Spectral theory and dynamics of asymptotically hyperbolic manifolds

Julie Rowlett

(U OF BONN)

Asymptotically hyperbolic manifolds are complete Riemannian manifolds with infinite volume and include many interesting examples such as the Poincaré-Einstein manifolds which are studied in adS-CFT correspondence in string theory. We will begin with the geometry of these spaces followed by their spectral theory. I will then discuss recent results for the dynamics of their geodesic flow, dynamical zeta functions, and a “prime orbit theorem.” In conclusion, based on a trace formula relating the spectral theory and dynamics via a renormalized wave trace, together with a counting estimate from analytic number theory, I will discuss a result which gives a quantitative relationship between the spectrum and the dynamics. Physically, this result describes an interaction between the quantum and classical mechanics.
