\mathrm{x}) \mathrm{x} \quad\left(\Psi \in \mathrm{C}^{\infty}(\underline{\mathrm{R}})\right) \\
\Rightarrow & \\
& \Phi(\chi-1)-1=\psi(x-1)(\chi-1) \in W_{\delta}^{k} .
\end{aligned}
$$

I.e.: $\left.\quad x^{4}-1 \in W_{\delta}^{k}.\right]$

In particular: Replacing $q$ by $q^{\prime}=\chi^{4} q$ in the conformal replacement principle does not take one outside of $Q_{A E}(k, \delta) \quad\left(x-1 \in W_{\delta}^{k},-1 \leq \delta<-\frac{1}{2}\right)$.

LEMMA Suppose that $q \in Q_{A E}^{*}(k, \delta)$ with $S(q) \geq 0$ - then $q^{\prime} \in Q_{A E}^{*}(k, \delta)$ and

$$
P^{0}\left(q^{\prime}\right)=P^{0}(q)-8 \lim _{R \rightarrow \infty} \int_{\underline{D}^{3}(R)} \Delta_{q^{\prime}} X \operatorname{vol}_{q} .
$$

Trivially, $q^{\prime} \in Q_{A E}^{*}(k, \delta)\left(S\left(q^{\prime}\right)=0\right)$. This said, to fix the ideas let $k=2$, $\delta=-1$.

Rappel: If $f \in W_{0}^{1}$ and $F \in W_{-1}^{2}$, then

$$
\int_{\underline{s}^{2}(\mathrm{R})}|\mathrm{f}| \cdot|\mathrm{F}| \mathrm{d} \Omega=o(1)
$$

We have

$$
\begin{aligned}
& q_{i \ell, i}^{\prime}-q_{i i, \ell}^{\prime}=\left(\partial_{i} x^{4}\right) q_{i \ell}-\left(\partial_{\ell} \chi^{4}\right) q_{i i} \\
& \\
& +\chi^{4}\left(q_{i \ell, i}-q_{i i, \ell}\right)
\end{aligned}
$$

$$
=\left(x^{4}-1\right)\left(q_{i \ell, i}-q_{i i, \ell}\right)+q_{i \ell, i}-q_{i i, \ell}
$$

Since $x^{4}-1 \in W_{-1}^{2}$ and
=>

$$
\begin{aligned}
& {\left[\begin{array}{ll}
q_{i \ell}-n_{i \ell} & \\
q_{i i}-n_{i i} & \\
& q_{-1}^{2} \\
q_{i l, i} & \\
q_{i i, \ell} &
\end{array}\right.}
\end{aligned}
$$

it follows that

$$
\left(x^{4}-1\right)\left(q_{i \ell, i}-q_{i i, \ell}\right)
$$

can be ignored.

$$
\begin{aligned}
& -\left(\partial_{i} \chi^{4}\right) q_{i \ell}-\left(\partial_{\ell} \chi^{4}\right) q_{i i} \\
& =4 \chi^{3}\left(\partial_{i} x\right) q_{i \ell}-4 \chi^{3}\left(\partial_{\ell} \chi\right) q_{i i} \\
& =4 \chi^{3}\left(\partial_{i} x\right)\left(q_{i \ell}-\eta_{i \ell}\right)-4 \chi^{3}\left(\partial_{\ell} \chi\right)\left(q_{i i}-\eta_{i i}\right) \\
& +4 \chi^{3}\left(\partial_{i} x\right) n_{i \ell}-4 \chi^{3}\left(\partial_{\ell} \chi\right) n_{i i}
\end{aligned}
$$

The products

$$
\left.\right|_{-4 x^{3}\left(q_{i \ell}-\eta_{i \ell}\right)} ^{4 x^{3}\left(q_{i i}-\eta_{i i}\right)}
$$

are in $W_{-1}^{2}$. On the other hand,

$$
\partial_{i} x, \partial_{\ell} x \in W_{0}^{1}
$$

Therefore

$$
4 x^{3}\left(\partial_{i} \chi\right)\left(q_{i \ell}-\eta_{i \ell}\right)-4 \chi^{3}\left(\partial_{\ell} \chi\right)\left(q_{i i}-\eta_{i i}\right)
$$

will not contribute. Write

$$
\begin{aligned}
& 4 \chi^{3}\left(\partial_{i} x\right) \eta_{i \ell}-4 \chi^{3}\left(\partial_{\ell} \chi\right) \eta_{i i} \\
& \quad=4\left(x^{3}-1\right)\left(\partial_{i} x\right) \eta_{i \ell}-4\left(x^{3}-1\right)\left(\partial_{\ell} \chi\right) \eta_{i i}
\end{aligned}
$$

$$
+4\left(\left(\partial_{i} x\right) \eta_{i \ell}-\left(\partial_{\ell} x\right) \eta_{i i}\right)
$$

Then

$$
4\left(x^{3}-1\right)\left(\partial_{i} x\right) n_{i \ell}-4\left(x^{3}-1\right)\left(\partial_{l} x\right) n_{i i}
$$

will not contribute, leaving

$$
4\left(\left(\partial_{i} \chi\right) \eta_{i \ell}-\left(\partial_{\ell} \chi\right) \eta_{i i}\right)
$$

or still,

$$
\begin{aligned}
4\left(\partial_{\ell} X\right. & \left.-3\left(\partial_{\ell} X\right)\right) \\
& =-8 \partial_{\ell} X .
\end{aligned}
$$

## Summary:

$$
\begin{aligned}
& \int_{\underline{S}^{2}(R)}\left(q_{i \ell, i}^{\prime}-q_{i i, \ell}^{\prime}\right) \Omega_{R}^{\ell} \\
& = \\
& \int_{\underline{S}^{2}(R)}\left(q_{i \ell, i}-q_{i i, \ell}\right) \Omega_{R}^{\ell} \\
&
\end{aligned}
$$

SUBLEMMA $\sqrt{\mathrm{q}}-1 \in W_{-1}^{2}$.
[Let $I=\{x: x>-1\}$ and write

$$
\sqrt{1+x}-1=\Psi(x) x \quad\left(\Psi \in C^{\infty}(I)\right) .
$$

Bearing in mind that $\operatorname{det} q-1 \in W_{-1}^{2}$, the criterion formulated at the beginning then implies that

$$
\begin{aligned}
\sqrt{\mathrm{q}}-1 & =\sqrt{1+(\operatorname{det} \mathrm{q}-1)}-1 \\
& =\Psi(\operatorname{det} q-1)(\operatorname{det} q-1)
\end{aligned}
$$

is in $\left.W_{-1}^{2}.\right]$

Consequently,

$$
\begin{aligned}
& -8 \int_{\underline{s^{2}}(R)}\left(\partial_{\ell} \chi\right) \Omega_{R}^{\ell} \\
& =-8 \int_{\underline{s}^{2}(R)}\left(\sqrt{q} \partial_{\ell} \chi\right) \Omega_{R}^{\ell}+8 \int_{\underline{S}^{2}(R)}\left((\sqrt{q}-1) \partial_{\ell} \chi\right) \Omega_{R}^{\ell} \\
& =-8 \int_{\underline{S}^{2}(R)}\left(\sqrt{q} \partial_{\ell} X\right) \Omega_{R}^{\ell}+o(1) .
\end{aligned}
$$

But

$$
\begin{aligned}
\left(\partial_{k} x\right) q^{\ell k} & =\partial_{k} x\left(q^{\ell k}-n_{\ell k}+n_{\ell k}\right) \\
& =\partial_{k} x\left(q^{l k}-\eta_{\ell k}\right)+\left(\partial_{k} x\right) n_{\ell k} \\
& =\partial_{k} x\left(q^{\ell k}-n_{\ell k}\right)+\partial_{\ell} x \cdot
\end{aligned}
$$

And

$$
\begin{aligned}
& q^{l k}-n_{l k} \in W_{-1}^{2} \\
& \sqrt{q}\left(q^{l k}-n_{l k}\right) \in w_{-1}^{2} .
\end{aligned}
$$

Therefore

$$
-8 \int_{\underline{S}^{2}(R)}\left(\sqrt{q} \partial_{\ell} \chi\right) \Omega_{R}^{\ell}
$$

$$
\begin{aligned}
& =-8 \int_{\underline{S}^{2}(R)}\left(\sqrt{q} q^{l k} \frac{\partial x}{\partial x^{k}}\right) \Omega_{R}^{\ell}+o(1) \\
& =-8 \int_{\underline{D}^{3}(R)} \frac{\partial}{\partial x^{\ell}}\left(\sqrt{q} q^{\ell k} \frac{\partial x}{\partial x^{k}}\right) d^{3} x+o(1) \\
& =-8 \int_{\underline{D}^{3}(R)} \frac{1}{\sqrt{q}} \frac{\partial}{\partial x^{\ell}}\left(\sqrt{q} q^{\ell k} \frac{\partial \chi}{\partial x^{k}}\right) \sqrt{q} d^{3} x+o(1) \\
& =-8 \int_{\underline{D}^{3}(R)} \Delta_{q} X \operatorname{Vol}_{q}+o(1) .
\end{aligned}
$$

Now let $R \rightarrow \infty$ to get:

$$
P^{0}\left(q^{\prime}\right)=P^{0}(q)-8 \lim _{R \rightarrow \infty} \int_{\underline{D}^{3}(R)} \Delta_{q} X \operatorname{vol}_{q} .
$$

[Note: It is not claimed that $\Delta_{q} X$ is integrable.]
Energy Reduction Principle This is the assertion that

$$
P^{0}\left(q^{\prime}\right) \leq P^{0}(q)
$$

In fact,

$$
\begin{array}{ll} 
& S(q) \geq 0 \& X>0 \\
\Rightarrow & \Delta_{q} X=\frac{1}{8} S(q) X \geq 0 \\
\Rightarrow & \\
& \int_{\mathbb{D}^{3}(R)} \Delta_{q} X{ }^{V 01}{ }_{q} \geq 0 .
\end{array}
$$

One can then quote the lemma.

Section 70: Positive Energy Retain the assumptions and notation of the preceding section.

THEOREM Let $\mathrm{qEQ}_{\mathrm{AE}}^{*}(4, \delta)\left(-1 \leq \delta<-\frac{1}{2}\right)$. Assume: $\mathrm{S}(\mathrm{q}) \geq 0$ - then $P^{0}(q) \geq 0$.

While we are not yet in a position to establish this result, in view of the energy reduction principle, to prove that $P^{0}(q) \geq 0$, it suffices to prove that $P^{0}\left(q^{\prime}\right) \geq 0$.

This said, replace $q^{\prime}$ by $q$ (so now $S(q)=0$ ). Fix a one parameter family of $C^{\infty}$ cutoff functions $\psi_{\theta}(\theta>0)$ satisfying the following conditions.

1. $0 \leq \psi_{\theta} \leq 1$.
2. $\psi_{\theta}(x)$ depends only on $|x|$ and is a decreasing function of $|x|$.
3. $\psi_{\theta}(x)=1$ if $|x| \leq \theta$.
4. $\psi_{\theta}(x)=0$ if $|x| \geq 2 \theta$.
5. $\exists \mathrm{C}>0: \forall \theta$,

$$
\theta\left|\psi_{\theta}^{\prime}\right|+\theta^{2}\left|\psi_{\theta}^{\prime \prime}\right| \leq C .
$$

Put

$$
q_{\theta}=\psi_{\theta} q+\left(1-\psi_{\theta}\right) n .
$$

Then it is clear that

$$
S\left(q_{\theta}\right)=\left.\right|_{-0} ^{0} \quad(r \leq \theta)
$$

[Note: From the definitions,

$$
s\left(q_{\theta}\right)=O\left(|x|^{-\frac{5}{2}}\right)
$$

for $\theta \leq|x| \leq 2 \theta$ uniformly in $\theta \gg 0$.

IEMMA We have

$$
\left[\int_{\underline{R}^{3}}\left|S\left(q_{\theta}\right)\right|^{3 / 2} \sqrt{q_{\theta}} d^{3} x\right]^{2 / 3}=o\left(\theta^{-\frac{1}{2}}\right)
$$

[Note: The implied constant on the right is independent of $\theta$.]

There is no guarantee that $S\left(q_{\theta}\right)$ is nonnegative, hence the conformal replacement principle is not applicable a priori. Still, as will be shown below, for all $\theta \gg 0$, $\exists X_{\theta} \in C_{>0}^{\infty}\left(\underline{R}^{3}\right)$ subject to $X_{\theta}-l \in W_{\delta}^{4}\left(-1 \leq \delta<-\frac{1}{2}\right)$ such that

$$
S\left(x_{\theta}^{4} q_{\theta}\right)=0
$$

Rappel: The conformal laplacian

$$
\Delta_{q_{\theta}}-\frac{1}{8} S\left(q_{\theta}\right): w_{\delta}^{4} \rightarrow W_{\delta+2}^{2}\left(-1 \leq \delta<-\frac{1}{2}\right)
$$

is Fredholm with index 0.
So, to conclude that

$$
\Delta_{q_{\theta}}-\frac{1}{8} S\left(q_{\theta}\right)
$$

is an isomorphism, one has only to show that

$$
\Delta_{q_{\theta}}-\frac{1}{8} S\left(q_{\theta}\right)
$$

is injective $(\theta \gg 0)$.
N.B. Granted this, the existence of $X_{\theta}$ is then immediate (argue as in the conformal replacement principle).

There are a couple of technicalities that have to be taken care of first.
Integration by Parts Let $q \in Q_{A E}(k, \delta)(\delta \geq-1)$. Suppose that $u, v \in W_{\delta}^{k}$ - then

$$
\int_{\underline{R}^{3}} q\left(\operatorname{grad}_{q} u, \operatorname{grad}_{q} v\right) \sqrt{q} d^{3} x=-\int_{\mathbb{R}^{3}} u\left(\Delta_{q} v\right) \sqrt{q} d^{3} x .
$$

Notation: Put

$$
\nabla_{q} f=\operatorname{grad}_{q} f \text { and }\left|\nabla_{q} f\right|^{2}=q\left(\nabla_{q} f, \nabla_{q} f\right)
$$

Sobolev Inequality Let $q \in Q_{A E}(k, \delta)(\delta \geq-1)$. Suppose that $f \in W_{\delta}^{k}$ - then

$$
\left[\int_{\underline{R}^{3}}|f|^{6} \sqrt{q} d^{3} x\right]^{1 / 3} \leq C_{q} \int_{\underline{R}^{3}}\left|\nabla_{q} f\right|^{2} \sqrt{q} d^{3} x .
$$

[Note: The positive constant $\mathrm{C}_{\mathrm{q}}$ is independent of f and the $\mathrm{C}_{\mathrm{q}_{\theta}}$ are uniform in $\left.\theta: \mathrm{C}_{\mathrm{q}_{\theta}}<\mathrm{C}_{0}(\forall \theta \gg 0).\right]$

Turning now to the injectivity of

$$
\Delta_{q_{\theta}}-\frac{1}{8} S\left(q_{\theta}\right)
$$

$\operatorname{fix} \theta_{0}: \theta>\theta_{0} \Rightarrow$

$$
\frac{1}{8}\left[\int_{\underline{R}^{3}}\left|S\left(q_{\theta}\right)\right|^{3 / 2} \sqrt{q_{\theta}} d^{3} x\right]^{2 / 3}<\frac{1}{C_{0}} .
$$

Let $f \in W_{\delta}^{4}\left(-1 \leq \delta<-\frac{1}{2}\right)$ :

$$
\Delta_{q_{\theta}} f-\frac{1}{8} S\left(q_{\theta}\right) f=0 \quad\left(\theta>\theta_{0}\right)
$$

and, to derive a contradiction, assume that $\mathrm{f} \neq 0$ - then

$$
\begin{aligned}
& f \Delta_{q^{\prime}} f-\frac{1}{8} S\left(q_{\theta}\right) f^{2}=0 \\
\Rightarrow & 0=\int_{\underline{R}^{3}}\left(f \Delta_{q_{\theta}} f-\frac{1}{8} S\left(q_{\theta}\right) f^{2}\right) \sqrt{q_{\theta}} d^{3} x \\
\Rightarrow & 0=\int_{\underline{R}^{3}}\left(\left|\nabla_{q_{\theta}} f\right|^{2}+\frac{1}{8} S\left(q_{\theta}\right) f^{2}\right) \sqrt{q_{\theta}} d^{3} x \\
\Rightarrow & \int_{\underline{R}^{3}}\left|\nabla_{q_{\theta}} f\right|^{2} \sqrt{q_{\theta}} d^{3} x \\
& =\frac{1}{8}\left|\int_{\underline{R}^{3}} S\left(q_{\theta}\right) f^{2} \sqrt{q_{\theta}} d^{3} x\right| .
\end{aligned}
$$

But for $\theta>\theta_{0}$,

$$
\begin{aligned}
& \frac{1}{8}\left|\int_{\underline{R}^{3}} S\left(q_{\theta}\right) f^{2} \sqrt{q_{\theta}} d^{3} x\right| \\
& \leq \frac{1}{8}\left[\int_{\underline{R}^{3}}\left|S\left(q_{\theta}\right)\right|^{3 / 2} \sqrt{q_{\theta}} d^{3} x\right]^{2 / 3}{ }_{\left[\int_{\underline{R}^{3}}|f|^{6} \sqrt{q_{\theta}} d^{3} x\right]^{1 / 3}}^{<\frac{1}{C_{0}}\left[\int_{\underline{R}^{3}}|f|^{6} \sqrt{q_{\theta}} d^{3} x\right]^{1 / 3}} \\
& \leq \int_{\underline{R}^{3}}\left|\nabla_{q_{\theta}} f\right|^{2} \sqrt{q_{\theta}} d^{3} x .
\end{aligned}
$$

Therefore $1<1$... .
Accordingly, if $\theta>\theta_{0}$, then $\exists x_{\theta} \in C_{>0}^{\infty}\left(\underline{R}^{3}\right)$ subject to $X_{\theta}-l \in W_{\delta}^{4}\left(-1 \leq \delta<-\frac{1}{2}\right)$ such that

$$
s\left(q_{\theta}^{\prime}\right)=0,
$$

where $q_{\theta}^{\prime}=\chi_{\theta}^{4} q_{\theta}$.

LEMMA We have

$$
\lim _{\theta \rightarrow \infty} P^{0}\left(q_{\theta}^{\prime}\right)=P^{0}(q)
$$

Take $\theta>\theta_{0}$-- then in a certain exterior domain $E_{E_{\theta}}, q_{\theta}^{\prime}=u_{\theta}^{4} \eta^{n} \quad\left(u_{\theta}=x_{\theta} \mid E_{R_{\theta}}\right)$ and there, $s\left(u_{\theta}^{4} \eta\right)=0$, thus

$$
\begin{aligned}
0=u_{\theta}^{5} S\left(u_{\theta}^{4} \eta\right) & =-8 \Delta u_{\theta}+S(\eta) u_{\theta} \\
& =-8 \Delta u_{\theta}
\end{aligned}
$$

i.e.,

$$
\Delta u_{\theta}=0
$$

This means that $u_{\theta}$ is harmonic. But $u_{\theta} \rightarrow l$ at infinity, so there is an expansion

$$
u_{\theta}(x)=1+\frac{A_{\theta}}{r}+\mu_{\theta}(x) \quad\left(\mu_{\theta}=o^{\infty}\left(\frac{1}{r^{2}}\right)\right)
$$

And

$$
P^{0}\left(q_{\theta}^{\prime}\right)=32 \pi A_{\theta} .
$$

N.B. Since $P\left(q_{\theta}^{\prime}\right) \rightarrow P(q)(\theta \rightarrow \infty)$, matters have been reduced to proving that $A_{\theta} \geq 0$.

IEMMA If $A_{\theta}<0$, then there exists a riemannian structure $q_{\theta}^{\prime \prime}$ on $\underline{R}^{3}$ with the following properties:

1. $S\left(q_{\theta}^{\prime \prime}\right) \geq 0$.
2. $\exists \mathrm{x}:\left.\mathrm{S}\left(\mathrm{q}_{\theta}^{\prime \prime}\right)\right|_{\mathrm{x}}>0$.
3. $\exists \mathrm{R}: \mathrm{q}_{\theta}^{\prime \prime}\left|\mathrm{E}_{\mathrm{R}}=\eta\right| \mathrm{E}_{\mathrm{R}}$.

But this is impossible. Thus let $M$ be a compact connected $C^{\infty}$ manifold of dimension $\geq 3$ - then there are three possibilities.
(A) $\exists$ a riemannian structure $g$ on $\mathrm{M}: \mathrm{S}(\mathrm{g}) \geq 0$ and $\mathrm{S}(\mathrm{g}) \not \equiv 0$.
(B) $\exists$ a riemannian structure g on $\mathrm{M}: \mathrm{S}(\mathrm{g}) \equiv 0$ and $\mathrm{M} \notin \mathrm{A}$.
(C) $\nexists$ a riemannian structure $g$ on $\mathrm{M}: \mathrm{S}(\mathrm{g}) \geq 0$.

Example: $\forall \mathrm{n} \geq 3$,

In particular: $\underline{T}^{3}$ does not admit a riemannian structure $\mathrm{g}: \mathrm{S}(\mathrm{g}) \geq 0$ and $\left.\mathrm{S}(\mathrm{g})\right|_{\mathrm{X}}>0$ at some x .

Now take a cube centered at the origin which strictly contains $\underline{D}^{3}(\mathrm{R})$ and identify opposite sides to get a torus -- then $q_{\theta}^{n}$ induces a riemannian structure $g$ on this torus: $S(g) \geq 0$ and $\left.S(g)\right|_{x}>0$ at same $x$, a contradiction.

The proof of the lemma depends on an elementary preliminary fact.

SUBLEMMA Suppose that $u=\frac{1}{\mathrm{r}}+\mathrm{v}$ is harmonic in

$$
\underset{A}{A}=\{x: 1<|x|<6\} .
$$

Then $\exists \delta>0:|v|<\delta$ implies $\exists H \in C_{>0}^{\infty}$ (A) with the following properties:

1. $\Delta H \geq 0$ and $\Delta H \neq 0$.
2. $\mathrm{H}=\mathrm{u}$ near $|\mathrm{x}|=1$.
3. $H=$ constant near $|x|=6$.
[Assume first that $v=0$ and construct a function $f \in C_{>0}^{\infty}$ (] $1,6[$ ) subject to:
4. $f(x)=\frac{1}{x} \quad(1<x \leq 2)$.
5. $f(x)=$ constant $(5 \leq x<6)$.
6. $f^{\prime \prime}(x)+\frac{2}{x} f^{\prime}(x)>0 \quad(2<x<5)$.

For the particulars, see below. Since $\Delta=\frac{\partial^{2}}{\partial r^{2}}+\frac{2}{r} \frac{\partial}{\partial r}$ on radial functions, one can let $H(x)=f(|x|)$. To treat the general case, fix a rotationally invariant $C^{\infty}$ cutoff function $\psi: \underline{R}^{3} \rightarrow[0,1]$ such that

$$
\left[\begin{array}{l}
\psi(x)=1 \text { if }|x| \leq 3 \\
\psi(x)=0 \text { if }|x| \geq 4
\end{array}\right.
$$

and consider

$$
H(x)=f(|x|)+\psi(x) v(x) .
$$

Elliptic theory can then be used to secure $\delta$ (for, by hypothesis, $v$ is harmonic).
[Note: Denote by K the constant figuring in the definition of f - then it is clear that $H=K$ near $|x|=6$, so the constant of property 3 is independent
of v.$]$

Details Observe first that

$$
f^{\prime \prime}(x)+\frac{2}{x} f^{\prime}(x)=\frac{1}{x^{2}} \frac{d}{d x}\left(x^{2} f^{\prime}(x)\right)
$$

Motivated by this, for $\varepsilon$ small and positive, let

$$
x^{2} f^{\prime}(x)=\phi_{\varepsilon}(x) \quad(1<x<6) .
$$

Here $\phi_{\varepsilon}(x)=-1(1<x \leq 2)$, then climbs from -1 to $-\varepsilon$ between 2 and $2+\varepsilon$, then slowly strictly increases hitting 0 at 5 (usual $\mathrm{e}^{-1 / \mathrm{x}}$ stuff), and finally $\phi_{\varepsilon}(\mathrm{x})=0$ $(5 \leq x<6)$. Take $f(x)=\frac{1}{x}(1<x \leq 2)$ and if $x>2$,

$$
f(x)=\int_{2}^{x} \frac{1}{t^{2}} \phi_{\varepsilon}(t) d t+\frac{1}{2}
$$

Obviously, $f(5)$ is positive provided $\varepsilon$ is close enough to zero. And

$$
\mathrm{f}^{\prime \prime}(\mathrm{x})+\frac{2}{\mathrm{x}} \mathrm{f}^{\prime}(\mathrm{x})>0 \quad(2<\mathrm{x}<5) .
$$

The function $u_{\theta}$ is harmonic in a certain exterior domain $\mathrm{E}_{\mathrm{R}_{\theta}}$. Choose a positive integer $k$ such that $R_{\theta}<\sigma^{k}$ and consider

$$
v(x)=\frac{6^{k}}{A_{\theta}} \mu_{\theta}\left(6^{k} x\right) \quad(1<|x|<6)
$$

Then for $k \gg 0,|v|<\delta$ and the function

$$
x(x)=1+\frac{A_{\theta}}{6^{k}} H\left(\frac{x}{6^{k}}\right) \quad\left(6^{k}<|x|<6^{k+l}\right)
$$

is positive.
[Note: Therefore

$$
L=l+\frac{A_{\theta}}{6^{k}} K
$$

9. 

is positive.]
Put

$$
q_{\theta}^{\prime \prime}=\left[\begin{array}{cl}
q_{\theta}^{\prime} & \left(|x| \leq 6^{k}\right) \\
x^{4} \eta & \left(6^{k}<|x|<6^{k+1}\right) \\
L^{4} n & \left(|x| \geq 6^{k+1}\right)
\end{array}\right.
$$

This makes sense:

- on $\underline{s}^{2}\left(6^{k}\right), q_{\theta}^{\prime}=u_{\theta}^{4} n$.

But near $\underline{s}^{2}\left(6^{k}\right)$,

$$
\begin{aligned}
x(x) & =1+\frac{A_{\theta}}{6^{k}} H\left(\frac{x}{6^{k}}\right) \\
& =1+\frac{A_{\theta}}{6^{k}}\left[\frac{6^{k}}{|x|}+\frac{6^{k}}{A_{\theta}} \mu_{\theta}(x)\right] \\
& =1+\frac{A_{\theta}}{r}+\mu_{\theta}(x) \\
& =u_{\theta}(x)
\end{aligned}
$$

And near $\underline{s}^{2}\left(6^{k+1}\right)$,

$$
\begin{aligned}
x(x) & =1+\frac{A_{\theta}}{6^{k}} H\left(\frac{x}{6^{k}}\right) \\
& =1+\frac{A_{\theta}}{6^{k}} K \\
& =I .
\end{aligned}
$$

After rescaling, we might just as well take $L=1$. So, to complete the proof, one merely has to explicate $S\left(q_{\theta}^{\prime \prime}\right)$ and this is only an issue if $6^{k}<|x|<6^{k+1}$. But when $x$ is thus restricted,

$$
\begin{aligned}
x^{5} S\left(x^{4} \eta\right) & =-8 \Delta x+S(\eta) x \\
& =-8 \Delta x
\end{aligned}
$$

And

$$
-\left.8 \Delta x\right|_{x}=\frac{1}{6^{3 k}}\left(-8 A_{\theta}\right)\left(\left.\Delta H\right|_{\frac{x}{6^{k}}}\right)
$$

$\geq 0$.
Here, of course, $A_{\theta}<0 \Rightarrow-8 A_{\theta}>0$. Moreover,

$$
\exists \mathrm{x}:\left.\Delta \mathrm{H}\right|_{\frac{\mathrm{x}}{6^{k}}}>0 .
$$

Consequently, $S\left(q_{\theta}^{\prime \prime}\right)$ has properties 1 and 2.
Remark: It can be shown that if $S(q) \geq 0$ and $P^{0}(q)=0$, then $\left(\underline{R}^{3}, q\right)$
is isometric to $\left(\underline{R}^{3}, \eta\right)$.
Example: There is one special set of circumstances where one can immediately assert that $P^{0}(q) \geq 0$. To this end, work in all of $\underline{R}^{3}$ and take $q=u^{4} \eta\left(u \in C_{>0}^{\infty}\left(\underline{R}^{3}\right)\right)$. Assume: $\Delta u \leq 0$ and in a certain exterior domain $E_{R^{\prime}} u$ is harmonic with

$$
u(x)=1+\frac{A}{r}+\mu(x) \quad\left(\mu=0^{\infty}\left(\frac{1}{r^{2}}\right)\right) .
$$

Then

$$
A \geq 0
$$

In fact, $1-u=o(1)$ and $\Delta(1-u) \geq 0$, thus the weak maximm principle implies that $1-\mathrm{u} \leq 0$ or still, $\mathrm{l} \leq \mathrm{u}$. Therefore

$$
\begin{aligned}
& 1+\frac{A}{r}+O\left(\frac{1}{r^{2}}\right) \geq 1 \\
\Rightarrow & \frac{A}{r}+O\left(\frac{1}{r^{2}}\right) \geq 0 \\
\Rightarrow & A+O\left(\frac{1}{r}\right) \geq 0
\end{aligned}
$$

$$
A \geq 0
$$
